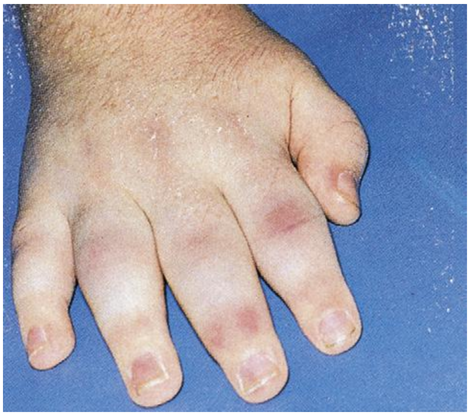
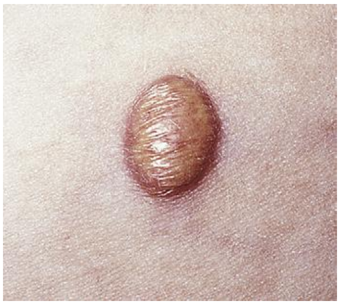
juvenile rheumatoid arthritis (JRA), a form of rheumatoid arthritis, usually affecting the larger joints of children younger than 16 years of age and often accompanied by systemic manifestations. As bone growth in children is dependent on the epiphyseal plates of the distal epiphyses, skeletal development may be impaired if these structures are damaged. Treatment is supportive and includes analgesia, antiinflammatory medication, and rest. Also called **Still's disease.**



Juvenile rheumatoid arthritis: deformity of the fingers *(Zitelli and Davis, 2002)*

juvenile spinal muscular atrophy, a disorder beginning in childhood in which progressive degeneration of anterior horn and medullary nerve cells leads to skeletal muscle wasting. The condition usually begins in the legs and pelvis. Also called **Wohlfart-Kugelberg-Welander disease.**

juvenile xanthogranuloma, a skin disorder characterized by groups of yellow, red, or brown papules or nodules on the extensor surfaces of the arms and legs and, in some cases, on the eyeball, meninges, and testes. The lesions typically appear in infancy or early childhood and usually disappear in a few years.



Juvenile xanthogranuloma *(Callen et al, 2000)*

juxta-, prefix meaning "near": *juxtaglomerular, juxtangina, juxtaposition.*

juxtaarticular /juk′stə·ärtik′yələr/ [L, *juxta,* near, *articulus,* joint], pertaining to a location near a joint.

juxtacrine /juks′təkrin/, describing a hormonal relationship in which the secretory cell is adjacent to an effector cell.

juxtaglomerular /-glōmer′ələr/ [L, *juxta,* near, *glomerulus,* small ball], pertaining to an area near or adjacent to the afferent and efferent arterioles of the kidney glomerulus.

juxtaglomerular apparatus, a collection of cells located beside each renal glomerulus, consisting of a portion of the distal convoluted tubule arising from that glomerular capsule, segments of the afferent and efferent arterioles closest to the glomerulus, and cells lying between these structures. It is involved in the secretion of renin and EPO in response to blood pressure changes and is important in autoregulation of certain kidney functions. Also called **juxtaglomerular complex.**

juxtaglomerular cells [L, *juxta,* near, *glomerulus,* small ball, *cella,* storeroom], smooth myoepithelioid cells lining the glomerular end of the afferent arterioles in the kidney that are in opposition to the macula densa region of the early distal tubule. These cells synthesize and store renin and release it in response to decreased renal perfusion pressure, increased sympathetic nerve stimulation of the kidneys, or decreased sodium concentration in fluid in the distal tubule.

juxtaglomerular complex. See **juxtaglomerular apparatus.**

juxtamedullary /-med′əler′ē/, near the border of a medulla.

juxtamedullary cortex, the part of the renal cortex nearest to the medulla.

juxtamedullary glomerulus, a renal glomerulus located particularly close to the corticomedullary border.

juxtamedullary nephron, one whose proximal convoluted tubule is close to the corticomedullary border and whose loop of Henle extends deep into the renal medulla.

juxtaposition /-pəzish′ən/, the placement of objects side by side or end to end.

JVP, abbreviation for **jugular venous pressure.**

J wave. See **Osborn wave.**

K

k, abbreviation for *kilo,* 1000, or 10^3.

K, **1.** symbol for **ionization constant. 2.** symbol for **Kelvin scale. 3.** symbol for the element **potassium** (kalium). **4.** abbreviation for **kilobyte. 5.** symbol in electronics for 1024 (2^{10}). **6.** abbreviation for **katal.**

K_m, symbol for *Michaelis-Menten constant*. See **Michaelis-Menten kinetics.**

kA, abbreviation for *kiloampere*.

-kacin, suffix for antibiotics derived from *Streptomyces kanamyceticus*.

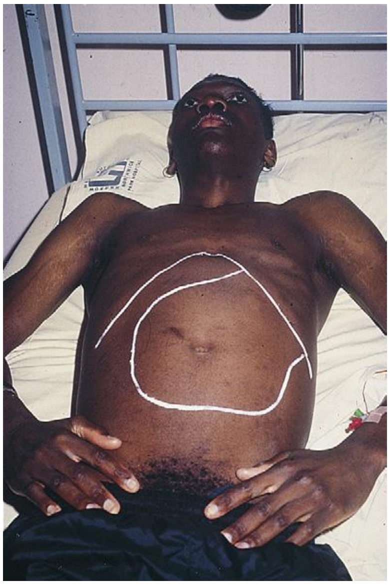
Kaffir pox. See **alastrim.**

kainate /kī′nāt/, a non-NMDA (*N*-methyl-D-aspartate) receptor agonist. The natural mineral is used as a fertilizer.

kak-, prefix meaning "bad": *kakidrosis, kakosmia*.

kakosmia. See **cacosmia.**

kala-azar /kä′lə äzär′/ [Hindi, *kala,* black; Assamese, *azar,* fever], a chronic and potentially fatal disease caused by the protozoan *Leishmania donovani,* transmitted to humans, particularly to children, by the bite of the sand fly. Kala-azar occurs primarily in Asia, parts of Africa, several South and Central American countries, and the Mediterranean region. The liver and spleen are the main sites of infection; signs and symptoms include anemia, hepatomegaly, splenomegaly, irregular fever, suppression of bone marrow, and emaciation. Patients with kala-azar are also susceptible to secondary bacterial infections. Untreated, the disease has an extremely high mortality. Treatment includes sodium antimony gluconate, blood transfusions (for anemia), bed rest, and adequate nutrition. Also called **Assam fever, black fever, dumdum fever, ponos, visceral leishmaniasis.** See also **leishmaniasis.**



Kala-azar *(Cohen, Powderly, and Opal, 2010)*

kalemia /kəlē′mē·ə/, the presence of potassium in the blood.

kali-, prefix meaning "potassium": *kaligenous, kalinite, kalium*.

kaliopenia. See **hypokalemia.**

kalium (K) /kā′lē·əm/ [Ar, *quali*, potash], potassium.

kaliuresis /kal′iyŏŏrē′sis/, the excretion of potassium in the urine.

kallak /kal′ak/, a pustular skin disease observed among Eskimos.

kallikrein-kinin system /kalik′rē·in-/, a proposed hormonal system that functions within the kidney, with the enzyme kallikrein in the renal cortex mediating production of bradykinin, which acts as a vasodilator peptide. Kallikrein is present in blood plasma, urine, and tissues in an inactive state. Also spelled *kallikren-kinin system*.

Kallmann's syndrome^1 [Franz J. Kallmann, American psychiatrist, 1897–1965], a condition characterized by the absence of the sense of smell and longer-than-average limbs. It is caused by agenesis of the olfactory bulbs and secondary hypogonadism related to a decrease of luteinizing hormone–releasing hormone (interstitial cell-stimulating hormone).

Kallmann's syndrome^2 /kahl′mahns/, a type of hypogonadotropic hypogonadism caused by failure of fetal gonadotropin-releasing hormone neurons to migrate to the thalamus, usually associated with anosmia or hyposmia. It is usually passed by autosomal-recessive inheritance and, in some cases, is X-linked.

kanamycin /kan′əmī′sin/, an antibacterial substance derived from *Streptomyces kanamyceticus*.

kanamycin sulfate, an aminoglycoside antibiotic.

■ INDICATIONS: It is prescribed in the treatment of certain severe infections (especially those caused by gram-negative aerobes) and as second-line therapy for tuberculosis.

■ CONTRAINDICATIONS: Concomitant administration of ototoxic drugs or known hypersensitivity to this drug or to other aminoglycoside antibiotics prohibits its use. It is used with caution in patients having impaired renal function and in the elderly.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nephrotoxicity, vestibular and auditory ototoxicity, neuromuscular blockade, and hypersensitivity reactions.

kangaroo care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promoting closeness between parent and physiologically stable preterm infant by preparing the parent and providing the environment for skin-to-skin contact. See also **Nursing Interventions Classification.**

Kanner's syndrome [Leo Kanner, Austrian-born American child psychiatrist, 1896–1981], a form of infantile psychosis with an onset in the first 30 months of life. It is characterized by infantile autism, with signs of lack of attachment, avoidance of eye contact, and general failure to develop social relationships; rituals and compulsive behavior manifested by a resistance to change and repetitive acts; general intellectual retardation; and language disorders, which may range from muteness to echolalia. Treatment may include psychotherapy and special education, depending on the child's intelligence level.

Kantian theory, the ethical theory of the 18th-century German philosopher Immanuel Kant (1724–1804). It focuses on the rightness or wrongness of actions in and of themselves, rather than on the consequences of those actions. According to Kant, the principles by which actions are judged right or wrong can be determined by reason, and the individual has a duty to act in accordance with these principles.

Kantrex, a trademark for an antibacterial **(kanamycin sulfate).**

Kaochlor, a trademark for an electrolyte replacement solution **(potassium chloride).**

kaodzera. See **Rhodesian trypanosomiasis.**

kaolin /kā′əlin/ [Chin, *kao-ling,* high ridge], an adsorbent used internally to treat diarrhea, often in combination with pectin. Kaolin in an ointment base is also used topically as an absorbent and a protective emollient.

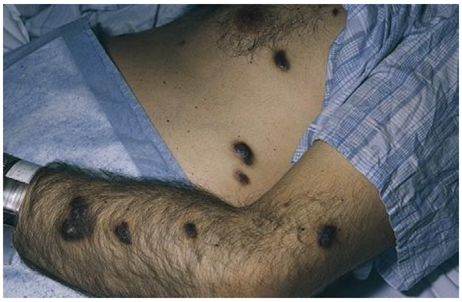
kaolinosis /kā′əlinō′sis/, a form of pneumoconiosis acquired by inhaling clay dust (kaolin). Kaolin is used in the manufacture of paper, ceramics, heat-resistant wood, soaps, toothpaste, and some medicines.

Kaon Cl, a trademark for an electrolyte replacement solution **(potassium chloride).**

Kaopectate, a trademark for an antidiarrheal fixed-combination drug containing an adsorbent **(kaolin)** and an emollient **(pectin).**

Kaposi's disease /kap′əsēz/ [Moritz K. Kaposi, Austrian dermatologist, 1837–1902; L, *dis* + Fr, *aise,* ease], a rare inherited skin disorder that begins in childhood and mainly involves exposed skin areas. Exposure to sunlight results in erythema and vesiculation, followed by increased pigmentation and telangiectasia, skin ulcers, warts, and malignant epitheliomas. Also called **xeroderma pigmentosum.**

Kaposi's sarcoma (KS, ks) [Moritz K. Kaposi], a malignant, multifocal neoplasm of reticuloendothelial cells that begins as soft brownish or purple papules on the feet or hard palate and slowly spreads in the skin, metastasizing to the lymph nodes and viscera. It occurs most often in men and is associated with diabetes, malignant lymphoma, acquired immunodeficiency syndrome, or other disorders. Radiotherapy and chemotherapy are usually recommended. Also called *idiopathic multiple pigmented hemorrhagic sarcoma,* **multiple idiopathic hemorrhagic sarcoma.**



Kaposi's sarcoma *(Swartz, 2009)*

Kaposi's sarcoma–associated herpesvirus. See **human herpesvirus 8.**

Kaposi's varicelliform eruption. See **eczema herpeticum.**

kappa /kap′ə/, K, κ, the tenth letter of the Greek alphabet, used to denote (in chemistry) the tenth carbon atom in a chain, one of two light chains in an immunoglobulin molecule, a type of killer particle present in certain strains of *Paramecium,* and a visual axis angle.

kappa chain, a type of light polypeptide chain of immunoglobulin molecules.

kappa light chain, one of two kinds of smaller peptide chains present in an immunoglobulin molecule. See also **lambda light chain.**

kaps-. See **caps-.**

karat, the proportion of gold in 24 parts of a gold alloy; 24-karat gold is pure gold.

karaya powder /kär′äyä/ [Hindi, *karayal,* resin; L, *pulvis,* dust], a dried form of *Sterculia urens* or other species of *Sterculia,* used as a bulk cathartic. The use of such a bulk-forming cathartic may also increase the loss of sodium, potassium, and water. With some individuals the use of karaya powder may cause allergic reactions such as urticaria, rhinitis, dermatitis, and asthma. Methylcellulose has largely replaced this drug in modern use. Externally it is used as a drying agent for stage I and stage II pressure ulcers.

Kardex, a trademark for a card-filing system that allows quick reference to the particular needs of each patient for certain aspects of nursing care. Included on the card may be a schedule of medications, level of activity allowed, ability to perform basic self-care, diet, any special problems, a schedule of treatments and procedures, and a care plan. The Kardex is updated as necessary and is usually kept at the nurses' station.

Kartagener's syndrome /kärtag′ənərz/, an inherited disorder characterized by bronchiectasis, chronic paranasal sinusitis, and transposed viscera, usually dextrocardia. Compare **immotile cilia syndrome.**

karyenchyma. See **karyolymph.**

karyo-, prefix meaning "nucleus": *karyochrome, karyokinesis, karyolymph.*

karyoclasis, karyoclastic. See **karyoklasis.**

karyocyte /ker′ē·əsīt′/ [Gk, *karyon,* nut + *kytos,* cell], a normoblast, or developing red blood cell, with a nucleus condensed into a homogenous staining body. It is normally found in the red bone marrow. The term is not in common usage.

karyogamy /ker′ē·og′əmē/ [Gk, *karyon,* nut + *gamos,* marriage], the fusion of cell nuclei, as in conjugation and zygosis. **—karyogamic,** *adj.*

karyogenesis /ker′ē·ōjen′əsis/ [Gk, *karyon* + *genein,* to produce], the formation and development of the nucleus of a cell. **—karyogenetic,** *adj.*

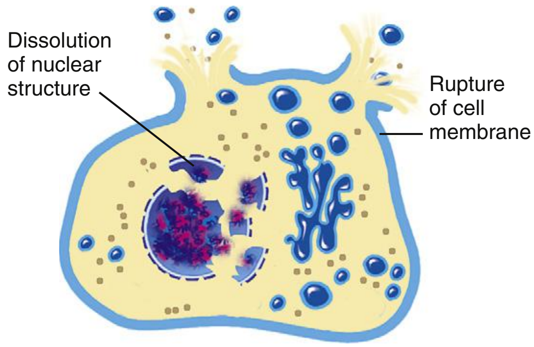
karyokinesis /ker′ē·ōkinē′sis, -kīnē′sis/ [Gk, *karyon* + *kinesis,* motion], the division of the nucleus and equal distribution of nuclear material during mitosis and meiosis. The process involves the four stages of prophase, metaphase, anaphase, and telophase. It precedes the division of the cytoplasm. Also called **karyomitosis.** See also **cytokinesis. —karyokinetic,** *adj.*

karyoklasis /ker′ē·ok′ləsis/ [Gk, *karyon* + *klasis,* breaking], **1.** the disintegration of a cell nucleus or nuclear membrane. **2.** the interruption of mitosis. Also spelled **karyoclasis. —karyoclastic, karyoklastic,** *adj.*

karyology /ker′ē·ol′əjē/ [Gk, *karyon* + *logos,* science], the branch of cytology that concentrates on the study of the cell nucleus, especially the structure and function of the chromosomes. **—karyologic, karyological,** *adj.,* **karyologist,** *n.*

karyolymph /ker′ē·əlimf′/ [Gk, *karyon* + *lympha,* water], the clear, usually nonstaining, fluid substance of a cell nucleus. It consists primarily of proteinaceous, colloidal material in which the nucleolus, chromatin, linin, and various submicroscopic particles are dispersed. Also called **karyenchyma, linin, nuclear hyaloplasm, nuclear sap, nucleochyme. —karyolymphatic,** *adj.*

karyolysis /ker′ē·ol′isis/ [Gk, *karyon* + *lysis,* loosening], the dissolution of a cell nucleus. It occurs normally, both as a form of necrobiosis and during the generation of new cells through mitosis and meiosis.



Karyolysis *(Huether and McCance, 2008)*

karyolytic /ker′ē·əlit′ik/, **1.** *adj,* pertaining to karyolysis. **2.** *n,* something that causes the destruction of a cell nucleus.

karyomegaly /ker′ē·ōmeg′əlē/ [Gk, *karyon,* nut + *megas,* large], an increase in the nuclear size of tissue cells.

karyomere /ker′ē·əmir′/ [Gk, *karyon* + *meros,* part], **1.** a saclike structure containing an unequal portion of the nuclear material after atypical mitosis. **2.** a segment of a chromosome. See also **chromomere.**

karyometry /ker′ē·om′ətrē/, the measurement of the nucleus of a cell. **—karyometric,** *adj.*

karyomit /ker′ē·əmit′/ [Gk, *karyon* + *mitos,* thread], **1.** a single chromatin fibril of the network within the nucleus of a cell. **2.** a chromosome.

karyomitome /ker′ē·om′itōm/ [Gk, *karyon* + *mitos,* thread], the fibrillar chromatin network within the nucleus of a cell. Also called **karyoreticulum.**

karyomitosis. See **karyokinesis.**

karyomorphism /-môr′fizəm/ [Gk, *karyon* + *morphe,* form], the shape or form of a cell nucleus, especially that of a leukocyte. **—karyomorphic,** *adj.*

karyon /ker′ē·on/ [Gk, nut], the nucleus of a cell. **—karyontic,** *adj.*

karyophage /ker′ē·ōfāj′/ [Gk, *karyon* + *phagein,* to eat], an intracellular protozoan parasite that destroys the nucleus of the cell it infects. **—karyophagic, karyophagous,** *adj.*

karyoplasm. See **nucleoplasm.**

karyoplasmic ratio. See **nucleocytoplasmic ratio.**

karyopyknosis /-piknō′sis/ [Gk, *karyon* + *pyknos,* thick], the state of a cell in which the nucleus has shrunk and the chromatin has condensed into solid masses, as in cornified cells of stratified squamous epithelium. **—karyopyknotic,** *adj.*

karyoreticulum. See **karyomitome.**

karyorrhexis /-rek′sis/ [Gk, *karyon* + *rhexis,* rupture], the disintegration of the nucleus in a cell. **—karyorrhectic,** *adj.*

karyosome /ker′ē·əsōm′/ [Gk, *karyon* + *soma,* body], a dense, irregular mass of chromatin filaments in a cell nucleus. It is often seen during interphase and may be confused with the nucleolus because of similar staining properties. Also called **chromatin nucleolus, chromocenter, false nucleolus, prochromosome.**

karyospheric /-sfer′ik/ [Gk, *karyon* + *sphaira,* ball], **1.** *n,* a spheric nucleus. **2.** *adj,* pertaining to such a nucleus.

karyostasis /ker′ē·os′təsis/ [Gk, *karyon* + *stasis,* standing], the resting stage of the nucleus between cell division. See also **interphase. —karyostatic,** *adj.*

karyotheca. See **nuclear envelope.**

karyotin. See **chromatin.**

karyotype /ker′ē·ətīp′/ [Gk, *karyon* + *typos,* mark], **1.** the number, form, size, and arrangement within the nucleus of the somatic chromosomes of an individual or species, as determined by a microphotograph taken during metaphase of mitosis. **2.** a diagrammatic representation of the chromosome complement of an individual or species, in which the chromosomes are arranged in pairs in descending order of size and according to the position of the centromere. See also **chromosome, Denver classification, idiogram. —karyotypic,** *adj.*

Kasabach-Merritt syndrome. See **hemangioma-thrombocytopenia syndrome.**

Kasabach method /kas′əbak/, (in radiology) a technique for positioning a patient for radiographic examination of the odontoid process.

Kasai operation. See **portoenterostomy.**

Kashin-Bek disease [Nikolai I. Kashin, Russian orthopedist, 1825–1872; E.V. Bek; L, *dis* + Fr, *aise,* ease], a form of osteoarthrosis afflicting mainly children living in China, Tibet, Korea, and eastern Siberia. It is believed to be caused by eating foods made with wheat contaminated by the fungus *Fusarium sporotrichiella.* Also spelled *Kaschin-Beck disease.* Also called *osteoarthritis deformans edemica.*

kat, abbreviation for **katal.**

kat-, kata-, cat-, cata-, prefix meaning "to go down, to go against, or to reverse": *katadidymus, katakinetomeric, katolysis.*

katadidymus /kat′ədid′əməs/ [Gk, *kata,* down + *didymos,* twin], conjoined twins united in the lower portion of the body and separated at the top.

katal (K, kat) /kat′al/ [Gk, *kata,* down], an enzyme unit in moles per second defined by the SI system: 1 K lm= 6.6 × 10^9 U.

Katz index /kats/, a tool for assessing a patient's ability to perform activities of daily living in the areas of bathing, dressing, toileting, transferring, continence, and feeding. In each category, a score of one indicates complete independence in performing the activity and zero indicates that assistance is required, so that the total score ranges from zero to six.

kava, an herb that is harvested from a shrub that grows in the South Sea islands.

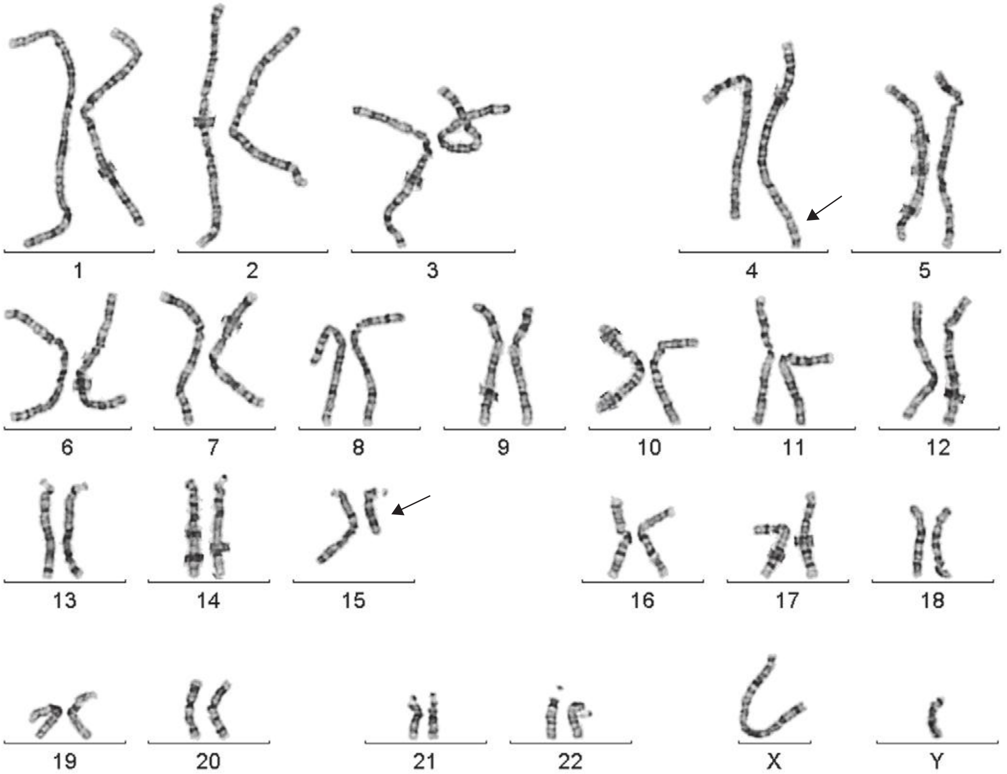
■ USES: Although it is useful for nervous anxiety, restlessness, sleep disturbances, and stress, there are safety concerns following several reports of hepatotoxicity and liver failure occurring with relatively normal doses used for a short term.

■ CONTRAINDICATIONS: Kava should not be used during pregnancy and lactation, in children less than 12 years of age, or in persons with known hypersensitivity, major depressive disorder, or Parkinson's disease.

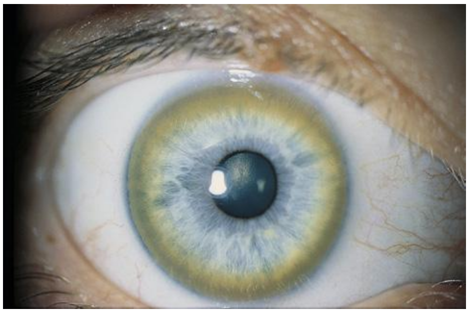
Kawasaki disease. See **mucocutaneous lymph node syndrome.**

Kay Ciel, a trademark for an electrolyte replacement solution **(potassium chloride).**

Kayser-Fleischer ring /kī′zər flī′shər/ [Bernhard Kayser, German ophthalmologist, 1869–1954; Bruno Fleischer, German ophthalmologist, 1874–1904], a gray-green to red-gold pigmented ring at the outer margin of the cornea (limbal border), pathognomonic of hepatolenticular degeneration, a rare progressive disease caused by a defect in copper metabolism and transmitted as an autosomal-recessive trait. The disease is characterized by cerebral degenerative changes, liver cirrhosis, splenomegaly, involuntary movements, muscle rigidity, psychic disturbances, and dysphagia. See also **Wilson's disease.**



Normal male karyotype *(Goldman et al, 2008)*



Kayser-Fleischer ring
(Kanski, 2003/Courtesy of R. Chopdar)

Kazanjian's operation /kasan′jē·ənz/ [Varaztad J. Kazanjian, Armenian-born maxillofacial surgeon in U.S., 1879–1974], a surgical procedure for extending the vestibular sulcus to improve the prosthetic foundation of toothless dental ridges.

kb, **1.** abbreviation for **kilobase. 2.** abbreviation for **kilobyte.**

kbe, abbreviation for *keyboard entry*.

kbp, abbreviation for **kilobase pair.**

kbs, abbreviation for *kilobits per second*. Also *kpps*.

kcal, abbreviation for **kilocalorie.**

kcalorie. See **Calorie.**

kCi, abbreviation for *kiloCurie*.

KCl, symbol for **potassium chloride.**

KE, abbreviation for **kinetic energy.**

Kearns-Sayre syndrome /kernz sār/ [Thomas P. Kearns, American ophthalmologist, 1922–2011; George P. Sayre, American pathologist, 1911–1991], progressive ophthalmoplegia, pigmentary degeneration of the retina, myopathy, ataxia, and cardiac conduction defect, with onset before the age of 20 years. Almost all patients have large mitochondrial DNA deletions, and ragged red fibers are seen on muscle biopsy. Also called **ophthalmoplegia plus.**

Kedani fever. See **scrub typhus.**

K-edge, a discontinuity in the absorption coefficient at an energy level corresponding to the binding energy of K-shell electrons.

keel, (in prosthetics) a device in a stored-energy foot prosthesis that bends the foot upward when weight is applied to the toe. See also **carina, Seattle Foot, stored-energy foot.**

kefir /kef′ər/ [Russ, fermented milk], a slightly effervescent, acidulous beverage prepared from the milk of cows, sheep, or goats through fermentation by kefir grains, which contain yeasts and lactobacilli. It is an important source of the bacteria necessary in the GI tract to synthesize vitamin K. Also spelled **kephir.**

Keflex, a trademark for an antibacterial **(cephalexin).**

Kefzol, a trademark for an antibacterial **(cefazolin sodium).**

Kegel exercises. See **pubococcygeus exercises.**

Keith's bundle, Keith-Flack node. See **sinoatrial node.**

Keith-Wagener-Barker classification system [Norman M. Keith, Canadian physician, b. 1885; Henry P. Wagener, American physician, b. 1890; N.W. Barker, 20th century American physician], a method of classifying the degree of hypertension in a patient on the basis of retinal changes. The stages are group 1, identified by constriction of the retinal arterioles; group 2, constriction and sclerosis of the retinal arterioles; group 3, characterized by hemorrhages and exudates in addition to group 2 conditions; and group 4, papilledema of the retinal arterioles.

kel-, prefix meaning "tumor or fibrous growth": *kelectome, keloid, keloplasty*.

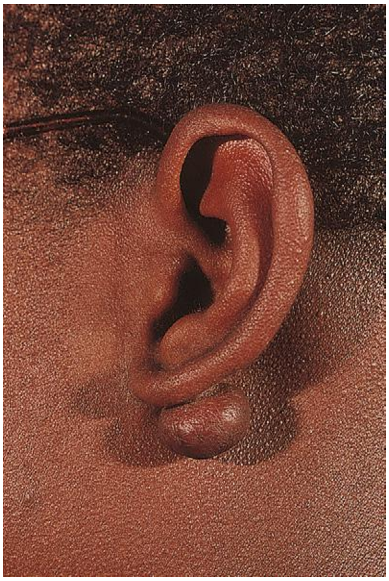
Kellgren's syndrome /kel′grinz/ [Henry Kellgren, Swedish physician, b. 1827], a form of osteoarthritis affecting the proximal and distal interphalangeal joints, the first metatarsophalangeal and carpometacarpal joints, the knees, and the spine. The absence of rheumatoid factor and rheumatoid nodules and the lack of systemic involvement differentiate this syndrome from rheumatoid arthritis. Also called **erosive osteoarthritis.**

Kelly clamp [Howard A. Kelly, American gynecologist, 1858–1943; AS, *clam,* to fasten], a curved hemostat without teeth, used primarily for grasping vascular tissue in gynecological procedures.

Kelly plication, an operation for correction of stress incontinence in women. The connective tissue between the vagina and the urethra and the floor of the bladder are sutured to form a wide shelf of firm tissue supporting the urethra and bladder.

Kelly's pad, a horseshoe-shaped inflatable rubber drainage pad used in a bed or on the operating table.

keloid /kē′loid/ [Gk, *kelis,* spot + *eidos,* form], an overgrowth of collagenous scar tissue at the site of a skin injury, particularly a wound or a surgical incision. The new tissue is elevated, rounded, and firm. Young women and African-Americans are particularly susceptible to keloid formation. Types of therapy include solid carbon dioxide, liquid nitrogen, intralesional corticosteroid injections, radiation, silicon gel, and surgery. Treatment may worsen the condition and should be performed only by skilled professionals. Also spelled **cheloid.** Compare **hypertrophic scarring**. **—keloidal, cheloidal,** *adj.*



Keloid *(Kumar and Clark, 2009)*

keloid acne [Gk, *kelis,* spot + *eidos,* form + *akme,* point], pyoderma in and around the pilosebaceous structures, resulting in keloid scarring. African-Americans are highly susceptible. Also called **dermatitis papillaris capillitii, folliculitis keloidalis.**

keloidal. See **keloid.**

keloidal scar. See **keloid scar.**

keloidosis /kē′loidō′sis/ [Gk, *kelis* + *eidos,* form + *osis,* condition], habitual or multiple formation of keloids. Also spelled **cheloidosis.**

keloid scar [Gk, *kelis,* spot + *eidos,* form + *eschara,* scab], an overgrowth of tissue in a scar at the site of skin injury, particularly a wound or a surgical incision. The amount of tissue growth is in excess of that necessary to repair the wound and is partially caused by an accumulation of collagen at the site. Also called **keloidal scar.**

kelp [ME, *culp*], **1.** any of the brown seaweed species of ***Laminaria*** found on the Atlantic coast of Europe. **2.** the ashes of ***Laminaria*** seaweed burned in a process of extracting iodine and potassium salts.

Kelvin scale (K) [Lord Kelvin (William Thomson), British physicist, 1824–1907], an absolute temperature scale calculated in Celsius units from the point at which molecular activity apparently ceases, –273.15° C. To convert Celsius degrees to Kelvin, add 273.15.

Kemadrin, a trademark for an antiparkinsonian skeletal muscle relaxant **(procyclidine hydrochloride).**

Kempner rice-fruit diet. See **rice diet.**

Kenalog, a trademark for a glucocorticoid (triamcinolone acetonide).

Kennedy classification [Edward Kennedy, American dentist, b. 1883], a method of classifying partial edentulous conditions and partial dentures, based on the position of the spaces once occupied by the missing teeth in relation to the remaining teeth. It is useful in the construction of and planning for removable partial dentures.

Kenny treatment. See **Sister Kenny's treatment.**

keno-, prefix meaning "empty": *kenophobia, kenotoxin, kenotron.*

kenogenesis. See **cenogenesis.**

kenophobia /kē′nōfō′bē·ə/ [Gk, *kenos,* empty + *phobos,* fear]. See **agoraphobia.**

Kent bundle [Albert F. S. Kent, English physiologist, 1863–1958; AS, *byndel,* to bind], an accessory pathway between an atrium and a ventricle outside of the conduction system. This congenital anomaly causes **Wolff-Parkinson-White syndrome.** The term "accessory pathway" is preferred because the one Kent described had a precise location (anterior and near the fibrous ring of the tricuspid valve).

Kenya fever. See **Marseilles fever.**

kephal-. See **cephalo-.**

kephir. See **kefir.**

kera-, prefix meaning "horn": *keracele, keraphyllocele, keratosis, keratin.*

kerasin /ker′əsin/ [L, *cera,* wax], a cerebroside, found in brain tissue, that consists of a fatty acid, galactose, and sphingosine.

kerat-, kerato-, **1.** prefix meaning "horny, cornified": *keratolysis, keratoma, keratonosis.* **2.** prefix meaning "cornea, corneal": *keratoiritis, keratoleukoma, keratome.*

keratectomy /ker′ətek′təmē/ [Gk, *keras,* horn + *ektomē,* excision], surgical removal of a part of the cornea, performed to excise a small, superficial lesion that does not warrant a corneal graft. Local anesthesia is used. The scar is excised, and an antibiotic is injected under the conjunctiva. A topical steroid is given and a light pressure dressing applied. After surgery, the dressings are changed daily. Corneal epithelium grows rapidly, filling a small surgical area in about 60 hours.

keratic /kərat′ik/ [Gk, *keras,* horn + L, *icus,* like], **1.** pertaining to keratin. **2.** pertaining to the cornea.

keratic precipitate, a group of inflammatory cells deposited on the endothelial surface of the cornea after trauma or inflammation, sometimes obscuring vision.

keratin /ker′ətin/ [Gk, *keras,* horn], a fibrous sulfur-containing protein that is the primary component of the epidermis, hair, nails, enamel of the teeth, and horny tissue of animals. The protein is insoluble in most solvents, including gastric juice. For this reason, it is often used as a coating for pills that must pass through the stomach unchanged to be dissolved in the intestines.

keratin cyst, an epithelial cyst containing keratin. Also called **keratinous cyst.**

keratinization /-īzā′shən/ [Gk, *keras* + L, *izein,* to cause], a process by which epithelial cells lose their moisture and are replaced by horny tissue.

keratinize /ker′ətinīz/, to make or become horny tissue.

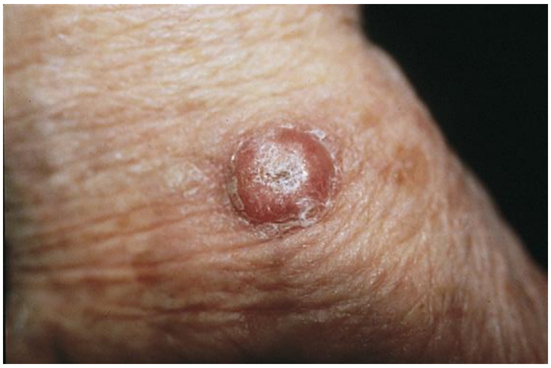
keratinocyte /kerat′inōsīt′/ [Gk, *keras* + *kytos,* cell], an epidermal cell that synthesizes keratin and other proteins and sterols. These cells constitute 95% of the epidermis, being formed from undifferentiated, or basal, cells at the dermal-epidermal junction. Its characteristic intermediate filament protein is cytokeratin. In its various successive stages, keratin forms the prickle cell layer and the granular cell layer, in which the cells become flattened and slowly die to form the final layer, the stratum corneum, which gradually exfoliates.

keratinophilic /kerat′inōfil′ik/, describing a type of fungi that uses keratin as a substrate.

keratinous cyst. See **keratin cyst.**

keratitis /ker′ətī′tis/, any inflammation of the cornea. Kinds of keratitis include **dendritic keratitis, interstitial keratitis, keratoconjunctivitis sicca,** and **trachoma.** Compare **keratopathy. —keratic,** *adj.*

keratoacanthoma /ker′ətō·ak′anthō′mə/ *pl.* **keratoacanthomas, keratoacanthomata** [Gk, *keras* + *akantha,* thorn + *oma,* tumor], a benign, rapidly growing, flesh-colored papule or nodule of the skin with a central plug of keratin. The lesion is most common on the face or the back of the hands and arms. It disappears spontaneously in 4 to 6 months, leaving a slightly depressed scar. Biopsy is often necessary to differentiate it from a squamous cell carcinoma.



Keratoacanthoma *(Courtesy Department of Dermatology, School of Medicine, University of Utah)*

keratocele /ker′ətōsēl′/, a hernia of Descemet's membrane through an ulcer in the outer layers of the cornea.

keratoconjunctivitis /ker′ətōkənjungk′tivī′tis/ [Gk, *keras* + L, *conjunctivus,* connecting + Gk, *itis,* inflammation], inflammation of the cornea and the conjunctiva. Kinds of keratoconjunctivitis include **eczematous conjunctivitis, epidemic keratoconjunctivitis,** and **keratoconjunctivitis sicca.**

keratoconjunctivitis sicca, dryness of the cornea caused by a deficiency of tear secretion in which the corneal surface appears dull and rough and the eye feels gritty and irritated. The condition may be associated with erythema multiforme, Sjögren's syndrome, trachoma, and vitamin A deficiency. Methylcellulose artificial tears may give some relief, as can insertion of plugs into the punctae and use of cyclosporine drops.

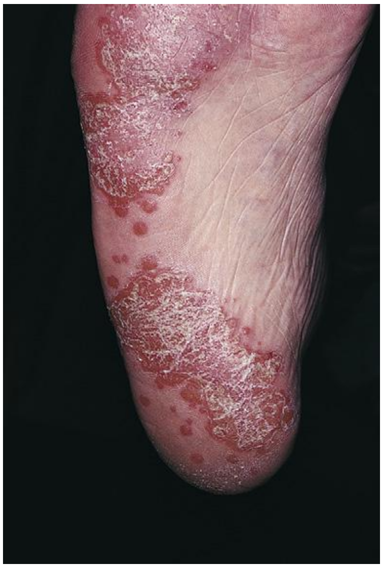
keratoconus /ker′ətōkō′nəs/ [Gk, *keras* + *konos,* cone], a noninflammatory protrusion of the central or paracentral region of the cornea. It is worse in allergy sufferers and may result in marked irregular astigmatism. It is also associated with Down syndrome. Gas permeable contact lenses often significantly improve visual acuity as compared with spectacles, although a corneal transplant is indicated in about 15% of patients with this condition. The cause of the condition is unknown, but it likely has a genetic basis.

keratocyst /ker′ətōsist′/, a thin-walled, tooth-forming cyst lined by keratinizing epithelium. It may be solitary or part of a multiple lesion, most frequently in the posterior body or ramus of the mandible, and may or may not be associated with teeth.

keratocyte. See **corneal corpuscle.**

keratoderma /ker′ətōdur′mə/ [Gk, *keras,* horn + *derma,* skin], **1.** a horny skin or covering. **2.** hypertrophy of the horny layer of the skin. See also **callus, hyperkeratosis.**

keratoderma blennorrhagica /-durmə/, the development of hyperkeratotic skin lesions (pustules and crusts) of the palms, soles, and nails. The condition tends to occur in some patients with Reiter's syndrome.



Keratoderma blennorrhagica *(Callen et al, 2000)*

keratodermatitis /-dur′mətī′tis/, an inflammation and proliferation of the cells of the horny layer of the skin.

keratoectasia /ker′ətō·ektā′zhə/, a forward bulging or protrusion of the cornea. Also called **kerectasis.**

keratoepithelioplasty /-ep′ithē′lē·əplas′tē/, a surgical procedure for the repair of corneal epithelial defects. The defective cornea is removed and replaced with small pieces of donor cornea, which proliferate and replace the original tissue.

keratogenesis /-jen′əsis/, the formation of horny tissue caused by the growth of keratin-producing cells.

keratogenic /-jen′ik/, pertaining to an agent that induces a growth of horny tissue.

keratogenous /ker′ətoj′ənəs/, pertaining to development of the horny layer of the skin or the growth of cells that produce keratin, which results in the formation of horny tissue, such as fingernails and scales.

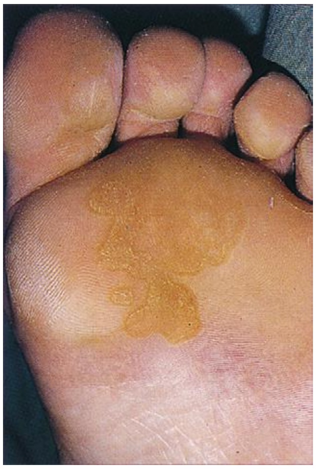
keratoglobus /-glō′bəs/, a congenital anomaly characterized by distension of the cornea and the anterior segment of the eye. Also called **megalocornea.**

keratohyalin /-hī′əlin/ [Gk, *keras* + *hyalos,* glass], a substance in the granules found in keratinocytes of the epidermis. The keratohyalin granule develops within and around the fibrillar protein, contributing in an unknown manner to the functional maturity of keratin.

keratoid /ker′ətoid/ [Gk, *keras,* horn, *eidos,* form], resembling horny or corneal tissue.

keratoiritis /ker′ətōirī′tis/, an inflammation of the cornea in association with iritis.

keratolysis /ker′ətol′ə-sis/ [Gk, *keras* + *lysis,* loosening], the loosening and shedding of the outer layer of the skin, which may occur normally by exfoliation or as a congenital condition in which the skin is shed at periodic intervals. **—keratolytic,** *adj.*



Keratolysis *(Lawrence and Cox, 2002)*

keratoma /ker′ətō′mə/, a hard, thick epidermal growth caused by hypertrophy of the horny layer of the skin. See also **callus,** def. 2.

keratomalacia /-məlā′shə/ [Gk, *keras* + *malakia,* softness], a condition characterized by xerosis and ulceration of the cornea, resulting from severe vitamin A deficiency. It commonly occurs as a secondary result of diseases that affect vitamin A absorption or storage, such as ulcerative colitis, celiac syndrome, cystic fibrosis, and sprue. Also at risk are infants and children who are given dilute formula, who are malnourished, or who are allergic to whole milk and fed skimmed milk, which is a poor source of vitamin A. Early symptoms include night blindness; photophobia; swelling and redness of the eyelids; and drying, roughness, pain, and wrinkling of the conjunctiva. In advanced deficiency, Bitot's spots appear; the cornea becomes dull, lusterless, and hazy, and without adequate therapy it eventually softens and perforates, resulting in blindness. See also **vitamin A.**

■ INTERVENTIONS: Treatment consists of vitamin A supplements. The dosage is determined by the severity of the condition, although prolonged daily administration of large doses, especially to infants, may result in hypervitaminosis. An adequate diet containing whole milk and foods high in vitamin A or carotenes prevents the condition.

keratomycosis /-mīkō′sis/, a fungal disease of the cornea.

keratopathy /ker′ətop′əthē/ [Gk, *keras* + *pathos,* disease], any noninflammatory disease of the cornea. Compare **keratitis.**

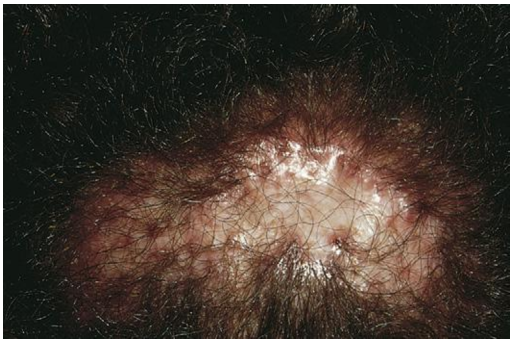
keratophakia /-fā′kē·ə/, the surgical implantation of donor cornea to the anterior cornea to modify a refractive error.

keratoplasty. See **corneal grafting.**

keratorhexis /ker′atorek′sis/, rupture of the cornea. Also spelled *keratorrhexis*.

keratosis /ker′ətō′sis/ [Gk, *keras* + *osis,* condition], any skin lesion in which there is overgrowth and thickening of the cornified epithelium. Approximately 20% of these skin lesions develop into squamous cell carcinoma. Prevention includes the use of sunscreen and the avoidance of drugs known to cause photosensitivity reactions. Kinds of keratosis include **actinic keratosis,** *keratosis pilaris,* **keratosis senilis,** and **seborrheic keratosis. —keratotic,** *adj.*

keratosis follicularis, a group of several skin disorders characterized by keratotic papules that coalesce to form brown or black, crusted, wartlike patches. These vegetations may spread widely, ulcerate, and become covered with a purulent exudate. Treatment includes large doses of topical or oral retinoids and oral or topical corticosteroids. Also called **Darier's disease.**



Keratosis follicularis *(Hordinsky, Sawaya, and Scher, 2000)*

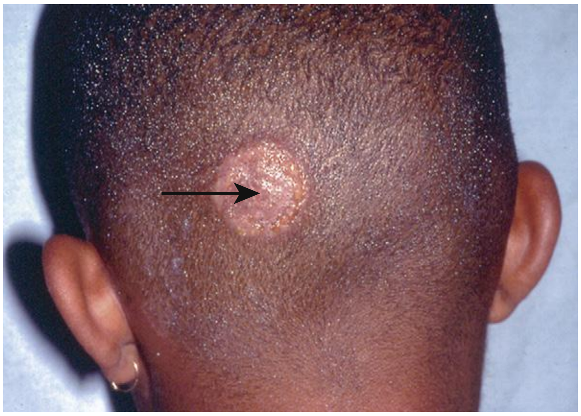
keratosis seborrheica. See **seborrheic keratosis.**

keratosis senilis, keratotic. See **keratosis.**

kerauno-, prefix meaning "lightning": *keraunoneurosis, keraunophobia*.

kerectasis. See **keratoectasia.**

kerion /kir′ē·on/ [Gk, honeycomb], an inflamed, boggy granuloma or secondary infected lesion that develops as an immune reaction to a superficial fungus infection, generally in association with *Tinea capitis* of the scalp. This disease is much more prevalent in patients of African-American descent. The most common treatment is antifungal medicine administered orally, which may be supplemented with corticosteroids.



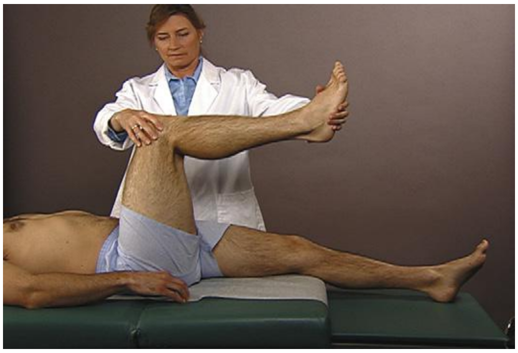
Kerion *(Corodoro and Ganz, 2005)*

Kerley lines /kur′lē/ [Peter J. Kerley, English radiologist, 1900–1979], lines resembling interstitial infiltrate that appear on chest x-ray images and are associated with certain disease conditions, such as congestive heart failure and pleural lymphatic engorgement. They are several centimeters long and may be oriented in many directions. Also called *everywhere lines*.

KERMA, **1.** abbreviation for *kinetic energy released in the medium,* a quantity that describes the transfer of energy from a photon to a medium as the ratio of energy transferred per unit mass at each point of interaction. **2.** abbreviation for *kinetic energy released in matter*, a unit of quantity referring to the kinetic energy transferred from photons to charged particles, such as electrons in Compton interactions, per unit mass. The SI unit for the KERMA is the gray, and the special unit is the rad.

kernicterus /kərnik′tərəs/ [Ger, *kern,* kernel; Gk, *ikteros,* jaundice], an abnormal toxic accumulation of bilirubin in central nervous system tissues caused by hyperbilirubinemia. See also **hyperbilirubinemia of the newborn.**

Kernig's sign /ker′niks/ [Vladimir M. Kernig, Russian physician, 1840–1917], a diagnostic sign for meningitis marked by a loss of the ability of a supine patient to completely straighten the leg when it is fully flexed at the knee and hip. Pain in the lower back and resistance to straightening the leg constitutes a positive Kernig's sign. Usually the patient can extend the leg completely when the thigh is not flexed on the abdomen. Compare **Brudzinski's sign.**



Assessing for Kernig's sign *(Seidel et al, 2011)*

kerosene poisoning /ker′əsēn/ [Gk, *keros,* wax; L, *potio,* drink], a toxic condition caused by the ingestion of kerosene or the inhalation of its fumes. Symptoms after ingestion include drowsiness, fever, a rapid heartbeat, tremors, and severe pneumonitis if the fluid is aspirated. Vomiting is not induced. See also **petroleum distillate poisoning.**

Ketalar, a trademark for a general anesthetic **(ketamine hydrochloride).**

ketamine hydrochloride /kē′təmēn/, a nonbarbiturate general anesthetic induction agent administered parenterally to achieve dissociative anesthesia. Ketamine hydrochloride does not cause muscle relaxation. It is a potent somatic analgesic and is particularly useful for brief, minor surgical procedures. Hallucinations, confusion, and disorientation may occur on emergence from anesthesia. See also **dissociative anesthesia.**

Ketek, a trademark for **telithromycin.**

keto-, prefix indicating possession of the carbonyl (:C:O) group: *ketoheptose, ketolysis, ketonuria*.

ketoacidosis /kē′tōas′idō′sis/ [Gk, *keton,* form of acetone; L, *acidus,* sour, *osis,* condition], acidosis accompanied by an accumulation of ketones in the body, resulting from extensive breakdown of fats because of faulty carbohydrate metabolism. It occurs primarily as a complication of diabetes mellitus and is characterized by a fruity odor of acetone on the breath, mental confusion, dyspnea, nausea, vomiting, dehydration, weight loss, and, if untreated, coma. Emergency treatment includes the administration of insulin and IV fluids and the evaluation and correction of electrolyte imbalance. Nasogastric intubation and bladder catheterization may be required if the patient is comatose. Before discharge of the patient from the hospital, the nurse carefully reviews the meal plan, activity, blood glucose and urine ketone monitoring, and insulin schedule prescribed, emphasizing to the patient that ketoacidosis may be life-threatening and is largely avoidable by strict adherence to the patient's diabetic regimen, monitoring, and appropriate action for illness or stress. See also **diabetes mellitus, ketosis. —ketoacidotic,** *adj*.

ketoaciduria /-as′idŏŏr′ē·ə/ [Gk, *keton* + L, *acidus,* sour; Gk, *ouron,* urine], presence in the urine of excessive amounts of ketone bodies, occurring as a result of uncontrolled diabetes mellitus, starvation, or any other metabolic condition in which fats are rapidly catabolized. The condition can be diagnosed with a dipstick reagent or acetone test tablet. Also called **ketonuria.** See also **Acetest, ketosis. —ketoaciduric,** *adj*.

17-ketoandrosterone /-andros′tərōn/, a metabolite of a sex hormone secreted by the testes and adrenal glands that may be measured in the urine to assess hormonal and adrenal functions. Normal amounts in the urine after 24-hour collection are 0.2 to 1 mg in men and 0.2 to 0.8 mg in women.

ketoconazole /-kō′nəzōl/, an antifungal agent.

■ INDICATIONS: It is prescribed for the treatment of candidiasis, coccidioidomycosis, histoplasmosis, and other fungal diseases.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It should not be used for fungal meningitis. Because it is also an inhibitor of some important drug metabolizing enzymes and can cause toxic intermediates from other drugs to accumulate, the safe use of ketoconazole with other prescribed medications should be verified.

■ ADVERSE EFFECTS: The most serious adverse effects are liver disorders.

17-ketoetiocholanolone /kē′tō·ē′tē·ōkəlan′əlōn/, a metabolite of a sex hormone secreted by the testes and adrenal glands that may be measured in the urine to assess hormonal and adrenal functions. Normal amounts in the urine after 24-hour collection are 0.2 to 1 mg in men and 0.2 to 0.8 mg in women.

ketogenesis /-jen′əsis/ [Fr, *keton* + Gk, *genein,* to produce], the formation or production of ketone bodies.

ketogenic amino acid /-jen′ik/, an amino acid whose carbon skeleton serves as a precursor for ketone bodies.

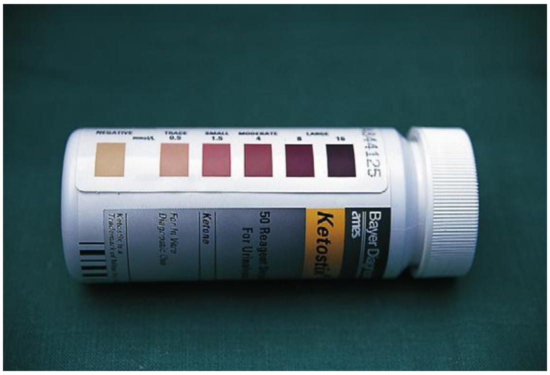
ketogenic diet, a diet high in fats (often as medium chain triglycerides) and proteins and low in carbohydrates, primarily used in the treatment of epilepsy.

ketonaemia. See **ketonemia.**

ketone /kē′tōn/ [Fr, *acetone*], an organic chemical compound characterized by having in its structure a carbonyl, or keto, group, ═CO, attached to two alkyl groups. It is produced by oxidation of secondary alcohols.

ketone alcohol [Gk, *keton* + Ar, *alkohl,* essence], an alcohol containing the ketone group.

ketone bodies, two products of lipid pyruvate metabolism, beta-hydroxybutyric acid and aminoacetic acid, from which acetone may arise spontaneously. Ketone bodies are produced from acetyl-CoA in the liver and are oxidized by the muscles. Excessive production leads to their excretion in urine, as in diabetes mellitus. Also called **acetone bodies.**



Measurement of ketone bodies
(Belchetz and Hammond, 2003)

ketone group, the chemical carbonyl group of a ketone (i.e., with two alkyl groups attached to it). See also **ketone.**

ketonemia /kē′tōnē′mē·ə/, the presence of ketones, mainly acetone, in the blood. It is characterized by the fruity breath odor of ketoacidosis. Also spelled **ketonaemia.** Also called *acetonaenemia*.

ketonuria. See **ketoaciduria.**

ketoprofen /-prō′fən/, a nonsteroidal antiinflammatory drug with analgesic and antipyretic actions.

■ INDICATIONS: It is prescribed for the treatment of rheumatoid arthritis and osteoarthritis and other conditions causing mild to moderate pain.

■ CONTRAINDICATIONS: Hypersensitivity to ketoprofen or to aspirin or other nonsteroidal antiinflammatory drugs prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, including peptic ulcer and GI bleeding; central nervous system effects of headache, dizziness, and drowsiness; and skin rash.

ketose /kē′tōs/ [Gk, *keton* + *glykys*, sweet], the chemical form of a monosaccharide in which the carbonyl group is a ketone.

ketosis /kitō′sis/ [Gk, *keton* + *glykys*, sweet + *osis*, condition], the abnormal accumulation of ketones in the body as a result of excessive breakdown of fats caused by a deficiency or inadequate use of carbohydrates. Fatty acids are metabolized instead, and the end products, ketones, begin to accumulate. This condition is seen in starvation, occasionally in pregnancy if the intake of protein and carbohydrates is inadequate, and most frequently in diabetes mellitus. It is characterized by ketonuria, loss of potassium in the urine, and a fruity odor of acetone on the breath. Untreated, ketosis may progress to ketoacidosis, coma, and death. See also **diabetes mellitus, ketoacidosis, starvation. —ketotic,** *adj.*

ketosis-prone diabetes. See **type 1 diabetes mellitus.**

ketosis-resistant diabetes. See **type 2 diabetes mellitus.**

17-ketosteroid /kē′tōstir′oid, kētō′stəroid/, any of the adrenal cortical hormones, or ketosteroids, that has a ketone group attached to its seventeenth carbon atom. These hormones are commonly measured in the blood and urine to aid the diagnoses of Addison's disease, Cushing's syndrome, stress, and endocrine problems associated with precocious puberty, feminization in men, and excessive hair growth. Measured in patients in the morning, the normal concentration in plasma is less than 30 μg/dL, in the evening, less than 10 μg/dL. The normal amounts in the urine of men after 24-hour collection are 8 to 15 mg; in women, 6 to 11.5 mg; in children 12 to 15 years of age, 5 to 12 mg; and in children younger than 12 years of age, less than 5 mg. Levels of 17-ketosteroids increase 50% to 100% after an injection of ACTH.

17-ketosteroids (17-KS) test, a rarely used 24-hour urine test that is useful in diagnosing adrenocortical dysfunction. It is used to detect levels of 17-KS, which are metabolites of the testosterone and nontestosterone androgenic sex hormones secreted from the adrenal cortex and the testes.

ketotic /kētot′ik/ [Fr, *acetone*], **1.** pertaining to the presence of ketone in the body. **2.** denoting the presence of a carbonyl group in a chemical compound.

ketotifen /ke′toti′fen/, a noncompetitive H_1-receptor antagonist and mast cell stabilizer used as the fumarate salt, administered orally in the chronic treatment of children with mild atopic asthma and topically to the conjunctiva as an antipruritic in the treatment of allergic conjunctivitis.

keV, abbreviation for *kiloelectron volts*, an energy unit equivalent to 1000 electron volts. Also abbreviated *kev.*

Kew Gardens spotted fever. See **rickettsialpox.**

keyboard, a computer input device consisting of rows of switches with key tops marked as letters or numbers. Manual pressure on a series or combination of the keys generates an electronic code representing words, data, commands, or other input.

keypad, a numeric keyboard consisting of the numerals 1 to 9 arranged in three ranks of three keys each and an additional key for zero, as on some calculators.

key pinch. See **lateral pinch.**

key points of control, areas of the body, the shoulder and pelvic girdles, that can be handled by a therapist in a specific manner to change an abnormal pattern, to reduce spasticity throughout the body, and to guide the patient's active movements.

key ridge, the lowest point of the zygomaticomaxillary ridge. Also called **zygomaxillare.**

kg, abbreviation for **kilogram.**

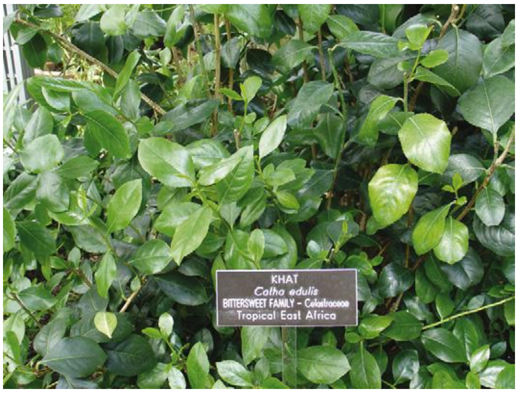
kG, abbreviation for *kilogauss*.

kg cal, abbreviation for **kilogram calorie.**

khat, an herbal product taken from a tree found in Africa and the Arabian peninsula.

■ USES: It is used for obesity and gastric ulcers, and as a stimulant to offset depression and fatigue. Its efficacy for these indications is unproven because of insufficient reliable data. Khat causes a psychologically addicting euphoria and cannot be legally imported into the United States.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity. People with renal, cardiac, or hepatic disease also should avoid its use.

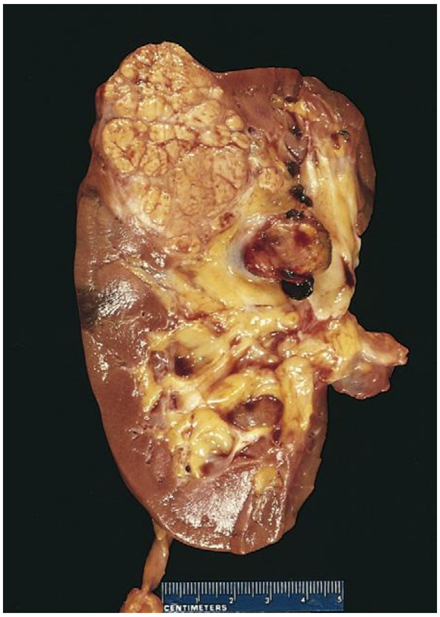


Khat *(Auerbach, 2012/Courtesy Dr. Daniel Brooks and Tammy Tyree, NP)*

kHz, abbreviation for **kilohertz.**

kidney [ME, *kidnere*], one of a pair of bean-shaped, purplish brown urinary organs in the dorsal part of the abdomen, located on each side of the vertebral column between the twelfth thoracic and third lumbar vertebrae. In most individuals the right kidney is slightly lower than the left. Each kidney is about 11 cm long, 6 cm wide, and 2.5 cm thick. In the newborn the kidneys are about three times as large in proportion to the body weight as in the adult. The kidneys filter the blood and eliminate wastes in the urine through a complex filtration network and resorption system comprising more than 2 million nephrons. The nephrons are composed of glomeruli and renal tubules that filter blood under high pressure, removing urea, salts, and other soluble wastes from blood plasma and returning the purified filtrate to the blood. More than 1183 L of blood pass through the kidneys every day, entering the kidneys through the renal arteries and leaving through the renal veins. All the blood in the body passes through the kidneys about 20 times every hour, but only about one fifth of the blood volume is routed through the nephrons. The kidneys remove water as urine and return water that has been filtered to the blood plasma, thus helping to maintain the water balance of the body. Hormones produced by the pituitary gland, especially the antidiuretic hormone, control the function of the kidneys in regulating the water-electrolyte balance of the body.

kidney cancer, a malignant neoplasm of the renal parenchyma or renal pelvis. Factors associated with an increased incidence of disease are exposure to aromatic hydrocarbons or tobacco smoke. A long asymptomatic period may precede the onset of the characteristic symptoms, which include hematuria, flank pain, fever, and a palpable mass. Diagnostic measures include urinalysis, excretory urography, nephrotomography, ultrasonography, renal arteriography, and microscopic and cytological studies of cells from the renal pelvis. Adenocarcinoma of the renal parenchyma accounts for 80% of kidney tumors, occurring twice as frequently in men as in women; transitional cell or squamous cell carcinomas in the renal pelvis account for approximately 15% and are equally frequent in both men and women. Radical nephrectomy with lymph node dissection is usually recommended for tumors of the parenchyma. Nephroureterectomy is usually recommended for operable tumors of the renal pelvis. Radiotherapy may be used before or after surgery and as palliation for inoperable tumors. Chemotherapeutic agents may induce temporary remission. See also **renal cell carcinoma, Wilms' tumor.**



Kidney cancer *(Kumar et al, 2007)*

kidney dialysis. See **hemodialysis.**

kidney disease, any one of a large group of conditions, including infectious, inflammatory, obstructive, vascular, and neoplastic disorders of the kidney. Characteristics of kidney disease are hematuria, persistent proteinuria, pyuria, edema, dysuria, and pain in the flank. Specific symptoms vary with the type of disorder. For example, hematuria with severe, colicky pain suggests obstruction by a kidney stone; hematuria without pain may indicate renal carcinoma; proteinuria is generally a sign of disease in the glomerulus, or filtration unit, of the kidney; pyuria indicates infectious disease; and edema is characteristic of the nephrotic syndrome. Diagnosis of kidney disease is made after laboratory tests and other diagnostic procedures or radiography has been performed. Among the special tests for kidney disorders are excretory urography, IV pyelography, tests of the glomerular filtration rate, biopsy, and ultrasound examination. Treatment depends on the type of disease diagnosed. Some forms of advanced kidney disease may lead to renal failure, coma, and death unless hemodialysis is started. See also **glomerulonephritis, nephrotic syndrome, renal failure, urinary calculus.**

kidney failure. See **renal failure.**

kidney function, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as filtration of blood and elimination of metabolic waste products through the formation of urine. See also **Nursing Outcomes Classification.**

kidney machine. See **artificial kidney.**

kidney stone. See **renal calculus.**

Kielhofner, Gary, (1949–2010), occupational therapist, researcher and scholar who developed the Model of Human Occupation (MOHO), the most evidence-based model of practice in occupational therapy. His goal was to assist individuals with chronic health conditions and disability to live fulfilling and satisfying lives.

Kielland's forceps. See **obstetric forceps.**

Kielland's rotation /kē′lands/ [Christian Kielland, Norwegian obstetrician, 1871–1941], an obstetric procedure in which Kielland's forceps are used in turning the head of the fetus from an occiput posterior or occiput transverse position to an occiput anterior position. It is performed most commonly to correct an arrest in the active stage of labor. The rotation is done at the midplane of the pelvis. Because it is associated with increased harm to the mother and to the baby, cesarean section is often preferred instead. See also **forceps delivery, obstetric forceps.**

Kiesselbach's plexus /kē′səlbäkhs′, -bäks′/ [Wilhelm Kiesselbach, German laryngologist, 1839–1902], a convergence of small fragile arteries and veins located superficially on the anterosuperior part of the nasal septum. It is the most common site for septal bleeding.

Kikuchi's lymphadenitis /kēko͞o′chēz/ [M. Kikuchi, Japanese pathologist, 20th century], a benign, self-limited syndrome of lymphadenopathy, usually in the neck, with a female predominance. Characteristics include patchy necrotizing lesions of the paracortex and proliferation of distinctive histiocytes, plasmacytoid monocytes, and lymphoblasts surrounded by karyorrhectic debris. Some consider it a self-limited form of systemic lupus erythematosus. Also called **histiocytic necrotizing lymphadenitis,** *Kikuchi's disease,* **subacute necrotizing lymphadenitis.** See also **systemic lupus erythematosus.**

killed vaccine [ME, *killen* + L, *vaccinus,* of a cow], a vaccine prepared from dead microorganisms, generally used to provide immunization from organisms that are too virulent to be used in the living attenuated state. The immune system reacts to the presence of the pathogen in the same manner, whether the organism is alive or dead. However, immunity produced by a live, attenuated vaccine is usually more effective.

killer T cells, antigen-stimulated T lymphocytes or cytotoxic T cells that attack foreign antigens directly and destroy cells that bear those antigens. See **cytoxic T lymphocytes.** Compare **natural killer cell.**

killer yeast, a strain of yeast cells that contains a toxic protein that destroys other yeast strains.

kilo-, prefix meaning “one thousand”: *kilocalorie, kilogram, kilometer.*

kilobase (kb), a length of nucleic acid equal to 1000 bases or nucleotides.

kilobase pair (kbp), a length of DNA or double-stranded RNA equal to 1000 base pairs.

kilobyte (K, kb) /kil′ə-bīt/, one thousand (or, more precisely, 1024) bytes.

kilocalorie (kcal) /-kəl′ərē/ [Gk, *chilioi,* thousand; L, *calor,* heat], a unit of heat equal to 1000 small calories or 4186 joules. Also called **large calorie.**

kilogram (kg) /-gram/ [Gk, *chilioi,* thousand; Fr, *gramme*], a unit for the measurement of mass in the metric system. One kilogram is equal to 1000 grams or 2.2046 pounds avoirdupois.

kilogram calorie. See **Calorie.**

kilohertz (kHz) /-hurts/ [Gk, *chilioi,* thousand; *hertz,* Heinrich R. Hertz, German physicist, 1857–1894], unit of frequency equal to 1000 (10^3) hertz. See also **hertz.**

kiloliter (kL) /-lē′tər/ [Gk, *chilioi,* thousand; Fr, *litre*], unit of volume equivalent to 1057 quarts, 1000 liters, or 1 cubic meter (1 m^3). Also spelled *kilolitre.*

kilometer (km) /-mē′tər/ [Gk, *chilioi,* thousand, *metron*], measure equivalent to 1000 meters (about 0.62 mile).

kilovolt (kV) /-volt/ [Gk, *chilioi,* thousand; volt, Count Alessandro Volta, Italian scientist, 1745–1827], measure of electrical potential, 1000 volts.

kilovolt peak (kVp), a measure of the maximum electrical potential in kilovolts across an x-ray tube. Most diagnostic x-ray machines have a kVp of 40 to 150. However, x-ray equipment is usually operated at the minimum potential necessary for an examination.

Kimmelstiel-Wilson syndrome. See **intercapillary glomerulosclerosis.**

kinaesthesia. See **kinesthesia.**

kinanesthesia /kin′anesthē′zhə/, **1.** an inability to perceive the movement or position of one’s body parts. The condition is observed as a sign of ataxia. **2.** loss of movement sense.

kinase /kī′nās/ [Gk, *kinesis,* motion; *ase,* enzyme], **1.** an enzyme that catalyzes the transfer of a phosphate group or another high-energy molecular group to an acceptor molecule. Each of these kinases is named for its receptor, such as acetate kinase, fructokinase, or hexokinase. **2.** an enzyme that activates a preenzyme (zymogen). Each of these kinases is named for its source, such as bacterial kinase, enterokinase, fibrinokinase, insulin kinase, staphylokinase, streptokinase, streptokinase-streptodornase, or urokinase.

kind firmness, (in psychology) a direct, clear, and confident approach to a patient in which rules and regulations are calmly cited in response to infractions and requests.

kindred /kin′drid/, a group of genetically related individuals.

kine-. See **kinesio-.**

kinematic face-bow /kin′əmat′ik/, an adjustable caliperlike device used for precisely locating the axis of rotation of a mandible through the sagittal plane. Also called **adjustable axis face-bow,** *hinge-bow.*

kinematics /kin′əmat′iks, kī-′/ [Gk, *kinema,* motion], the description, measurement, and recording of body motion without regard to the forces acting to produce the motion. Recordings of body motions are defined in one-plane relationships, although natural motions of the body often occur in more than one plane. Kinematics considers the motions of all body parts relative to the segments of the part involved in the motion and not necessarily in relation to the standard anatomical position. For example, the movements of the fingers are considered in relation to the midline of the hand, not the midline of the body. The most common types of motions studied in kinematics are flexion, extension, adduction, abduction, internal rotation, and external rotation. Kinematics is especially important in orthopedics, rehabilitation medicine, and physical therapy. Also spelled **cinematics.** Compare **kinetics.**

kineplastic amputation. See **kineplasty.**

kineplasty, amputation in which the stump is formed in such a way that the muscles are able to produce motion in a prosthesis.

kinesia /kīnē′zhə/ [Gk, *kinein,* to move], a condition caused by erratic or rhythmic motions in any combination of directions, such as in a boat or a car. Severe cases are characterized by nausea, vomiting, vertigo, and headache; mild cases by headache and general discomfort. Various antihistamines are used prophylactically. **Motion sickness** includes air sickness, car sickness, and **seasickness (mal de mer).** Also spelled **cinesia.** Also called **kinetosis.**

-kinesia, suffix meaning “movement”: *hyperkinesia.*

kinesic behavior /kīnē′sik/, nonverbal cues of communication that help to achieve and maintain bonds of attachment between people.

kinesics /kīnē′siks/ [Gk, *kinesis,* motion], the study of body position, posture, movement, and facial expression in relation to communication. The observance of nonverbal interactional behavior is an integral part of health assessment and is used especially in mental health assessment as an objective and measurable tool for diagnosing disturbances of communication and behavioral disorders. See also **body language, communication.**

kinesio-, kine-, prefix meaning “movement”: *kinesiology, kinesioneurosis, kinesiotherapy.*

kinesiological electromyography /kinē′sē·əloj′ik/, the study of muscle activity involved in body movements.

kinesiology /-ol′əjē/ [Gk, *kinesis* + *logos,* science], the scientific study of muscular activity and the anatomy, physiology, and mechanics of the movement of body parts.

kinesiotherapist, a health care professional who, under the direction of a physician, treats the effects of disease, injury, and congenital disorders through the use of rehabilitative exercise and education alone. See also **kinesiotherapy.**

kinesiotherapy, a specialized area of medicine in which exercise and movement are used as the primary form of rehabilitation. It is typically used in the treatment of amputees. See also **kinesiotherapist.**

kinesis /kīnē′sis, kinē′sis/, physical movement or force, particularly when induced by a stimulus.

-kinesis, -kinesia, suffix meaning an “activation”: *angiokinesis, lymphokinesis, thrombokinesis.*

kinesthesia /kin′esthē′zhə/ [Gk, *kinesis,* motion, *aisthesis,* feeling], the perception of one’s own body parts, weight, and movement. Also spelled **kinaesthesia.**

kinesthetic memory /kin′esthet′ik/, the recollection of movement, weight, resistance, and position of the body or parts of the body.

kinesthetic sense [Gk, *kinesis*, motion; L, *sentire*, to feel], an ability to be aware of muscular movement and position. By providing information through receptors about muscles, tendons, joints, and other body parts, the kinesthetic sense helps control and coordinate activities such as walking and talking.

kinetic analysis /kinet′ik/, analysis in which the change of the monitored parameter with time is related to concentration, such as change of absorbance per minute, to determine the rate of a reaction.

kinetic ataxia. See **motor ataxia.**

-kinetic, -cinetic, -cinetical, suffix meaning "movement": *akinetic, parakinetic, synkinetic*.

kinetic energy (KE) [Gk, *kinesis*, motion, *energeia*], the energy possessed by an object by virtue of its motion. It is expressed by the formula $KE = (\frac{1}{2})mv^2$, where m represents the mass of the object and v is its velocity.

kinetic hallucination [Gk, *kinesis*, motion + L, *allucinari*, wandering mind], a false perception of body movement.

kinetic proofreading, **1.** a molecular activity in which an enzyme distinguishes correct substrates. **2.** a mechanism that permits a ribosome to make correct codon-anticodon interactions.

kinetic reflex [Gk, *kinesis*, motion + L, *reflectere*, to bend back], a postural response resulting from stimulation of the vestibular apparatus. Also called **labyrinthine reflex.**

kinetics /kinet′iks/ [Gk, *kinesis* + L, *icus*, like], **1.** the study of the forces that produce, arrest, or modify the motions of the body. Newton's first and third laws of motion are especially applicable to kinetics. Newton's first law states that bodies at rest stay at rest and bodies in motion keep moving unless they are acted on by an unbalancing force. Newton's third law states that every action force has a reaction force that is equal in magnitude but opposite in direction. These two laws apply to the forces produced by muscles that act on joints. The reaction forces of the muscles contribute to equilibrium and the motion of the body. Compare **kinematics.** **2.** the study of the rate of chemical and biochemical reactions as in chemical kinetics and enzyme kinetics. It may also refer to the fate of pharmaceuticals upon administration to an organism in terms of absorption, distribution, metabolism and excretion (pharmacokinetics).

kinet(o), [word element, Gr.], *motion*.

kineto-, prefix meaning "movable": *kinetochore, kinetogenic, kinetoplasm*.

kinetochore. See **centromere.**

kinetoplasm /kīnet′ōplaz′əm/, the most highly contractile part of a cell.

kinetosis. See **kinesia.**

kinetotherapeutic bath /kinet′ōthur′əpyo͞o′tik/ [Gk, *kinesis* + *therapeutike*, medical practice + AS, *baeth*], a bath in which underwater exercises are performed to strengthen weak or partially paralyzed muscles.

King-Devick test /kingdev′ik/, a tool for evaluation of saccade, consisting of a series of charts of numbers. The charts become progressively more difficult to read in a flowing manner because of increasing space between the numbers. Both errors in reading and speed of reading are included in deriving a score.

King, Imogene, (1923–2007), a nursing theorist who introduced her theory of goal attainment in her book, *Toward a Theory for Nursing* (1971). King defines nursing as a process of human interactions between nurse and patients who communicate to set goals and then agree to meet the goals. King's conceptual framework specifies three interacting systems: personal system, interpersonal system, and social system. She believes that the patient is a personal system within a social system, coexisting through interpersonal processes with other personal systems. The nurse and patient perceive each other and the situation, act and react, interact, and transact. From her major concepts (interaction, perception, communication, transaction, role, stress, growth and development, and time and space), she derives her theory of goal attainment. King describes nursing as a discipline and an applied science, with emphasis on the derivation of nursing knowledge from other disciplines. She suggests that the patient's and nurse's perceptions, judgments, and actions lead to reaction, interaction, and transaction, which she calls the process of nursing.

kin group, family members who are related genetically or by marriage.

kinin /kī′nin/, any of a group of polypeptides with varying physiological activity, such as contraction of visceral smooth muscle, vascular permeability, and vasodilation. Two principal kinins, bradykinin and lysylbradykinin, are formed in the blood from precursor kininogens by the action of kallikrein and kinases.

kinky hair disease [Du, *kink*, short twist + AS, *haer* + L, *dis* + Fr, *aise*, ease], an inherited condition characterized by short, sparse, poorly pigmented hair with shafts that are twisted and broken. Other mental and physical disorders are usually associated with the disease.

kino-, kinesi-, kinesio-, prefix meaning "movement": *kinematics, kinesiology, hyperkinesia*.

kinomere. See **centromere.**

Kinsbourne's syndrome /kinz′born/, a neurological disorder of unknown cause with onset between ages 1 and 3 years, characterized by myoclonus of trunk and limbs and by nonrhythmic horizontal and vertical oscillations of the eyes, with ataxia of gait and intention tremor. Some cases have been associated with occult neuroblastoma. Also called **myoclonic encephalopathy of childhood.**

kinship model family group, a family unit comprising the biological parents and their offspring. It is like a nuclear family but more closely tied to an extended family. Characteristics of this family group include dominance by the maternal grandmother, who raises the children and makes most of the decisions; clearly delineated sex roles; and resistance to change.

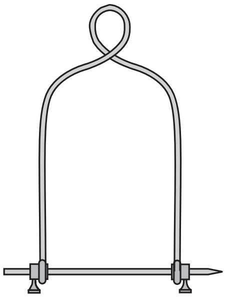
Kinyoun stain, a modification of the Ziehl-Neelsen acid-fast stain in which organisms are stained cold by using carbol-fuchsin. It is often used for detection of mycobacteria, ***Nocardia,*** and oocysts of some parasites. See also **carbol-fuchsin stain.**

Kirkland knife [Olin Kirkland, American periodontist, 1876–1969; AS, *cnif*], a surgical knife with a heart-shaped blade that is sharp on all edges. It is used for a primary gingivectomy incision.

Kirklin staging system, a system for determining the prognosis of colon cancer on the basis of the extent to which the tumor has penetrated the bowel area. See also **cancer staging, Dukes' classification, TNM.**

Kirlian photography, a photographic technique in which a high-voltage current passed over a subject in contact with photographic film or paper produces an image surrounded by a luminous radiation, or aura, which some claim is a bioenergetic field that can reveal information about the subject's physical health and emotional state.

Kirschner's wire /kursh′nərz/ [Martin Kirschner, German surgeon, 1879–1942; AS, *wir*], a threaded or smooth metallic wire 22.86 cm long and available in three diameters. The wire is used in internal fixation of fractures or for skeletal traction. Also known as a *K-wire*.



Kirschner's wire *(Perry, Potter, and Elkin, 2012)*

Kite method, a technique for positioning a patient for radiographic examination of congenital clubfoot. The foot is imaged in two planes and is placed on the film holder without altering the foot's abnormal alignment.

kiting /kī′ting/, *(informal)* the improper and illegal practice of altering a drug prescription to indicate that more of a drug was prescribed than was actually ordered by the physician. Kiting may be done by a patient seeking greater quantities of drugs, especially opioids, than the physician prescribed, or by the pharmacist to increase reimbursement from a third party, such as an insurance company.

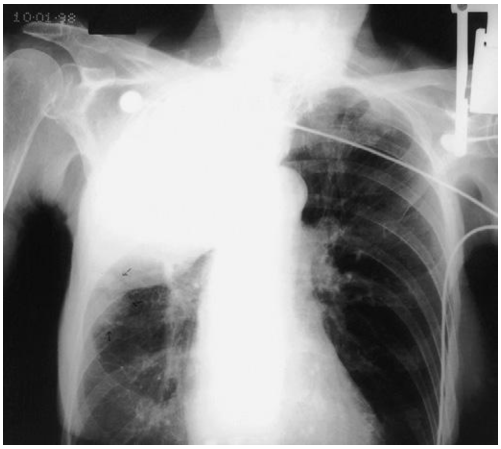
KJ, abbreviation for *knee jerk*.

kL, abbreviation for **kiloliter.**

klang association. See **clang association.**

Klebsiella /kleb′zē·el′ə/ [Theodore A.E. Klebs, German bacteriologist, 1834–1913], a genus of diplococcal bacteria that appear as small, plump rods with rounded ends. Several respiratory diseases, including bronchitis, sinusitis, and some forms of pneumonia, are caused by infection by species of *Klebsiella*.

Klebsiella pneumoniae [Theodore A.E. Klebs; Gk, *pneumon,* lung], a species of gram-negative, nonmotile bacteria found in soil, water, cereal grains, and the intestinal tract of humans and other animals. It is associated with several pathological conditions, including pneumonia. It is commonly implicated in nosocomial urinary tract infections, especially in immunocompromised patients. Also called **Friedländer's bacillus.**



***Klebsiella* pneumonia** *(Belchetz and Hammond, 2003)*

Klebs-Löeffler bacillus /klebz′ lef′lər/ [Theodore A.E. Klebs, German bacteriologist, 1834–1913; Friederich A.J. Löeffler, German bacteriologist, 1852–1915; L, *bacillum,* small rod], The gram-positive asporogenic bacteria *Corynebacterium diphtheriae* that has three cultural types according to severity of the cases. See also ***Corynebacterium.***

kleeblattschädel deformity syndrome. See **cloverleaf skull deformity.**

Kleine-Levin syndrome /klīn′ lev′in/ [Willi Kleine, German psychiatrist, 1879–1961; Max Levin, Russian-born American neurologist, 1901–1974], a disorder of unknown cause often associated with psychotic conditions that is characterized by episodic sleep, abnormal hunger, and hyperactivity. The episodes of sleep may last for several hours or days and are followed by confusion on awakening. There is no specific treatment. Compare **narcolepsy.**

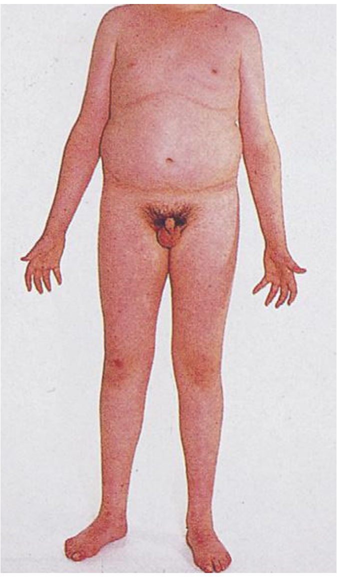
Klein-Waardenburg syndrome. See **Waardenburg's syndrome** (def. 2).

klepto-, prefix meaning "theft or stealing": *kleptolagnia, kleptomania*.

kleptolagnia /klep′tōlag′nē·ə/ [Gk, *kleptein,* to steal, *lagneia,* lust], sexual excitement or gratification produced by stealing.

kleptomania /-mā′nē·ə/ [Gk, *kleptein,* to steal, *mania,* madness], an anxiety disorder characterized by an abnormal, uncontrollable, and recurrent urge to steal. The objects are taken not for their monetary value, immediate need, or utility but because of a symbolic meaning usually associated with some unconscious emotional conflict; they are usually given away, returned surreptitiously, or kept and hidden. People who have the condition experience an increased sense of tension before committing the theft and intense gratification during the act. Afterward they display signs of depression, guilt, and anxiety over the possibility of being apprehended and losing status in society. In less severe cases the impulse is expressed by continuously borrowing objects and not returning them. Treatment consists of psychotherapy to uncover the underlying emotional problems. See also **impulse control disorder. —kleptomaniac,** *n.*

Klinefelter's syndrome /klīn′feltərz/ [Harry F. Klinefelter, American physician, 1912–1990], a condition of gonadal defects appearing in males after puberty, caused by an extra X chromosome in at least one cell line. Characteristics are small firm testes, long legs, gynecomastia, poor social adaptation, subnormal intelligence, chronic pulmonary disease, and varicose veins. The severity of the abnormalities increases with greater numbers of X chromosomes. The most common abnormality is a 47 XXY karyotype. Men with the karyotype XXXXY have marked congenital malformations and mental retardation.



Klinefelter's syndrome *(Patton and Thibodeau, 2010)*

Klippel-Feil syndrome /klipel′ fel′, klip′əl fīl′/ [Maurice Klippel, French neurologist, 1858–1942; Andre Feil, French neurologist, b. 1884], a condition of short neck and limited neck movements because of congenital fusion of the cervical vertebrae or reduction in the number of cervical vertebrae. Also called *Klippel-Feil disease, Klippel-Feil malformation, Klippel's disease*. See **congenital short neck syndrome.**

Klippel-Trénaunay syndrome /klipel′ trānōnā′/ [Maurice Klippel, French neurologist, 1858–1942; Paul Trénaunay, French physician, 20th century], a rare condition usually affecting one extremity, characterized by hypertrophy of the bone and related soft tissues, large cutaneous hemangiomas, persistent nevus flammeus, and skin varices.

Kloehn headgear, an extraoral orthodontic appliance consisting of a cervical strap and a long outer bow, used to retract maxillary teeth or to reinforce tooth anchorage during retraction.

Klonopin, a trademark for an anticonvulsant **(clonazepam).**

Klor, a trademark for an electrolyte replacement solution **(potassium chloride).**

Klorvess, a trademark for an electrolyte replacement solution **(potassium chloride).**

Klumpke's palsy /klo͝omp′kēz/ [Augusta Dejerine-Klumpke, French neurologist, 1859–1927], atrophic paralysis of the forearm and hand. It is present at birth and involves the seventh and eighth cervical nerves and the first thoracic nerve. The condition may be accompanied by Horner's syndrome, ptosis, and miosis because of involvement of sympathetic nerves. Also called **Dejerine-Klumpke's paralysis.**

K-Lyte/Cl, a trademark for an electrolyte replacement solution **(potassium chloride).**

km, abbreviation for **kilometer.**

kneading /nē′ding/ [AS, *cnedan*], a grasping, rolling, and pressing movement, as is used in massaging the muscles. See also **massage.**

knee /nē/ [AS, *cneow*], a joint complex that connects the thigh with the leg. It consists of three condyloid joints, 12 ligaments, 13 bursae, and the patella. The motion of this joint is not a simple gliding motion because the articular surfaces of the bones involved are not mutually adapted to each other. Various orthopedic conditions such as arthritis commonly affect the knee, especially in elderly individuals. The knee is relatively unprotected by surrounding muscles and is often injured by blows, sudden stops, and turns, especially those associated with sports. Ligament tears of the knee joint are extremely common in athletes and produce a variety of signs and symptoms, such as effusion, varying degrees of edema, differences in the shape of the knee joint, tenderness on palpation, crepitation, instability of the knee joint, and possible ecchymosis. Torn menisci are very common sports injuries and can cause severe pain, limping, edema, and greatly reduced motion.

knee-ankle interaction, one of the five major kinetic determinants of gait, which helps to minimize the displacement of the body's center of gravity during the walking cycle. The knee and the foot work simultaneously to lower the body's center of gravity. When the heel of the foot is in contact with the ground, the foot is dorsiflexed, and the knee is fully extended so that the associated limb is at its maximum length with the center of gravity at its lower point. Plantar flexion of the foot with the initiation of knee flexion maintains the center of gravity in its forward progression at about the same level, also helping to minimize the vertical displacement of the center of gravity. Knee-ankle interaction is often a factor in the diagnosis and treatment of various orthopedic diseases, deformities, and abnormal conditions and in the analysis and the correction of pathological gaits. Compare **knee-hip flexion, lateral pelvic displacement, pelvic rotation, pelvic tilt.**

kneecap. See **patella.**

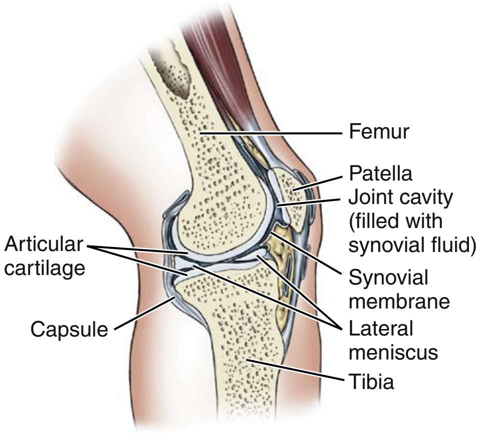
knee-chest position. See **genupectoral position.**

knee-elbow position [AS, *cneow* + *elboga*], a position in which a patient being examined rests on the knees and elbows with the head supported on the hands.

knee-hip flexion, one of the five major kinetic determinants of gait, which allows the passage of body weight over the supporting extremity during the walking cycle. Knee-hip flexion occurs during the stance and swing phases of the cycle. The knee first locks into extension as the heel of the weight-bearing limb strikes the ground and is unlocked by final flexion and initiation of the swing phase in the walking cycle. Hip flexion is synchronized with these movements, which help minimize the vertical displacement of the body's center of gravity in the act of walking. Knee-hip flexion is often a factor in the diagnosis and treatment of various orthopedic diseases, deformities, and abnormal conditions and in the analysis and correction of pathological gaits. Compare **knee-ankle interaction, lateral pelvic displacement, pelvic rotation, pelvic tilt.**

knee-jerk reflex. See **patellar reflex.**

knee joint, the complex, hinged joint at the knee, regarded as three articulations in one, comprising condyloid joints connecting the femur and the tibia and a partly arthrodial joint connecting the patella and the femur. The knee joint and its ligaments permit flexion, extension, and, in certain positions, medial and lateral rotation. It is a common site for sprain and dislocation. Also called **articulatio genus.**



Knee joint *(Herlihy, 2011)*

knee replacement, the surgical insertion of a hinged prosthesis performed to relieve pain and restore motion to a knee severely affected by osteoarthritis, rheumatoid arthritis, or trauma. With the patient under general or spinal anesthesia, the diseased surfaces are removed and tricompartmental implants are inserted to replace the opposing femorotibial joint and the patellofemoral joint. After surgery, progressive exercise and whirlpool baths are prescribed through physical therapy. Possible complications include infection, hemorrhage, fat embolism, thrombophlebitis, peroneal nerve palsy, loosening of the prosthesis, and flexion contractures. To prevent contractures, the knee is immobilized. A blanket roll along the femur prevents external rotation. The mobility and range of motion of the joint increase slowly. See also **arthroplasty, hip replacement, osteoarthritis, plastic surgery.**

Knee replacement *(Black and Hawks, 2009)*

knee sling, a leg support in sling form used under the knee for **Russell's traction.**

knife needle /nīf/ [AS, *cnif* + *neal*], a slender surgical knife with a needle point, used in the discission of a cataract and other ophthalmic procedures such as goniotomy and goniopuncture.

knock-knee. See **genu valgum.**

knockout mouse, a mouse that has had a specific gene artificially deleted from its genome.

Knoop hardness test /no͞op/ [Frederick Knoop, 20th century American metallurgist], a method of assessing surface hardness by measuring resistance to the penetration of an indenting tool made of diamond. The test is commonly used for testing the hardness of teeth.

knot /not/ [AS, *cnotta*], (in surgery) the interlacing of the ends of a ligature or suture so that they remain in place without slipping or becoming detached. The ends of the suture are passed twice around each other before being pulled taut to form a simple surgeon's knot. For additional stability, the ends may be recrossed and a second simple knot made over the first.

knowledge: arthritis management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about arthritis, its treatment, and the prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: asthma management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about asthma, its treatment, and the prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: body mechanics, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about proper body alignment, balance, and coordinated movement. See also **Nursing Outcomes Classification.**

knowledge: breastfeeding, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about lactation and nourishment of an infant through breastfeeding. See also **Nursing Outcomes Classification.**

knowledge: cancer management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about the cause, type, progress, symptoms, and treatment of cancer. See also **Nursing Outcomes Classification.**

knowledge: cancer threat reduction, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about causes, prevention, and early detection of cancer. See also **Nursing Outcomes Classification.**

knowledge: cardiac disease management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about heart disease, its treatment, and the prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: child physical safety, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about safely caring for a child from 1 year through 17 years of age. See also **Nursing Outcomes Classification.**

knowledge: conception prevention, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about prevention of unintended pregnancy. See also **Nursing Outcomes Classification.**

knowledge: congestive heart failure management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about heart failure, its treatment, and the prevention of exacerbations. See also **Nursing Outcomes Classification.**

knowledge: depression management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about depression and interrelationships among causes, effects, and treatments. See also **Nursing Outcomes Classification.**

knowledge: diabetes management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about diabetes mellitus, its treatment, and the prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: diet, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about recommended diet. See also **Nursing Outcomes Classification.**

knowledge: disease process, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about a specific disease process and prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: energy conservation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about energy conservation techniques. See also **Nursing Outcomes Classification.**

knowledge: fall prevention, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about prevention of falls. See also **Nursing Outcomes Classification.**

knowledge: fertility promotion, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about fertility testing and the conditions that affect conception. See also **Nursing Outcomes Classification.**

knowledge: health behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about the promotion and protection of health. See also **Nursing Outcomes Classification.**

knowledge: health promotion, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about information needed to obtain and maintain optimal health. See also **Nursing Outcomes Classification.**

knowledge: health resources, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about relevant health care resources. See also **Nursing Outcomes Classification.**

knowledge: hypertension management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about high blood pressure, its treatment, and the prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: illness care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about illness-related information needed to achieve and maintain optimal health. See also **Nursing Outcomes Classification.**

knowledge: infant care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about caring for a baby from birth to first birthday. See also **Nursing Outcomes Classification.**

knowledge: infection management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about infection, its treatment, and the prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: labor & delivery, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about labor and vaginal delivery. See also **Nursing Outcomes Classification.**

knowledge: medication, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about the safe use of medication. See also **Nursing Outcomes Classification.**

knowledge: multiple sclerosis management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about multiple sclerosis, its treatment, and the prevention of relapses or exacerbations. See also **Nursing Outcomes Classification.**

knowledge: ostomy care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about maintenance of an ostomy for elimination. See also **Nursing Outcomes Classification.**

knowledge: pain management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about causes, symptoms, and treatment of pain. See also **Nursing Outcomes Classification.**

knowledge: parenting, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about the provision of nurturing a constructive environment for a child from 1 year through 17 years of age. See also **Nursing Outcomes Classification.**

knowledge: personal safety, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about the prevention of unintentional injuries. See also **Nursing Outcomes Classification.**

knowledge: postpartum maternal health, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about maternal health in the period following the birth of an infant. See also **Nursing Outcomes Classification.**

knowledge: preconception maternal health, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about maternal health prior to conception to ensure a healthy pregnancy. See also **Nursing Outcomes Classification.**

knowledge: pregnancy, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about promotion of a healthy pregnancy and prevention of complications. See also **Nursing Outcomes Classification.**

knowledge: pregnancy & postpartum sexual functioning, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about sexual function during pregnancy and postpartum. See also **Nursing Outcomes Classification.**

knowledge: prescribed activity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about prescribed activity and exercise. See also **Nursing Outcomes Classification.**

knowledge: preterm infant care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about the care of a premature infant born 24 to 37 weeks (term) gestation. See also **Nursing Outcomes Classification.**

knowledge: sexual functioning, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about sexual development and responsible sexual practices. See also **Nursing Outcomes Classification.**

knowledge: substance use control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about controlling the use of addictive drugs, toxic chemicals, tobacco, or alcohol. See also **Nursing Outcomes Classification.**

knowledge: treatment procedure, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about a procedure required as part of a treatment regimen. See also **Nursing Outcomes Classification.**

knowledge: treatment regimen, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about a specific treatment regimen. See also **Nursing Outcomes Classification.**

knowledge: weight management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of understanding conveyed about the promotion and maintenance of optimal body weight and fat percentage congruent with height, frame, gender, and age. See also **Nursing Outcomes Classification.**

knuckle /nuk′əl/, the dorsal aspect of any interphalangeal joint, but especially of the metacarpophalangeal joints of the flexed fingers. By extension the term is sometimes applied to any anatomical structure of similar appearance, such as an extruded loop of intestine in a hernia.

Kocher's forceps /kō′kərz/ [Emil T. Kocher, Swiss surgeon, 1841–1917], a kind of surgical forceps that has notched jaws, interlocking teeth, and thick curved or straight powerful handles.

Koch's bacillus /kōks/ [Robert Koch, German bacteriologist, 1843–1910; L, *bacillum,* small rod], the *Mycobacterium tuberculosis* microorganism, a gram-positive bacterium.

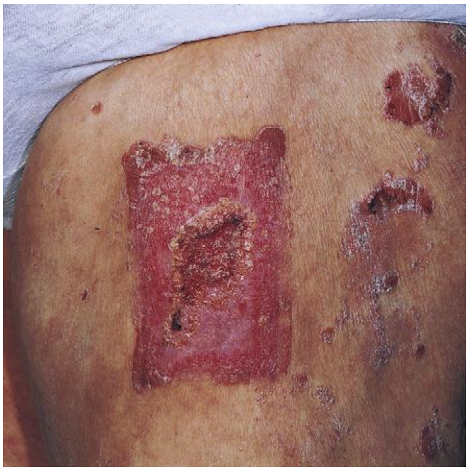
Koch's phenomenon [Robert Koch; Gk, *phainomenon,* anything seen], a tuberculin reaction that occurs when a culture of tubercle bacilli is injected into the skin of subjects already infected with the disease. In humans a positive tuberculin reaction indicates sensitization resulting from a tuberculosis infection. Also called **Koch's reaction.**

Koch's postulates [Robert Koch; L, *postulare,* to demand], the prerequisites for experimentally establishing that a specific microorganism causes a particular disease. The following conditions must be met (1) the microorganism must be observed in all cases of the disease; (2) the microorganism must be isolated and grown in pure culture; (3) microorganisms from the pure culture, when inoculated into a susceptible animal, must reproduce the disease; and (4) the microorganism must be observed in and recovered from the experimentally diseased animal.

Koch's reaction. See **Koch's phenomenon.**

Kock's pouch. See **continent ileostomy.**

Koebner phenomenon /kōb′nər/ [Heinrich Koebner, Polish dermatologist, 1838–1904; Gk, *phainomenon,* something observed], the development of isomorphic lesions at the site of an injury, occurring in psoriasis, lichen nitidus, lichen planus, and verruca plana.



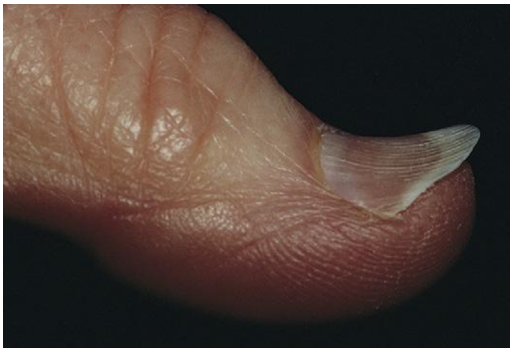
Koebner phenomenon. Psoriasis appears on the donor site of a skin graft *(Habif, 2009)*

KOH, chemical formula for **potassium hydroxide.**

Kohnstamm's phenomenon. See **aftermovement.**

koilo-, prefix meaning "hollow or concave": *koilonychia, koilorrhachic, koilosternia.*

koilonychia /koi′lōnik′ē·ə/ [Gk, *koilos,* hollow, *onyx,* nail], a condition in which nails are thin and concave from side to side. It is usually familial but may occur with trauma and iron deficiency anemia. Also called *spoon nails.*



Koilonychia *(Hordinsky, Sawaya, and Scher, 2000)*

koinoni-, prefix meaning "community": *koinonia, koinoniphobia.*

Kolcaba, Katharine, a nursing theorist who developed the Theory of Comfort to help nurses design interventions to increase the physical, psychospiritual, environmental, and social comfort of the patient. Nurses can use the General Comfort Questionnaire to measure outcomes.

kolpo-. See **colpo-.**

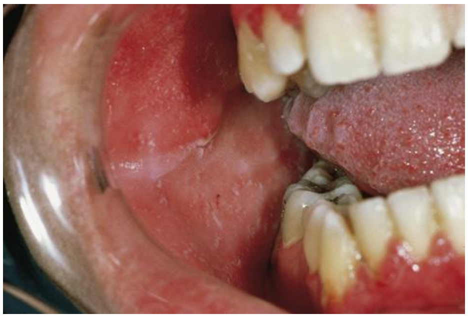
koly-, prefix meaning "to hinder": *kolypeptic, kolyphrenia, kolyseptic.*

kon-, prefix meaning "dust": *konometer, koniocortex.*

Konakion, a trademark for a vitamin K formulation **(phytonadione).**

Kopan's needle /kō′pənz/, a long biopsy needle used to pinpoint the location of a breast tumor on x-ray film. The needle is inserted into the approximate location of the tumor and is left in place during radiography so that it can be repositioned if necessary. In some cases the site is further identified for the surgeon by injecting a colored dye such as methylene blue.

Koplik's spots /kop′liks/ [Henry Koplik, American pediatrician, 1858–1927], small red spots with bluish-white centers on the lingual and buccal mucosa, characteristic of measles. The rash of measles usually erupts a day or two after the appearance of Koplik's spots.



Koplik's spots *(Regezi, Sciubba, and Jordan, 2008)*

kopr-, kopra-. See **copro-.**

Korányi's sign /kôr′ənyēz/ [Friedrich von Korányi, Hungarian physician, 1828–1913; L, *signum*], a paravertebral area of dullness found posteriorly on the side opposite a pleural effusion. Also called **Grocco's sign, Grocco's triangle,** *Korányi-Grocco triangle,* **triangular dullness.**

Korean hand acupuncture, a system of acupuncture in which the hand is considered to be a representation of the entire body and stimulation of specific points on the hand is used to obtain effects in distant areas of the body.

Korean hemorrhagic fever. See **epidemic hemorrhagic fever.**

Korotkoff sounds /kôrot′kôf/ [Nickolai Korotkoff, Russian physician, 1874–1920], sounds heard during the taking of a blood pressure reading using a sphygmomanometer and stethoscope. The sphygmomanometer is inflated enough to collapse an artery. As air is released from the cuff, pressure on the artery is reduced, and the blood is heard pulsing through the collapsed vessel. See also **blood pressure, diastole, sphygmomanometer, systole.**

Korsakoff's psychosis /kôr′səkôfs/ [Sergei S. Korsakoff, Russian psychiatrist, 1854–1900], a form of amnesia often seen in chronic alcoholics that is characterized by a loss of short-term memory and an inability to learn new skills. The person is usually disoriented, may present with delirium and hallucinations, and confabulates to conceal the condition. The cause of the condition can often be traced to degenerative changes in the thalamus as a result of a deficiency of B complex vitamins, especially thiamine and B_{12}. Deficits are often permanent. Compare **Wernicke's encephalopathy.**

kosher [Heb, *kasher,* fit or proper], pertaining to the preparation and serving of foods according to Jewish dietary laws (e.g., keeping dairy and meat separate in cooking and ingesting). Kosher foods include common fruits, vegetables, and cereals, as well as tea and coffee. Foods that are not kosher include pork, birds of prey, and seafood that lacks fins and scales, such as lobster and eels. Most poultry and meat products, excluding pork, are kosher if properly processed.

Kostmann's syndrome /kost′mahnz/, infantile genetic agranulocytosis.

K^+ pump. See **potassium pump.**

Kr, symbol for the element **krypton.**

Krabbe's disease. See **galactosyl ceramide lipidosis.**

K-ras gene, a type of oncogene, the activating mutations of which play a key role in neoplastic progression, especially in colorectal, pancreatic, and lung cancer.

Kraske position /kras′kə/ [Paul Kraske, Swiss surgeon, 1851–1930], an anatomical position in which the patient is prone, with hips flexed and elevated, head and feet down. The position is used for renal surgery, as it enlarges the costovertebral angle, allowing the surgeon to have optimal access to the kidneys.

kraurosis /krôrō′sis/ [Gk, *krauros,* dry, *osis,* condition], a thickening and shriveling of the mucous membranes, particularly the female genitalia. See also **kraurosis vulvae.**

kraurosis vulvae, a skin disease of aged women characterized by dryness, itching, and atrophy of the external genitalia. It is a condition that exhibits a predisposition to leukoplakia and carcinoma of the vulva. See also **lichen sclerosis et atrophicus.**

Krause's corpuscles [Wilhelm J. F. Krause, German anatomist, 1833–1910; L, *corpusculum,* little body], any of a number of sensory end organs in the conjunctiva of the eye; mucous membranes of the lips and tongue; epineurium of nerve trunks, the penis, and the clitoris; and synovial membranes of certain joints. Krause's corpuscles are tiny cylindric oval bodies with a capsule formed by the expansion of the connective tissue sheath of a medullated fiber. They contain a soft, semifluid core in which the axon terminates either in a bulbous extremity or in a coiled mass. Also called **end bulbs of Krause.** Compare **Golgi-Mazzoni corpuscles, Pacini's corpuscles.**

Krebs cycle. See **citric acid cycle.**

Krebs-Henseleit cycle. See **urea cycle.**

Krukenberg's tumor /kro͞o′kənbərgz/ [Friedrich E. Krukenberg, German pathologist, 1871–1946], a neoplasm of the ovary that is a metastasis of a GI malignancy, usually stomach cancer. Cytological examination often reveals mucoid degeneration and many large cells shaped like signet rings. Also called **carcinoma mucocellulare.**

krypto-. See **crypto-.**

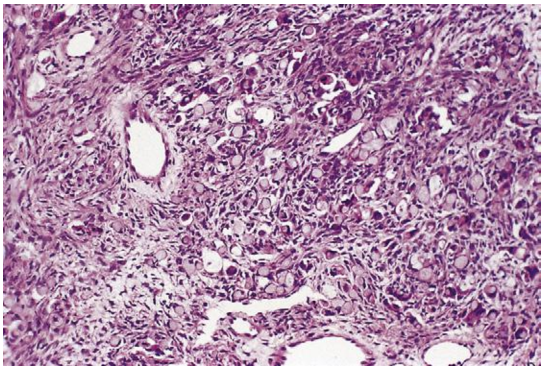
krypton (Kr) /krip′ton/, a generally inert, rare gaseous element present in air. Its atomic number is 36; its atomic mass is 83.80.

KS, ks, abbreviation for **Kaposi's sarcoma.**

KUB, abbreviation for *kidney, ureter, and bladder;* a term used in a radiographic examination to determine the location, size, shape, and malformation of the kidneys, ureters, and bladder. Stones and calcified areas may be detected.

Kuchendorf method /ko͞o′kəndôrf/, (in radiology) a technique for positioning a patient for radiographic examination of the patella. The patella is placed against the image receptor and is moved laterally to reduce superimposition.

kudzu, an herb that grows in vine form, native to China and Japan and introduced to the United States.



Krukenberg's tumor *(Fletcher, 2007)*

■ USES: It is used to reduce alcohol cravings and to treat alcohol hangovers and menopausal symptoms. Its efficacy is unproven.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity. It should be used with caution by people who have heart disease.

Kufs' disease /ko͞ofs/ [H. Kufs, German psychiatrist, 1871–1955], an adult form of hereditary cerebral sphingolipidosis (amaurotic familial idiocy) characterized by cerebromacular degeneration, hypertonicity, and progressive spastic paralysis. Also called **adult ceroid lipofuscinosis.**

Kugelberg-Welander syndrome. See **juvenile spinal muscular atrophy.**

Kulchitsky cell carcinoma. See **carcinoid.**

Kulchitsky's cell. See **argentaffin cell.**

Kümmell's disease /kim′əlz/ [Hermann Kümmell, German surgeon, 1852–1937; L, *dis* + Fr, *aise,* ease], a set of symptoms that develop after a compression fracture of the vertebrae with spinal injury. They include spinal pain, intercostal neuralgia, kyphosis, and weakness in the legs. Also called *Kümmell's spondylitis,* **posttraumatic spondylitis, traumatic spondylopathy.**

kundalini yoga, a style of yoga whose purpose is controlled release of latent kundalini energy.

kunecatechins, a topical keratolytic.

■ INDICATIONS: This drug is used to treat external genital and perianal warts.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

kunitz inhibitor. See **trypsin inhibitor.**

Küntscher nail /ko͝on′chər, kin′chər/ [Gerhard Küntscher, German surgeon, 1902–1972; AS, *naegel*], a stainless steel nail used in orthopedic surgery for the fixation of fractures of the long bones, especially the femur. Also called *Küntscher intramedullary nail.*

Kupffer cells /ko͝op′fərz/ [Karl W. von Kupffer, German anatomist, 1829–1902], immobile macrophages that line liver sinusoids. Kupffer cells filter bacteria and other foreign proteins from the blood and initiate immune responses.

kurtosis /kerto′sis/, the degree of peakedness or flatness of a probability distribution relative to the normal distribution with the same variance.

kuru /ko͞o′ro͞o/ [New Guinea, trembling with fear], a slow, progressive, fatal infection of the central nervous system that was endemic to natives of the New Guinea highlands. The incubation period could be 30 or more years, but death usually occurred within months of the onset of symptoms. It was characterized by ataxia and decreased coordination progressing to paralysis, dementia, slurring of speech, and visual disturbances. Disease was transmitted by ritual cannibalism of brain tissue during funeral rites. No new cases have been recorded since cessation of the cannibalism. This disease is a model for prion diseases such as BSE and variant CJD.

Kussmaul breathing /ko͝os′moul/ [Adolf Kussmaul, German physician, 1822–1902; AS, *braeth*], abnormally deep, very rapid sighing respirations characteristic of diabetic ketoacidosis.

Kussmaul's coma [Adolf Kussmaul; Gk, *koma,* deep sleep], a diabetic coma characterized by acidosis and deep breathing or extreme hyperpnea.

Kussmaul's sign [Adolf Kussmaul; L, *signum,* mark], **1.** a paradoxic rise in venous pressure with distension of the jugular veins during inspiration, as seen in constrictive pericarditis or mediastinal tumor. **2.** conditions of convulsions and coma associated with a GI disorder caused by absorption of a toxic substance.

kV, abbreviation for **kilovolt.**

Kveim reaction [Morton A. Kveim, Norwegian physician, b. 1892; L, *re,* again, *agere,* to act], a reaction, used in a diagnostic test for sarcoidosis, to an intradermal injection of antigen derived from a lymph node known to be sarcoid. If a noncaseating granuloma appears on the skin at the test site in 4 to 8 weeks, the reaction is said to be positive evidence that the patient has sarcoidosis.

kVp, abbreviation for **kilovolt peak.**

kVp test cassette, (in radiology) a lightproof box containing a copper filter, a series of stepwedges, and an optical attenuator, used to test the accuracy of kVp settings for peak electrical potential across an x-ray tube.

kwashiorkor /kwä′shē·ôr′kôr/ [Afr], a malnutrition disease, primarily of children, caused by severe protein deficiency that usually occurs when the child is weaned from the breast. The child does not lose weight as dramatically and does not look as sick as a marasmic child, who lacks both protein and calories. Some now believe kwashiorkor may relate to bacterial grain contamination and occur when the newly weaned child begins to ingest grain products. Eventually the following symptoms occur: retarded growth, changes in skin and hair pigmentation, diarrhea, loss of appetite, nervous irritability, lethargy, edema, anemia, fatty degeneration of the liver, necrosis, dermatoses, and fibrosis, often accompanied by infection and multivitamin deficiencies. Because dietary fats are poorly tolerated in kwashiorkor, its treatment includes a skimmed milk formula in initial feedings, followed by additional foods until a full, well-balanced diet is achieved. See also **marasmic kwashiorkor, marasmus, protein-energy malnutrition.**

Kwell, a trademark for a pediculicide and scabicide **(gamma benzene hexachloride).**

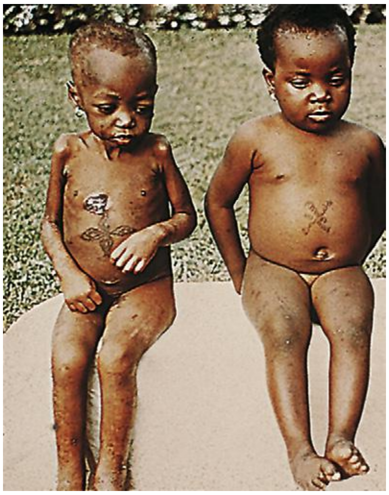
Kyasanur Forest disease, a flavovirus infection transmitted by the bite of a tick, *Haemophysalis spinigera,* that is harbored by shrews and other forest animals in western tropical India. Characteristics of the infection include fever, headache, muscle ache, cough, abdominal and eye pain, and photophobia. Treatment is symptomatic. A vaccine is used in India. Also called **monkey disease.**

kymo-, prefix meaning "waves": *kymograph, kymoscope, kymotrichous.*

kymography /kēmog′rəfē/ [Gk, *kyma,* wave + *graphein,* to record], a technique for graphically recording motions of body organs, such as the heart and the blood vessels.

kyno-, prefix meaning "dogs": *kynocephalus, kynophobia.*

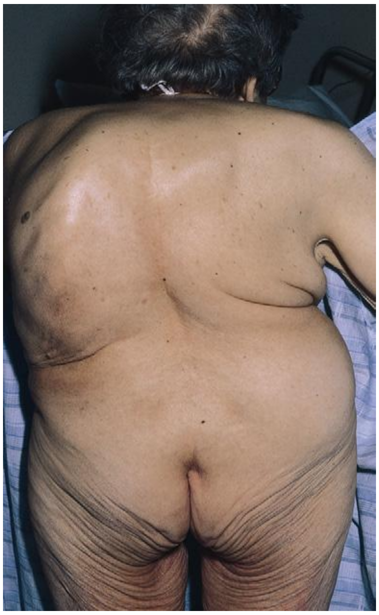
kypho-, prefix meaning "hump": *kyphoscoliosis, kyphosis, kyphotone.*



The child on the left has severe muscle wasting with oedema representing marasmic kwashiorkor. The other child pictured does not have a nutritional deficiency *(Shetty, 2006)*

kyphos /kī′fəs/ [Gk, *kyphos,* hunchbacked], the exaggeration or angulation from the normal position of the thoracic vertebral column that is associated with kyphosis. See also **kyphosis.**

kyphoscoliosis /kī′fōskō′lē·ō′sis/ [Gk, *kyphos,* hunchbacked + *skolios* curved + *osis,* condition], an abnormal condition characterized by an anteroposterior and a lateral curvature of the spine. It occurs in children and adults and is often associated with cor pulmonale. Also called **scoliokyphosis.** Compare **kyphosis, scoliosis. —kyphoscoliotic,** *adj.*

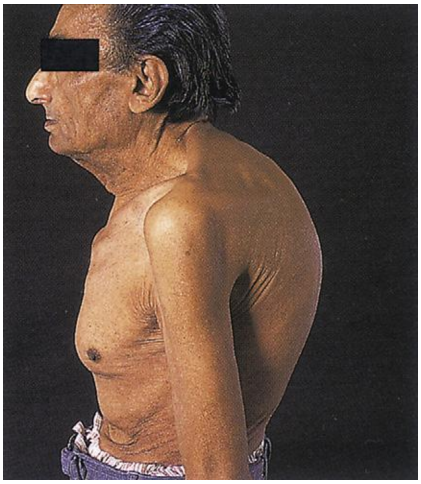


Kyphoscoliosis *(Swartz, 2009)*

kyphosis /kīfō′sis/ [Gk, *kyphos,* hunchbacked], an abnormal condition of the vertebral column, characterized by increased convexity in the curvature of the thoracic spine as viewed from the side. The spinal sagittal contour ordinarily consists of a lordosis in the lumbar and cervical spinal segments that balances the rounding, or the kyphosis, in the thoracic segment. Kyphosis describes this expected rounding but also is used to describe the abnormal condition of the vertebral column. It may be caused by rickets or tuberculosis of the spine. Adolescent kyphosis is usually self-limiting and often undiagnosed, but, if the curvature progresses, there may be moderate back pain. Conservative treatment consists of spine-stretching exercises and sleeping without a pillow, with a board under the mattress. A modified Milwaukee brace may be used for severe kyphosis, and, rarely, spinal fusion may be required. Also called **humpback. —kyphotic,** *adj.*

kysth-, kystho-. See **colpo-.**

kyto-. See **cyt-.**



Severe kyphosis of the thoracic spine

(Epstein et al, 2003)

L

L, **1.** symbol for *kinetic potential*. **2.** abbreviation for ***Lactobacillus.*** **3.** abbreviation for **lambert.** **4.** abbreviation for *Latin*. **5.** abbreviation for **liter.** **6.** abbreviation for **lung.**

L & A, abbreviation for reaction of the pupil to *light and accommodation*.

La, symbol for the element **lanthanum.**

LA, abbreviation for **left atrium.**

lab, abbreviation for **laboratory.**

label [ME, band], **1.** *n*, a substance with a special affinity for an organ, tissue, cell, or microorganism in which it may become deposited and fixed. **2.** *n*, an atom or molecule attached to either a ligand or binding protein and capable of generating a signal for monitoring in the binding reaction. **3.** *v*, to deposit and fix a substance, tissue, cell, or microorganism. **4.** *v*, to attach a radioisotope to a compound for the purpose of tracing it during a physiological action in the body.

labeled compound, a chemical substance in which part of the molecules are labeled with a radionuclide or isotope so that observations of the radioactivity or isotopic composition make it possible to follow the compound or its fragments through physical, chemical, or biological processes.

labeling, **1.** the providing of information on a drug, food, device, or cosmetic to the purchaser or user. The information may be in any one of various forms, including printing on a carton, adhesive label, package insert, and monograph. Regulations for labeling are provided by the Food and Drug Administration. The label must contain directions for use, unless such directions are exempted by regulation, as well as warnings or contraindications. It must not contain false or misleading information. **2.** the assignment of a word or term to a form of behavior. **3.** the act of classifying a patient according to a diagnostic category. Labeling can be misleading because not all patients conform to defined characteristics of standard diagnostic categories. Also spelled *labelling*.

la belle indifference /lä bel indifāräNs′/ [Fr, nice indifference], an air of unconcern displayed by some patients toward their physical symptoms. It is believed the physical symptoms may relieve anxiety and result in secondary gains in the form of sympathy and attention given by others.

labetalol hydrochloride /ləbet′əlol/, an antihypertensive drug with beta and alpha blocking properties.

■ INDICATIONS: It is prescribed for the treatment of moderate to severe hypertension.

■ CONTRAINDICATIONS: The presence of asthma or emphysema prohibits its use. It should be used with caution in patients with diabetes because it may mask symptoms of hypoglycemia, particularly tachycardia.

■ ADVERSE EFFECTS: Among the most serious adverse effects are orthostatic hypotension, fatigue, headache, skin rashes, scalp paresthesia, nausea, and vomiting.

labia /lā′bē·ə/ *sing*. **labium** [L, lip], **1.** the lips. **2.** the fleshy liplike edges of an organ or tissue. **3.** the folds of skin at the opening of the vagina. **—labial,** *adj*.

labial /lā′bē·əl/, pertaining to the lips. See also **bilabial.**

-labial, suffix meaning "lips": *alveololabial, glossolabial, maxillolabial*.

labial arch wire, an arch wire of high tensile strength whose arms come through the embrasure between the canine and lateral incisors in the maxillary arch, and between the canines and first premolar in the mandibular arch. It is used primarily for moving teeth in the lingual direction and for retruding the anterior teeth and closing spaces.

labial bar /lā′bē·əl/, a bar that is installed labially or buccally to the dental arch and connects bilateral parts of a mandibular removable partial denture.

labial flange, the part of a denture that occupies the outer vestibule of the mouth.

labial glands [L, *labium*, lip, *glans*, acorn], small mucous or serous glands embedded in the lips.

labial notch, a depression in the border of a denture that accommodates the labial frenum.

labial vestibule, that portion of the vestibule of the mouth that lies between the lips and the teeth and gingivae or residual alveolar ridges.

labia majora *sing*. *labium majus* /mā′jəs/, two long lips of skin, one on each side of the vaginal orifice outside the labia minora. They extend from the anterior labial commissure to the posterior labial commissure and form the lateral boundaries of the pudendal cleft. Each labium contains areolar tissue, fat, and a thin layer of nonstriated muscle. In some women the outer surface of each lip may be covered with coarse pubic hair. The embryonic derivations of the labia majora and the scrotum are homologous.

labia minora /minôr′ə/, *sing*. *labium minus* /mē′nəs/, two thin folds of skin between the labia majora, extending from the clitoris backward on both sides of the vaginal orifice, ending between it and the labia majora. Anteriorly each labium divides into an upper and a lower division. The upper divisions pass above the clitoris and meet to form the preputium clitoridis. The lower divisions pass beneath the clitoris and unite to form the frenulum of the clitoris. Opposed surfaces of the labia minora contain sebaceous follicles.

labile /lā′bil/ [L, *labilis*, slipping], **1.** unstable; characterized by a tendency to change or be altered or modified. **2.** (in psychiatry) characterized by rapidly shifting or changing emotions, as in bipolar disorder and certain types of schizophrenia; emotionally unstable. **—lability,** *n*.

-labile, suffix meaning "unstable, subject to change": *frigolabile, siccolabile, thixolabile*.

lability. See **labile.**

labio-, prefix meaning "lips, particularly the lips of the mouth": *labiocervical, labiodental, labiomental*.

labiodental /lā′bē·ōden′təl/ [L, *labium*, lip, *dens*, tooth], **1.** pertaining to the labial, or lip-facing, surfaces of the 12 anterior teeth. **2.** pertaining to the sounds of speech that require a special coordination of teeth and lips, such as /f/ and /v/.

labioglossolaryngeal paralysis. See **bulbar paralysis.**

labiolingual fixed orthodontic appliance /lā′bē·ōling′gwəl/ [L, *labium*, lip, *lingua*, tongue], an appliance for correcting or improving malocclusion that is anchored to the maxillary and mandibular first permanent molars. The appliance has labial arches that fit into horizontal buccal tubes attached to anchor bands and lingual arches that are fastened to the lingual side of the anchor bands.

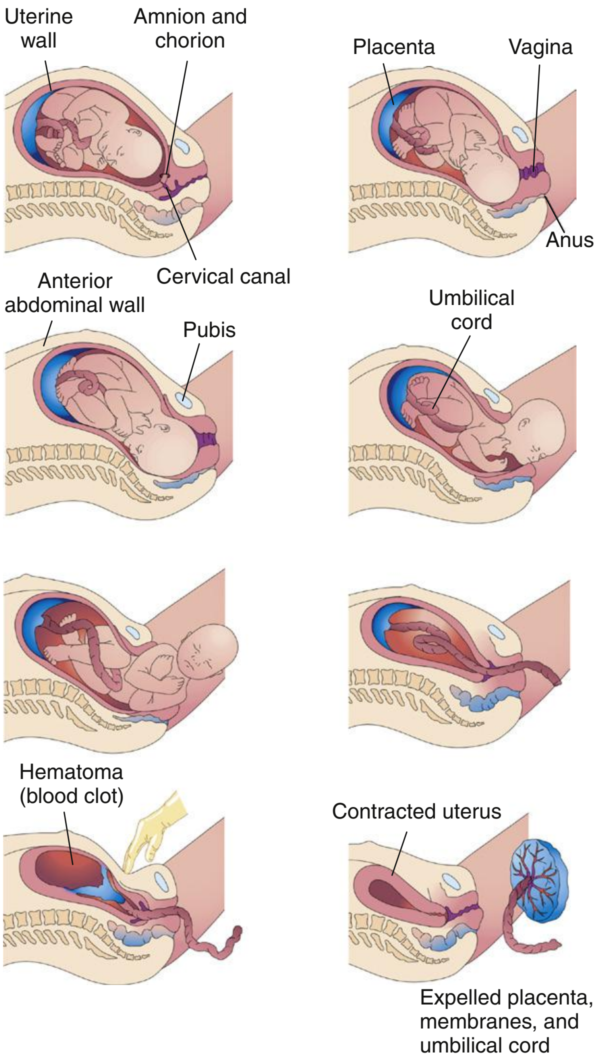
labioversion /lā′bē·ōver′zhən/ [L, *labium*, lip + vertere, to turn], displacement of a tooth labially from the line of occlusion.

labium. See **labia.**

labium majus. See **labia majora.**

labium minus. See **labia minora.**

labor [L, work], the time and the processes that occur during parturition from the beginning of cervical dilation to the delivery of the placenta. Also spelled **labour.** See also **birth, cardinal movements of labor, station.**



Mechanisms of labor *(Moore and Persaud, 2008)*

labor, abnormal. See **dystocia.**

laboratory (lab) /lab′ərətôr′e/ [L, *laborare*, to labor], **1.** *n*, a facility, room, building, or part of a building in which scientific research, experimentation, testing, or other investigative activities are carried out. **2.** *adj*, pertaining to a laboratory.

laboratory core. See **core,** def 2.

laboratory data interpretation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as critical analysis of patient laboratory data in order to assist with clinical decision making. See also **Nursing Interventions Classification.**

laboratory diagnosis, a diagnosis arrived at after study of secretions, excretions, or tissue through chemical, microscopic, or bacteriological means or by biopsy. See also **diagnosis.**

laboratory error, any error made by the personnel in a clinical laboratory in performing a test, interpreting data, or reporting or recording the results. Laboratory error must always be considered a possible explanation for findings that are at variance with the composite clinical condition of the patient or are widely divergent from previous laboratory tests. The general procedure is to repeat the test when an abnormal result is found.

laboratory medicine, the branch of medicine in which specimens of tissue, fluid, or other body substance are examined outside of the person, usually in the laboratory. Some fields of laboratory medicine are **chemistry, cytology, hematology, histology,** and **pathology.**

Laboratory Response Network (LRN), a network of federal, state, and local laboratories, established in 1999 by the Centers for Disease Control and Prevention, whose purpose is to provide the laboratory infrastructure and capacity to respond to biological and chemical terrorism and other public health emergencies.

laboratory test, a procedure, usually conducted in a laboratory, that is intended to detect, identify, or quantify one or more significant substances, evaluate organ functions, or establish the nature of a condition or disease. Laboratory tests range from quite simple to extremely sophisticated. In modern medical practice they are commonly used to help establish or confirm a diagnosis and often aid in the management of disease.

labor coach, a person who assists a woman in labor and delivery by closely attending to her emotional needs and encouraging her to use properly the breathing patterns, concentration techniques, body positions, and massage techniques that were taught in a program of psychophysical preparation for childbirth. The task of a labor coach is to minimize the need for pharmacological pain relief and to decrease or eliminate the use of analgesia or anesthesia. Usually the coach is the father of the baby or a close friend of the mother, but a professional labor coach, often a registered nurse specially trained in a method, may fill the role. Also called **doula, labor support person.** See also **monitrice.**

labored breathing, abnormal respiration characterized by evidence of increased effort, including the use of accessory muscles of respiration in the chest wall, stridor, grunting, or nasal flaring.

labor induction, a nursing intervention from the Nursing Interventions Classification (NIC) defined as initiation or augmentation of labor by mechanical or pharmacological methods. See also **Nursing Interventions Classification.**

labor pains [L, *labor,* work, *poena,* penalty], pain associated with contraction of the uterus in labor.

labor support person. See **labor coach.**

labor suppression, a nursing intervention from the Nursing Interventions Classification (NIC) defined as controlling uterine contractions prior to 37 weeks of gestation to prevent preterm birth. See also **Nursing Interventions Classification.**

labour. See **labor.**

labyrinth. See **internal ear.**

labyrinth-, prefix meaning "labyrinth or inner ear": *labyrinthitis, labyrinthectomy.*

labyrinthectomy /lab′ərinthek′təmē/, the surgical excision of the aural labyrinth.

labyrinthine /lab′ərin′thin/ [Gk, *labyrinthos,* maze], pertaining to or resembling a labyrinth or maze, such as the structure of the inner ear.

labyrinthine reflex. See **kinetic reflex.**

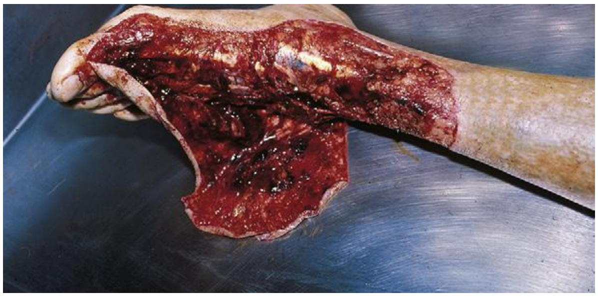
labyrinthine righting, one of the five basic neuromuscular reactions involved in a change of body positions. The change stimulates cells in the semicircular canals of the inner ear, causing neck muscles to respond by automatically adjusting the head to the new position.

labyrinthine vertigo. See **Ménière's disease.**

labyrinthitis /lab′ərinthī′tis/ [Gk, *labyrinthos,* maze, *itis*], inflammation or dysfunction of the labyrinthine canals of the inner ear, resulting in vertigo, often accompanied by nausea, vomiting, or malaise.

labyrinthus osseus. See **osseous labyrinth.**

laceration /las′ərā′shən/ [L, *lacerare,* to tear], **1.** the act of tearing or slashing. **2.** a torn, jagged wound. *—lacerate, v., lacerated, adj.*



Avulsed laceration *(Huether and McCance, 2008)*

laceration of cervix [L, *lacerare,* to tear, *cervix,* neck], a wound or irregular tear of the cervix uteri during childbirth.

laceration of the perineum [L, *lacerare,* to tear; Gk, *perineos*], a wound or irregular tear of the perineal tissues during childbirth.

lacertus /ləser′təs/ [L, lizard, because of a fancied resemblance], a general term for certain fibrous attachments of muscles.

lachrymal. See **lacrimal.**

lachrymation. See **lacrimation.**

lacri-, lachry-, prefix meaning "tears": *lacrimalin, lacrimator, lacrimotomy.*

lacrimal /lak′riməl/ [L, *lacrima,* tear], pertaining to tears. Also spelled **lachrymal.**

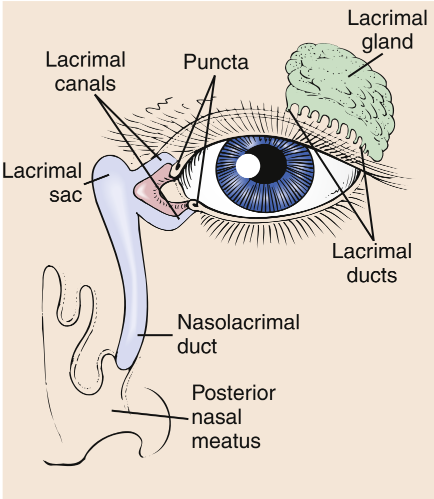
lacrimal apparatus, a network of structures of the eye that secrete tears and drain them from the surface of the eyeball. These parts include the lacrimal glands, lacrimal ducts, lacrimal canals, lacrimal sacs, and nasolacrimal ducts.

lacrimal artery, an artery arising from the ophthalmic artery on the lateral side of the optic nerve that supplies the lacrimal gland, muscles, the anterior ciliary branch to the eyeball, and the lateral sides of the eyelid.

lacrimal bone, one of the smallest and most fragile bones of the face, located at the anterior part of the medial wall of the orbit. It unites with the maxilla to form the groove for the lacrimal sac.

lacrimal canaliculus. See **lacrimal duct.**

lacrimal caruncle, the small, reddish, fleshy protuberance that fills the triangular space between the medial margins of the upper and lower eyelids. It contains sebaceous and sudoriferous glands and secretes a whitish substance that collects and often dries in the corner of the eye.



Lacrimal apparatus *(Lewis et al, 2007)*

lacrimal duct, one of a pair of channels through which tears pass from the lacrimal lake to the lacrimal sac of each eye. Also called **lacrimal canaliculus.**

lacrimal fold [L, *lacrima,* tear; AS, *fealdan*], a valvelike fold of mucous membrane at the lower part of the nasolacrimal duct. Also called **Hasner's fold.**

lacrimal gland, one of a pair of glands situated superiorly and laterally to the eye bulb in the lacrimal fossa of the frontal bone. It is an oval structure about the size of an almond. The gland has about 10 ducts that run obliquely beneath the conjunctiva and open along the upper and lateral half of the superior conjunctival fornix. The watery secretion from the gland consists of the tears, slightly alkaline and saline, that moisten the conjunctiva.

lacrimal groove, a groove formed by the lacrimal bone and the frontal process of the maxilla that contains the lacrimal sac.

lacrimal lake, an accumulation of fluid secreted by the lacrimal gland. It is drained by the lacrimal canaliculi.

lacrimal papilla, the small conic elevation on the medial margin of each eyelid, supporting an apex pierced by the punctum lacrimale through which tears emerge to moisten the conjunctiva.

lacrimal punctum, an opening through which fluid enters each lacrimal canaliculum.

lacrimal reflex [L, *lacrima,* tear, *reflectere,* to bend back], a release of tears in response to stimulation or irritation of the cornea or conjunctiva.

lacrimal sac, the upper end of each of the two nasolacrimal ducts. Each sac is lodged in a deep groove formed by the lacrimal bone and the frontal process of the maxilla. The sac is ovoid and about 13 mm long. Its upper end is closed and rounded, its lower end continuous with the nasolacrimal duct. The lacrimal sacs fill with tears secreted by the lacrimal glands and conveyed through the lacrimal ducts.

lacrimation /lak′rimā′shən/, **1.** the normal continuous secretion of tears by the lacrimal glands. **2.** an excessive amount of tear production, as in crying or weeping. Also spelled **lachrymation.**

lacrimator /lak′rimā′tər/, an agent that stimulates the secretion of tears.

lacrimomaxillary suture. See **maxillolacrimal suture.**

lacrimotomy /lak′rimot′əmē/, a surgical incision in the lacrimal gland.

La Crosse encephalitis, encephalitis caused by the La Crosse virus (a California serogroup virus in the family Bunyaviridae), transmitted by *Aedes triseriatus*, seen primarily in children, chiefly in the Midwestern United States. It is one of the most prevalent mosquito-borne diseases recognized in the United States. Most cases result in mild illness.

lact-. See **lacto-.**

lactalbumin /lak′təlbyo͞o′min/ [L, *lac*, milk, *albus*, white], a simple, highly nutritious protein found in milk. See also **albumin, serum albumin.**

lactam /lak′təm/, a cyclic amide created by the elimination of a molecule of water from aminocarboxylic acid. **Lactim** is the isomeric form of lactam.

lactase /lak′tās/ [L, *lac* + Fr, *diastase*, enzyme], an enzyme that catalyzes the hydrolysis of lactose to glucose and galactose. Lactase is concentrated in the kidney, liver, and intestinal mucosa. Also called **beta-galactosidase.**

lactase deficiency, an inherited abnormality in which the amount of the digestive enzyme lactase is inadequate for the normal digestion of milk products, resulting in lactose intolerance, the inability to digest lactose (except for the bacterial breakdown of lactose in the large intestine). Lactose intolerance usually doesn't appear until 4 or 5 years of age, begins gradually, and persists throughout life. In adults a relative deficiency may appear as a natural process of aging; it occurs more frequently in persons of Asiatic, Native American, and African heritage. A lactase inadequacy also may result from subtotal gastrectomy and may be secondary to any disease of the small intestine in which structural changes occur, such as tropical sprue, ulcerative colitis, infectious hepatitis, and kwashiorkor; severe malnutrition; or some types of antibiotic therapy. See also **lactose intolerance.**

lactate /lak′tāt/, an anion of lactic acid.

lactate dehydrogenase (LDH), an enzyme that is found in the cytoplasm of almost all body tissues, where its main function is to catalyze the oxidation of L-lactate to pyruvate. It is assayed as a measure of anaerobic carbohydrate metabolism and as one of several serum indicators of myocardial infarction and muscular dystrophies. Serum levels of LDH usually rise 12 to 18 hours after myocardial cell necrosis. See also **aspartate aminotransferase, CK isoenzyme fraction, Duchenne's muscular dystrophy.**

lactate dehydrogenase (LDH) test, a blood test used to detect levels of LD, which is widely distributed throughout the body. Disease or injury to body tissues such as the heart, liver, red blood cells, kidneys, skeletal muscles, brain, and lungs will result in higher-than-normal blood levels. Five separate isoenzymes make up the total LDH, with each body tissue containing a predominance of one or more of these fractions.

lactation /laktā′shən/ [L, *lac*, milk, *atio*, process], the process of synthesis and secretion of milk from the breasts in the nourishment of an infant or child. See also **breastfeeding.**

lactation consultant, a health care professional, often with advanced certification, who provides education and management related to breastfeeding.

lactation counseling, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of an interactive helping process to assist in maintenance of successful breastfeeding. See also **Nursing Interventions Classification.**

lactation mastitis. See **caked breast.**

lactation suppression, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating the cessation of milk production and minimizing breast engorgement after giving birth. See also **Nursing Interventions Classification.**

lacteal /lak′tē·əl/, referring to the tiny vessels in the villi of the wall of the small intestine through which chylomicrons are absorbed and released into the lymphatic system.

lacteal fistula, an abnormal passage opening into a lacteal duct.

lacteal vessel, one of the many central intestinal capillaries in the villi of the small intestine. They open into the lymphatic vessels in the submucosa. The capillary is filled with milky-white chyle caused by the absorption of fat from the lumen (chylomicrons) and passes chyle to the lymph circulation via the thoracic duct to the blood vascular system.

lactic /lak′tik/ [L, *lac* + *icus*, like], referring to milk and milk products. See also **lactic acid, lactose.**

lactic acid, a three-carbon organic acid produced by anaerobic respiration. L-Lactic acid in muscle and blood is a product of glucose and glycogen metabolism; D-lactic acid is produced by the fermentation of dextrose by a species of micrococcus; a mixture of both D- and L-isomers is found in the stomach, in sour milk, and in certain foods prepared by bacterial fermentation, such as sauerkraut. Also called **alpha-hydroxypropionic acid** or *2-hydroxypropanoic acid*. See also **glycolysis.**

lactic acid fermentation, **1.** the anaerobic production of lactic acid from glucose. **2.** the souring of milk.

lactic acidosis, a disorder characterized by an accumulation of lactic acid in the blood, resulting in a lowered pH in muscle and serum. The condition occurs most commonly in tissue hypoxia but may also result from liver impairment, respiratory failure, burn trauma, neoplasms, and cardiovascular disease.

lactic acid test, a blood test that measures lactate levels, which are a fairly sensitive and reliable indicator of tissue hypoxia. Lactic acid blood levels are used to document the presence of tissue hypoxia, determine the degree of hypoxia, and monitor the effect of therapy. See also **lactate.**

lactiferous /laktif′ərəs/ [L, *lac* + *ferre*, to carry], pertaining to a structure that produces or conveys milk, such as the tubules of the breasts.

lactiferous duct, one of many channels that carry milk from the lobes of each breast to the nipple.

lactiferous glands [L, *lac*, milk, *ferre*, to carry, *glans*, acorn], glands that secrete or convey milk, such as mammary glands.

lactim. See **lactam.**

lactin. See **lactose.**

Lactinex, a trademark for a GI, fixed-combination drug containing ***Lactobacillus acidophilus*** and ***Lactobacillus bulgaricus***, used to reestablish normal gastrointestinal flora after antibiotic therapy.

lactitol /lak′t-tol/, a disaccharide analog of lactulose, used as a sweetener. It is also a laxative and is used to treat constipation.

lacto-, lact-, prefix meaning "milk or lactic acid": *Lactobacillus, lactopeptin, lactotoxin*.

***Lactobacillus* (L)** /lak′tōbəsil′əs/ [L, *lac* + *bacillum*, small rod], any one of a group of nonpathogenic gram-positive rod-shaped bacteria that produce lactic acid from carbohydrates. Many species are normally found in the human intestinal tract and vagina.

Lactobacillus acidophilus [L, *lac*, milk, *bacillum*, small rod, *acidus*, sour; Gk, *philein*, to love], a bacterium present in the intestinal tract and vagina, as well as in milk and dairy products. The strain is used to manufacture a fermented milk product. Generally considered to be beneficial because it produces vitamin K, lactase, and other antimicrobial substances when ingested. See also **acidophilus milk.**

***Lactobacillus bulgaricus*,** a genus of bacteria used in the production of yogurt.

lactoferrin /lak′tō·fer′in/, an iron-binding protein present in neutrophil granules. By combining with iron, lactoferrin prevents microorganisms from combining with and using iron for their growth and development.

lactoferrin assay, a test of a fecal sample to detect inflammatory white blood cells in the intestinal tract. It is used to help diagnose bacterial enteritis, acute Crohn's disease, and acute ulcerative colitis.

lactogen /lak′təjən/ [L, *lac* + Gk, *genein,* to produce], a drug or other substance that enhances the production and secretion of milk. —*lactogenic, adj.*

lactogenesis /lak′tojen′ĕsis/. See **galactopoiesis.**

lactogenic hormone. See **prolactin.**

lacto-ovo-vegetarian /lak′tō ōv′ō vej′əter′ē·ən/, a person whose diet consists primarily of foods of vegetable origin but also includes some animal products, such as eggs *(ovo),* milk, and cheese *(lacto),* but no meat, fish, or poultry. Also called **ovo-lacto-vegetarian.**

lactoperoxidase /-pərok′sidās/, an enzyme found in milk and saliva. It is believed to inhibit a number of microorganisms, functioning in a nonspecific immunity role.

lactose /lak′tos/ [L, *lac* + Gk, *glykys,* sweet], a disaccharide found in the milk of all mammals. On hydrolysis, lactose yields the monosaccharides glucose and galactose. Lactose is used as a laxative, a diuretic, and a component of formulas for infants. Also called **lactin, milk sugar.** See also **lactase deficiency, lactose intolerance, sugar.**

lactose intolerance, a sensitivity disorder resulting in the inability to digest lactose from milk products because of an inadequate production of or defect in the enzyme lactase. Symptoms of the disorder are bloating, flatus, nausea, diarrhea, and abdominal cramps. The diet is adjusted according to the tolerance level; the milk-derived foods (milk, cheese, butter, and margarine), and any products containing milk, such as cakes, ice cream, cream soups, and sauces, are restricted. Also called **milk intolerance.** See also **lactase deficiency.**

lactose tolerance test, a blood test performed to detect lactose intolerance.

lactosuria /lak′təso͝or′ē·ə/ [L, *lac* + Gk, *glykys,* sweet, *ouron,* urine], the presence of lactose in the urine, a condition that may occur in late pregnancy or during lactation.

lactotherapy /-ther′əpē/ [L, *lac,* milk; Gk, *therapeia,* treatment], any treatment that depends on a diet consisting exclusively or almost exclusively of milk.

lactotoxin /-tok′sin/, any toxic base occurring in milk as a result of decomposition of its proteins.

lactotroph /lak′totrōf′/, a type of acidophil in the adenohypophysis that secretes prolactin. Also called *lactotrope,* **luteotrope, mammotroph.**

lactovegetarian /-vej′əter′ē·ən/, one whose diet consists of milk and milk products *(lacto)* in addition to foods of vegetable origin but does not include eggs, meat, fish, or poultry.

lactulose /lak′tyəlōs/, a nonabsorbable synthetic disaccharide, 4-0-beta-D-galactopyranosyl-D-fructose, $C_{12}H_{22}O_{11}$. It is hydrolyzed in the colon by bacteria primarily to lactic acid and small amounts of formic and acetic acids, which results in increased osmotic pressure and acidification of the colonic contents. It is used as a cathartic in chronic constipation. Because the acidification causes ammonia to be removed from the blood to form ammonium ion, it is also used in the treatment of hepatic coma. Its ability to increase fecal water content, however, may also cause diarrhea.

lacuna /ləkyo͞o′nə/ *pl. lacunae* [L, pit], **1.** a hollow within a structure, especially bony tissue, in which lie osteoblasts. **2.** a gap, as in the field of vision.

lacunar /lakyo͞o′nər/ [L, *lacuna,* pit], pertaining to or characterized by the presence of pits, depressions, hollows, or spaces.

lacunar ligament, a crescent-shaped extension of fibers at the medial end of the inguinal ligament that passes backward to attach to the pecten pubis on the superior ramus of the pubic bone.

lacunar state, a pseudobulbar disorder characterized by the appearance of small, smooth-walled cavities in the brain tissue. The condition usually follows a series of small strokes, particularly in older adults with arterial hypertension and arteriosclerosis. Also called **status lacunaris.**

lacus lacrimalis /lā′kəs lak′rimā′ləs/ [L, *lacus,* lake, *lacrimalis,* tears], a triangular space separating the medial ends of the upper and the lower eyelids at the inner canthus where the tears collect. It is an extension of the medial canthus and contains the lacrimal caruncle.

LAD, **1.** abbreviation for *left anterior descending*. **2.** abbreviation for **leukocyte adhesion deficiency.**

Ladd's bands, a series of peritoneal folds in patients in whom the cecum ends up in the midabdomen. These folds extend to the right undersurface of the liver and compress the duodenum.

LADME /lad′mē/, an abbreviation for the time course of drug distribution, representing the terms *liberation, absorption, distribution, metabolism,* and *elimination*.

Laënnec's catarrh /lā′əneks′/ [René T.H. Laënnec, French physician, 1781–1826; Gk, *kata,* down, *rhoia,* flow], a form of bronchial asthma characterized by the expectoration of small, viscous, beadlike bodies of sputum. These bodies, called **Laënnec's pearls,** are formed in the bronchioles.

Laënnec's cirrhosis [René T.H. Laënnec; Gk, *kirrhos,* yellow-orange, *osis,* condition], a fibrotic form of cirrhosis precipitated by alcohol abuse. Also called **alcoholic cirrhosis.** See also **cirrhosis.**

Laënnec's pearls. See **Laënnec's catarrh.**

Laetrile /lā′ətril/, a substance composed primarily of amygdalin, a cyanogenic glycoside derived from apricot pits. Laetrile has been offered as a cancer medication despite clinical studies by the National Cancer Institute that failed to show benefits from its use. It is claimed that amygdalin is hydrolyzed by enzymes in cancer cells to produce benzaldehyde and hydrogen cyanide, which kill the cancer cells. It is not FDA approved. Also called **vitamin B_{17}.**

laevo-. See **levo-.**

laf, abbreviation for **laminar air flow.**

lag, the afterglow of an image on a screen or television camera, caused by phosphorescence.

lagen-, prefix meaning "flasklike": *lageniform.*

-lagnia, -lagny, suffix meaning "lust or a sexual predilection": *osmolagnia, pyrolagnia, scoptolagnia.*

lag of accommodation, the dioptric value in which the accommodative stimulus exceeds the accommodative response.

lagophthalmos /lag′əfthal′məs/ [Gk, *lagos,* hare, *ophthalmos,* eye], an abnormal condition in which an eye may not be fully closed because of a neurological, muscular, or mechanical disorder.

lag phase [Dan, *lakke,* go slowly; Gk, *phasis,* appearance], a time span during which bacteria injected into a fresh medium have not begun to multiply, although they may enlarge.

la grippe. See **influenza.**

laity /lā′itē/ [Gk, *laikos,* of the people], a nonprofessional segment of the population, as viewed from the perspective of a member of a particular profession. A clergyman may regard a physician as a member of the laity and vice versa.

LAK, abbreviation for *lymphokine-activated killer*. See **lymphokine-activated killer cells.**

laked blood /lākt/ [Fr, *laque,* a deep red color], blood that is clear, red, and homogenous because of hemolysis of the red blood cells, as may occur in poisoning and severe extensive burns.

lal-, lalio-, lalo-, prefix meaning "talk, babble": *laliatry, lalognosis, lalopathology.*

La Leche League International /lälech′ā/ [Sp, *la leche,* the milk], an organization that promotes breastfeeding and provides education about it.

-lalia, suffix meaning a "disorder of speech": *agitolalia, echolalia, oxylalia.*

lalio-. See **lal-.**

lallation /lalā′shən/ [L, *lallare,* to babble], **1.** babbling, repetitive, unintelligible utterances, such as the babbling of an infant and the mumbled speech of schizophrenics, alcoholics, and the severely mentally retarded. **2.** a speech disorder characterized by a defective pronunciation of words containing the sound /l/ or by the use of the sound /l/ in place of the sound /r/. Compare **rhotacism.**

lalo-. See **lal-.**

lalophobia /lal′ōfō′bē·ə/ [Gk, *lalia,* speech, *phobos,* fear], a morbid dread of talking caused by fear and anxiety that one will stammer or stutter.

lamarckism /ləmär′kizəm/ [Jean B.P. de Lamarck, French naturalist, 1744–1829; Gk, *ismos,* practice], a theory postulating that organic evolution results from structural changes in plants and animals caused by adaptation to environmental conditions and that these acquired characteristics are transmitted to offspring. Also called *lamarckianism, Lamarck's theory.* Compare **darwinian theory.** —*lamarckian, adj., n.*

Lamaze method /ləmäz′/ [Fernand Lamaze, French obstetrician, 1890–1957], a method of psychophysical preparation for childbirth developed in the 1950s. It requires classes, practice at home, and coaching during labor and delivery, often by a trained coach called a monitrice. The classes, given during pregnancy, teach the physiology of pregnancy and childbirth, exercises to develop strength in the abdominal muscles and control of isolated muscles of the vagina and perineum, and techniques of breathing and relaxation to promote control and relaxation during labor. The woman is conditioned by repetition and practice to dissociate herself from the source of a stimulus by concentration on a focal point, by consciously relaxing all muscles, and by breathing in a special way at a particular rate—thereby training herself not to pay attention to the stimuli associated with labor. The kind and rate of breathing change with the advancing stages of labor. During the early part of the first stage of labor, when the uterine cervix is dilated less than 5 cm and the contractions occur every 2 to 4 minutes, last 40 to 60 seconds, and are of mild to moderate strength, the mother does slow chest breathing during contractions. Her fingers may rest lightly on her lower ribs to feel them rise and fall. The abdominal wall does not move with respiration. She may perform an **effleurage,** or rhythmic fingertip massage, of her lower abdomen during the contractions. The rate of respiration is 10 or fewer breaths a minute, increasing to 12 per minute as labor intensifies. During the active part of the first stage of labor up to the transition to the second stage, the cervix is from 5 cm to nearly fully dilated, the interval between contractions is from 1½ to 4 minutes, and the duration of contractions is from 45 to 90 seconds. (The interval decreases, and the intensity and duration increase as labor progresses.) During contractions the mother breathes quietly and shallowly in her chest. The rate of her breathing varies with the strength of the contractions, increasing during a contraction to as fast as once a second at the peak and slowing to every 6 seconds as the uterus relaxes. She is coached to concentrate on the focal point she has selected, to perform the effleurage of her abdomen, to relax her perineal and vaginal muscles, and to take a cleansing breath at the beginning and end of each contraction. At the end of the first stage of labor, when the cervix is almost completely dilated and the contractions are strong, occurring every 1½ to 2 minutes and lasting 60 to 90 seconds, the mother begins to feel the urge to bear down and push during contractions. She avoids pushing before full dilation by combining several light, shallow breaths in the chest with short puffing exhalations as the urge increases during the contractions. During the second stage of labor the cervix is fully dilated and contractions are strong, frequent, and expulsive. The mother's head and shoulders are supported on pillows. During contractions she is helped to draw her legs back, flexing the thighs against the abdomen, holding them behind the lower thigh with her hands. Her chin is tucked on her chest, the air is blocked from escaping from her lungs, her perineum is relaxed, and she bears down forcibly. Depending on the length of the contraction, several pushes of 10 to 15 or more seconds may be possible during the contraction. As the baby's head crowns, she is asked to pant lightly so that the head may be delivered slowly. The advantages of the method include the need for little or no analgesia for relief of pain and participation in the labor by the mother, giving her a great sense of self-satisfaction at delivery. The father of the baby also benefits by participating in the birth of his child. Compare **Bradley method, Read method.**

lambda /lam′də/, **1.** Λ, λ, the eleventh letter of the Greek alphabet. **2.** a posterior fontanel of the skull marking the point where the sagittal and lambdoidal sutures meet.

lambda chain, a type of light polypeptide chain found in immunoglobulin molecules.

lambda light chain, one of two kinds of smaller polypeptide chains present in an immunoglobulin molecule. See also **kappa light chain.**

lambda wave, a low-voltage occipital wave recorded by electroencephalography during visual activity.

lambdoid /lam′doid/, having the shape of the Greek letter lambda. See also **lambdoidal suture.**

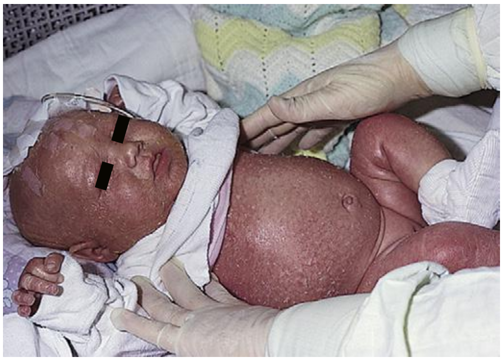
lambdoidal suture /lamdoi′dəl/, the interdigitating connection between the occipital bone and the parietal bones of the skull. It is continuous with the occipitomastoid suture between the occipital and the mastoid portions of the temporal bones.

lambert (L) /lom′bert, lam′bərt/ [J.H. Lambert, German physicist, 1728–1777], a unit of luminance or brightness of a perfectly diffusing surface, whether emitting or reflecting, equal to a total luminous flux of one lumen per square centimeter.

lamella /ləmel′ə/ *pl. lamellae* [L, small plate], **1.** a thin leaf or plate, as of bone. **2.** a medicated disk of glycerin and an alkaloid, for insertion under the eyelid, where it dissolves and is absorbed for local application.

lamellar /ləmel′ər/ [L, *lamella,* small plate], pertaining to or characterized by lamellae.

lamellar exfoliation [L, *lamella* + *ex,* without, *folium,* leaf], a congenital skin disorder transmitted as an autosomal-recessive trait in which a parchmentlike scaly membrane that covers the infant peels off within 24 hours of birth. Complete healing or a progressively less severe process of reforming and shedding of the scales then occurs. Also called **ichthyosis congenita, ichthyosis fetalis,** *lamellar desquamation of the newborn, lamellar ichthyosis of newborn.* See also **collodion baby.**



Lamellar exfoliation in an infant
(Eichenfield, 2008)

lamellar transplant. See **deep lamellar endothelial keratoplasty.**

lameness /lām′nəs/ [ME, *lama,* to break], a condition of diminished function, particularly because of a foot or leg injury. The term may also be applied to a stiff or painful back that makes walking difficult.

Lamictal, a trademark for an anticonvulsant drug **(lamotrigine).**

lamin-, prefix meaning "layer or lamina": *laminagram, laminated, laminotomy.*

lamina /lam′inə/ *pl. laminae* [L, thin plate], any thin, flat layer of membrane or other bulkier tissue. It may be structureless or part of a structure, as the laminae of the vertebral arch.

lamina densa, a layer of epithelial basal lamina that appears dark in electron micrographs.

lamina dura, **1.** a sheet of compact alveolar bone that lies adjacent to the periodontal membrane, the lining of the alveolus. **2.** a radiographic term used to identify the radiopaque lining of an alveolus.

lamina lucida, an electron-dense layer of the basal lamina lying between the lamina densa and the adjoining cell layer, divided in the pulmonary alveolus and renal glomerulus into the internal and external laminae rarae.

lamin antibody /lam′in/, a type of immunoglobulin found in the serum of some patients with autoimmune diseases, including systemic lupus erythematosus.

lamina of modiolus. See **modiolus.**

lamina propria, a layer of connective tissue that lies just under the epithelium of a mucous membrane.

laminar air flow (laf) /lam′iner/ [L, *lamina,* plate; Gk, *aer;* AS, *flowan*], a system of circulating filtered air in parallel-flowing planes in hospitals or other health care facilities. The system reduces the risk of airborne contamination and exposure to chemical pollutants in surgical theaters, food preparation areas, hospital pharmacies, and laboratories.

lamina rara, **1.** in the renal glomerulus and pulmonary alveolus, one of the layers of lamina lucida surrounding the lamina densa. The *lamina rara externa* is on the epithelial side and the *lamina rara interna* is on the endothelial side. **2.** a term sometimes used as a synonym for lamina lucida.

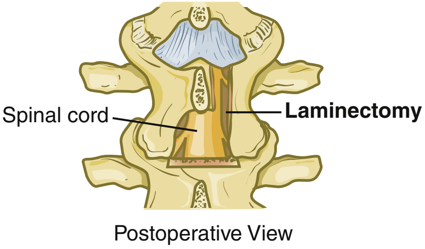
laminar flow. See **laminar air flow.**

Laminaria /lam′iner′ē·ə/ [L, *lamina,* plate], a type of seaweed that swells on absorption of water.

laminaria tent, a cone of dried seaweed that swells as it absorbs water, used to dilate the cervix nontraumatically in preparation for induced abortion or induced labor.

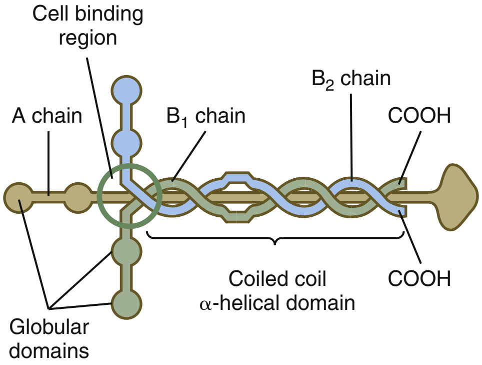
laminated thrombus /lam′inā′tid/, a blood clot composed of blood platelets, fibrin, clotting factors, and cellular elements arranged in layers, apparently formed at different times.

laminectomy /lam′inek′təmē/ [L, *lamina* + Gk, *ektomē,* excision], surgical removal of the bony arches of one or more vertebrae. It is performed to treat compression fractures, dislocations, herniated nucleus pulposus, and cord tumors and to stimulate the spinal cord. With the patient under general anesthesia and prone to eliminate lordosis, reduce venous congestion, and keep the abdomen free, the laminae are removed, and the underlying problem is corrected. Spinal fusion with cages, rods, screws, and/or bone graft is used to stabilize the spine if several laminae are removed. If the procedure is a cervical laminectomy, the patient is observed for signs of respiratory distress caused by cord edema. Motor function and sensation in the extremities are evaluated every 2 to 4 hours for 48 hours. The dressing is examined frequently for hemorrhage or leakage of cerebrospinal fluid. The patient is taught to logroll without twisting the spine or hips. —*laminectomize, v.*



Laminectomy *(Black and Hawks, 2009)*

laminin /lam′inin/, any of several large glycoproteins consisting of three polypeptide subunits and found in basement membranes. It facilitates linkage with collagen and other basement membrane components and is involved in neurite regeneration.



Laminin *(Carlson, 2009)*

laminotomy /-ot′əmē/, the surgical division of the lamina of a vertebral arch. Also called **rachiotomy.**

lamivudine (3TC) /lämiv′udēn/, a nucleoside analog that inhibits reverse transcriptase and is used as an antiviral agent in treatment of hepatitis B infection and, in combination with zidovudine, in treatment of HIV infection and AIDS. Administered orally.

■ INDICATIONS: The Epivir brand name form of this drug is used to treat HIV infection in combination with zidovudine. The Epivir-HBV brand name form is used to treat hepatitis B.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are neutropenia, anemia, thrombocytopenia, and pediatric pancreatitis. Other adverse effects are anorexia, cramps, dyspepsia, taste change, hearing loss, and photophobia. Common side effects are fever, headache, malaise, dizziness, insomnia, depression, fatigue, chills, nausea, vomiting, diarrhea, cough, rash, myalgia, arthralgia, and musculoskeletal pain.

lamotrigine /lämo′trijēn/, an anticonvulsive used in treatment of certain forms of epilepsy.

■ INDICATIONS: It is prescribed as adjunct therapy in the treatment of partial seizures in epilepsy patients over the age of 16 and as an adjunct therapy for children less than 16 years of age with generalized seizures associated with Lennox-Gastaut syndrome. It is not approved for use in children less than 2 years of age.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effects include hepatotoxicity, potentially life-threatening rash, and Stevens-Johnson syndrome. When discontinued, the drug should be tapered off gradually over a 2-week period to avoid patient risk-rebound effect.

lampbrush chromosome [Gk, *lampas,* torch; AS, *bryst,* bristle], an excessively large type of chromosome found in the oocytes of many animals. It has long, threadlike, projecting loops, giving it a hairy, brushlike appearance. See also **giant chromosome.**

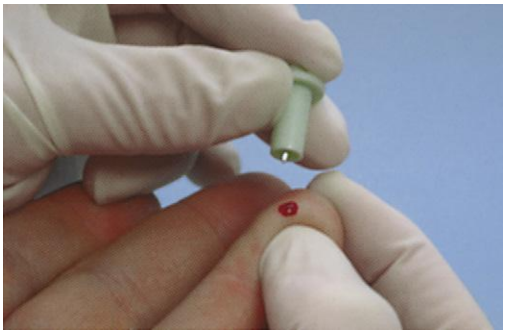
lampro-, combining form meaning "clear": *lamprophonia, lamprophonic*.

LAN, an abbreviation for **local area network.**

lance [L, *lancea,* spear], to incise a furuncle or an abscess to release accumulated pus. A topical anesthetic is applied, the lesion is incised, and the pus is drained. A drain is inserted if the infection is deep. The bacteria involved are most often staphylococci. An antibiotic is given systemically if the boil is facial to prevent infection from spreading into the cranial sinuses. Infected drainage is kept off surrounding skin to prevent a recurrence. Careful handwashing is essential to prevent spread of infection to others.

Lancefield's classification [Rebecca C. Lancefield, American bacteriologist, 1895–1981], a serological classification of streptococci based on their antigenic characteristics. The bacteria are divided into 13 groups by the identification of their pathological action. Group A contains most of the streptococci that cause infection in humans. Groups B to O are less pathogenical and are often present without causing disease. Most are hemolytic; of those, the beta subgroup is the most likely to be the cause of infection.

lancet /lan′sit/ [L, *lancea,* lance], a short pointed blade used to obtain a drop of blood for a capillary sample. It has a guard above the blade that prevents deep incision, and it is usually disposable.



Lancet *(Zakus, 2001)*

lancinating /lan′sinā′ting/ [L, *lancea,* lance], sharply cutting or tearing, such as lancinating pain.

Landau-Kleffner syndrome /län′dou klef′nər/ [William M. Landau, American neurologist, 20th century; F.R. Kleffner, American neurologist, 20th century], an epileptic syndrome of childhood characterized by partial or generalized seizures, psychomotor abnormalities, and language regression that can progress to mutism. The electroencephalogram from bilateral temporal regions is abnormal. Also called **acquired epileptic aphasia.**

Landau reflex /län′dou/, a normal response of infants when held in a horizontal prone position to maintain a convex arc with the head raised and the legs slightly flexed. The reflex is displayed at about 3 months of age. It is poor in those with floppy infant syndrome and exaggerated in hypertonic and opisthotonic infants.

landmark /land′mark/ [AS *land,* + *meark,* mark], a readily recognizable anatomical structure used as a point of reference in establishing the location of another structure or in determining certain measurements.

landmark position [AS, *land* + *meark,* mark; L, *positio*], the correct placement of the hands on the chest in cardiopulmonary resuscitation. See also **cardiopulmonary resuscitation.**

Landouzy-Dejerine muscular dystrophy. See **fascioscapulohumeral muscular dystrophy.**

Langer-Giedion syndrome /lang′ər zhēdē·ôN′/ [Leonard O. Langer, Jr., American physician, 20th century; A. Giedion, Swiss physician, 20th century], an inherited disorder characterized by mental retardation, microcephaly, multiple exostoses, characteristic facies with bulbous nose, sparse hair, cone-shaped epiphyses, loose redundant skin, joint laxity, and other anomalies.

Langerhans' cells /lung′ərhuns, lang′ərhans/ [Paul Langerhans, German pathologist, 1847–1888], a stellate dendritic cell found mostly in the stratum spinosum of the epidermis. It is believed to have an immune function, with surface markers characteristic of macrophages and monocytes.

Langer's line. See **cleavage line.**

Langer's muscle /läng′ərz/ [Carl Ritter von Edenberg von Langer, Austrian anatomist, 1819–1887], muscular fibers from the insertion of the pectoralis major muscle over the bicipital groove to the insertion of the latissimus dorsi.

Langhans' layer. See **cytotrophoblast.**

language /lang′gwij/ [L, *lingua,* tongue], **1.** a defined set of characters that, when used alone or in combinations, form a meaningful set of words and symbols that are used for communication. **2.** a unified, related set of commands or instructions that a computer can use to perform work.

language delay, the failure of language to develop at the expected age.

language disorder, a partial or complete disruption in the ability to understand and/or produce the conventional symbols or words that comprise one's native language.

lano-, prefix meaning "wool": *lanolin, lanonol, lanosterol*.

lanolin /lan′əlin/ [L, *lana,* wool, *oleum,* oil], a fatlike substance from the wool of sheep. It contains about 25% water as a water-in-oil emulsion and is used as an ointment base and an emollient for the skin. Also called **hydrous wool fat.**

Lanoxin, a trademark for a cardiac glycoside **(digoxin).**

lanreotide, an antigrowth hormone.

■ INDICATION: This drug is used to treat acromegaly in patients having an inadequate response to other treatments.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or latex allergy prohibits its use.

lansoprazole, an antiulcer agent and proton pump inhibitor.

■ INDICATIONS: It is used to treat gastroesophageal reflux disease (GERD), severe erosive esophagitis, poorly responsive systemic GERD, and pathological hypersecretory conditions (Zollinger-Ellison syndrome, systemic mastocytosis, multiple endocrine adenomas). It is also a potentially effective treatment for duodenal and gastric ulcers and for maintenance of healed duodenal ulcers.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are cerebrovascular accident, myocardial infarction, shock, hematuria, and hemolysis. Other adverse effects include confusion, agitation, amnesia, depression, diarrhea, vomiting, nausea, acid regurgitation, anorexia, irritable colon, upper respiratory infections, asthma, bronchitis, dyspnea, alopecia, weight gain or loss, gout, deafness, eye pain, otitis media, chest pain, angina, tachycardia, bradycardia, palpitations, hypertension or hypotension, vasodilation, glycosuria, impotence, kidney calculus, breast enlargement, and anemia.

lanthanum (La)[1] /lan′thənəm/ [Gk, *lanthanein,* to escape notice], a rare earth metallic element. Its atomic number is 57; its atomic mass is 138.91.

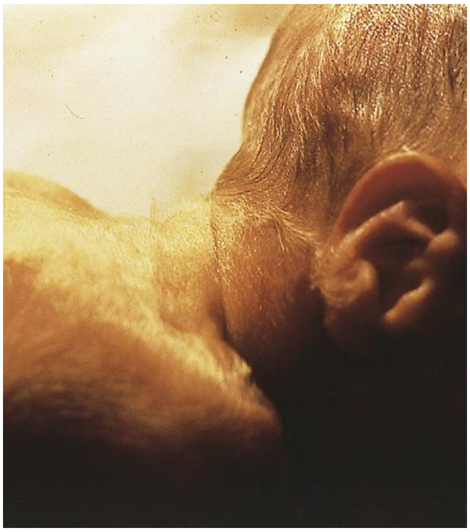
lanthanum[2]**,** a phosphate binder.

■ INDICATION: This drug is used to treat end-stage renal disease.

■ CONTRAINDICATIONS: Hypophosphatemia and known hypersensitivity to this drug prohibit its use.

lanuginous /ləno͞o′jinəs/ [L, *lanugo,* down], pertaining to lanugo.

lanugo /lanyo͞o′gō/ [L, down], **1.** the soft, downy hair covering a normal fetus beginning in the fifth month of gestation and almost entirely shed by the ninth month. **2.** the fine, soft hair covering all parts of the body except palms, soles, and areas where other types of hair are normally found. Also called **vellus hair.**



Lanugo *(Zitelli and Davis, 2007)*

lanulous /lan′yo͝oləs/ [L, *lana,* wool, *osus,* filled with], downy or covered with short, fine wooly hair, such as the skin of a fetus. See also **lanugo.**

lap, abbreviation for **laparotomy.**

LAP, **1.** abbreviation for *left atrial pressure*. **2.** abbreviation for **leukocyte alkaline phosphatase. 3.** abbreviation for *leucine aminopeptidase*. See **leucine aminopeptidase test.**

laparectomy /lap′ərek′təmē/, the surgical excision of tissue from the abdomen wall, usually performed to correct muscle laxity.

laparo- /lap′ərō/, prefix meaning "abdomen or abdominal wall": *laparectomy, laparotomy, laparorrhaphy.*

laparoenterostomy /lap′ərō·en′təros′təmē/ [Gk, *lapara,* loin, *enteron,* bowel, *stoma,* mouth], the surgical installation of a tube through an external opening in the abdomen to drain the bowel. A similar procedure may be used to supply nutrients to a patient with an upper digestive tract obstruction. See also **jejunostomy.**

laparoenterotomy /lap′ərō·en′tərot′əmē/ [Gk, *lapara,* loin, *enteron,* bowel, *temnein,* to cut], a surgical incision in the intestine through the abdominal wall.

laparohysterectomy /-his′tərek′təmē/ [Gk, *lapara,* loin, *hystera,* womb, *ektomē,* excision], a hysterectomy performed by making an excision through the abdominal wall.

laparohystero-oophorectomy /-his′tərō-/, the surgical removal of the uterus and ovaries through a small incision in the abdominal wall.

laparohysterosalpingo-oophorectomy /-his′tərō′salping′gō-/, the surgical removal of the uterus, ovaries, and fallopian tubes through a small incision in the abdominal wall.

laparomyitis /-mī·ī′tis/, an inflammation of the abdominal or lumbar muscles.

laparosalpingo-oophorectomy /-salping′gō-/, the surgical removal of the ovaries and fallopian tubes through a small incision in the abdominal wall.

laparoscope /lap′ərəskōp′/ [Gk, *lapara,* loin, *skopein,* to look], a type of endoscope consisting of an illuminated tube with an optical system. It is inserted through the abdominal wall for examining the peritoneal cavity. Also called **celioscope, peritoneoscope.** —*laparoscopic, adj.,* **laparoscopy,** *n.*

laparoscopic-assisted vaginal hysteroscopy /-skop′ik/, a procedure for viewing the inner surface of the uterus with a specially designed endoscope inserted through the cervix. Before insertion the uterus is inflated with carbon dioxide or a glucose solution administered through the cervix. See also **hysteroscopy, laparoscopy.**

laparoscopic biopsy, biopsy of the abdominal organs performed with instruments introduced through a laparoscope for the removal of tissue.

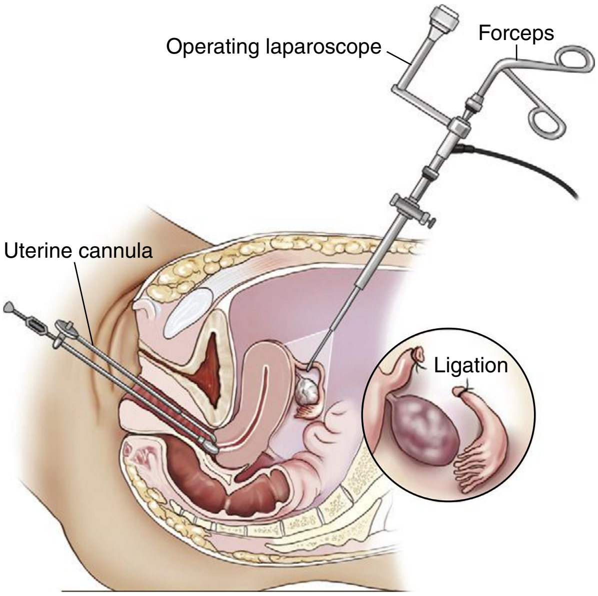
laparoscopic cholecystectomy. See **cholecystectomy.**

laparoscopic gastric banding (LGB), gastric banding performed through a laparoscope.

laparoscopic nephrectomy, a minimally invasive type of nephrectomy performed with laparoscopic techniques.

laparoscopic sterilization [Gk, *lapara,* loin, *skopein,* to view; L, *sterilis,* barren], the process of rendering a woman incapable of reproduction by inserting a specialized endoscope through a small incision in the abdominal wall throughout which clips are affixed to occlude the fallopian tubes or electrocoagulation and severance are performed.

laparoscopy /lap′əros′kəpē/, a technique to examine the abdominal cavity with a laparoscope through one or more small incisions in the abdominal wall, usually at the umbilicus. The procedure is used for inspection of the gallbladder, ovaries, and fallopian tubes; diagnosis of endometriosis, intestinal conditions, and hernias; destruction of uterine leiomyomas; and myomectomy. Gynecological sterilization also can be accomplished by fulguration of the oviducts or by tubal ligation. Also called **abdominoscopy.** See also **endoscopy, laparoscope.**



Laparoscopy *(LaFleur Brooks and LaFleur Brooks, 2012)*

laparotomy (lap) /lap′ərot′əmē/ [Gk, *lapara* + *temnein,* to cut], any surgical incision into the abdominal wall, usually performed under general or regional anesthesia, often on an exploratory basis. Food and fluids by mouth are withheld for several hours before surgery. Immediately before surgery the skin may be shaved and cleansed from the nipple line to the pubis. If the intestine is opened, a nasogastric tube is inserted postoperatively. Frequent observation of vital signs and drainage systems is essential. Fluid intake and output are recorded. The patient is turned and encouraged to breathe deeply every hour and to cough if necessary. Medication is given as needed for pain relief. Some kinds of laparotomy are **appendectomy, cholecystectomy,** and **colostomy.** —*laparotomize, v.*

laparotomy sponge, a radiopaque pad used as an absorbent and as a covering for the viscera.

lapatinib, a miscellaneous antineoplastic.

■ INDICATION: This drug is used to treat advanced breast cancer in patients with tumors that overexpress HER2 protein and who have received previous chemotherapy.

■ CONTRAINDICATIONS: Pregnancy, breastfeeding, torsade de points, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include fatigue, insomnia, palpitations, anorexia, diarrhea, dyspepsia, mouth ulcerations, nausea, vomiting, xerosis, rash, palmar-plantar erythrodysesthesia, and dyspnea. Life-threatening side effects include heart failure, QT prolongation, anemia, neutropenia, and thrombocytopenia.

lapboard [ME, *lappa* + *bord,* plank], a flat board placed over the lap to serve as a temporary desk or table.

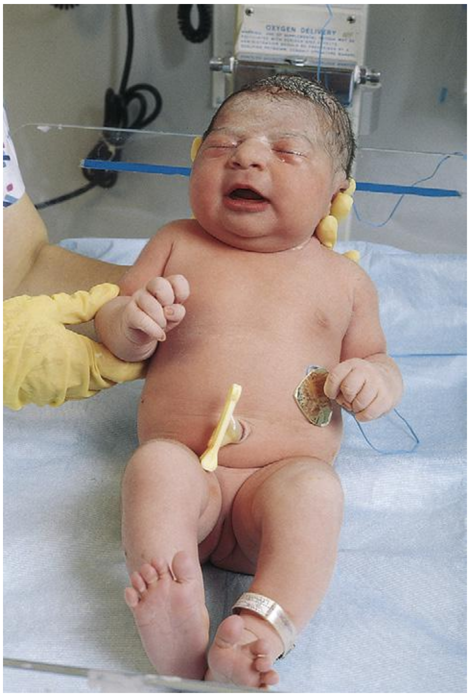
lapis /lap′is/ [L, stone], any substance that does not easily volatilize, such as lapis dentalis, or tooth tartar.

Laplace's law /läpläs′/ [Pierre S. de Laplace, French physicist, 1749–1827], a principle of physics that the tension on the wall of a sphere is the product of the pressure times the radius of the chamber and the tension is inversely related to the thickness of the wall.

-lapse, suffix meaning "a slip or fall backward": *collapse, prolapse, relapse.*

large calorie. See **Calorie.**

large for gestational age (LGA) infant, a newborn whose fetal growth was accelerated and whose size and weight at birth fall above the 90th percentile of appropriate for gestational age infants, whether delivered prematurely, at term, or later than term. Factors other than genetic influences that cause accelerated intrauterine growth include maternal diabetes mellitus and Beckwith's syndrome. LGA infants born of diabetic mothers are generally macrosomic and plethoric, with very pink skin and red, shiny cheeks. They are often listless and limp, feed poorly, and become hypoglycemic within the first few hours. A major problem is that preterm LGA infants, because of their size, are not recognized as high-risk neonates with immature organ system development. Often these infants develop respiratory distress syndrome because pulmonary maturation occurs later in gestation. In cases of Beckwith's syndrome the infant is characterized by gigantism, macroglossia, omphalocele or umbilical hernia, and visceromegaly. Compare **appropriate for gestational age infant, small for gestational age infant.**



Large for gestational age infant
(Murray and McKinney, 2006)

large intestine [L, *largus,* abundant, *intestinum*], the part of the digestive tract comprising the cecum; appendix; ascending, transverse, descending, and sigmoid colons; and rectum. The ileocecal valve separates the cecum from the ileum.

lariat structure /ler′ē·ət/, a ring of intron segments that has been spliced out of a messenger ribonucleic acid molecule by enzymes. Some introns form a long tail attached to the ring, giving the structure the appearance of a microscopic cowboy lariat.

Larmor frequency [Joseph Larmor, Irish physicist, 1857–1942], the frequency of the precession of a charged particle when its motion comes under the influence of an applied magnetic field and a central force.

Larodopa, a trademark for an antiparkinsonian agent **(levodopa).**

Laron dwarfism /lä·rôN′/ [Zvi Laron, Israeli endocrinologist, b. 1927], an autosomal-recessive syndrome of skeletal growth retardation resulting from impaired ability to synthesize insulin-like growth factor I, usually because of growth hormone receptor defects. Also called *Laron's syndrome*.

laronidase, a rarely used miscellaneous drug.

■ INDICATION: This drug is used to treat mucopolysaccharidosis I.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

Larsen's syndrome /lär′sənz/ [Loren Joseph Larsen, American orthopedic surgeon, b. 1914], a rare genetic disorder characterized by cleft palate, flattened facies, multiple congenital dislocations, and foot deformities.

larva /lär′və/*pl. larvae* [L, specter], the early immature form of an animal, which undergoes metamorphosis to an adult form. It is one of the growth stages for some insects; the state between the egg and the pupolarval stage is the feeding stage in the growth process. **—larval,** *adj*.

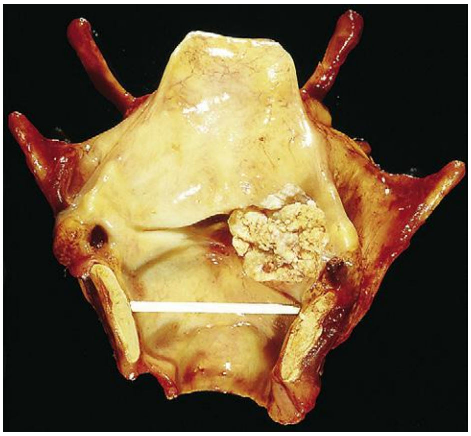
larva migrans. See **cutaneous larva migrans, visceral larva migrans.**

laryng-. See **laryngo-.**

laryngeal /lerin′jē·əl/ [Gk, *larynx*], pertaining to the larynx.

laryngeal artery, either of the two arteries, superior and inferior, that are responsible for the major blood supply to the larynx.

laryngeal cancer [Gk, *larynx* + L, *cancer,* crab], a malignant neoplastic disease characterized by a tumor arising from the epithelium of the structures of the larynx. Laryngeal tumors are more common in men than in women and occur most frequently between 50 and 70 years of age. Chronic alcoholism and heavy use of tobacco increase the risk of developing the cancer. Persistent hoarseness is usually the first sign. Advanced lesions may cause a sore throat, dyspnea, dysphagia, and cervical adenopathy. Diagnostic measures include direct laryngoscopy, biopsy, MRI, and radiological examination, including tomographic studies and chest films. Malignant tumors of the larynx are usually epidermoid carcinomas. Radiation is generally recommended for small lesions. Total laryngectomy, often combined with radiotherapy, is indicated for extensive lesions. Chemotherapy may be used to try to spare the larynx. After the operation many persons with laryngectomies learn esophageal speech. Some use an electric larynx, and a few undergo surgical reconstruction. See also **laryngectomy.**



Squamous cell carcinoma of the larynx *(Fletcher, 2007)*

laryngeal catheterization, the insertion of a catheter into the larynx for the purpose of removing secretions or introducing gases.

laryngeal diphtheria. See **diphtheritic laryngitis.**

laryngeal edema. See **edema of glottis.**

laryngeal inlet, the opening connecting the larynx and pharynx.

laryngeal mask airway, a device for maintaining a patent airway without tracheal intubation, consisting of a tube connected to an oval inflatable cuff that seals the larynx. It was the first effective product to offer significant advantages over traditional methods of airway support during surgical procedures and life-saving interventions. Also called **brain airway.**

laryngeal polyp [Gk, *larynx* + *poly,* many, *pous,* foot], a polyp on the vocal cords that causes hoarseness, resulting from vocal abuse or smoking.

laryngeal pouch. See **laryngocele.**

laryngeal prominence, the bulge at the front of the neck produced by the thyroid cartilage of the larynx. Also called **Adam's apple.**

laryngeal reflex [Gk, *larynx* + L, *reflectere,* to bend back], a cough reflex caused by irritation of the fauces and larynx.

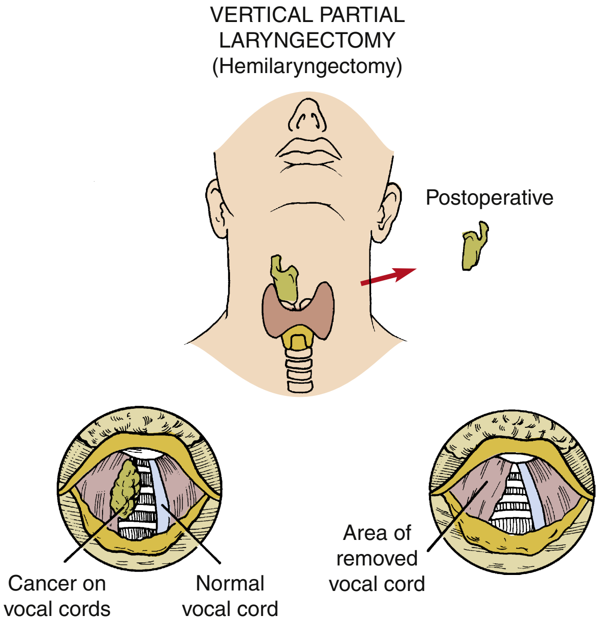
laryngeal vertigo [Gk, *larynx* + L, *vertere,* to turn], a short episode of dizziness or unconsciousness after a paroxysmal attack of coughing or laryngeal spasm. Also called **cough syncope.**

laryngeal web, a congenital malformation of the larynx that may be thin and translucent or thicker and more fibrotic. It is spread between the vocal folds near the anterior commissure. It may cause hoarseness, aphonia, or respiratory symptoms.

laryngectomy /ler′injek′təmē/ [Gk, *larynx* + *ektomē*, excision], surgical removal of the larynx performed to treat cancer of the larynx. Before complete laryngectomy the patient is referred to a speech pathologist to discuss alaryngeal communication methods. Antibiotics are usually administered to reduce the risk of infection. In a partial laryngectomy only the vocal cords are removed. If the malignancy is extensive, the entire larynx is removed, along with the hyoid, epiglottis, false cords, true cords, cricoid cartilage, and two or three rings of the trachea; the trachea is sutured to the skin of the neck, and the patient breathes through his or her neck, not through the mouth. This operation is permanent. After surgery the patient is observed for bleeding. A humidified oxygen vaporizer may decrease coughing and mucus viscosity. IV fluids are given, and liquid feedings may be given via nasogastric tube. The patient cannot smell, sniff, or blow his or her nose. A Magic Slate and flash cards are useful for communication. Speech loss is permanent after total laryngectomy. Compare **neck dissection, radical neck dissection.** *—laryngectomize, v.*

laryngismus stridulus, a sudden laryngeal spasm with cyanosis and inhalation accompanied by a crowing sound, usually seen in children at night. Also called **crowing inspiration, spasmatic croup, spasmodic croup.**

laryngitis/ler′injī′tis/ [Gk, *larynx* + *itis*], inflammation of the mucous membrane lining the larynx, accompanied by edema of the vocal cords with hoarseness or loss of voice, occurring as an acute disorder caused by a cold, irritating fumes, or sudden temperature changes or as a chronic condition resulting from excessive use of the voice, heavy smoking, or exposure to irritating fumes. In acute laryngitis there may be a cough, and the throat usually feels scratchy and painful. The patient is advised to remain in an environment with an even temperature, to avoid talking



Partial laryngectomy *(Black and Hawks, 2009)*

and exposure to tobacco smoke, and to inhale steam containing aromatic vapors such as tincture of benzoin, oil of pine, or menthol. Acute laryngitis may cause severe respiratory distress in children under 5 years of age because the relatively small larynx of the young child is subject to spasm when irritated or infected and readily becomes partially or totally obstructed. The youngster may develop a hoarse, barking cough and an inspiratory stridor and may become restless, gasping for air. Treatment consists of the administration of copious amounts of vaporized cool mist. Chronic laryngitis may be treated by removal of irritants, avoidance of smoking, voice rest, correction of stressful voice habits, cough medication, steam inhalations, and spraying the throat with an astringent antiseptic, such as hexylresorcinol.

laryngo-, laryng-, prefix meaning "larynx": *laryngocentesis, laryngograph*.

laryngocele /ləring′gōsēl′/, an abnormal air-containing cavity connected to the laryngeal ventricle. It is caused by a protrusion of the mucous membrane of the ventricle and may displace and enlarge the false vocal cord, resulting in hoarseness and airway obstruction. Because a laryngocele is also a potential reservoir of infection, it is usually excised. Also called **laryngeal pouch, saccule of larynx.**

laryngography. See **laryngopharyngography.**

laryngologist /ler′ing·gol′əjist/, a physician who specializes in the diagnosis and treatment of disorders of the larynx.

laryngology /ler′ing·gol′əjē/ [Gk, *larynx* + *logos,* science], the branch of medicine that specializes in the causes and treatments of disorders of the larynx.

laryngopharyngeal /-ferin′jē·əl/, pertaining to the larynx and pharynx. See also **laryngopharynx.**

laryngopharyngeal reflux, a complication of gastroesophageal reflux caused by reflux from the esophagus into the pharynx, characterized by a variety of intermittent chronic symptoms, including hoarseness, cough, throat clearing, and dysphagia.

laryngopharyngitis /ləring′gōfer′injī′tis/ [Gk, *larynx* + *pharynx,* throat, *itis*], inflammation of the larynx and pharynx. See also **laryngitis, pharyngitis.**

laryngopharyngography /lering′gōfer′ing·gog′rəfē/ [Gk, *larynx* + *pharynx* + *graphein,* to record], the radiographic examination of the larynx and pharynx. Also called **laryngography.**

laryngopharynx /lering′gōfer′ingks/ [Gk, *larynx* + *pharynx,* throat], one of the three regions of the throat, extending from the hyoid bone to the esophagus.Compare **nasopharynx, oropharynx. —laryngopharyngeal** /lering′gōferin′jē·əl/, *adj*.

laryngoplastic phonosurgery, phonosurgery that restructures the cartilaginous framework of the larynx.

laryngoscope /ləring′gəskōp/, an endoscope for examining the larynx.

Laryngoscope *(Zakus, 2001)*

laryngoscopy /ler′ing·gos′kəpē/ [Gk, *larynx* + *skopein,* to view], the use of a laryngoscope to view the larynx. See also **indirect laryngoscopy. —laryngoscopic,** *adj*.

laryngospasm /ləring′gōspaz′əm/ [Gk, *larynx* + *spasmos,* spasm], a spasmodic closure of the larynx.

laryngostasis. See **croup.**

laryngotomy /ler′ing·got′əmē/ [Gk, *larynx* + *temnein,* to cut], a surgical incision into the larynx through the cricovocal membrane. It is usually an emergency procedure that is performed when a standard tracheotomy cannot be done.

laryngotracheal tube, the embryonic endodermal tube that is split off from the primordium of the oropharynx and esophagus when the tracheoesophageal septum divides the cranial part of the foregut. It constitutes the primordium of the larynx, trachea, bronchi, and lungs.

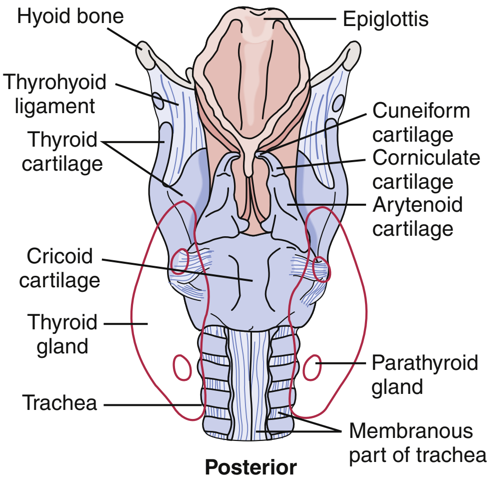
laryngotracheitis /-trā′kē·ī′tis/, an inflammation of the larynx and trachea.

laryngotracheobronchitis (LTB) /lering′gōtrā′kē·ō′brongkī′tis/ [Gk, *larynx* + L, *trachea;* Gk, *bronchos,* windpipe, *itis*], an inflammation of the major respiratory passages, usually causing hoarseness, nonproductive cough, dyspnea, and, in severe cases, significant airway obstruction. Among the causes are infections by coxsackieviruses, echoviruses, **Haemophilus influenzae,** and *Corynebacterium diphtheriae*. Treatment usually includes steam inhalations, cough suppressants, and, for bacterial infections, appropriate antibiotics. See also **croup.**

laryngotracheoesophageal cleft, a cleft between the larynx and the upper trachea resulting from incomplete separation of these structures during embryonic development, with respiratory manifestations including respiratory distress with feeding, flaccid aryepiglottic folds, chronic cough, and increased oral secretions. It is frequently associated with other congenital anomalies of the respiratory system or GI tract. Complications include failure to thrive and recurrent aspiration pneumonia.

laryngotracheotomy /-trā′kē·ot′əmē/, a surgical incision into the larynx and trachea.

larynx /ler′ingks/ [Gk], the organ of voice that is part of the upper air passage connecting the pharynx with the trachea. It accounts for a large bump in the neck called the Adam's apple and is larger in men than in women, although it remains the same size in men and women until puberty. The larynx forms the caudal portion of the anterior wall of the pharynx and is lined with mucous membrane that is continuous with that of the pharynx and the trachea. The larynx extends vertically to the fourth, fifth, and sixth cervical vertebrae and is somewhat higher in women and children. It is composed of three single cartilages and three paired cartilages, all connected by ligaments and moved by various muscles. The single cartilages are the thyroid, cricoid, and epiglottis. The paired cartilages are the arytenoid, corniculate, and cuneiform, which support the vocal folds. Also called **voice box.** **—laryngeal,** *adj.*



Larynx: posterior view *(Monahan et al, 2007)*

LAS, **1.** abbreviation for **lymphadenopathy syndrome.** **2.** abbreviation for **lymphangioscintigraphy.**

laser /lā′zər/, abbreviation for *light amplification by stimulated emission of radiation,* a source of intense monochromatic radiation of the visible, ultraviolet, or infrared portions of the spectrum. Lasers are used in surgery to divide or cause adhesions or to destroy or fix tissue in place. Also called **optic laser.**

laser angioplasty, the opening of an occluded artery with laser energy delivered to the site through a fiberoptic probe.

laser bronchoscopy, bronchoscopy performed with the aid of a laser beam directed through fiberoptic equipment, used in the diagnosis and treatment of bronchial disorders, tracheobronchial tumors, and subglottic stenosis.

laser disk, a plastic disk that stores computer data as tiny pits etched in the surface. A laser beam scanning the pits translates the data into a computer language. Laser disks are frequently used for computer-assisted instruction.

laser iridotomy, a procedure for the treatment of closed-angle glaucoma in which an opening is created in the peripheral iris so that the aqueous fluid is granted access to the trabecular meshwork drainage system. It is usually performed after control of an acute attack when signs of ocular congestion have disappeared. It is also used for prophylaxis against anticipated attacks.

laser pain management, the use of lasers to relieve pain. This treatment has been applied effectively to specific acupuncture points where there is no anatomical dysfunction at the base of the pain.

laser precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as limiting the risk of laser-related injury to the patient. See also **Nursing Interventions Classification.**

laser printer, a high-speed output device for computers using a technique in which laser beams focus images on photosensitive drums. Compare **dot-matrix printer, impact printer.**

laser prostatectomy, removal of the prostate after it has been exposed to a laser either by direct contact with vaporization or by an indirect system that causes coagulation necrosis.

laser trabeculoplasty, an application of argon or selective laser energy to the trabecular meshwork to increase aqueous outflow in the treatment of glaucoma. The procedure may be recommended when intraocular pressure increases despite administration of topical agents. The eye is anesthetized with a topical anesthetic. The trabecular network is viewed through an antireflective-coated four-mirror gonioprism. A power setting and exposure time are selected to blanch the anterior trabecular meshwork with laser energy without causing bubble formation. A potential complication is a temporary increase in intraocular pressure, which is treated with drugs. The effects of laser trabeculoplasty are not always long lasting.

LASIK /lā′sik/, acronym for *laser-assisted in-situ keratomileusis,* a retractive surgery on the cornea in which the excimer laser and microkeratome are combined for correction of distance vision. The microkeratome is used to shave a thin slice and create a hinged flap in the cornea, the flap is reflected back, the exposed cornea is reshaped by the laser, and the flap is replaced, without sutures, to heal back into position. Preoperatively, a topical antibiotic and topical anesthesia are instilled into the eye. Postoperatively, the patient receives antibiotic drops and antiinflammatory drops and wears goggles for 24 hours to prevent slippage.

Lasix, a trademark for a diuretic **(furosemide).**

Lassa fever /lä′sə/ [Lassa, Nigeria; L, *febris,* fever], a highly contagious disease of West Africa caused by an arenavirus. It is transmitted by contact with or inhalation of excreta of infected rodents. Person-to-person transmission occurs through contact with infected blood, secretions, or excreta, or transmission may be airborne. Lassa fever is characterized by fever, pharyngitis, dysphagia, and ecchymoses. Varying degrees of deafness occur in one third of cases. Pleural effusion, edema and renal involvement, mental disorientation, confusion, and death from cardiac failure often ensue. Stringent precautions are taken against the spread of infection. Early treatment with ribavirin and supportive symptomatic care are essential. See also ***Arenavirus,*** **Argentine hemorrhagic fever, Bolivian hemorrhagic fever.**

last sacraments [ME, *laste* + L, *sacramentum,* solemn oath], a religious ceremony performed by a member of the clergy on behalf of a person about to die. Also called *last rites.*

latanoprost /lah-tan′o-prost′/, an agent applied topically to the conjunctiva for treatment of open-angle glaucoma and ocular hypertension.

latchkey children, minors who are often at home alone because their parents are at work.

late dyspituitary eunuchism. See **acromegalic eunuchoidism.**

latency period /lā′tənsē/ [L, *latere,* to be concealed; Gk, *peri* + *hodos,* way], **1.** also called **incubation period.** The period between contact with a pathogen and development of symptoms. **2.** also called *latency of response*. The time between stimulus and response. **3.** See **latency stage.**

latency stage [L, *latere,* to be concealed; Fr, *estage,* stage], (in psychoanalysis) a period in psychosexual development occurring between 6 years of age and puberty when sexual motivation and expression are repressed or transferred, through sublimation, to the feelings and behavioral patterns expected as typical of the age. In this stage, the child develops same-sex friendships.

latent /lā′tənt/ [L, *latere,* to be concealed], dormant; existing as a potential. For example, tuberculosis may be latent for extended periods of time and become active under certain conditions.

latent allergy, allergy that does not have overt symptoms but may be detected by tests.

latent carcinoma. See **occult carcinoma.**

latent diabetes. See **impaired glucose tolerance.**

latent energy [L, *latere,* to be concealed; Gk, *energeia*], the energy contained in an object as a result of its position in space, its internal structure, and stresses imposed on it. Also called **potential energy.** Compare **kinetic energy.**

latent heat [L, *latere,* to be concealed; AS, *haetu*], the heat absorbed by a substance when it changes from a solid to a liquid or from a liquid to a gas without an accompanying rise in temperature.

latent image, an invisible image produced in a film emulsion by x-rays or visible light that can be converted into a visible image by development.

latent learning [L, *latere,* to be concealed; ME, *lernen*], learning acquired unintentionally. It may remain in the subconscious, or be latent, until a need for the knowledge arises.

latent malaria [L, *latere,* to be concealed; It, *mal* + *aria,* bad air], a continuing infection without clinical symptoms, resulting from a balance established between the parasite and the body's immune system. See also **malaria.**

latent period, the interval between the time of exposure to an injurious dose of radiation and the response.

latent phase, the early stage of labor that is characterized by irregular, infrequent, and mild contractions and little or no dilation of the cervix or descent of the fetus. Also called **prodromal labor.** See also **Friedman curve.**

latent syphilis [L, *latere,* to be concealed; Gk, *syn,* together, *philein,* to love], a stage of syphilis infection in which no clinical symptoms appear, although serological tests indicate the presence of the syphilis spirochete. Latent syphilis occurs in two phases following secondary syphilis. The early phase occurs within 1 year of infection, and the late phase occurs after 1 year of infection. Late latent syphilis is noninfectious. Latency can persist for 3 to 30 years and may or may not progress to tertiary syphilis. See also **syphilis.**

latent tetany [L, *latere,* to be concealed; Gk, *tetanos,* convulsive tension], a form of tetany that is elicited only by mechanical or electrical stimuli. Symptoms are nonspecific, including generalized weakness and cramping in the hand and foot.

late-phase hypersensitivity reaction, an inflammatory response in IgE allergic diseases. It begins 2 to 4 hours after exposure to an antigen, peaks at 6 to 12 hours, and disappears after 24 hours.

lateral /lat′ərəl/ [L, *latus,* side], **1.** pertaining to the side. **2.** away from the midsagittal plane. **3.** farther from the midsagittal plane. **4.** to the right or left of the midsagittal plane. **5.** pertaining to a speech sound produced by passing air along one or both sides of the tongue, such as /l/.

lateral abdominal region. See **lateral region.**

lateral antebrachial cutaneous nerve, a continuation of the musculocutaneous nerve that innervates the skin over the radial side of the forearm and sometimes an area of skin of the back of the hand. Its modality is sensory.

lateral aortic node, a lumbar lymph node in any of three clusters of nodes serving the pelvis and abdomen. The afferent vessels from both sides drain various structures such as the testes, ovaries, kidneys, and lateral abdominal muscles. Most of the efferent vessels from the lateral aortic nodes converge to form the right and left lumbar trunks, which join the cisterna chyli. Compare **preaortic node, retroaortic node.**

lateral aperture of the fourth ventricle, an opening between the end of each lateral recess of the fourth ventricle and the subarachnoid space.

lateral atlantoaxial joint, either of a pair of joints, one on each side of the body, formed by the inferior articular surface of the atlas and the superior surface of the axis.

lateral cerebellar nucleus. See **dentate nucleus.**

lateral cerebral sulcus, a deep cleft marking the division of the temporal from the frontal and parietal lobes of the brain. Also called **fissure of Sylvius,** *lateral cerebral fissure*.

lateral column. See **lateral horn.**

lateral condensation method, a technique for filling root canals, in which a preselected master gutta-percha cone is sealed into the apex of the root and other auxiliary gutta-percha cones are forced laterally and compacted with a spreader hand instrument until the canal is filled. Compare **Johnson's method.**

lateral corticospinal tract, a group of nerve fibers in the lateral funiculus of the spinal cord, originating in the cerebral cortex, that control voluntary movement of the body.

lateral cuneiform bone, one of the three cuneiform bones of the foot. It is located in the center of the front row of tarsal bones between the intermediate cuneiform bone medially, the cuboid bone laterally, the scaphoid bone posteriorly, and the third metatarsal anteriorly. It also articulates with the second and fourth metatarsals. Also called **external cuneiform bone, third cuneiform bone.**

lateral decentering, in radiology, an error in positioning of the tube head or a focused grid, resulting in partial grid cutoff over the entire film.

lateral flexures of rectum, the three lateral bends in the rectum.

lateral geniculate body, one of two elevations of the lateral posterior thalamus receiving visual impulses from the retina via the optic nerves and tracts and relaying the impulses to the calcarine (visual) cortex.

lateral horn, a small hornlike projection of gray matter into the white matter of the spinal cord, located between the anterior and posterior horns or columns. Also called **intermediate column, lateral column.**

lateral humeral epicondylitis, inflammation of the tissue at the lower end of the humerus at the elbow joint, caused by the repetitive flexing of the wrist against resistance. It may result from athletic activity or manual manipulation of tools or other equipment. Pain radiates from the elbow joint. Also called **tennis elbow.** See also **epicondylitis.**

lateral incisal guide angle, the inclination of the incisal guide of a dental articulator in the frontal plane.

lateralis, lateral, a term denoting a structure situated farther from the median plane of the body or the midline of an organ.

laterality. See **handedness.**

lateralization /lat′əral′īzā′shən/, the tendency for certain processes to be more highly developed on one side of the brain than the other, such as development of spatial and musical thoughts in the right hemisphere and verbal and logical processes in the left hemisphere in most persons.

lateral ligament of the ankle, one of the three ligaments on the lateral side of the ankle: the anterior talofibular ligament, the posterior talofibular ligament, and the cacaneofibular ligament.

lateral lobes of thyroid gland [L, *latus,* side; Gk, *lobos* + *thyreos,* shield; L, *glans,* acorn], the left and right lobes of the thyroid gland, situated in front of the neck. The two conical lobes lying on either side of and attached to the larynx are connected by a narrow isthmus.

lateral medullary syndrome. See **Wallenberg's syndrome.**

lateral nystagmus [L, *latus,* side; Gk, *nystagmos,* nodding], an involuntary jerky movement in which the eyes move from side to side.

lateral pectoral nerve, one of a pair of branches from the brachial plexus that, with the medial pectoral nerve, supplies the pectoral muscles. It lies lateral to the axillary artery, arises from the lateral cord of the plexus or from the anterior divisions of the superior and middle trunks just before they unite into the cord, and ends on the deep surface of the clavicular and the cranial sternocostal parts of the pectoralis major. Compare **medial pectoral nerve.**

lateral pectoral region, the most lateral part of the pectoral region, bounded laterally by the axillary region.

lateral pelvic displacement, one of the five major kinetic determinants of gait. It helps to synchronize the rhythmic movements of walking and is produced by the horizontal shift of the pelvis or relative hip abduction. It is often a factor in the diagnosis and treatment of various orthopedic diseases, deformities, and abnormal conditions and in the analysis and correction of dysfunctional gaits. Compare **knee-ankle interaction, knee-hip flexion, pelvic rotation, pelvic tilt.**

lateral periodontal cyst, a multilocular variant of the lateral periodontal cyst; a developmental nonkeratinizing odontogenic cyst that arises from the periodontal ligament along the lateral root surface. Also called **Botryoid odontogenic cyst.**

lateral pinch, a grasp in which the thumb is opposed to the middle phalanx of the index finger. Also called **key pinch.** See also **palmar pinch, pinch, tip pinch.**

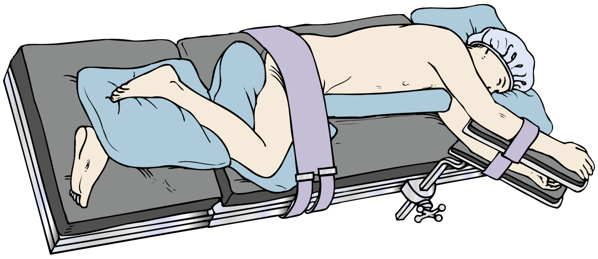
lateral pivot shift test, a test for integrity of the anterior cruciate ligament. The patient lies prone with the hip flexed and the knee extended. The examiner gradually flexes the knee while pushing the outside of the knee medially and internally rotating the tibia. A thud or jerk at 30° to 40° of flexion indicates deficiency of the anterior cruciate ligament.

lateral plantar nerve, one of the two terminal branches of the tibial nerve that innervates all but three intrinsic muscles in the sole of the foot and a strip of skin on the lateral side of the anterior two thirds of the sole and the adjacent plantar surfaces of the fifth toe and lateral half of the fourth.

lateral projection, a radiographic representation of the body produced by an x-ray beam that travels from the left to the right side of the body, or vice versa. It is a right lateral projection if the right side of the body is adjacent to the cassette and a left lateral projection if the left side is adjacent to it.

lateral pubovesical ligament, the lateral branch of the pubovesical ligament in the female, extending from the bladder neck to the tendinous arch of the pelvic fascia.

lateral recumbent position, the posture assumed by the patient lying on the left side with the right thigh and knee drawn up. Also called **English position, obstetric position, Sims' position.**



Lateral recumbent position *(Phillips, 2007)*

lateral region, the part of the abdomen in the middle zone on both sides of the umbilical region. Also called **external abdominal region, lateral abdominal region, lumbar region.** See also **abdominal regions.**

lateral resolution, the resolution of objects in a plane perpendicular to the axis of an ultrasound beam. It is a measure of the ability of the system to detect closely separated objects, such as adjacent blood vessels.

lateral rocking, a sideways rocking of the body used to move the body forward or backward when normal muscle action is not possible. The technique is used by some handicapped patients to move the body to or from the edge of a chair or to a different sitting position on a bed. The rocking is performed while leaning the trunk forward with the arms in front and the head in line above the knees and feet, which are pulled back.

lateral rotation, a turning away from the midline of the body. Compare **medial rotation.** See also **rotation.**

lateral sacral artery, one of two arteries that originate from the posterior division of the internal iliac artery and give rise to branches that pass into the anterior sacral foramina to supply related bone and soft tissues, structures in the vertebral canal, and skin and muscle posterior to the sacrum.

lateral sinus [L, *latus,* side, *sinus,* hollow], one of the transverse bilateral sinuses of the dura mater that lie along the attached margin of the tentorium cerebelli. They receive the superior sagittal and straight sinuses and drain into the internal jugular veins.

lateral spinal curvature [L, *latus,* side, *spina,* backbone, *curvatura,* bend], a bending or abnormal curve of the vertebral column to the right or left side. See also **scoliosis.**

lateral sural cutaneous nerve, a branch of the common fibular nerve that innervates skin over the upper lateral leg.

lateral umbilical fold, a fold in the peritoneum produced by a slight protrusion of the inferior epigastric artery and the interfoveolar ligament. The lateral umbilical fold is about 3 cm lateral to the middle umbilical fold. Also called **plica umbilicalis lateralis.**

lateral ventricle [L, *latus,* side, *ventriculus,* little belly], a cavity in each cerebral hemisphere that communicates with the third ventricle through the interventricular foramen.

late rickets [Gk, *rhachis,* backbone], a form of rickets in which bone changes because of a kidney defect that results in a vitamin D or calcium deficiency. The disorder tends to affect older children.

latero-, prefix meaning “side”: *laterodeviation, lateroduction, laterotorsion*.

lateroconal fascia, the lateral part of the renal fascia where its anterior and posterior parts join. This extends on either side posteriorly to the ascending and descending colon and is continuous with the parietal peritoneum.

lateroduction /lat′ərōduk′shən/, **1.** muscular action in movement to one side or the other. **2.** a turning away from the midline.

laterognathism /lat′ərōnath′izəm/, an asymmetric mandible resulting from irregular growth and development, fractures, tumors, or soft tissue atrophy or hypertrophy.

laterotorsion /-tôr′shən/, **1.** displacement of the uterus to one side. **2.** a twisting of the uterus to one side.

lateroversion /-vur′zhən/, the act of turning over or being deflected from one side to the other.

latex /lā′teks/ [L, liquid], an emulsion or fluidlike sap produced in special cells or vessels of certain plants. Latex contains resins, proteins, and other substances and is a source of rubber. It can cause allergic reactions in some individuals.

latex allergy, anaphylactic hypersensitivity to soluble proteins in latex, seen most often in patients and health care workers sensitized by repeated exposure to latex.

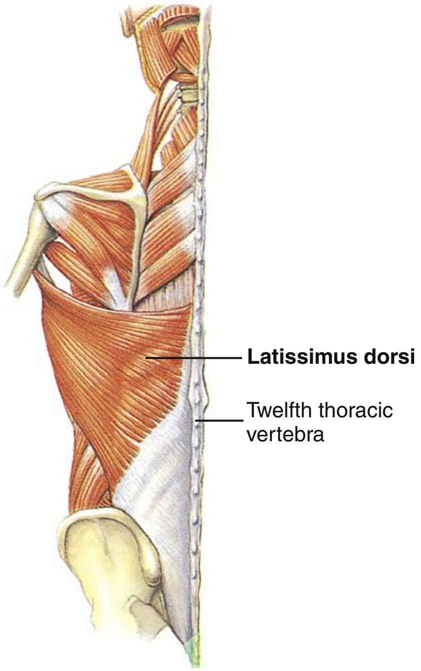
latex fixation test [L, *latex,* fluid, *figere,* to fasten], a diagnostic study used to detect certain antibodies in body fluids; latex particles are used as passive carriers, and particles clump together following the addition of the antibody. One use is a serological test for rheumatoid factor in the diagnosis of rheumatoid arthritis. Also called **RA latex test, RF test.** See also **rheumatoid factor.**

latex precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as reducing the risk of a systemic reaction to latex. See also **Nursing Interventions Classification.**

Lathrop, Rose Hawthorne, (1851–1926), an American nurse who was a daughter of Nathaniel Hawthorne. She established a home in New York for patients with incurable cancer, mostly those who were poor and not accepted in hospitals because of the nature of their disease. Later she became a member of the Third Order of St. Dominic and founded the order of sisters called Servants of Relief for Incurable Cancer, which was received into the Third Order of St. Dominic in 1899. The order founded hospitals wherever there was sufficient need and offered quality care to their patients.

Latin American medical practices, an ethnomedical system representing many healing practices throughout Latin America. In Mexico it is known as **curanderismo**. The etiology of illness is framed in terms of imbalance, which can be between hot and cold in the body, between parts of the body, between patients and the social environment, or between patients and the spiritual realm. These illnesses can be treated by curanderismo and biomedicine, but only the curandero can treat supernatural ailments. This system has been used to treat susto (fear), believed to cause the soul to become dislodged from the body, resulting in illness; empacho, a gastrointestinal disorder believed to be caused by blockage in the stomach or intestine; and mal de ojo (evil eye), characterized by fever, irritability, headache, and weeping, generally affecting children.

latissimus dorsi /latis′iməs dôr′sī/ [L, widest, *dorsum,* the back], one of a pair of large triangular muscles on the thoracic and lumbar areas of the back. The base of the triangle inserts through lumbar aponeuroses to the spines of lumbar and sacral vertebrae and in the supraspinous ligaments, posterior iliac crest, and the lower four ribs. The fibers of the muscle twist as they pass the scapula and converge at the base of the intertubercular groove of the humerus. The latissimus dorsi extends, adducts, and rotates the arm medially; draws the shoulder back and down; and, with the pectoralis major, draws the body up when climbing. It is innervated by the thoracodorsal nerve. Compare **levator scapulae, rhomboideus major, rhomboideus minor, trapezius.**



Latissimus dorsi *(Patton and Thibodeau, 2010)*

latitude [L, *latitudio,* breadth], the ability of an x-ray imaging system to produce acceptable images over a range of exposures. If a system has wide latitude, it is possible to image parts of the body that vary in thickness or density with only one exposure. A system of lesser latitude would require a lower exposure over the thin section and a greater exposure where the absorption was greater.

Latrodectus mactans. See **black widow spider.**

LATS, abbreviation for **long-acting thyroid stimulator.**

LATS-P, abbreviation for **long-acting thyroid stimulator protector.**

lattice formation [OFr, *lattis,* geometric design], a three-dimensional cross-linked structure formed by the reaction of polyvalent antigens with antibodies.

latus /lā′təs/ [L], broad, wide.

laudanum /lôd′ənəm/ [Gk, *landanon,* gum resin], a tincture of opium made from a solution of macerated raw opium and 50% alcohol. It is believed to have originated as a secret remedy of Paracelsus, sixteenth century Swiss alchemist and physician.

Lauenstein method, a technique for positioning a patient for radiographic examination of the hip joint emphasizing the relationship of the femur to the acetabulum. The knee of the affected leg is flexed, and the thigh is drawn up to nearly a right angle. Also called **frog leg position.**

laughing gas /laf′ing/, *(informal)* nitrous oxide, a side effect of which is laughter or giggling when administered in low doses.

Launois’ syndrome /lonwah′/, pituitary gigantism.

Laurence-Moon-Bardet-Biedl syndrome /lôr′əns mo͞on′ bärdā′ bē′dəl/ [John Z. Laurence, English ophthalmologist, 1829–1870; Robert C. Moon, American ophthalmologist, 1844–1933; Georges Bardet, French physician, b. 1885; Artur Biedl, Czechoslovakian physician, 1869–1933], a hereditary condition characterized by obesity, hypogenitalism, mental deficiency, polydactylism, and retinitis pigmentosa. It is transmitted as an autosomal-recessive trait.

Laurence-Moon syndrome /lô′rəns mo͞on/ [John Zachariah Laurence, British ophthalmologist, 1830–1874; Robert C. Moon, American ophthalmologist, 1844–1914], an autosomal recessive disorder characterized by mental retardation, pigmentary retinopathy, hypogonadism, and spastic paraplegia.

laureth-9 /law′reth/, a compound used as a spermicide, surfactant, and sclerosing agent.

lavage /ləväzh′/ [Fr, washing], **1.** *n,* the process of washing out an organ, usually the bladder, bowel, paranasal sinuses, or stomach, for therapeutic purposes. **2.** *v,* to perform a lavage. Kinds of lavage are **blood lavage, gastric lavage,** and **peritoneal dialysis.** See also **irrigation.**

law [AS, *lagu*], **1.** (in a field of study) a rule, standard, or principle that states a fact or a relationship between factors, such as Dalton's law regarding partial pressures of gas or Koch's law regarding the specificity of a pathogen. **2.** a rule, principle, or regulation established and promulgated by a government to protect or restrict the people affected; the field of study concerned with such laws; the collected body of the laws of a people, derived from custom and from legislation.

Law method, (in radiology) any of several techniques for positioning a patient for radiographic examination of the facial bones, mastoid process, and relationship of the teeth to the maxillary sinuses.

law of definite composition, (in chemistry) a law stating that a given compound is always made of the same elements present in the same proportion.

law of dominance, formerly considered as a separate principle of Mendel's laws of inheritance, but in modern genetics incorporated as part of the first mendelian law, the law of segregation. See also **Mendel's laws.**

law of independent assortment. See **Mendel's laws.**

law of initial value, the physiological and psychological principle that states that, with a given intensity of stimulation, the degree of change produced tends to be greater when the initial value of that variable is low. The higher the initial level of functioning, the smaller is the change that can be produced.

law of segregation. See **Mendel's laws.**

law of specific nerve energies. See **Müller's law.**

law of universal gravitation, (in physics) the law stating that the force with which bodies are attracted to each other is directly proportional to the masses of the objects and inversely proportional to the square of the distance by which they are separated. See also **gravity, mass.**

lawrencium (Lr) /lôren′sē·əm/ [Ernest O. Lawrence, American physicist, 1901–1958], a synthetic transuranic metallic element. Its atomic number is 103, and its atomic mass is 257.

laws of cure, in homeopathy, the four general directions in which cure of a disease moves: from above downward, from inside outward, from more vital to less vital organs, and in reverse order of symptom appearance.

lax, **1.** abbreviation for **laxative. 2.** pertaining to a condition of relaxation or looseness.

laxative (lax) /lak′sətiv/ [L, *laxare,* to loosen], **1.** *adj,* pertaining to a substance that causes evacuation of the bowel by a mild action. **2.** *n,* a laxative agent that promotes bowel evacuation by increasing the bulk of the feces, softening the stool, or lubricating the intestinal wall. Compare **cathartic.**

laxative regimen, a diet that ensures an adequate intake of high-fiber bulk foods, including fruits and vegetables, to avoid chronic constipation. The regimen is supplemented with fluids and physical exercise.

lay referral system, an illness referral system through which a person passes from the first recognition of an abnormality to an announcement to the family, to members of the community, to traditional or culturally recognized healers, and then to the regular medical system that includes nurses and physicians. Depending on the culture and the medical care available, some steps may be omitted.

lazy colon. See **atonic constipation.**

lazy leukocyte syndrome, an immunodeficiency disease of children characterized by recurrent stomatitis, gingivitis, otitis media, and low-grade fever with severe neutropenia. The condition has been associated with abnormal chemotaxis by leukocytes. It is treated with normal human serum transfusions.

lb [L, *libra*], abbreviation for **pound.**

lb ap, abbreviation for *apothecary pound,* equal to 5760 grains or 374.4 g, as opposed to the English pound with 7000 grains or 455 g.

lb avdp, abbreviation for *avoirdupois pound.*

LBBB, abbreviation for **left bundle branch block.**

lbd, abbreviation for *lower back disorder.*

lbf, abbreviation for *pound-force.*

lbf/ft^2, abbreviation for *pound-force per square foot.*

lbf/in^2, abbreviation for *pound-force per square inch.*

lbm, abbreviation for **lean body mass.**

lbp, **1.** abbreviation for **low back pain. 2.** abbreviation for *low blood pressure.*

LBW, abbreviation for *low birth weight.* See **low-birth weight infant.**

LCAT, abbreviation for *lecithin-cholesterol acyltransferase.* See **lecithin-cholesterol acyltransferase deficiency.**

LCBF, abbreviation for **local cerebral blood flow.**

LCD, abbreviation for **liquid crystal display,** a video display device that is more compact and uses less electrical power than the conventional cathode ray tube (CRT). Laptop computers use LCD displays. LCD monitors are frequently used instead of CRTs for desktop computers. An LCD is composed of electrically sensitive liquid crystals laminated between layers of plastic. Application of small electrical currents alters the orientation of the crystals, producing the image.

L chain, abbreviation for **light chain.**

LCMRG, abbreviation for **local cerebral metabolic rate of glucose utilization.**

LD, abbreviation for **lethal dose.**

LD$_{50}$, symbol for **median lethal dose.**

LDH, abbreviation for **lactate dehydrogenase.**

LDL, abbreviation for **low-density lipoprotein.**

L-dopa. See **levodopa.**

le, abbreviation for *left eye.*

LE, abbreviation for **lupus erythematosus.** See **systemic lupus erythematosus.**

leaching /lē′ching/, removal of the soluble contents of a substance by running water or another liquid through it, leaving the insoluble portion behind.

lead /lēd/ [As, *laedan,* to lead], an electrical connection attached to the body to record electrical activity, especially of the heart or brain. See also **electrocardiograph, electroencephalograph.**

lead (Pb) /led/ [ME, *leed*], a common soft blue-gray metallic element. Its atomic number is 82 and its atomic mass is 207.19. In its metallic form, lead is used as a protective shielding against x-rays. Lead is poisonous, a characteristic that has led to a reduction in the use of lead compounds as pigments for paints and inks. Normal concentrations in whole blood are 0 to 5 μg/dL. The normal amount in urine after 24-hour collection is less than 100 μg.

lead apron /led/ [AS, *led* + Fr, *napperon*], a protective shield of lead and rubber that may be worn by a patient, radiological technologist or radiologist, or both during exposure to x-rays or other diagnostic radiation. It is intended to guard against excessive exposure of the reproductive and other vital body organs to ionizing radiation. Also called **protective apron.**

lead-containing eyeglasses /led/, glasses that provide radiation shielding for the eyes of radiographic personnel. They are particularly useful during fluoroscopic procedures or angiographic examinations.

lead encephalopathy /led/ [AS, *led* + Gk, *enkephalos,* brain, *pathos,* disease], a condition of brain structure and function resulting from lead poisoning, including exposure to tetraethyl lead. Children are commonly afflicted after eating chips of lead-based paints. The untreated disorder is characterized by delirium, convulsions, mania, cortical blindness, and coma.

lead equivalent /led/, the thickness of lead required to achieve the same shielding effect against radiation, under specified conditions, as that provided by a given material.

leadership [AS, *leadan,* to lead, *scieppan,* to shape], the ability to influence others in the attainment of goals. Kinds of leadership include authoritarian, democratic, participative, and permissive (laissez faire).

lead nephropathy, the kidney damage that accompanies lead poisoning. Lead deposits appear in the epithelium of the proximal tubules and as nuclear inclusions in cells. In time this leads to tubulointerstitial nephritis with chronic renal failure and other symptoms.

lead pipe fracture /led/, a linear fracture that is produced on the side of a bone opposite from the side of impact with a hard object. The point of impact is marked by a compression of bony tissue. Also called **torus fracture.**

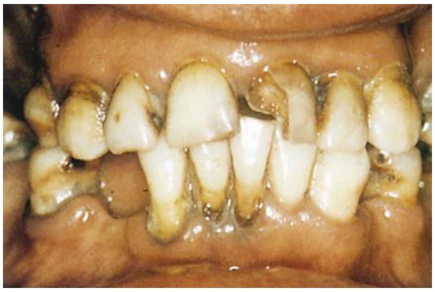
lead-pipe rigidity /led/, a state of stiffness and inflexibility that remains uniform throughout the range of passive movement, associated with diseases of the basal ganglia.

lead poisoning /led/, a toxic condition caused by the ingestion or inhalation of lead or lead compounds. Many children develop the condition as a result of eating flaked lead paint. Poisoning also occurs from the ingestion of water from lead pipes and lead salts in certain foods and wines, the use of pewter or earthenware glazed with a lead glaze, and the use of leaded gasoline. Inhalation of lead fumes is common in industry. The acute form of intoxication is characterized by a burning sensation in the mouth and esophagus, colic, constipation or diarrhea, mental disturbances, and paralysis of the extremities, followed in severe cases by convulsions and muscular collapse. Chronic lead poisoning, which is characterized by extreme irritability, anorexia, and anemia, may progress to the acute form. Encephalopathy must be anticipated in children with lead poisoning.

■ OBSERVATIONS: Lead poisoning is frequently asymptomatic, with mild toxicity. Likely initial manifestations include loss of appetite, abdominal discomfort, constipation, fatigue, irritability, headache, insomnia, and myalgia. Toxicity leads to three major clinical syndromes: cerebral (hyperactivity, behavior problems, learning problems, neurological disability, and/or mental retardation); neuromuscular (peripheral neuritis, paresthesias, and poor coordination); and alimentary (anorexia, abdominal cramping, weight loss, intestinal spasm, and rigidity of abdominal wall). Lead exposure in pregnant women can retard fetal development. Diagnosis is made by measuring lead levels in the blood, which will be greater than 10 μg/dl. Blood studies will also reveal a mild anemia with basophilic stippling. Chronic exposure may lead to renal failure, liver damage, and encephalopathy with blindness, seizures, paralysis, coma, and death.

■ INTERVENTIONS: Treatment is dictated by serum lead levels. Children with levels between 10 and 19 μg/dl are treated conservatively with calcium, iron, zinc, and vitamin C supplements. They are placed on an elevated-protein–reduced fat diet to reduce lead absorption. For children with blood levels between 20 and 44 μg/dl, case management with environmental assessment is recommended, with aggressive control and removal of lead hazards. Case reports are made to the local health department for lead levels more than 20 μg/dl. All occupationally related cases should be reported to OSHA. Chelation with succimer and edetate calcium disodium (EDTA) is used in cases with blood levels greater than 45 μg/dl or in refractory cases.

■ NURSING CONSIDERATIONS: All health care providers play an important role in the prevention of and screening for lead poisoning. All children should be screened for lead levels starting at 6 months to 1 year of age. Families should be educated about the risks of exposure to lead and instructed in the detection, removal, or treatment of potential sources of lead in and around the home. When the child has elevated lead levels, the focus is on aggressive reduction of further lead exposure. Education in diet and supplement therapy and the importance of continuing monitoring of blood levels is also necessary. Families of children undergoing chelation need instructional preparation for the procedure. EMLA cream should be applied before chelation injections, and EDTA should be mixed with succimer to reduce pain associated with the injections. Seizure precautions should be instituted for children with high lead blood levels. Renal function should be assessed through urinalysis, and lead blood levels rechecked after chelation. If lead exposure is occupationally related, workers should be instructed in the importance and consistent use of proper safety equipment such as respirators.



Lead poisoning *(Moll, 1997)*

lead shielding /led/, the use of aprons and other devices containing lead as protective measures against radiation. A layer of lead 1 mm thick can attenuate 99% of x-rays of 50 kVp and 94% of x-rays of 100 kVp.

leakage /le′kaj/, the escape of something through a break in a barrier or wall.

leakage radiation /lē′kij/ [ONorse, *leka,* to drip; L, *radiare,* to emit rays], radiation, exclusive of the primary beam, that is emitted through the housing of equipment used in radiation therapy and radiography.

leak point pressure, as the bladder fills, the pressure at which leakage occurs through the urethra, used as a measure of strength of the urethral sphincters.

leaky gene. See **hypomorph.**

lean body mass (lbm) [ME, *lenen,* slender; AS, *bodig* + ME, *massa,* lump], the combination of cell solids, extracellular and intracellular water, and mineral mass of the body.

learned helplessness /lurnd/, a behavioral state and personality trait of a person who believes that he or she is ineffectual, his or her responses are futile, and control over reinforcers in the environment has been lost. It may be seen in depression.

learning [AS, *leornian,* to learn], **1.** the act or process of acquiring knowledge or some skill by means of study, practice, or experience. **2.** knowledge, wisdom, or a skill acquired through systematic study or instruction. **3.** (in psychology) the modification of behavior through practice, experience, or training. See also **conditioning.**

learning curve, a graphic presentation of the effects of a specified method of teaching or training on the ability of a subject to learn, as shown by improved performance in a particular task.

learning disability, an abnormal condition often affecting children of normal or above-average intelligence, characterized by difficulty in learning such fundamental procedures as reading, writing, and numeric calculation. The condition may result from psychological or organic causes and is usually related to slow development of perceptual motor skills. See also **attention deficit disorder, dysgraphia, dyslexia.**

learning-disabled adult, an adult with a nonspecific difficulty in the learning process, commonly resulting from developmental lag rather than brain damage or demonstrable illness. Research into adult learning disabilities indicates that, as among children, the disability may be expressed throughout the total personality: cognitively, perceptually, and emotionally. Functional difficulties persist, but in adulthood they are expressed in vocational adjustment, work management, and social and family interactions.

learning environment, the sum of the internal and external circumstances and influences surrounding and affecting a person's learning.

learning facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promoting the ability to process and comprehend information. See also **Nursing Interventions Classification.**

learning readiness enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as improving the ability and willingness to receive information. See also **Nursing Interventions Classification.**

learning theory [AS, *leornian,* to learn; Gk, *theoria,* speculation], a group of concepts and principles that attempts to explain the learning process. One concept, Guthrie's contiguous conditioning premise, postulates that each response becomes permanently linked with stimuli present at the time so that contiguity rather than reinforcement is a part of the learning process.

leather-bottle stomach. See **linitis plastica.**

leave. See **parole.**

Leber's congenital amaurosis /lā′bərz/ [Theodor von Leber, German ophthalmologist, 1840–1917; L, *congenitus,* born with; Gk, *amauroein,* to darken], a rare kind of blindness or severely impaired vision caused by a defect transmitted as an autosomal-recessive trait and occurring at birth or shortly thereafter. The eyes appear normal externally, but pupillary constriction to light is sluggish or absent, and electroretinographic responses are decreased or absent. Pendular nystagmus, photophobia, cataract, and keratoconus may be present; the ophthalmic disorder may be associated with mental retardation and epilepsy. One type of Leber's amaurosis results in complete blindness. In a second kind the pathology does not progress, and the patient has very mild vision loss.

Leber's plexus /lā′bərz/ [Theodor Leber], a venous plexus in the ciliary region connected with the **canal of Schlemm.** Also called **Hovius' plexus.**

Leboyer method of delivery /ləboiyā′/ [Frederick LeBoyer, French obstetrician, b. 1918], a psychophysical approach to delivery with the goal of minimizing the trauma of birth by gently and pleasantly introducing the newborn to life outside the womb. It has four aspects: a gentle controlled delivery in a quiet dimly lit room, avoidance of pulling on the head, avoidance of overstimulation of the infant's sensorium, and encouragement of maternal-infant bonding. Unnecessary intervention in the process of birth is eschewed. After delivery, the baby is gently laid on the mother's abdomen, the back is massaged as the cord stops pulsating, and, when regular spontaneous respirations are established, the baby is gently supported in a warm tub of water by the father. Many birth centers and obstetric services in the United States have found that no adverse effects result from this method. Some studies in France have suggested superior psychological, social, and intellectual development in young children delivered by this method. Compare **Bradley method, Lamaze method, Read method.**

LE cell, a neutrophil that has phagocytosed the nucleus of another leukocyte that has already been altered by interacting with the LE factor in the bloodstream. Also called **lupus erythematosus cell.**

lecithin /les′ithin/ [Gk, *lekithos,* yolk], phosphatidylcholine, a phospholipid common in plants and animals. Lecithin is found in the liver, nerve tissue, semen and in smaller amounts, in bile and blood. It is essential as a component of all cell membranes and for fat metabolism and is used in the processing of foods, pharmaceutical products, cosmetics, and inks. Rich dietary sources are soybeans, egg yolk, and corn. See also **choline, inositol.**

lecithin-cholesterol acetyltransferase (LCAT) deficiency, an autosomal-recessive disorder characterized by an accumulation of unesterified cholesterol in the tissues, corneal opacity, hemolytic anemia, proteinuria, renal insufficiency, and premature atherosclerosis. It is caused by a deficiency of LCAT activity.

lecithin/sphingomyelin ratio (L/S ratio), the ratio of two components of amniotic fluid, used for predicting fetal lung maturity. The normal ratio in amniotic fluid is 2:1 or greater when fetal lungs are mature.

lecitho-, prefix meaning "yolk of an egg or ovum": *lecithoblast, lecithoprotein, lecithovitellin.*

lecithoblast /les′ithəblast′/, an embryonic cell, the primitive entoderm of a two-layered blastodisc.

lecithoprotein /les′ithəprō′tēn/, a compound formed by lecithin and a protein.

lectin /lek′tin/, a protein in seeds and other parts of certain plants that binds with glycoproteins and glycolipids on the surface of animal cells, causing agglutination. Some lectins agglutinate erythrocytes in specific blood groups, and others stimulate the production of T lymphocytes.

Ledercillin VK, a trademark for a bacterial antibiotic (penicillin V potassium).

leech therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as application of medicinal leeches to help drain replanted or transplanted tissue engorged with venous blood. See also **Nursing Interventions Classification.**

Leeuwenhoekia australiensis [Anton van Leeuwenhoek, Dutch microscopist, 1632–1723; Australia], a mite indigenous to New South Wales that burrows into the skin, producing severe irritation. Also called **scrub itch.**

leeway space, the amount by which the space occupied by the primary canine and first and second primary molars exceeds that occupied by the canine and premolar teeth of the secondary dentition, usually averaging 1.7 mm on each side of the dental arch.

Lee-White method [Roger I. Lee, American physician, b. 1881; Paul D. White, American physician, 1886–1973; Gk, *meta,* beyond, *hodos,* way], a method of determining the length of time required for a clot to form in a test tube of venous blood. It is not specific for any coagulation disorder but is often used to monitor coagulation during heparin therapy. Because normal values and precise methodology vary, instructions are provided by most laboratories. See also **clotting time.**

leflunomide, a pyrimidine synthesis inhibitor with anti-inflammatory effects.

■ INDICATIONS: It is used to treat rheumatoid arthritis.

■ CONTRAINDICATIONS: Pregnancy, lactation, hepatic disease, jaundice, positive hepatitis B and C, severe immunosuppression, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects include chest pain, angina pectoris, migraine, bronchitis, cough, respiratory infection, pneumonia, and sinusitis. Common side effects include nausea, anorexia, vomiting, constipation, flatulence, dizziness, insomnia, depression, paresthesia, palpitations, hypertension, rash, pruritus, pharyngitis, and rhinitis.

LeFort I fracture. See **Guérin's fracture.**

left atrioventricular orifice, the opening between the left atrium and ventricle of the heart. Also called *mitral orifice*.

left atrioventricular valve. See **mitral valve.**

left atrium (LA), the uppermost chamber on the left side of the heart. It receives blood from the pulmonary veins.

left brachiocephalic vein [ME, *left,* weak; Gk, *brachys,* short, *kephale,* head], a vessel about 6 cm long that starts in the root of the neck at the junction of the internal jugular and the subclavian veins on the left side and runs obliquely across the thorax to join the right brachiocephalic vein and form the superior vena cava. Also called **left innominate vein.** Compare **right brachiocephalic vein.**

left bundle branch block (LBBB), the failure of the cardiac impulse to propagate down the left bundle branch from the bundle of His, resulting in early activation of the right side of the septum and the right ventricular myocardium. See also **bundle branch block.**

left common carotid artery, the longer of the two common carotid arteries, arising from the aortic arch and having cervical and thoracic parts. The cervical part passes obliquely from the level of the sternoclavicular articulation to the cranial border of the thyroid cartilage, dividing into the left internal and the left external carotid arteries. Compare **right common carotid artery.**

left coronary artery, one of a pair of branches from the ascending aorta, arising in the left posterior aortic sinus, dividing into the left interventricular artery and the circumflex branch, and supplying both ventricles and the left atrium. Compare **right coronary artery.**

left-handedness /left′ han′didnes/, a natural tendency by some persons to favor the use of the left hand in performing certain tasks. Also called **sinistrality.** See also **cerebral dominance, handedness.**

left-heart failure, an abnormal cardiac condition characterized by the impairment of the left side of the heart and elevated pressure and congestion in the pulmonary veins and capillaries. Left-heart failure may be related to right-heart failure, because both sides of the heart are part of a circuit and the impairment of one side will eventually affect the other. Experimentally produced failure of one ventricle may produce significant hemodynamic and biochemical abnormalities of the opposite ventricle, even without the usual signs of failure. In "pure" left-heart failure, the body retains significant amounts of sodium and water and consequently develops peripheral edema without clinical evidence of right-heart failure. It is most commonly caused by coronary artery disease, hypertension, or aortic stenosis. Also called **left-sided failure.** Compare **right-heart failure.** See also **heart failure.**

left hepatic duct, the duct that drains the bile from the left lobe of the liver into the common bile duct.

left innominate vein. See **left brachiocephalic vein.**

left lateral recumbent position [ME, *left* + L, *latus,* side, *recumbere,* to lie down, *positio*], a position in which the patient lies on the left side with the upper knee and thigh drawn upward. See also **Sims' position.**

left lymphatic duct. See **thoracic duct.**

left pulmonary artery, the shorter and smaller of two arteries conveying venous blood from the heart to the lungs, rising from the pulmonary trunk, connecting to the left lung, and tending to have more separate branches than the right pulmonary artery. In the fetus, it is larger and more important than the right pulmonary artery because it provides the ductus arteriosus that degenerates to become a ligament after birth. Compare **right pulmonary artery.**

left-sided failure. See **left-heart failure.**

left subclavian artery, an artery, divided into three parts, that arises from the aortic arch to supply the vertebral column, spinal cord, ear, and brain. The short second part lies dorsal to the scalenus anterior and forms the arch described by the vessel. The third part runs from the scalenus anterior to the first rib, where it becomes the axillary artery. Compare **right subclavian artery.** See also **subclavian artery.**

left-to-right shunt, **1.** a diversion of blood from the left side of the heart to the right, such as through a septal defect. **2.** a diversion of blood from the systemic to the pulmonary circulation, such as from a patent ductus arteriosus. Pathology results from the inability of the right circulation to compensate for left-sided (systemic) pressures.

left ventricle (LV), the thick-walled chamber of the heart that pumps blood through the aorta and the systemic arteries, the capillaries, and back through the veins to the right atrium. It has walls about three times thicker than those of the right ventricle and contains a mitral valve with two flaps that controls the flow of blood from the left atrium. The left ventricle occupies about half the diaphragmatic surface of the heart and is longer and more conical than the right ventricle, narrowing caudally to form the apex. The chordae tendineae of the left ventricle are thicker, stronger, and less numerous than those in the right ventricle. See also **chordae tendineae.**

left ventricular assist device (LVAD), a mechanical pump that temporarily and artificially aids the natural pumping action of the left ventricle.

left ventricular failure, heart failure in which the left ventricle fails to contract forcefully enough to maintain a normal cardiac output and peripheral perfusion. Pulmonary congestion and edema develop from back pressure of accumulated blood in the left ventricle. Signs include breathlessness, crackles, dyspnea, orthopnea, pallor, sweating, and peripheral vasoconstriction. The heart is usually enlarged, resulting in a displaced point of maximum impulse. A prominent third heart sound (gallop), normal in children and young adults, is a sign of left ventricular failure in older adults with heart disease. Hypertension is common and may be a causative factor or a result of pulmonary edema. Treatment includes meperidine or morphine for sedation, angiotensin-converting enzyme inhibitors or calcium channel blockers to reduce afterload, diuretics, digitalis, and rest. See also **congestive heart failure.**

left ventricular thrust. See **precordial movement.**

left ventricular veins, rarely occurring cardiac veins emptying into the left ventricle of the heart. These are the smallest of all cardiac veins.

leg /leg/ [ONor, *leggr*], **1.** that section of the lower limb between the knee and ankle. **2.** in common usage, the entire lower limb (in which case, the part below the knee is called the lower leg).

legacy /leg′əsē/ [L, *legatum,* bequest], something that is handed down from the past or intended to be bestowed on future generations.

legal [L, *lex,* law], actions or conditions that are permitted or authorized by law.

legal blindness [L, *lex,* law; ME, *blend,* sightless], a state of visual acuity in which no better than 20/200 is measured in the better eye with corrective lenses or a visual field of not more than 20 degrees is obtained.

legal death. See **death.**

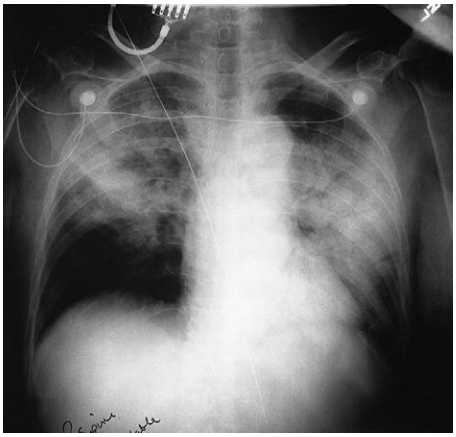
leg cylinder cast [ONor, *leggr* + Gk, *kylindros* + ONorse, *kasta*], an orthopedic device of plaster of paris or fiberglass used to immobilize the leg in treating fractures from the ankle to the middle femur. It is used especially for repairing knee fractures and dislocations, for treating soft tissue trauma around the knee, for maintaining postoperative positioning and immobilization of the knee, and for correcting or maintaining correction of knee deformities. The cast extends from the upper thigh to the ankle. The foot is not encased. The long-leg cast may also be used for these purposes because it encases the foot and ensures greater immobilization.

Legg-Calvé-Perthes disease [Arthur T. Legg, American surgeon, 1874–1939; Jacques Calvé, French orthopedist, 1875–1954; Georg C. Perthes, German surgeon, 1869–1927]. See **Perthes disease.**

legionellosis /lē′jənelō′sis/, infection with a species of *Legionella,* which may cause any of several illnesses, including **Legionnaires' disease.**

Legionnaires' disease /lē′jənerz′/ [American Legion], an acute bacterial pneumonia caused by infection with *Legionella pneumophila*. It is characterized by an influenzalike illness followed within a week by high fever, chills, muscle aches, and headache. The symptoms may progress to dry cough, pleurisy, and sometimes diarrhea. Usually the disease is self-limited, but mortality has been 15% to 20% in a few localized epidemics. Contaminated air-conditioning cooling towers and warm stagnant water supplies, including water vaporizers, water sonicators, whirlpool spas, and showers, may be sources of organisms. Person-to-person contagion has not occurred. Risk of infection is increased by the presence of other conditions, such as cardiopulmonary diseases. Treatment includes supportive care and antibiotic therapy. Also called **legionellosis.**

Legionnaires' disease antibody test, direct and indirect fluorescent testing for antibodies against *L. pneumophila*.



Legionnaires' disease

(Kowalczyk and Mace, 2009/Courtesy American College of Radiology)

Leigh disease /lē/ [Archibald Denis Leigh, British neuropathologist, b. 1915], an encephalopathy of unclear clinical and pathological criteria, causing neuropathological damage like that of the Wernicke-Korsakoff syndrome. It occurs in two forms: the infantile form, which may be the same as pyruvate carboxylase deficiency, is characterized by degeneration of gray matter with necrosis and capillary proliferation in the brainstem; hypotonia, seizures, and dementia; anorexia and vomiting; slow or arrested development; and ocular and respiratory disorders. Death usually occurs before age 3. The adult form usually first manifests as bilateral optic atrophy with central scotoma and color blindness; then there is a quiescent period of up to 30 years before late symptoms appear, such as ataxia, spastic paresis, clonic jerks, grand mal seizures, psychic lability, and mild dementia. Also called **subacute necrotizing encephalomyelopathy, subacute necrotizing encephalopathy.** See also **Wernicke-Korsakoff syndrome.**

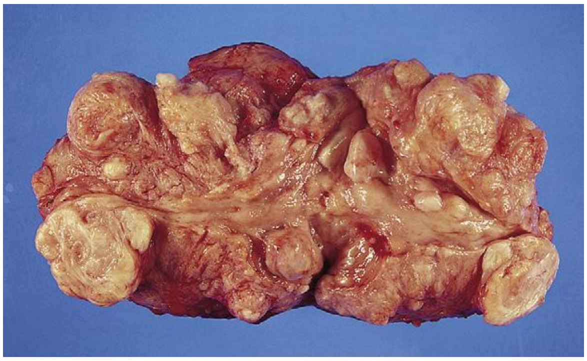
Leiner's disease /lī′nərz/ [Karl Leiner, Austrian pediatrician, 1871–1930], an infant condition of generalized dermatitis, with scaling and erythema, as well as seborrheic dermatitis of the scalp, generalized lymphadenopathy, and diarrhea. Also called **erythroderma desquamativum.**

Leininger, Madeleine, a nursing theorist, author, educator, researcher, and consultant who formulated the foundation of transcultural nursing and the resultant nursing research, education, and practice in this subfield of nursing. The most complete account of transcultural care theory is found in her book, *Care: The Essence of Nursing and Health* (1984). Some of the major concepts are care, caring, culture, cultural values, and cultural variations. A basic tenet of Leininger's theory is that human beings are inseparable from their cultural background and social structure. She advocates caring as the central theme in nursing care, nursing knowledge, and practice. Caring includes assistive, supportive, or facilitative acts toward an individual or group with evident or anticipated needs. Caring serves to ameliorate or improve human conditions and life ways (life process). Her methodology is borrowed from anthropology, but the concept of caring is an essential characteristic of nursing practice.

leio-, lio-, prefix meaning “smooth”: *leiodermia, leiodystonia, leiomyofibroma.*

leiomyofibroma /lī′ōmī′ōfībrō′mə/ *pl. leiomyofibromas, leiomyofibromata* [Gk, *leios,* smooth, *mys,* muscle; L, *fibra,* fiber; Gk, *oma,* tumor], a tumor consisting of smooth muscle cells and fibrous connective tissue, commonly occurring in the uterus in middle-aged women. See also **fibroid.**

leiomyoma /lī′ōmī·ō′mə/, *pl. leiomyomas, leiomyomata* a benign smooth-muscle tumor occurring most commonly in the uterus, stomach, esophagus, or small intestine. Surgical resection is usually indicated.



Leiomyomas *(Finkbeiner, Ursell, and Davis, 2009)*

leiomyoma cutis, a neoplasm of the smooth muscles of the skin. The lesion is characterized by many small, tender, red nodules. It may also occur as a solitary genital lesion or a solitary angioleiomyoma arising from the muscle of veins.

leiomyoma uteri, a benign neoplasm of the smooth muscle of the uterus. The tumor is characteristically firm, well-circumscribed, round, and gray-white. Histologically a pattern of whorls is present. Tumors of this kind develop in the myometrium and occur in women between 30 and 50 years of age. They are usually small but may grow quite large and occupy most of the uterine wall. Symptoms vary according to the location and size of the tumors. As they grow, they may cause pressure on neighboring organs, painful menstruation, profuse and irregular menstrual bleeding, vaginal discharge, or frequent urination, as well as enlargement of the uterus. In pregnancy, the tumors may interfere with natural enlargement of the uterus with the growing fetus. Also called *(informal)* **fibroid, fibromyoma uteri, myoma previum.**

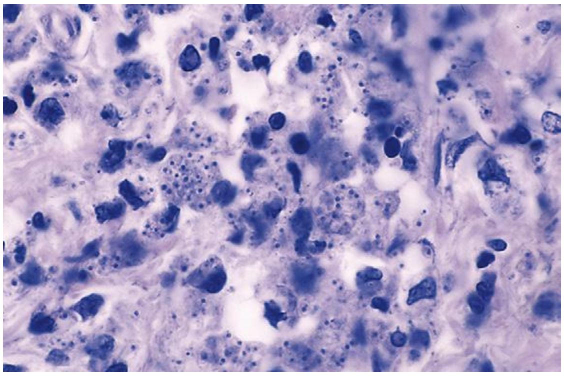
leiomyosarcoma /-särkō′mə/ [Gk, *leios,* smooth, *mys,* muscle, *sarx,* flesh, *oma,* tumor], a sarcoma that contains large spindle cells of unstriated muscle.

leipo-. See **lip-.**

Leishman-Donovan body /lēsh′mən don′əvən/ [William B. Leishman, English pathologist, 1865–1926; Charles Donovan, Irish physician, 1863–1951], the resting stage of an intracellular nonflagellated protozoan parasite *(Leishmania donovani)* that causes kala-azar, or visceral leishmaniasis, as it appears in infected tissue specimens.

Leishmania /lēshmā′nē·ə/ [William B. Leishman], a genus of protozoan parasites. These organisms are transmitted to humans by any of several species of sand flies.

leishmaniasis /lēsh′mənī′əsis/ [William B. Leishman], infection with any species of protozoan of the genus *Leishmania*. The diseases caused by these organisms may be cutaneous, mucocutaneous, or visceral. The infection is transmitted to humans by several species of nocturnal *Phlebotomus* sandflies. Other species of the blood-sucking insects infect other animals. Diagnosis is made by microscopic identification of the intracellular nonflagellated protozoan on a Giemsa-stained smear taken from a cutaneous lesion or visceral biopsy. A typical infection may begin with a cutaneous sore and progress to ulceration of the mouth, palate, and nose. Some cases are accompanied by a febrile illness. There are three major types of leishmaniasis: **American leishmaniasis,** the form found in Central America and South America, **kala-azar,** and **cutaneous.** Visceral leishmaniasis occurs mainly in the tropical areas of Asia; cutaneous leishmaniasis is encountered most frequently in the Middle East. See also ***Leishmania.*** *—leishmanial, adj.*



Visceral leishmaniasis *(Kumar, Abbas, and Fausto, 2005)*

leishmanin test. See **Montenegro test.**

leisure participation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the use of relaxing, interesting, and enjoyable activities to promote well-being. See also **Nursing Outcomes Classification.**

-lemma, suffix meaning a “confining membrane”: *axiolemma, epilemma, neurolemma.*

lemniscal system /lemnis′kəl/ [Gk, *lemniskos,* fillet, *systema*], a part of the somatosensory network of large-diameter myelinated A fibers. It includes the dorsal columns and the neospinothalamic tract extending from the spinal cord to the thalamus and cortex.

lemniscus /lemnis′kəs/ [Gk, *lemniskos,* fillet], a band or tract of central nervous system fibers, particularly the ascending axons of secondary sensory neurons leading to the thalamus.

lemon balm, a perennial herb found in the Mediterranean, Asia, Europe, and North America.

■ USES: It is used for abdominal gas and cramping, and for cold sores, and there is evidence of efficacy.

■ CONTRAINDICATIONS: Its use is not recommended during pregnancy and lactation, in children, or in those with known hypersensitivity to this herb. It should not be used in people with hypothyroidism.

lenalidomide, an antianemic, biological response modifier, hormone.

■ INDICATIONS: This drug is used to treat transfusion-dependent anemia due to low or intermediate-1-risk myelodysplastic syndrome and to treat multiple myeloma in combination with dexamethasone.

■ CONTRAINDICATIONS: Pregnancy, breastfeeding, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include chest pain, hypotension, palpitations, abdominal pain, anorexia, constipation, diarrhea, nausea and vomiting, dysgeusia, xerosis, anemia, leucopenia, pancytopenia, thrombocytopenia, hypokalemia, hypomagnesia, arthralgia, back pain, myalgia, depression, dizziness, fatigue, fever, headache, sweating, peripheral neuropathy, cough, dyspnea, epistaxis, and rhinitis. A life-threatening side effect is pulmonary embolism.

Lenègre's disease /lenāgrāz/ [Jean Lenègre, 20th century French cardiologist, b. 1904], sclerodegeneration of the conduction system of the heart that eventually results in complete heart block.

length of stay (LOS), the period of time a patient remains in a hospital or other health care facility as an inpatient.

Lennox-Gastaut syndrome /len′oks-gästō′/ [William G. Lennox, American neurologist, 1884–1960; Henri Gastaut, French biologist, b. 1914], a condition in which a variety of generalized seizures, such as tonic, atonic, absence, tonic-clonic, akinetic, and myoclonic, begin to appear in the first 5 years of life. Seizures are often intractable and may require multiple antiepileptic medications. Mental retardation is often present. Among suggested causes are inherited metabolic abnormalities and perinatal or postnatal disorders. Also called **Gastaut's disease.**

lens [L, lentil], **1.** a curved transparent piece of plastic or glass that is shaped, molded, or ground to refract light in a specific way, as in eyeglasses, microscopes, or cameras. **2.** *(informal)* the crystalline lens of the eye. See **crystalline lens. —lenticular,** *adj.*

lens capsule, the clear thin elastic capsule that surrounds the lens of the eye. Also called **capsule of the lens.**

lens implant, an artificial lens that is usually implanted at the time of cataract extraction but may also be used for patients with extreme myopia, diplopia, ocular albinism, and certain other abnormalities. The operation is usually performed with a local anesthetic in an outpatient center. Eyedrops containing an antibiotic such as neomycin are instilled before surgery to prevent infection and several times a day for a number of weeks after surgery. After extraction of the cataract, the lens is inserted through a corneal incision. It may be held in place in the anterior chamber by extremely fine sutures to the iris, or, if the lens is implanted into the capsular sac, a miotic agent such as pilocarpine is used to prevent the iris from dilating too widely, which would allow the implant to slip. The implanted lens does not cause the problems with abnormal peripheral vision that are associated with cataract spectacles.

Lente Insulin, a trademark for an intermediate-acting insulin. See also **intermediate-acting insulin.**

lenticonus /len′tikō′nəs/, an abnormal spheric or conic protrusion on the lens of the eye. It is a congenital defect found in Alport's syndrome.

lenticular. See **lens.**

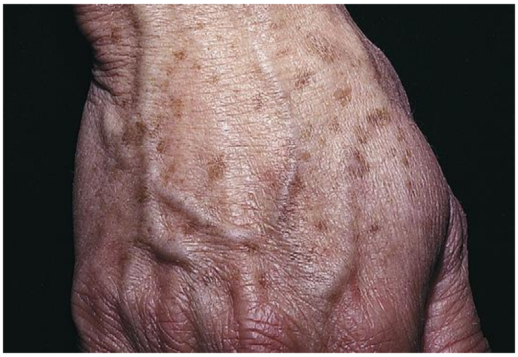
lenticular nucleus /lentik′yələr/ [L, *lens*, lentil, *nucleus*, nut], biconvex basal ganglia of the cerebrum, composed of lateral putamen and medial globus pallidus tissue as part of the corpus striatum.

lentiform /len′tifôrm/ [L, *lens* + *forma*], pertaining to or resembling a lentil shape, such as the lens of the eye.

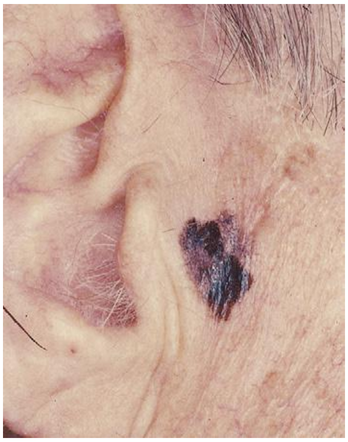
lentigo /lentī′gō/ *pl. lentigines* [L, freckle], a tan or brown macule on the skin brought on by sun exposure, usually in a middle-aged or older person. It is benign, and no treatment is necessary. However, in some cases it may mimic melanoma and should be biopsied. Compare **freckle.**

lentigo maligna. See **Hutchinson's freckle.**

lentigo maligna melanoma, a neoplasm developing from Hutchinson's freckle on the face or other exposed surfaces of the skin in elderly patients. It is asymptomatic, flat, and tan or brown, with irregular darker spots and frequent hypopigmentation. It is one of the major clinical types of melanoma and occurs in 10% to 15% of melanoma patients. See also **nodular melanoma, superficial spreading melanoma.**



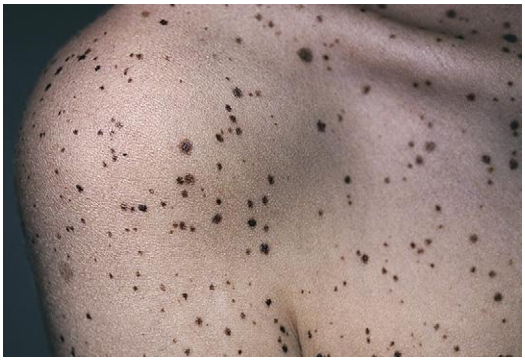
Lentigo *(Callen et al, 2000)*



Lentigo maligna melanoma *(Swartz, 2009)*

lentivirus /len′tivī′rəs/, any member of a genus of retroviruses that have long incubation periods and cause chronic, progressive, usually fatal diseases in humans and other animals. Species include the types of human immunodeficiency virus.

LEOPARD syndrome, a hereditary syndrome transmitted as an autosomal-dominant trait, consisting of multiple lentigines, asymptomatic cardiac defects, and typical coarse facies. It may also be associated with pulmonary stenosis, sensorineural hearing loss, skeletal changes, ocular hypertelorism, and abnormalities of the genitalia. Also called **multiple lentigines syndrome.**



LEOPARD syndrome *(Callen et al, 2000)*

Leopold's maneuver [Christian G. Leopold, German physician, 1846–1911], a series of four steps used in palpating the abdomen of a pregnant woman to determine position and presentation of the fetus.

leper /lep′ər/ [Gk, *lepis,* scaly], an outdated term for a person afflicted with leprosy (Hansen's disease).

lepido-, prefix meaning "flake or scale": *lepidoma, lepidosis*.

lepirudin, a direct thrombin inhibitor.

■ INDICATIONS: It is used to treat heparin-induced thrombocytopenia and other thromboembolic conditions.

■ CONTRAINDICATION: Known hypersensitivity to hirudins prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects of lepirudin include heart failure, pericardial effusion, ventricular fibrillation, multiorgan failure, sepsis, hematuria, hemorrhage, intracranial bleeding, and thrombocytopenia. Other adverse effects include GI bleeding, abnormal liver function tests, abnormal kidney function, pneumonia, and allergic skin reactions. Fever is a common side effect. Drug interactions with NSAIDs, aspirin, salicylates, and antiplatelets may occur. Use of the herbs feverfew, ginkgo, ginger, and valerian may potentiate bleeding. Caution should be used in its use in patients with cirrhosis of the liver.

leprechaunism /lep′rəkän′izəm/, a rare lethal familial condition marked by slow physical and mental development, the elfin facies suggested by the name (wide-set eyes, low-set ears, and hirsutism), and severe endocrine disorders, such as enlargement of the clitoris and breasts in females and of the phallus in males. Also called **Donohue's syndrome.**

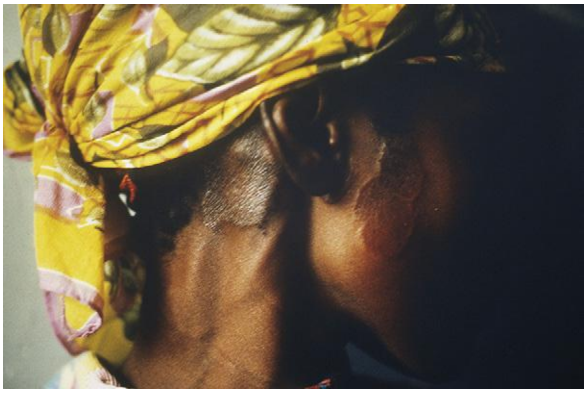
lepro-, prefix meaning "leprosy": *leprologist, lepromatous, leprosarium*.

lepromatous, lepromatous leprosy. See **leprosy.**

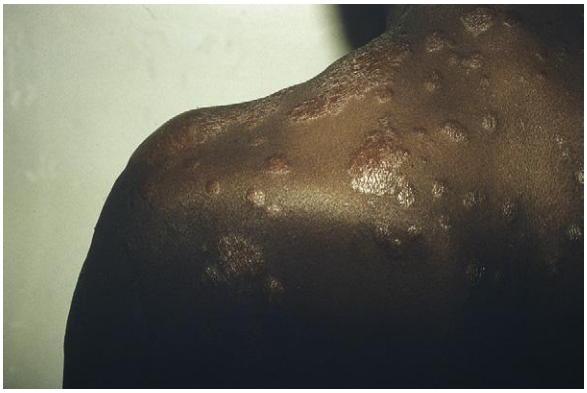
lepromin test /leprō′min/, a skin sensitivity test used to distinguish between the lepromatous and tuberculoid forms of leprosy. The test consists of an intradermal injection of lepromin, which is prepared from heat-sterilized ***Mycobacterium leprae.*** The appearance of a palpable nodule in 8 to 10 days is indicative of the tuberculoid form of leprosy. As no nodule appears in the lepromatous form, the test is not diagnostic of leprosy. The test is used only to follow the course of the disease. See also **leprosy.**

leprosarium /lep′rōser′ē·əm/ [Gk, *lepra,* leprosy], a hospital for persons who have leprosy.

leprosy /lep′rəsē/ [Gk, *lepra*], a chronic communicable disease caused by ***Mycobacterium leprae*** that may take either of two forms, depending on the degree of immunity of the host. **Tuberculoid leprosy,** seen in those with high resistance, presents as thickening of cutaneous nerves and anesthetic, saucer-shaped skin lesions. **Lepromatous leprosy,** seen in those with little resistance, involves many body systems, with widespread plaques and nodules in the skin, iritis, keratitis, destruction of nasal cartilage and bone, testicular atrophy, peripheral edema, and involvement of the reticuloendothelial system. Blindness may result. Death is rare unless amyloidosis or tuberculosis occurs concurrently. Contrary to traditional belief, leprosy is not very contagious, and prolonged intimate contact is required for it to be spread between individuals. Children are more susceptible than adults. Plastic surgery, physical therapy, and psychotherapy are often necessary. Treatment with sulfones such as dapsone continued for several years usually results in improvement of skin lesions, but recovery from nerve impairment is limited. The disease is found mostly in underdeveloped tropic and subtropic countries. In the United States patients may be referred to the U.S. Public Health Service leprosarium in Carville, Louisiana. Bacille Calmette-Guérin vaccine may be at least partially protective against leprosy. Also called **Hansen's disease.** See also ***Mycobacterium.*** **—lepromatous,** *leprotic, leprous, adj.*



Tuberculoid leprosy *(Conlon and Snydman, 2000)*



Lepromatous leprosy *(Conlon and Snydman, 2000)*

-lepsy, -lepsia, -lepsis, suffix meaning a "seizure": *deolepsy, electrolepsy, pyknolepsy*.

-leptic, suffix meaning "a (specified) type of seizure": *cataleptic, epileptic, hypnoleptic*.

leptin /lep′tin/ [Gk, thin], a peptide secreted by adipose tissue. Leptin inhibits neuropeptide Y and is thought to be an appetite suppressant. It increases expenditure of energy when fat stores increase. Excess leptin has been found in some obese humans, but the majority have normal levels of leptin.

lepto-, prefix meaning "slender, small, thin, or delicate": *leptodermic, leptodactylosis*.

leptocyte. See **target cell.**

leptocytosis /lep′tōsītō′sis/ [Gk, *leptos,* thin, *kytos,* cell, *osis,* condition], a hematologic disorder in which target cells are present in the blood. Thalassemia, some forms of liver disease, and hemoglobin C disease are associated with leptocytosis.

leptomeningeal cyst. See **arachnoid cyst.**

leptomeninges /lep′tōminin′jēz/ [Gk, *leptos* + *meninx,* membrane], the arachnoid membrane and the pia mater, two of the three layers covering the brain and spinal cord. Compare **meninges.**

leptomeningitis /-men′injī′tis/, an inflammation of the arachnoid and pia mater layers of the meninges. See also **meningitis.**

leptonema /lep′tənē′mə/ [Gk, *leptos* + *nema,* thread], the threadlike chromosome formation in the leptotene stage in the first meiotic prophase of gametogenesis, before the beginning of synapsis.

Leptospira /-spī′rə/ [Gk, *leptos* + *speira,* coil], a genus of the family Leptospiraceae, order Spirochaetales; tightly coiled microorganisms having spirals with hooked ends. The spirochete thrives in the urine of infected animals, especially rodents; is pathogenic to humans and other mammals; and may cause hepatitis, jaundice, skin hemorrhages, fever, renal failure, mental status changes, and muscular illness. See also **leptospirosis.**

Leptospira interrogans *(Mahon, Lehman, and Manuselis, 2007/ Courtesy Drs. Abelson and Cameron)*

***Leptospira* agglutinin,** an agglutinin found in the blood of patients with leptospirosis.

leptospirosis /lep′tōspīrō′sis/ [Gk, *leptos* + *speira* + *osis,* condition], an acute infectious disease caused by several serotypes of the spirochete *Leptospira interrogans,* considered the most common zoonosis globally. It is transmitted in the urine of infected cattle, horses, pigs, dogs, rodents, or wild animals. Human infections arise directly from bacterial contact with mucous membranes or abraded skin with an infected animal's urine or tissues or indirectly from contact with contaminated water, food, or soil. Occupational contamination accounts for 30% to 50% of the cases. It is increasingly recognized as a disease of recreation. Clinical symptoms may include hepatitis, jaundice, hemorrhage into the skin, fever, chills, renal failure, meningitis with mental status changes, and muscular pain. The spirochete can be isolated from the urine or blood during the acute stage of the disease, and antibodies can be found in the patient's blood during convalescence. Treatment with antibiotics, usually penicillin or doxycycline, may be effective if it is administered during the first few days of the disease. Fluid and electrolyte replacement is essential if jaundice or other signs of severe illness are present. The disease is usually short-lived and mild, but severe infections can damage the kidneys and the liver. Blood pressure and vital signs should be monitored, and the patient's urine should be disposed of carefully to prevent spread of the organism. The most serious form of the disease, Weil's disease, makes up 5% to 10% of leptospirosis cases. Also called **autumn fever, mud fever.** See also **nanukayami.**

leptotene /lep′tətēn/ [Gk, *leptos* + *tainia,* ribbon], the initial stage in the first meiotic prophase in gametogenesis, in which the chromosomes consense and become visible as single, thin filaments. See also **diakinesis, diplotene, pachytene, zygotene.**

leptotrichosis /lep′totriko′sis/, infection with a species of *Leptotrichia*.

leptotrichosis conjunctivae, name given to Parinaud's oculoglandular syndrome when caused by infection with *Leptotrichia*.

Leriche's syndrome /lərēshs′/ [René Leriche, French surgeon, 1879–1955], a vascular disorder marked by gradual occlusion of the terminal aorta, bilateral iliac arteries, or both; intermittent claudication in the buttocks, thighs, or calves; absence of pulsation in femoral arteries; pallor and coldness of the legs; gangrene of the toes; and, in men, impotence. Symptoms are the result of chronic tissue hypoxia caused by inadequate arterial perfusion of the affected areas. Treatment may include endarterectomy, embolectomy, or synthetic bypass graft at the aortic bifurcation.

lesbian /lez′bē·ən/ [Gk, island of Lesbos, home of Sappho], **1.** *n,* a female homosexual. **2.** *adj,* pertaining to the sexual preference or desire of one woman for another. **—***lesbianism, n*.

Lesch-Nyhan syndrome /lesh′ nī′han/ [Michael Lesch, American pediatrician, b. 1939; William L. Nyhan, Jr., American pediatrician, b. 1926], a hereditary disorder of purine metabolism, characterized by mental retardation, self-mutilation of the fingers and lips by biting, impaired renal function, and abnormal physical development. It is transmitted as a recessive, sex-linked trait.

Leser-Trélat sign /lā′zər trālä′/ [Edmund Leser, German surgeon, 1828–1916; Ulysse Trélat, French surgeon, 1828–1890], a condition of malignant cells present in the skin, characterized by the sudden onset of multiple seborrheic keratoses, with pruritus or enlargement of preexisting keratosis in older adults. It is associated with adenocarcinoma of the stomach, breast cancer, and lung cancer.

lesion /lē′zhen/ [L, *laesus,* an injury], **1.** a wound, injury, or pathological change in body tissue. **2.** any visible local abnormality of the tissues of the skin, such as a wound, sore, rash, or boil. A lesion may be described as benign, cancerous, gross, occult, or primary.

lesser circulation. See **pulmonary circulation.**

lesser multangular bone. See **trapezoid bone.**

lesser occipital nerve [AS, *losian,* to lose; L, *occiput,* back of the head, *nervus,* nerve], one of a pair of cutaneous branches of the cervical plexus, arising from the second cervical nerve and ascending along the side of the head behind the ear to supply the skin. It communicates with the posterior auricular branch of the facial nerve.

lesser omentum [AS, *losian,* to lose; L, *omentum,* entrails], a membranous extension of the peritoneum from the peritoneal layers covering the ventral and the dorsal surfaces of the stomach and the first part of the duodenum. The lesser omentum extends from the portal fissure of the liver to the diaphragm, where the layers separate to enclose the end of the esophagus. It also forms two ligaments, one associated with the liver, the hepatogastric ligament, and the other, the hepatoduodenal ligament, with the duodenum. Also called **gastrohepatic omentum, small omentum.**

lesser petrosal nerve, a small nerve originating in the tympanic plexus that carries preganglionic parasympathetic fibers to the otic ganglion.

lesser sciatic foramen, an opening positioned below the attachment of the pelvic floor formed by the lesser sciatic notch of the pelvic bone, the ischial spine, the sacrospinous ligament, and the sacrotuberous ligament. It acts as a route of communication between the perineum and the gluteal region.

lesser sciatic notch [AS, *losian,* to lose; Gk, *ischiadikos,* hip joint; OFr, *enochier*], a notch on the posterior border of the ischium of the hip bone. It is smooth, is coated with cartilage, and has several ridges corresponding to subdivisions of the obturator internus tendon.

Primary skin lesions

Description	*Examples*		
Macule A flat, circumscribed area that is a change in the color of the skin; less than 1 cm in diameter	Freckles, flat moles (nevi), petechiae, measles, scarlet fever		 **Freckles** *(Marks and Miller, 2006)*
Papule An elevated, firm, circumscribed area less than 1 cm in diameter	Wart (verruca), elevated moles, lichen planus		 **Lichen planus** *(Weston, Lane, and Morelli, 2007)*
Patch A flat, nonpalpable, irregular-shaped macule more than 1 cm in diameter	Vitiligo, port-wine stains, mongolian spots, café-au-lait spot		 **Vitiligo** *(White and Cox, 2006)*
Plaque Elevated, firm, and rough lesion with flat top surface greater than 1 cm in diameter	Psoriasis, seborrheic and actinic keratoses		 **Plaque** *(Weston, Lane, and Morelli, 2007)*

Primary skin lesions—cont'd

Description	*Examples*		
Wheal Elevated irregular-shaped area of cutaneous edema; solid, transient; variable diameter	Insect bites, urticaria, allergic reaction		 **Wheal** *(Weston, Lane, and Morelli, 2007)*
Nodule Elevated, firm, circumscribed lesion; deeper in dermis than a papule; 1 to 2 cm in diameter	Erythema nodosum, lipomas		 **Nodule** *(Marks and Miller, 2006)*
Tumor Elevated and solid lesion; may or may not be clearly demarcated; deeper in dermis; greater than 2 cm in diameter	Neoplasms, benign tumor, lipoma, hemangioma		 **Hemangioma** *(Marks and Miller, 2006)*
Vesicle Elevated, circumscribed, superficial, not into dermis; filled with serous fluid; less than 1 cm in diameter	Varicella (chickenpox), herpes zoster (shingles)		 **Vesicles caused by zoster** *(Weston, Lane, and Morelli, 2007)*

Continued

Primary skin lesions—cont'd

Description	*Examples*		
Bulla Vesicle greater than 1 cm in diameter	Blister, pemphigus vulgaris		 **Bullous pemphigoid** *(White and Cox, 2006)*
Pustule Elevated, superficial lesion; similar to a vesicle but filled with purulent fluid	Impetigo, acne		 **Acne** *(Weston, Lane, and Morelli, 2007)*
Cyst Elevated, circumscribed, encapsulated lesion; in dermis or subcutaneous layer; filled with liquid or semisolid material	Sebaceous cyst, cystic acne		 **Sebaceous cyst** *(Weston, Lane, and Morelli, 2007)*
Telangiectasia Fine, irregular red lines produced by capillary dilation	Telangiectasia in rosacea		 **Telangiectasia** *(White and Cox, 2006)*

From Seidel et al: *Mosby's guide to physical examination*, ed 7, St Louis, 2011, Mosby. Modified from Thompson JM, Wilson SF: *Health assessment for nursing practice*, ed 2, St Louis, 2001, Mosby.

Secondary skin lesions

Description	*Examples*		
Scale Heaped-up keratinized cells; flaky skin; irregular; thick or thin; dry or oily; variation in size	Flaking of skin with seborrheic dermatitis after scarlet fever, or flaking of skin after a drug reaction; dry skin		 **Scale** *(Marks and Miller, 2006)*
Lichenification Rough, thickened epidermis secondary to persistent rubbing, itching, or skin irritation; often involves flexor surface of extremity	Chronic dermatitis		 **Atopic dermatitis** *(Marks and Miller, 2006)*
Keloid Irregular-shaped, elevated, progressively enlarging scar; grows beyond the boundaries of the wound; caused by excessive collagen formation during healing	Keloid formation after surgery		 **Keloid** *(Weston, Lane, and Morelli, 2007)*
Scar Thin to thick fibrous tissue that replaces normal skin following injury or laceration to the dermis	Healed wound or surgical incision		 **Hypertrophic scar** *(White and Cox, 2006)*

Continued

Secondary skin lesions—cont'd

Description	*Examples*		
Excoriation Loss of the epidermis; linear hollowed-out crusted area	Abrasion or scratch, scabies		 **Scabies** *(Weston, Lane, and Morelli, 2007)*
Fissure Linear crack or break from the epidermis to the dermis; may be moist or dry	Athlete's foot, cracks at the corner of the mouth		 **Fissure** *(Weston, Lane, and Morelli, 2007)*
Erosion Loss of part of the epidermis; depressed, moist, glistening; follows rupture of a vesicle or bulla	Varicella, variola after rupture		 **Erosion** *(Marks and Miller, 2006)*
Ulcer Loss of epidermis and dermis; concave; varies in size	Decubiti, stasis ulcers		 **Stasis ulcer** *(Marks and Miller, 2006)*

Secondary skin lesions—cont'd

Description	*Examples*		
Crust Dried serum, blood, or purulent exudate; slightly elevated; size varies; brown, red, black, tan, or straw.	Scab on abrasion, eczema		 **Scab** *(Seidel et al, 2011)*
Atrophy Thinning of skin surface and loss of skin markings; skin translucent and paperlike	Striae; aged skin		 **Striae** *(Seidel et al, 2011/Courtesy Dr. Antoinette Hood, Department of Dermatology, University of Indiana, Department of Medicine)*

From Seidel et al: *Mosby's guide to physical examination,* ed 7, St Louis, 2011, Mosby. Modified from Thompson JM, Wilson SF: *Health assessment for nursing practice,* ed 2, St Louis, 2001, Mosby.

lesser trochanter, one of a pair of conic projections on the shaft of the femur, just below the neck. It is the site of insertion of the psoas major muscle. Also called **trochanter minor.** Compare **greater trochanter.**

LET, abbreviation for **linear energy transfer.**

Letairis, a trademark for **ambrisentan.**

let-down, a sensation in the breasts of lactating women that often occurs as the milk flows into the ducts. It may occur when the infant begins to suck or when the mother hears the baby cry or even thinks of nursing the child.

let-down reflex. See **milk ejection reflex.**

lethal /lēʹthəl/, deadly, capable of causing death.

lethal allele, an allele that produces a phenotypic effect that causes the death of the organism at any stage of life. The allele may be dominant, incompletely dominant, or recessive. Human diseases caused by lethal genes include Huntington's disease, which is transmitted as an autosomal-dominant trait, and sickle cell anemia, which shows recessive lethality. Compare **sublethal allele.** See also **lethal equivalent.**

lethal dose (LD), the amount of toxin that produces death in all members of a species population within a specified period of time. See also **median lethal dose.**

lethal equivalent [L, *letum,* death, *aequus,* equal, *valere,* to be strong], a recessive allele carried in the heterozygous state that would be lethal in the homozygous state, or any combination of alleles, each with slightly deleterious effects, that are equivalent to such an allele. It is estimated that a person carries an average of three to eight lethal equivalents. See also **lethal allele.**

lethality /lēthalʹitē/, the probability that a person threatening suicide will succeed, based on the method described, the specificity of the plan, and the availability of the means.

lethargic encephalitis. See **epidemic encephalitis.**

lethargy /lethʹərjē/ [Gk, *lethargos,* forgetful], the state or quality of dullness, prolonged sleepiness, sluggishness, or serious drowsiness. Compare **stupor. —lethargic,** *adj.*

letrozole, an antineoplastic nonsteroidal aromatase inhibitor.

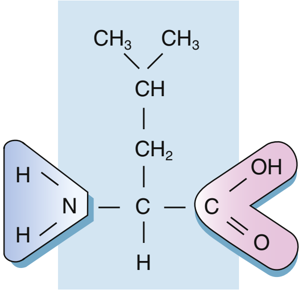
- ■ INDICATION: It is used to treat metastatic breast cancer in postmenopausal women.
- ■ CONTRAINDICATIONS: Known hypersensitivity and pregnancy prohibit its use.
- ■ ADVERSE EFFECTS: Hepatotoxicity is a life-threatening effect of this drug. Other adverse effects include dyspnea, cough, constipation, heartburn, diarrhea, alopecia, sweating, hot flashes, hypertension, somnolence, dizziness, depression, and anxiety. Common side effects include nausea, vomiting, anorexia, rash, pruritus, headache, and lethargy.

Letterer-Siwe syndrome /letʹərər zēʹvə/ [Erich Letterer, German pathologist, b. 1895; Sture A. Siwe, Swedish physician, 1897–1966], any of a group of acquired malignant neoplastic diseases of unknown origin, characterized by histiocytic elements. The syndrome, fatal when untreated, occurs in infancy. Anemia, hemorrhage, splenomegaly, lymphadenopathy, and localized tumefactions over bones are usually present.

letter quality printer, an electronic printer that produces characters resembling those of a typewriter in production quality. Laser printers and daisywheel printers produce letter-quality copy, as do some inkjet printers. Dot matrix printers produce near–letter-quality documents.

Leu, abbreviation for **leucine.**

leucine (Leu) /lo͞o′sēn/ [Gk, *leukos,* white], a white crystalline essential amino acid required for optimal growth in infants and nitrogen equilibrium in adults. It cannot be synthesized by the body and is obtained by the hydrolysis of food protein during digestion. An inherited defect in one of the enzymes involved in the process results in a rare disorder called maple syrup urine disease. See also **amino acid, leucinosis, maple syrup urine disease.**



Chemical structure of leucine

leucine aminopeptidase (LAP) test, a blood or 24-hour urine test that detects levels of LAP, used primarily in diagnosing liver, pancreas, and small intestine disorders and in the differential diagnosis of increased levels of alkaline phosphatase.

leucinosis /lo͞o′sinō′sis/ [Gk, *leukos* + *osis,* condition], a condition in which the pathways for the degradation of leucine are blocked and large amounts of the amino acid accumulate in body tissue, producing leucine in the urine. See also **leucine.**

leuco-. See **leuko-.**

leucocyte. See **leukocyte.**

leucocyte migration inhibition factor. See **macrophage migration inhibiting factor.**

leucocytopenia. See **leukopenia.**

leucocytosis. See **leukocytosis.**

leucoderma. See **leukoderma.**

leuconychia. See **leukonychia.**

leucopenia. See **leukopenia.**

leucophoresis. See **leukophoresis.**

leucopoiesis. See **leukopoiesis.**

leucorrhoea. See **leukorrhea.**

leucovorin. See **folinic acid.**

leucovorin calcium /lo͞o′kəvôr′in/, a reduced form of folic acid that can be used immediately for nucleic acid synthesis.

■ INDICATIONS: It is prescribed in the treatment of an overdose of a folic acid antagonist and certain cases of megaloblastic anemia. It is also used for leucovorin "rescue" after high-dose methotrexate therapy in osteosarcoma to diminish the toxicity of the methotrexate.

■ CONTRAINDICATIONS: Anemia caused by vitamin B_{12} deficiency or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Hypersensitivity reactions may occur.

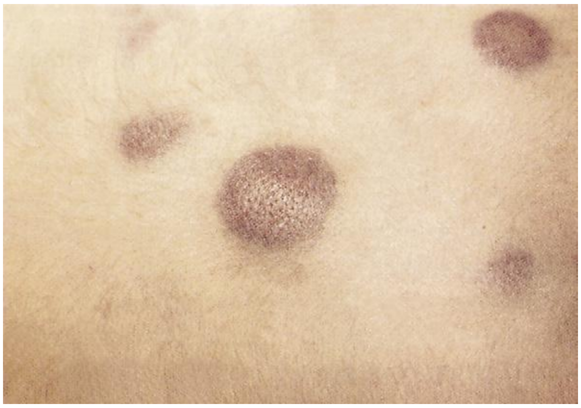
leukaemia. See **leukemia.**

leukapheresis /lo͞o′kəfərē′sis/ [Gk, *leukos* + *aphairesis,* removal], a donation process by which blood is withdrawn from a vein, white blood cells are selectively removed, and the remaining blood is reinfused into the donor. It is a treatment or supportive care measure in patients with leukocytopenia. Compare **plasmapheresis, plateletpheresis.** See also **apheresis.**

leukemia /lo͞okē′mē·ə/ [Gk, *leukos* + *haima,* blood], a group of malignant neoplasms of hematopoietic tissues characterized by diffuse replacement of bone marrow or lymph nodes with proliferative white blood cell precursors. Peripheral blood WBC counts become elevated and immature or variant forms appear in the peripheral blood. Leukemia may be chronic or acute, lymphoid, myeloid, or erythroid. In some chronic leukemias, when untreated, the WBC count becomes grossly elevated and the blood may appear whitish, giving leukemia its name. Also spelled *leukaemia*. See also **acute childhood leukemia, acute lymphocytic leukemia, acute myelocytic leukemia. —leukemic,** *adj.*

-leukemia, suffix meaning an "increased number of leukocytes in the tissues and/or in the blood": *chloroleukemia, erythroleukemia, hypoleukemia.*

leukemia cutis, a condition of the skin in which yellow-brown, red, or purple nodular lesions form localized or general diffuse infiltrations. Also called **lymphoderma perniciosa.**



Leukemia cutis *(Weston, Lane, and Morrelli, 2007)*

leukemia inhibitory factor (LIF), a cytokine named for its ability to suppress the spontaneous proliferation of lymphoid stem cells.

leukemic. See **leukemia.**

leukemic hiatus, a condition observed in acute myelogenous leukemia in which there are numerous myeloblasts and a number of mature neutrophils in the peripheral blood, with few or no intermediate forms.

leukemic reticuloendotheliosis. See **hairy-cell leukemia.**

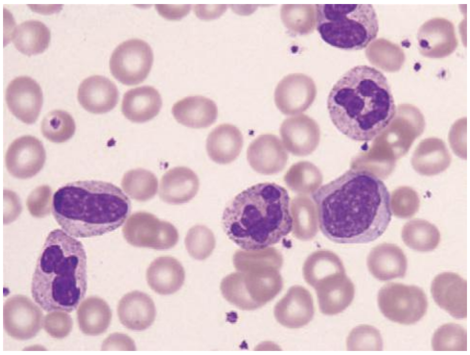
leukemoid /lo͞okē′moid/, resembling leukemia.

leukemoid reaction [Gk, *leukos* + *eidos,* form; L, *re,* again, *agere,* to act], a clinical syndrome resembling leukemia in which the white blood cell count is elevated in response to an allergy, inflammatory disease, infection, poison, hemorrhage, burn, or severe physical stress. Compare **leukemia.**

Leukeran, a trademark for an antineoplastic **(chlorambucil).**

-leukin, suffix for interleukin-2-type products.

leuko-, leuco-, prefix meaning "white corpuscle or white": *leukocytopenia, leukocytosis.*



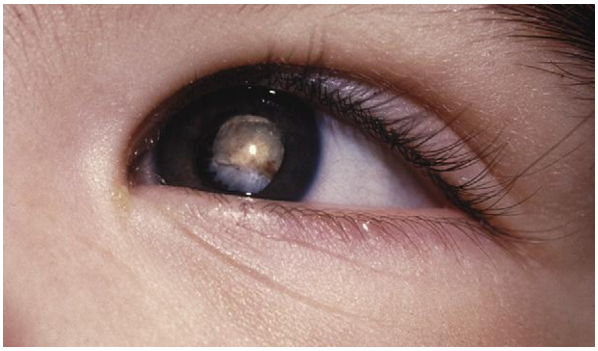
Leukemoid reaction *(McPherson and Pincus, 2011)*

leukoagglutinin /lo͞o′kō·aglo͞o′tinin/, an antibody that causes white blood cells to adhere to one another.

leukoagglutinin test, a blood test to determine whether WBC incompatibility is the source of transfusion reaction in patients who have undergone complete compatibility testing.

leukoblast /lo͞o′kəblast/ [Gk, *leukos,* white, *blastos,* germ], an immature leukocyte, or white blood cell. Not in common usage.

leukocoria /lo͞o′kōkor′ē·ə/ [Gk, *leukos,* white + *korē,* pupil]. See **cat's eye amaurosis.**

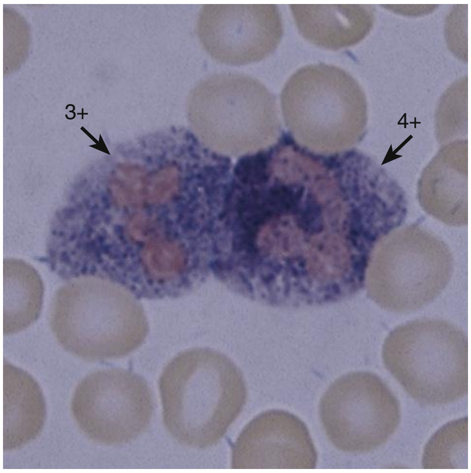


Leukocoria *(Kanski and Bowling, 2011/Courtesy K. Nischal)*

leukocyte /lo͞o′kəsīt/ [Gk, *leukos* + *kytos,* cell], a blood cell that participates in immunity and inflammation. Five categories of leukocytes are classified by nuclear appearance and the presence or absence of granules in the cytoplasm. Lymphocytes have no granules or a few scattered azurophilic granules. The granulocytes are monocytes, neutrophils, basophils, and eosinophils. White cells are able to pass through endothelial gap junctions by diapedesis and migrate by ameboid movements. Leukocytes measure 8 to 20 µm in diameter. Normal WBC counts vary from 4500 to 11,500 leukocytes per µL. Leukocytes function as phagocytes of bacteria, fungi, and viruses; detoxifiers of proteins that may result from allergic reactions and cellular injury; and immune system cells. Also spelled **leucocyte.** Also called **white blood cell, white corpuscle.** Compare **erythrocyte, platelets.** See also **complete blood count, differential white blood cell count, leukocytosis, leukopenia.** —**leukocytic,** *adj.*

leukocyte adhesion deficiency (LAD), an autosomal inherited disorder caused by a defective integrin molecule (CD18) that is important for cellular adhesion. This defect causes neutrophils to be immotile and unable to phagocytose. Patients with LAD have recurring bacterial infections and impaired wound healing, which may lead to necrosis and gangrene.

leukocyte alkaline phosphatase (LAP), an enzyme present in lymphocytes that is elevated in various diseases such as cirrhosis and polycythemia and in certain infections. It is measured in the blood to detect these disorders and to differentiate chronic myelogenous (myelocytic) leukemia from leukemoid reactions. Normal amounts of this enzyme in a smear of fresh venous blood are 50 to 150 units. Also called **neutrophil alkaline phosphatase.**



Leukocyte alkaline phosphatase reaction
(Carr and Rodak, 2008)

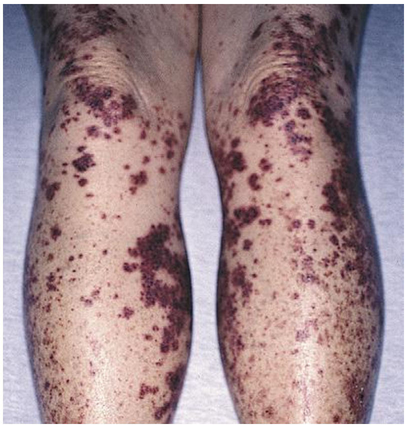
leukocyte emigration, the passage (diapedesis) of leukocytes through the endothelial gap junctions of blood vessels in inflammation.

leukocyte migration inhibition factor. See **macrophage migration inhibiting factor.**

leukocytic, pertaining to white blood cells. See **leukocyte.**

leukocytic crystal. See **Charcot-Leyden crystal.**

leukocytoclastic vasculitis /lo͞o′kəsī′təklas′tik/, an allergic inflammation of blood vessels, characterized by deposits of fragmented cells, nuclear dust, necrotic debris, and fibrin staining in the vessels. Many patients develop skin lesions, particularly on the legs, accompanied by arthralgia and fever. The disorder is seen in rheumatoid arthritis and other diseases.



Leukocytoclastic vasculitis: characteristic skin lesions
(Callen et al, 2000)

leukocytogenesis /-jen′əsis/, the origin and development of leukocytes.

leukocytopenia. See **leukopenia.**

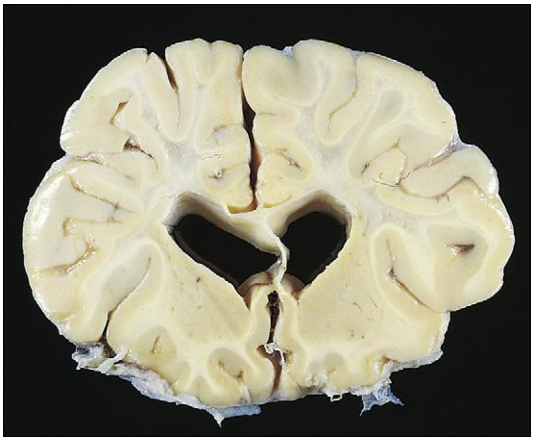
leukocytopoiesis. See **leukopoiesis.**

leukocytosis /lo͞o′kōsītō′sis/ [Gk, *leukos* + *kytos,* cell, *osis,* condition], an abnormally elevated total peripheral white blood cell count, often associated with bacterial infection. Extreme elevations may be associated with leukemia. Kinds of leukocytosis include *basophilia,* **eosinophilia,** and **neutrophilia.** Also spelled **leucocytosis.** Compare **leukemia, leukemoid reaction, leukopenia.** See also **leukocyte.**

leukocyturia /lo͞o′kəsītŏŏr′ē·ə/, the presence of white blood cells in the urine.

leukoderma /lo͞okōdur′mə/ [Gk, *leukos* + *derma,* skin], localized loss of skin pigment caused by several specific causes. Compare **vitiligo.** Also spelled **leucoderma.**

leukodystrophy /-dis′trəfē/ [Gk, *leukos,* white, *dys* + *trophe,* nourishment], a disease of the white matter of the brain, characterized by demyelination. See also **leukoencephalopathy.**



Leukodystrophy *(Kumar, Cotran, and Robbins, 2003)*

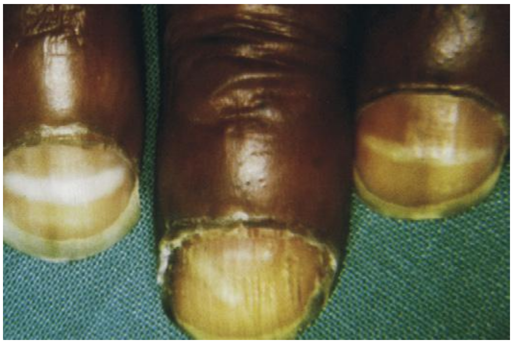
leukoencephalopathy /lo͞o′kō·ən·sef′əlop′əthē/ [Gk, *leukos,* white + *enkephalos,* brain + *pathos,* disease], any of a group of diseases affecting the white matter of the brain, especially of the cerebral hemispheres, occurring as a rule in infants and children. The term **leukodystrophy** is used to denote such disorders resulting from a defect in the formation and the maintenance of myelin in infants and children.

leukoerythroblastic /lo͞o′kō·erith′rōblas′tik/ [Gk, *leukos* + *erythros,* red, *blastos,* germ, *a* + *haima,* not blood], the presence of immature red blood cells and granulocytes in the peripheral blood and bone marrow, often associated with primary myelofibrosis and other myeloproliferative neoplasms. See also **myeloid metaplasia, myelophthisic anemia.**

leukokoria. See **leukocoria.**

leukonychia /lo͞o′kōnik′ē·ə/ [Gk, *leukos* + *onyx,* nail], a benign condition in which white patches appear under the nails. Trauma, infection, and many disorders can cause white spots or streaks on nails. Also spelled **leuconychia.**

leukopenia /lo͞o′kōpē′nē·ə/ [Gk, *leukos* + *penes,* poor], an abnormal decrease in the total peripheral blood white cell count, often associated with chemotherapy or radiation. Leukopenia may result from an idiosyncratic drug reaction and may be seen in acute myeloblastic leukemia. Also spelled **leucopenia.** Also called **leucocytopenia.** Compare **aleukia, leukocytosis.** See also **aplastic anemia, leukocyte.** —*leukopenic, adj.*



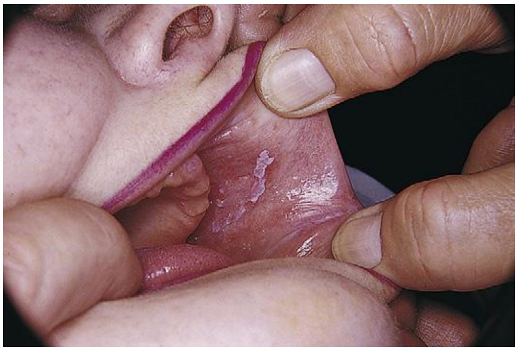
Leukonychia *(Hordinsky, Sawaya, and Scher, 2000)*

leukopenic leukemia. See **aleukemic leukemia.**

leukophlegmasia. See **phlegmasia alba dolens.**

leukophoresis /lo͞o′kōfərē′sis/ [Gk, *leukos* + *phoresis,* being transmitted], a laboratory procedure in which blood is drawn and white blood cells are separated from the blood and the red blood cells are returned to the patient. Also spelled **leucophoresis.**

leukoplakia /lo͞o′kōplā′kē·ə/ [Gk, *leukos* + *plakos,* plate], a precancerous, slowly developing change in a mucous membrane characterized by thickened, white, firmly attached patches that are slightly raised and sharply circumscribed. They may occur on the penis or vulva. Those appearing on the lips and buccal mucosa are associated with pipe smoking. Malignant potential is evaluated by microscopic study of biopsied tissue. Compare **lichen planus.** See also **lichen sclerosis et atrophicus.**



Leukoplakia *(Callen et al, 2000)*

leukoplakic vulvitis /-plā′kik/ [Gk, *leukos,* white, *plakos,* plate, *vulva* + *itis,* inflammation], a condition in which the skin of the vulva becomes thick and white, develops bleeding fissures, and later becomes atrophic. The condition may progress to cancer.

leukopoiesis /lo͞o′kōpō·ē′sis/ [Gk, *leukos* + *poiein,* to make], the production of white blood cells. Monocytes, neutrophils, basophils, and eosinophils are produced from bone marrow myeloblasts. Lymphocytes develop from lymphoblastic precursors in peripheral lymphoid tissue. Also spelled **leucopoiesis.** Also called **leukocytopoiesis.** —*leukopoietic, adj.*

leukorrhea /lo͞o′kôrē′ə/ [Gk, *leukos* + *rhoia,* flow], a white discharge from the vagina. Normally, vaginal discharge occurs in regular variations of amount and consistency during the course of the menstrual cycle. A greater than usual amount is normal in pregnancy, and a decrease is to be expected after delivery, during lactation, and after menopause. Leukorrhea is the most common reason for women to seek gynecological care. Also spelled **leucorrhoea.** See also **vaginal discharge.**

leukosarcoma. See **lymphoma.**

leukostasis, increased blood viscosity and tendency to clotting, seen in leukemia that is accompanied by hyperleukocytosis.

leukotomy. See **lobotomy.**

leukotoxin /lo͞o′kətok′sin/ [Gk, *leukos* + *toxikon,* poison], a substance that can inactivate or destroy leukocytes. *—leukotoxic, adj.*

leukotrienes /lo͞o′kətrī′ēnz/, a class of biologically active compounds that occur naturally in leukocytes and produce allergic and inflammatory reactions similar to those of histamine. They are thought to play a role in the development of allergic and autoallergic diseases such as asthma, rheumatoid arthritis, inflammatory bowel disease, and psoriasis.

leukovirus /lo͞o′kəvī′rus/ [Gk, *leukos,* white; L, *virus,* poison], a former genus composed of ribonucleic acid tumor viruses now included in the family Retroviridae.

leuprolide acetate /lo͞o′prōlīd/, an analog of gonadotropin-releasing hormone. It is an agonist administered at levels that desensitize the pituitary gland from responding to it or to endogenous gonadotropin-releasing hormone, thereby preventing pituitary stimulation of sex hormone production by the ovaries or testes.

■ INDICATIONS: It is used for the palliative treatment of advanced prostatic cancer, in the management of endometriosis, and for the treatment of children with central precocious puberty.

■ CONTRAINDICATIONS: Caution should be exercised during the beginning of leuprolide acetate therapy when symptoms of bone pain, urinary obstruction, and neurological problems may increase. Known hypersensitivity to the drug or pregnancy prohibits its uses.

■ ADVERSE EFFECTS: Among adverse effects reported are hot flashes, transient increases in testosterone levels, dizziness, pain, headache, decreased libido, impotence, and injection site irritation.

levalbuterol, an adrenergic beta$_2$-agonist.

■ INDICATIONS: It is used in the treatment and prevention of bronchospasm (reversible obstructive airway disease).

■ CONTRAINDICATIONS: Tachydysrhythmias, severe cardiac disease, and known hypersensitivity to sympathomimetics prohibit its use.

■ ADVERSE EFFECTS: Among adverse effects are insomnia, headache, dizziness, stimulation, hallucinations, flushing, irritability, dry nose, irritation of the nose and throat, palpitations, tachycardia, hypertension, angina, hypotension, arrhythmias, heartburn, nausea, vomiting, and muscle cramps. Common side effects include tremors, anxiety, and restlessness.

levamisole, an immunomodulator used as an adjuvant treatment in combination with fluorouracil after surgical resection in patients with Dukes' stage C colon cancer.

levarterenol bitartrate. See **norepinephrine bitartrate.**

levator /livā′tər/ *pl.* **levatores** [L, *levare,* to lift up], **1.** a muscle that raises a structure of the body, as the levator ani raises parts of the pelvic diaphragm. **2.** a surgical instrument used to lift depressed bony fragments in fractures of the skull and other bones.

levator anguli oris, a deeply placed oral muscle arising from the maxilla that elevates the corner of the mouth and may help deepen the furrow between the nose and the corner of the mouth during sadness.

levator ani, one of a pair of muscles of the pelvic diaphragm that stretches across the bottom of the pelvic cavity like a hammock, supporting the pelvic organs. It is a broad thin muscle that separates into the pubococcygeus and the iliococcygeus. It originates from the ramus of the pubic bone, the spine of the ischium, and a band of fascia between the pubis and the ischium; it inserts into the last two segments of the coccyx, the anococcygeal raphe, the sphincter ani externus, and the central tendinous point of the perineum. The left and right levator ani muscles are divided ventrally but converge as a single sheet across the midline dorsally, forming most of the pelvic diaphragm. The levator ani is innervated by branches of the pudendal plexus, which contains fibers from the fourth sacral nerve. It functions to support and slightly raise the pelvic floor. The pubococcygeus draws the anus toward the pubis and constricts it. Compare **coccygeus.**

levatores. See **levator.**

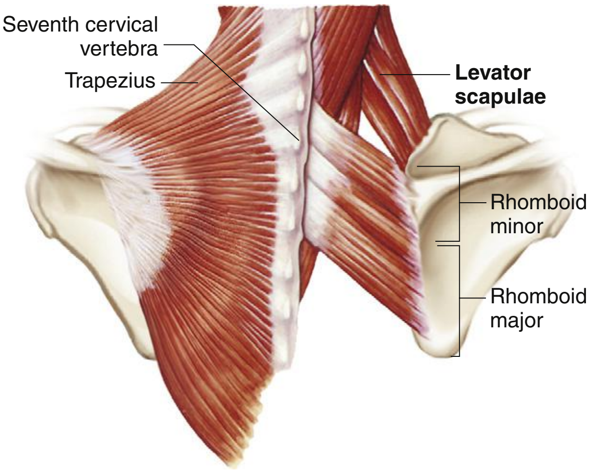
levatores costarum, muscles of the thoracic wall that together with muscles between the vertebrae and ribs posteriorly alter the position of the ribs and sternum and so change thoracic volume during breathing.

levator labii superioris, an oral muscle arising from the maxilla just superior to the infraorbital foramen that deepens the furrow between the nose and the corner of the mouth during sadness.

levator labii superioris alaeque nasi, an oral muscle medial to the levator labii superioris that arises from the maxilla next to the nose and inserts into both the alar cartilage of the nose and the skin of the upper lip. It may assist in flaring the nares.

levator palpebrae superioris, one of the three muscles of the eyelid, also considered an extrinsic muscle of the eye. It is thin and flat and rises from the small wing of the sphenoid. It is innervated by the oculomotor nerve. It elevates the upper eyelid and is the antagonist of the orbicularis oculi. Compare **corrugator supercilii, orbicularis oculi.**

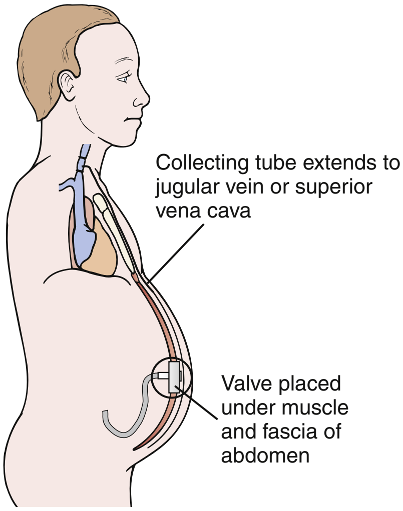
levator scapulae, a muscle of the dorsal and lateral aspects of the neck. It arises from the axis and the atlas, and it inserts into the transverse processes of the four upper cervical vertebrae. It is innervated by the third and fourth cervical nerves and acts to raise the scapula and pull it toward the midline.



Levator scapulae *(Patton and Thibodeau, 2010)*

levator veli palatini, one of the muscles originating from the base of the skull that elevate the palate above neutral position and close the pharyngeal isthmus between the nasopharynx and oropharynx.

LeVeen shunt [Harry H. LeVeen, American surgeon, b. 1914], a tube that is surgically implanted to connect the peritoneal cavity and the superior vena cava to drain accumulated fluid from the peritoneal cavity. It is used in cirrhosis of the liver, right-sided heart failure, or abdominal cancer. Before surgery a sodium-restricted diet and diuretics are used to decrease sodium and water retention. With the patient under general anesthesia, a silicone rubber tube is inserted under the subcutaneous tissue from the peritoneal cavity to the superior vena cava. As the patient inhales, the fluid pressure in the peritoneal cavity increases, and that in the blood vessel falls, allowing peritoneal fluid to enter the shunt valve. After surgery the patient is closely observed for signs of occlusion of the shunt, GI bleeding, or leakage of peritoneal fluid from the incision. Excessive dilution of the blood may lead to coagulation abnormalities.



Collecting tube extends to jugular vein or superior vena cava
Valve placed under muscle and fascia of abdomen

LeVeen shunt *(Lewis et al, 2007)*

level of activities [OFr, *livel* + L, *activus*], pertaining to the hierarchy of nervous system activity that determines the level responsible for certain functions while also being controlled by a higher level, as in the sequence of events in a reflex action.

level of consciousness (LOC) [OFr, *livel* + L, *conscire,* to be aware of], a degree of cognitive function involving arousal mechanisms of the reticular formation of the brain. The stages of response of the mind to stimuli vary from unconsciousness through vague awareness to full attention. The usual standard levels include coma, in which the patient does not appear to be aware of the environment; stupor, in which the patient is vaguely aware of the environment; drowsiness, in which the patient responds to stimuli but may be slow to react; and alert wakefulness. Impaired LOC may be expressed in obtundation or reduced alertness, stupor, syncope, or unresponsiveness. See also **Glasgow Coma Scale, preconscious, subconscious.**

level of inquiry [OFr, *livel* + *inquirere,* to ask about], (in nursing research) one of the levels in a rank-ordered system of classification and organization of the questions to be answered in a research study. The level of inquiry is determined by an analysis of the theory to be developed or tested and the kinds of data to be collected. Studies that describe comprise the first level, whereas those that explain comprise the second level. Those that prescribe or predict are the most difficult to answer or to support.

levels of care, a classification of health care service levels by the kind of care given, the number of people served, and the people providing the care. Kinds of health care service levels are **primary health care, secondary health care,** and **tertiary health care.**

lever /lē′vər, lev′ər/ [L, *levare,* to lift up], any one of the numerous bones and associated joints of the body that act as a simple machine so that force applied to one end of the bone tends to rotate the bone in the direction opposite from that of the applied force. The muscles of the body produce the forces that move the levers. The basic components of a lever are the fulcrum, the force arm, and the weight arm. A first-class lever, such as the joint between the base of the skull and the first cervical vertebra, has a fulcrum between the weight and the applied force. The body contains few second-class levers, which have the weight between the fulcrum and the force. A third-class lever, such as the forearm and elbow, has the force between the fulcrum and the weight. The body uses its third-class levers for speed and its first-class levers for either force or speed, depending on the force applied to the weight arm.

levetiracetam, an anticonvulsant.
- ■ INDICATION: It is used to treat partial onset seizures.
- ■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.
- ■ ADVERSE EFFECTS: Adverse effects include lowered hematocrit, lowered hemoglobin, infection, dizziness, somnolence, and asthenia.

Lévi-Lorain dwarf. See **pituitary dwarf.**

Levine, Myra Estrin, (1920–1996), a nursing theorist who developed a framework for nursing practice with the formulation of Four Conservation Principles: energy, structural integrity, personal integrity, and social integrity. The first edition of her book discussing the conservation principles, *Introduction to Clinical Nursing,* was published in 1969. Levine's emphasis on the ill person in the health care setting reflects the history of health care in the 1960s. Levine's model stresses nursing interventions and interactions based on the scientific background of these principles. Levine viewed people in a holistic manner, having their own environment, both internal and external. She identified four levels of integration that help a person maintain his or her integrity or wholeness: fight or flight, inflammatory response, response to stress, and perceptual response. The individual's stability is organized by his or her availability of responses and adaptation processes. It is the nurse's task to bring a body of scientific principles on which decisions are based into the situation shared with the patient.

Levin tube /lev′in/ [Abraham L. Levin, American physician, 1880–1940], a plastic catheter introduced through the nose and used in gastric intubation for gastric decompression or gavage feeding. Compare **Miller-Abbott tube.** See also **gastric intubation.**

levitation /lev′itā′shən/ [L, *levitas,* lightness, *atus,* process], (in psychiatry) a hallucinatory sensation of floating or rising in the air. **—***levitate, v.*

Levitra, a trademark for **vardenafil.**

levo-, prefix meaning "left": *levocardia, levoclination, levotorsion.*

levobetaxolol /le′vobatak′sälol/, a cardioselective beta-adrenergic blocking agent used in the form of the hydrochloride salt, administered topically to the conjunctiva in treatment of glaucoma and ocular hypertension.

levobunolol /le′vobu′nolol/, a beta-adrenergic blocking agent used in treatment of glaucoma and ocular hypertension, applied topically to the conjunctiva as the hydrochloride salt.

levobunolol hydrochloride /-bun′əlol/, a topical ophthalmic beta-adrenergic blocker drug for glaucoma.

■ INDICATIONS: It is prescribed for the treatment of chronic open-angle glaucoma and ocular hypertension.

■ CONTRAINDICATIONS: It is contraindicated for patients with bronchial asthma, severe chronic obstructive pulmonary disease, sinus bradycardia, second- or third-degree atrioventricular block, overt cardiac failure, or cardiogenic shock.

■ ADVERSE EFFECTS: Adverse effects may include transient ocular burning or stinging, bradycardia, pulmonary edema, and blepharoconjunctivitis.

levobupivacaine, a local anesthetic.

■ INDICATIONS: It is used for local and regional anesthesia, for pain management, and for continuous epidural analgesia.

■ CONTRAINDICATIONS: Severe liver disease and known hypersensitivity to this drug contraindicate its use. It is also contraindicated in children less than 12 years of age and in the elderly.

■ ADVERSE EFFECTS: Life-threatening effects are convulsions, loss of consciousness, myocardial depression, cardiac arrest, arrhythmias, fetal bradycardia, status asthmaticus, respiratory arrest, and anaphylaxis. Other adverse effects include anxiety, restlessness, drowsiness, disorientation, tremors, shivering, bradycardia, hypotension, hypertension, nausea, vomiting, blurred vision, tinnitus, pupil constriction, rash, urticaria, allergic reactions, edema, burning, skin discoloration at the injection site, and tissue necrosis.

levocabastine /le′vokab′ästēn/, an antihistamine applied topically to the conjunctiva as the hydrochloride salt to treat seasonal allergic conjunctivitis.

levocardia /-kär′dē·ə/, a congenital anomaly in which the viscera are transposed to the opposite side of the body, except for the heart, which is in its normal position.

levocarnitine /-kär′nitēn/, an oral drug for carnitine deficiency.

■ INDICATION: It is prescribed for the treatment of primary systemic carnitine deficiency.

■ CONTRAINDICATION: It should not be given to patients with a known hypersensitivity to carnitine.

■ ADVERSE EFFECTS: Adverse effects include nausea, dizziness, vomiting, abdominal cramps, diarrhea, and body odor.

levocetirizine, a low-sedating antihistamine.

■ INDICATIONS: This drug is used to treat perennial or seasonal rhinitis, allergy symptoms, and chronic idiopathic urticaria.

■ CONTRAINDICATIONS: Breastfeeding, end-stage renal disease, dialysis, and known hypersensitivity to this drug, cetirizine, or hydroxyzine prohibit its use. Children from 6 to 11 years of age with renal disease should not take this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include asthenia, dry mouth, increased liver function tests, and transient rash. Common side effects include drowsiness and fatigue.

levoclination. See **levotorsion.**

levodopa /lē′vōdō′pə/, an antiparkinsonian agent.

■ INDICATIONS: It is prescribed in the treatment of Parkinson's disease, juvenile forms of Huntington's disease when rigidity is the main feature, and chronic manganese poisoning (which can lead to Parkinson-like symptoms in welders).

■ CONTRAINDICATIONS: Narrow-angle glaucoma, concomitant use of a monoamine oxidase inhibitor, suspected melanoma, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are severe GI disturbances, hypotension, various movement disorders, emotional changes, cardiac arrhythmia, and anorexia.

Levo-Dromoran, a trademark for an opioid analgesic **(levorphanol tartrate).**

levofloxacin, an antiinfective.

■ INDICATIONS: It is used to treat acute sinusitis, acute chronic bronchitis, community-acquired pneumonia, uncomplicated skin infections, complicated urinary tract infections, and acute pyelonephritis caused by ***Streptococcus pneumoniae, Haemophilus influenzae,*** *H. parainfluenzae,* and ***Moraxella catarrhalis***.

■ CONTRAINDICATIONS: Known hypersensitivity to quinolones and photosensitivity prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects are anaphylaxis, multisystem organ failure, hemolytic anemia, pseudomembranous colitis, and Stevens-Johnson syndrome. Other adverse effects include hypoglycemia, hypersensitivity, dizziness, anxiety, encephalopathy, paresthesia, chest pain, palpitations, vasodilation, eosinophilia, lymphopenia, pneumonitis, flatulence, diarrhea, abdominal pain, vaginitis, crystalluria, rash, and pruritus. Common side effects are headache, insomnia, nausea, vomiting, and photosensitivity.

levomethadyl /le′vometh′ädil/, an opioid analgesic used as an adjunct in the treatment of opioid addiction, administered orally as the acetate hydrochloride salt.

Levophed Bitartrate, a trademark for an adrenergic **(norepinephrine bitartrate).**

levorphanol tartrate /lē′vôrfā′nol/, an opioid analgesic.

■ INDICATIONS: It is prescribed for the treatment of pain and preoperative analgesia.

■ CONTRAINDICATIONS: Alcoholism, asthma, increased intracranial pressure, respiratory depression, anoxia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are drug dependence, orthostatic hypotension, cardiac arrhythmia, and retention of urine.

levothyroxine sodium /-thī′rəksēn/, a thyroid hormone. Also called L-**thyroxine.**

■ INDICATION: It is prescribed in the treatment of hypothyroidism.

■ CONTRAINDICATIONS: Recent myocardial infarction or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effects are angina, tachycardia, arrhythmias, and tremors.

levotorsion /lev′itôr′shən/, the rotation to the left of the upper pole of the cornea of one or both eyes. Also called **levoclination.**

Lev's disease [Maurice Lev, American pathologist, 1908–1994], fibrosis or calcification of the conduction system of the heart that results in varying degrees of heart block in patients with a normal myocardium and coronary arteries.

Levulan Kerastick therapy, a treatment for actinic keratoses and acne that uses topical Levulan ALA activated by a light source to remove lesions and improve the appearance of the skin. See **photochemotherapy**.

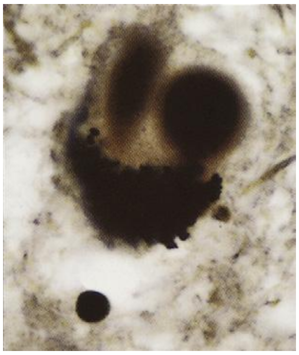
levulose. See **fructose.**

levulosuria. See **fructosuria.**

Lewis blood group system, a blood-group system based on antigens present in soluble forms in blood and secretions. The antigens are adsorbed from the plasma onto the red cell membrane. The expressed Lewis phenotype is based on whether the patient is a secretor or nonsecretor of the Lewis gene product.

lewisite /lo͞o′isīt/ [Winford L. Lewis, American chemist, 1878–1943], 2-chlorovinyl arsine, a poisonous blister gas used in World War I that causes irritation of the lungs, dyspnea, damage to the tissues of the respiratory tract, tears, and pain.

Lewy bodies /lā′wē, lo͞o′ē/ [Frederick H. Lewy, German neurologist, 1885–1950], concentric spheres found inside vacuoles in midbrain and brainstem neurons of patients with idiopathic parkinsonism, Alzheimer's disease, and other neurodegenerative conditions.



Lewy body in the substantia nigra *(Perkin, 2002)*

-lexia, suffix meaning "reading": *alexia, bradylexia, dyslexia.*

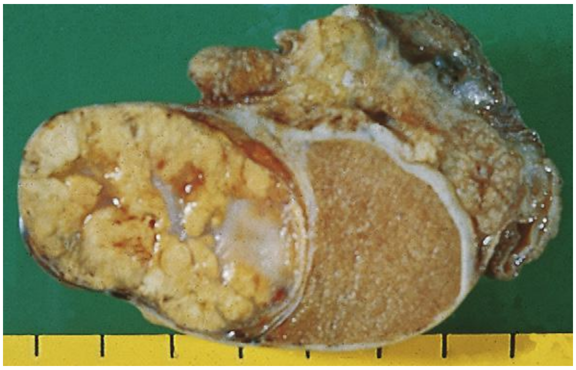
Lexiva, a trademark for **fosamprenavir.**

lexor retinaculum of the hand, the thick fibrous band of antebrachial fascia that wraps the carpal canal surrounding the tendons of flexor muscles of the forearm at the distal ends of the radius and the ulna. Also called *retinaculum flexorum manus,* **volar ligament.**

Leyden-Möbius muscular dystrophy /lī′dənmœ′bē·əs, mē′bē·əs/, a form of limb-girdle muscular dystrophy that begins in the pelvic girdle. Also called **pelvifemoral muscular dystrophy.**

Leydig cells /lī′dig/ [Franz von Leydig, German anatomist, 1821–1908], **1.** cells of the interstitial tissue of the testes that secrete testosterone. **2.** mucous cells that do not pour their secretions out over the surface of the epithelium.

Leydig cell tumor, a generally benign neoplasm of interstitial cells of a testis that may cause gynecomastia in adults and precocious sexual development if the lesion occurs before puberty. The tumor is usually a circumscribed lobulated palpable mass.



Leydig cell tumor *(Fletcher, 2007)*

LF, abbreviation for *low frequency.*

LFA, abbreviation for *left frontoanterior fetal position.*

LFP, abbreviation for *left frontoposterior fetal position.*

LFT, abbreviation for **liver function test.**

LGA, abbreviation for *large for gestational age.* See **large for gestational age infant.**

LGBT, abbreviation for lesbian, gay, bisexual, or transgender.

LGL, abbreviation for *Lown-Ganong-Levine.*

LGV, abbreviation for **lymphogranuloma venereum.**

LH, abbreviation for **luteinizing hormone.**

Lhermitte's sign /ler′mits/ [Jacques J. Lhermitte, French neurologist, 1877–1959], sudden, transient, electric-like shocks spreading down the body when the head is flexed forward, occurring chiefly in multiple sclerosis but also in compression disorders of the cervical spinal cord. The sign is usually elicited by the examiner when the patient is supine.

LH-RH, abbreviation for **luteinizing hormone–releasing hormone.**

Li, symbol for the element **lithium.**

liability /līəbil′itē/ [L, *ligare,* to bind], **1.** something one is obligated to do or an obligation required to be fulfilled by law, usually financial in nature. **2.** the amount of money required to fulfill a financial obligation.

Liaison Council on Certification for the Surgical Technologist. See **National Board of Surgical Technology & Surgical Assisting.**

liaison nursing /lē·ā′zən/, an arrangement with clinical specialists in psychiatric nursing whereby nurses and health professionals in other disciplines obtain consultation services in medical-surgical, parent-child, and geriatric settings.

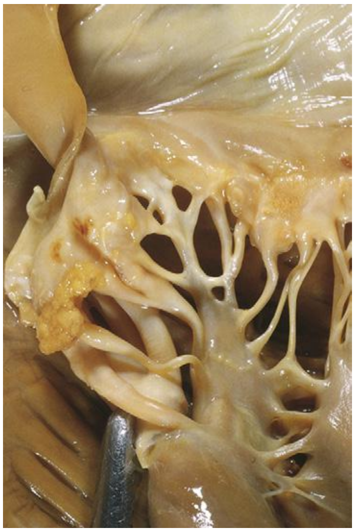
libel /lī′bəl/ [L, *libellus,* little book], a false accusation written, printed, or typewritten, or presented in a picture or a sign that is made with malicious intent to defame the reputation of a person who is living or the memory of a person who is dead, resulting in public embarrassment, contempt, ridicule, or hatred.

liberation /lib′ərā′shən/ [L, *liber,* free], the process of drug release from the dosage form.

libidinal development. See **psychosexual development.**

libido /libē′dō, libī′dō/, **1.** the psychic energy or instinctual drive associated with sexual desire, pleasure, or creativity. **2.** (in psychoanalysis) the instinctual drives of the id. **3.** lustful desire or striving.—**libidinal, libidinous,** *adj.*—*libidinize, v.*

Libman-Sacks endocarditis /lib′mən saks′/ [Emanuel Libman, American physician, 1872–1946; Benjamin Sacks, American physician, 1896–1939], the most common manifestation of lupus erythematosus, characterized by warty lesions that develop near the heart valves but rarely affect valvular action. The lesions usually are dry and granular, with a pink or tawny color. They contain basophilic cellular debris and develop in the angle of the atrioventricular valves and at the base of the mitral valve. Also called *Libman-Sacks disease, Libman-Sacks syndrome.*



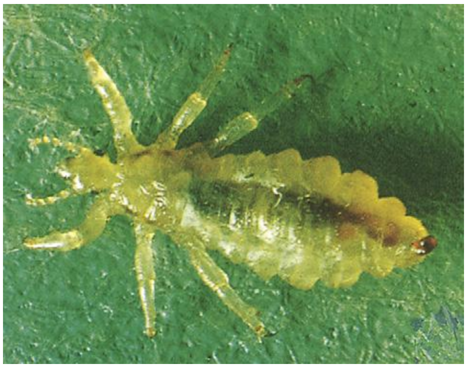
Libman-Sacks endocarditis *(Kumar et al, 2010/Courtesy Dr. Fred Schoen, Department of Pathology, Brigham and Women's Hospital, Boston, Massachusetts)*

Librax, a trademark for a GI, fixed-combination drug containing an anticholinergic (clidinium bromide) and a sedative (chlordiazepoxide hydrochloride).

Libritabs, a trademark for an antianxiety agent (chlordiazepoxide hydrochloride).

Librium, a trademark for an antianxiety agent (chlordiazepoxide hydrochloride).

lice [AS, *lus*,], any of the small wingless insect order of Phthiraptera. This order has been divided into four suborders, Anoplura (sucking lice), Rhyncopthira, Ischnocere, and Amblycer. Lice are ectoparasites of birds and mammals and may spend their entire life cycle on a single host, attaching eggs to the hair shafts or feathers. They transfer to humans by direct contact. Three forms that infect humans are the **head louse,** ***Pediculus humanus capitis;*** the **body louse,** ***Pediculus humanus corporis;*** and the **crab louse,** *Phthirus pubis*. See also **pediculosis.**



Human body louse *(Habif, 2011/Courtesy Ken Gray, Oregon State University Extension Services)*

license, an agency- or government-granted permission issued to a health care professional to engage in a given occupation on finding that the applicant has attained the degree of competency and met educational requirements necessary to ensure that the public health, safety, and welfare are reasonably well-protected.

licensed counselor, a mental health provider who has fulfilled certain standards of education and supervised practice and who has passed the National Counselor Examination of the National Board for Certified Counselors.

licensed marriage and family therapist (LMFT), a person who has earned a master's degree or PhD in marriage and family therapy from an accredited graduate program and has completed at least 1000 hours of supervised clinical practice and scored successfully on the National Certification Examination.

licensed practical nurse (LPN) /lī′sənst/ [L, *licere,* to be allowed; Gk, *praktikos,* fit for action; L, *nutrix,* nurse], *U.S.* a person educated in basic nursing techniques and direct patient care whose qualifications and education have been examined by a state board of nursing and who has legal authorization to practice. The course of education usually lasts 1 year. Once licensed, a licensed practical nurse practices under the supervision of a registered nurse. In Canada an LPN is called a *certified nursing assistant*. Also called *(U.S.)* **licensed vocational nurse.**

licensed psychologist, a person who has earned a doctorate in psychology from an accredited graduate school, has completed 2 to 3 years of postgraduate training with special emphasis on the diagnosis and treatment of psychological disorders, and is licensed in the state in which he or she practices. Also called clinical psychologist. See also **psychotherapist.**

licensed vocational nurse. See **licensed practical nurse.**

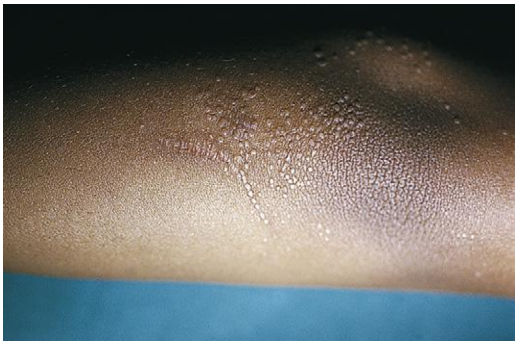
licensure /lī′sənshŏŏr/ [L, *licere,* to be allowed], the granting of permission by a competent authority (usually a government agency) to an organization or individual to engage in a practice or activity that would otherwise be illegal. Kinds of licensure include the issuing of licenses for general hospitals or nursing homes, for health professionals such as physicians, and for the production or distribution of biological products. Licensure is usually granted on the basis of education and examination rather than performance. It is usually permanent, but a periodic fee, demonstration of competence, or continuing education may be required. Licensure may be revoked by the granting agency for incompetence, criminal acts, or other reasons stipulated in the rules governing the specific area of licensure. Compare **certify.**

lichen amyloidosis /lī′kən/, a common form of amyloidosis characterized by symmetric distribution over the skin of translucent yellowish-brown dome-shaped pruritic papules, most commonly on the lower legs.

lichen aureus, a rare type of chronic pigmented purpura in which the patient has a single red or rust-colored lesion on the lower limb, usually over a perforating vein.

lichenification /līken′ifikā′shən/ [Gk, *leichen,* lichen, *facere,* to make], thickening and hardening of the skin, giving it a leathery, barklike appearance, often resulting from the irritation caused by repeated scratching of a pruritic lesion. —*lichenified, adj*.

lichen nitidus [Gk, *leichen* + L, *nitidus,* bright], a rare skin disorder characterized by numerous flat, glistening, pale, discrete papules measuring 2 to 3 mm in diameter. Lesions are localized in the early stages, chiefly on the lower abdomen, penis, and inner surface of the thighs. Distribution may become more generalized as the disease progresses.

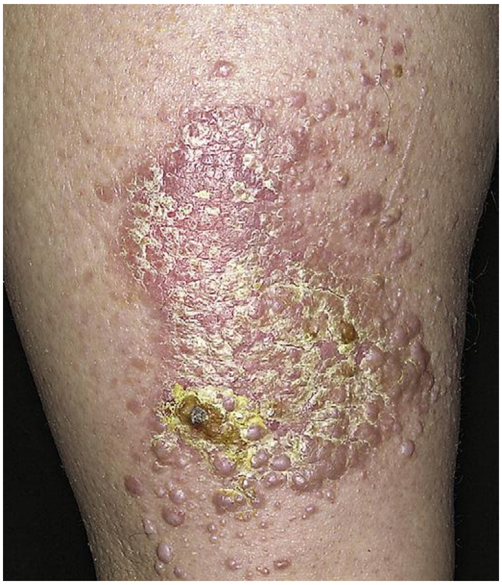


Lichen nitidus *(Callen et al, 2000)*

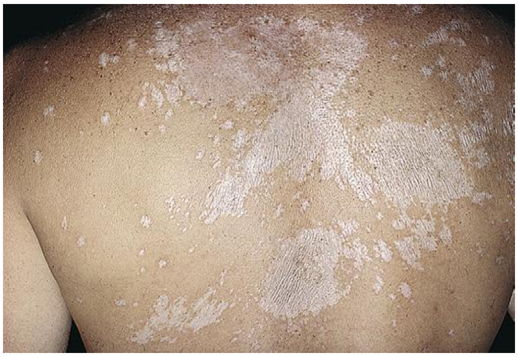
lichenoid eczema /lī′kənoid/, a chronic inflammatory cutaneous condition characterized by skin thickening and accentuated skin lesions.

lichen planus, a nonmalignant, chronic, pruritic skin disease of unknown cause that is characterized by small flat purplish polygonal papules or plaques with fine gray lines on the surface. Common sites are flexor surfaces of wrists, forearms, ankles, abdomen, sacrum, and genitalia. On mucous membranes the lesions appear gray and lacy. Nails may have longitudinal ridges. Episodes of disease activity vary but may last for months and may recur. Treatment with topical corticosteroids is common.

lichen sclerosis et atrophicus, a chronic skin disease characterized by white flat papules and black hard follicular plugs. In advanced cases the papules tend to coalesce into



Lichen planus *(Habif, 2010)*



Lichen sclerosus et atrophicus *(Callen et al, 2000)*

large white patches of thin pruritic skin. Lesions often occur on the torso and in the anogenital regions. Also called **white spot disease.** See also **kraurosis vulvae.**

lichen simplex chronicus, a form of dermatitis characterized by a patch of pruritic confluent papules. Factors such as scratching contribute to its chronicity. Treatment may include topical or intralesional application of corticosteroids to relieve the pruritus.

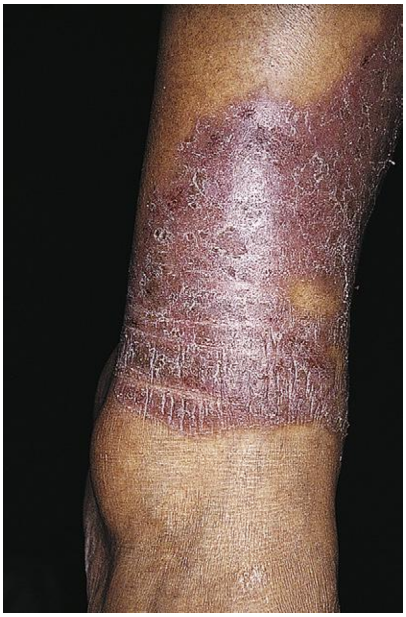
lichen urticatus. See **papular urticaria.**

licorice, an herb that grows in shrub form in many subtropical areas.

■ USES: It is used for allergies, arthritis, asthma, constipation, esophagitis, gastritis, hepatitis, inflammatory conditions, peptic ulcers, poor adrenal function, and poor appetite. Its efficacy for these indications is not proven, but its active ingredients (glycyrrhizin and glycyrrhetinic acid) alter prostaglandin synthesis, are agonists at mineralocorticoid receptors, and prolong the half-life of cortisol.

■ CONTRAINDICATIONS: Licorice should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity. It is also contraindicated in people with liver disease, renal disease, hypokalemia, hypertension, arrhythmias, and congestive heart failure.

lid. See **eyelid.**



Lichen simplex chronicus *(Callen et al, 2000)*

Lidex, a trademark for a glucocorticoid **(fluocinonide).**

lidocaine hydrochloride /lī′dəkān/, a local anesthetic agent.

■ INDICATIONS: It is prescribed as a local anesthetic for topical administration or local injection into skin or mucous membranes. It is used parenterally as an antiarrhythmic agent to increase the threshold of electrical stimulation in the ventricles during diastole.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its topical use. Adam-Stokes syndrome heart block or known hypersensitivity to this drug prohibits its systemic use.

■ ADVERSE EFFECTS: Among the more serious adverse effects of the systemic administration of the drug are central nervous system disturbances, hypotension, bradycardia, and cardiac arrest. A variety of hypersensitivity reactions may occur from topical administration of this drug. Eating and drinking are avoided for 1 hour after topical application of this drug to the pharynx or the esophagus.

lid poppers. See **amphetamines.**

lie [AS, *licgan,* position], the relationship between the long axis of the fetus and the long axis of the mother. In a longitudinal lie the fetus is lying lengthwise, or vertically, in the uterus, whereas in a transverse lie the fetus is lying crosswise, or horizontally.

Lieberkühn's glands /lē′bərkēnz/ [Johann N. Lieberkühn, German anatomist, 1711–1756; L, *glans,* acorn], tubular glands between the bases of the villi of the small intestine and on the surface of the epithelium of the large intestine. They secrete a watery fluid, not digestive enzymes. Also called **crypts of Lieberkühn, follicles of Lieberkühn, intestinal glands.**

lie detector [AS, *leogan,* untruth; L, *detegere,* to uncover], an electronic device or instrument used to detect lying or anxiety in regard to specific questions. A commonly used lie detector is the polygraph recorder that senses and records pulse, respiratory rate, blood pressure, and perspiration. Some experts hold that certain patterns indicate the presence of anxiety, guilt, or fear—emotions that are likely to occur when the subject is lying.

lien. See **spleen.**

lienal vein /lī′ənəl, lē·ē′nəl/ [L, *lien,* spleen, *vena*], a large vein of the lower body that unites with the superior mesenteric vein to form the portal vein. It returns blood from the spleen. Also called **splenic vein.**

lieno-, prefix meaning "spleen": *lienomalacia, lienomedullary, lienopathy.*

lienography /lē′ənog′rəfē/, the radiographic examination of the spleen after it has been injected with a contrast medium.

LIF, abbreviation for **leukemia inhibitory factor.**

LiF, symbol for **lithium fluoride.**

life [AS, *lif*], the energy that enables organisms to grow, reproduce, absorb and use nutrients, and evolve, and, in some organisms, to achieve mobility, express consciousness, and demonstrate a voluntary use of the senses.

life costs [AS, *lif* + L, *constare,* constant], the mortality, morbidity, and suffering associated with a given disease or medical procedure.

life cycle, **1.** the interval of time from conception to natural death. **2.** the series of stages from any stage of one generation to the same stage of the next generation.

life expectancy, the probable number of years a person will live after a given age, as determined by mortality in a specific geographic area. It may be individually qualified by the person's condition or race, sex, age, or other demographic factors. Also called **expectation of life.**

life extension [AS, *lif,* life; L, *extenere,* to stretch out], the process of extending the life span of an individual or population by intervention that promotes better use of preventive medicine and use of established diagnostic and therapeutic facilities.

life island, a plastic bubble enclosing a bed, used to provide a germ-free environment for patients with a specific kind of immune deficit.

life review, **1.** (in psychiatry) a progressive return to consciousness of past experiences. **2.** reminiscences that occur in old age as a consequence of the realization of the inevitability of death. Also called **reminiscence therapy.**

lifesaving measure, any medical intervention that is implemented when a patient's life is threatened.

life science, the study of the laws and properties of living matter. Some kinds of life science are **anatomy, bacteriology,** and **biology.** Compare **physical science.**

life space, a term introduced by American psychologist Kurt Lewin to describe simultaneous influences that may affect individual behavior. The totality of the influences make up the life space.

life span, the length of life of an individual or the average length of life in a population or species.

lifestyle-induced health problems, diseases with natural histories that include conscious exposure to certain health-compromising or risk factors. An example is heart disease associated with cigarette smoking, poor dietary habits, lack of exercise, and sustained unbuffered stress.

life support [AS, *lif,* life; L, *supportare,* to bring up to], the use of any therapeutic technique, device, or technology to maintain physical life functions.

lifetime reserve [AS, *lif* + *tid,* time; L, *re,* again, *servare,* to keep], a lifetime total of days of inpatient hospitalization benefits that may be drawn on by a patient who has exhausted the maximum benefits allowed under Medicare for a single episode of illness.

Li-Fraumeni cancer syndrome /lē′ frômen′ē/ [Frederick P. Li; Joseph F. Fraumeni, Jr.; 20th century American epidemiologists], a type of familial breast carcinoma affecting young women and associated with soft-tissue sarcomas and other cancers in close relatives.

lift assessment [AS, *lyft,* loft; L, *assidere,* to sit beside], the selection of the most appropriate lift method to use when moving a patient, as from the bed to a chair. The assessment involves consideration of such factors as whether the patient is conscious or unconscious; whether the patient has a visual, hearing, or cognitive impairment; the need for special care in handling patient attachments such as IV lines or monitors; the patient's body weight; and whether the patient has full range of motion or flaccid or spastic limbs.

ligament /lig′əmənt/ [L, *ligare,* to bind], **1.** one of many predominantly white, shiny, flexible bands of fibrous tissue binding joints together and connecting the articular bones and cartilages to facilitate movement. Such ligaments are slightly elastic and composed of parallel collagenous bundles. When part of the synovial membrane of a joint, they are covered with fibroelastic tissue that blends with surrounding connective tissue. Yellow elastic ligaments such as the ligamenta flava connect certain parts of adjoining vertebrae. Compare **tendon.** **2.** a layer of serous membrane with little or no tensile strength, extending from one visceral organ to another, such as the ligaments of the peritoneum. See also **broad ligament.** **—ligamentous,** *adj.*

ligamental tear /lig′əmen′təl/ [L, *ligare,* to bind; AS, *teran,* to destroy], a complete or partial rupture of a ligament caused by an injury to a joint, as by a sudden twisting motion or a forceful blow.

■ OBSERVATIONS: Ligamental tears may occur at any joint but are most common in the knees, where they typically involve the medial, lateral, and posterior ligaments and the anterior and posterior cruciate ligaments. Usually more than one structure is injured because of the way the structures connect with and support each other. The pathological features of knee ligamental tears depend on the location and severity of the injury. A mild tear may cause little damage, with tenderness, swelling, and pain with stress.

■ INTERVENTIONS: Treatment depends on the severity of the injury. Rest, compression, applications of heat and cold, elevation, and early use are usually recommended for mild tears. Injection of an antiinflammatory agent may be desirable. Treatment for a moderate tear in which few fibers have been completely severed is protective. In addition to the above measures, the joint is aspirated and supported. Treatment for a severe, complete tear is restorative and may include immobilization followed by physical therapy or, if necessary, by surgical repair or reconstruction.

■ NURSING CONSIDERATIONS: Ligamental tears of the knee joint are extremely common in young adults and are often associated with sports injuries. Good physical condition may help prevent many injuries, and proper care during healing is necessary to prevent permanent disability, which is often accompanied by joint instability, stiffness, or pain.

ligament of the head of the femur, a flat band of delicate connective tissue that attaches at one end to the fovea on the head of the femur and at the other end to the acetabular fossa, transverse acetabular ligament, and margins of the acetabular notch. It carries a small branch of the obturator artery, which contributes to the blood supply of the head of the femur.

ligament of the neck of the rib, one of five ligaments of each costotransverse joint, consisting of short, strong fibers passing from the neck of the rib to the transverse process of the adjacent vertebra. Also called **middle costotransverse ligament.**

ligament of the tubercle of the rib, one of the five ligaments of each costotransverse joint, comprising a short thick fasciculus passing obliquely from the transverse process of a vertebra to the tubercle of the associated rib. Compare **ligament of the neck of the rib.**

ligamentous /lig′əmen′təs/ [L, *ligare,* to bind], pertaining to or having the characteristics of a ligament.

ligamentum arteriosum. See **arterial ligament.**

ligand /lig′ənd, lī′gənd/ [L, *ligare,* to bind], **1.** a molecule, ion, or group bound to the central metal atom of a chemical compound, such as the oxygen molecule in oxyhemoglobin, which is bound to the central iron atom. **2.** an organic molecule attached to a specific site on a cell surface or to a tracer element. The binding is reversible in a competitive binding assay. It may be the analyte or a cross-reactant. Examples include vitamin B_{12}, a ligand with intrinsic factor as the binding protein, and various antigens, which are ligands with antibody-binding proteins.

ligase chain reaction, a type of DNA amplification that uses DNA ligase to link chains and amplify the template containing the sequence in question.

ligases /lī′gāsəz/ [L, *ligare* + Fr, *diastase,* enzyme], a group of enzymes that catalyze the formation of a bond between substrate molecules coupled with the breakdown of a pyrophosphate bond in ATP or a similar donor molecule. Examples of ligases include the synthetase enzymes.

ligation /līgā′shən/ [L, *ligare,* to bind], the procedure of tying off a blood vessel or duct with a suture or wire ligature. It may be performed to stop or prevent bleeding during surgery, to stop spontaneous or traumatic hemorrhage, to prevent passage of material through a duct as in tubal ligation, or to treat varicosities. In venous ligation the saphenous vein is tied above the varicosed part, and the distal parts are removed. After surgery the nurse observes the patient's feet and legs for circulatory impairment. The foot of the bed is raised to encourage venous return. Ambulation is begun the day of surgery, with elastic bandages for firm support. Analgesics are given as necessary for pain and discomfort. See also **ligature, tubal ligation, varicose vein.** —*ligate, v.*

ligation clip, a small V-shaped clip made from stainless steel, platinum, titanium, or an absorbable material, used to ligate bleeding vessels.

ligature /lig′əchər/ [L, *ligare,* to bind], **1.** a suture. **2.** a wire, as used in orthodontics.

ligature needle, a long, thin, curved needle used for passing a suture underneath an artery for ligation of the vessel.

ligature wire [L, *ligare,* to bind; AS, *wir*], a soft, thin wire used in dental procedures, particularly to connect brackets or attachments on orthodontic appliances.

light [AS, *leoht*], **1.** electromagnetic radiation of the wavelength and frequency that stimulate visual receptor cells in the retina to produce nerve impulses that are perceived as vision. **2.** electromagnetic radiation with wavelengths shorter than ultraviolet light and longer than infrared light, the range of visible light generally in the range of 400 to 800 nm.

light-adapted eye [AS, *leoht* + L, *adaptatio* + AS, *eage*], an eye that has been exposed to bright light long enough for chemical and physiological changes to take place, such as bleaching of the rhodopsin or visual purple. The loss of cone sensitivity to light may require increased light intensity to obtain the same degree of visual acuity. Also called **photopic eye.**

light bath, the exposure of the patient's uncovered skin to the sun or to actinic light rays from an artificial source for therapeutic purposes.

light chain deficiency, an immunodeficiency disease, such as megaloblastic anemia, that is associated with an alteration in the kappa or lambda light chains of immunoglobulins.

light chain disease, a type of multiple myeloma in which plasma cell tumors produce only monoclonal light chain proteins. Persons with light chain disease may develop lytic bone lesions, hypercalcemia, impaired kidney function, and amyloidosis. See also **gammopathy, heavy chain disease, multiple myeloma.**

light chain (L chain), immunoglobulin subunit of about 22,000 daltons molecular weight. Compare to **heavy chain.**

lightening /lī′təning/ [AS, *leoht,* light], a subjective sensation reported by many women late in pregnancy as the fetus settles lower in the true pelvis, leaving more space in the upper abdomen. The diaphragm, no longer restricted by the fundus of the uterus beneath it, can move down more fully during inspiration, allowing deeper breaths. The stomach, too, is less compressed, so the woman can comfortably eat more food at each meal. Urinary frequency occurs as the fetus drops. The profile of the abdomen changes with lightening, because the round, full uterus is visibly lower. The baby is then said to have "dropped."

light film fault [AS, *leoht,* light, *filmen,* membrane; L, *fallere,* to deceive], a defect in a radiograph photograph that appears as a barely distinct and inadequate image. It is caused by underexposure, underdevelopment, or use of the wrong film speed or film/screen combination.

light headedness, a condition of feeling giddy, faint, delirious, or slightly dizzy.

light microscope [AS, *leoht* + Gk, *mikros,* small, *skopein,* to view], a microscope that uses visible light to view objects too small for the naked eye to see.

light reflex, the mechanism by which the pupil of the eye constricts in response to direct or consensual stimulation with light. Also called **pupillary reflex.** Compare **consensual light reflex.** See also **accommodation reflex, direct light reflex.**

light scatter, light dispersion in any direction by suspended particles in a solution. The degree of scattering depends on the size and shape of the particles.

light therapy [AS, *leoht* + Gk, *therapeia,* treatment], the use of natural light or light of specified wavelengths to treat disease. This may include ultraviolet light, colored light, or low-intensity laser light. The eye is generally the initial entry point for the light because of its direct connection to the brain through the retinal hypothalamic pathway, which affects the autonomic nervous system and endocrine function. Light therapy has been used primarily for attention deficit disorders, cataracts, conjunctivitis, headaches, head trauma, hyperactivity, lazy eye, macular degeneration, migraine, night blindness, poor eyesight, stroke, and vision disorders. It has also been effective in treating eczema, fever, psoriasis, addictions, allergies, anxiety, autism, bronchitis, childbirth, glaucoma, insomnia, muscle spasm, premenstrual syndrome, stress, and strep throat. Light therapy complements many other treatments for these and other conditions.

light-touch palpation [AS, *leoht* + Fr, *toucher* + L, *palpare,* to touch gently], a method of examination in which the abdomen is gently depressed 1 to 2 cm to determine the size and position of abdominal organs.

light vaginal bleeding. See **vaginal bleeding.**

ligneous /lig′nē·əs/ [L, *ligum,* wood], woody or resembling wood in texture or other characteristics.

ligneous thyroiditis. See **fibrous thyroiditis.**

lignin /lig′nin/ [L, *lignum,* wood], an insoluble polysaccharide that with cellulose and hemicellulose forms the chief part of the skeletal substances of the cell walls of plants. It provides bulk in the diet necessary for proper GI functioning. See also **dietary fiber.**

lignocaine. See **lidocaine hydrochloride.**

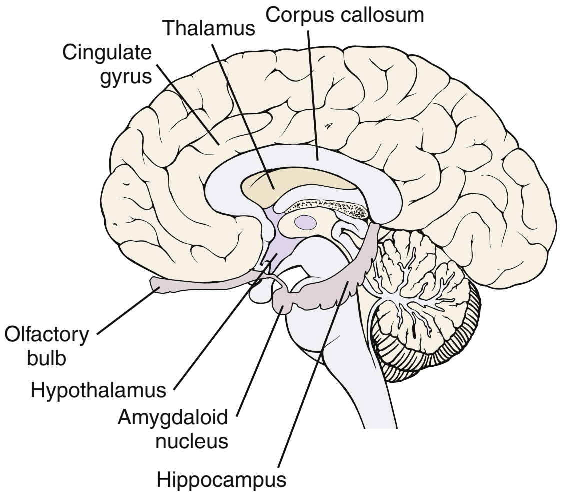
limb /lim/ [AS, *lim*], **1.** an appendage or extremity of the body, such as an arm or leg. **2.** a branch of an internal organ, such as a loop of a nephron.

limb-girdle muscular dystrophy [AS, *lim,* limb, *gyrdel*], a form of muscular dystrophy transmitted as an autosomal-recessive trait. The characteristic weakness and degeneration of the muscles begins in the shoulder girdle or in the pelvic girdle. The condition is progressive, regardless of the area in which it is first manifest. Kinds of limb-girdle muscular dystrophy are **Erb's muscular dystrophy, Leyden-Möbius muscular dystrophy.**

limbic /lim′bik/ [L, *limbus,* edge], pertaining to something that is marginal or at a junction between structures.

limbic lobe [L, *limbus,* edge; Gk, *lobos,* lobe], the marginal section of the cerebral hemispheres on the medial aspects. It forms a ring of neural tissue around the hypothalamus and some nuclei.

limbic system [L, *limbus,* edge], a group of structures within the rhinencephalon of the brain that are associated with various emotions and feelings such as anger, fear, sexual arousal, pleasure, and sadness. The structures of the limbic system include the cingulate gyrus, the isthmus, the hippocampal gyrus, the uncus, and the amygdala. The structures connect with various other parts of the brain such as the septum and the hypothalamus. Unless the limbic system is modulated by other cortical areas, periodic attacks of uncontrollable rage may occur in some individuals. The function of the system is incompletely understood.



Limbic system *(McKenry and Salerno, 2001)*

limb kinetic apraxia. See **ideomotor apraxia.**

limb lead /lēd/ [AS, *lim,* limb, *laeden,* lead], an electrocardiographic electrode that is attached to an arm or a leg.

Limbrel, a trademark for **flavocoxid.**

limbus /lim′bəs/, an edge or border, such as the corneal limbus at the edge of the cornea bordering the sclera.

lime [AS, *lim*], **1.** any of several oxides and hydroxides of calcium. The various kinds of lime have many uses, including the treatment of sewage, the purification of water and refining of sugar, and the manufacture of materials such as plaster and fertilizers. **2.** a citrus fruit yielding a juice with a high ascorbic acid content. Lime juice was one of the first effective agents to be used in the treatment of scurvy. See also **ascorbic acid, scurvy.**

limen. See **threshold stimulus.**

lime water. See **calcium hydroxide solution.**

liminal stimulus. See **threshold stimulus.**

limitation of motion /lim′itā′shən/ [L, *limes,* limit], the restriction of or reduction of normal range of motion of a body part, caused by disease or injury.

limited fluctuation method of dosing [L, *limes,* limit, *fluctuare,* to wave], a method of drug administration in which the dose is not allowed to rise or fall beyond specified maximum and minimum limits.

limiting charge, the maximum amount that can be charged in the United States for the services of a physician who does not accept the restrictions on fees established by Medicare laws. Also called **billing limit.**

limiting resolution, in computed tomography, the spatial frequency at a modulation transfer function equal to 0.1. The absolute object size that can be resolved by a scanner is equal to the reciprocal of the spatial frequency.

limit of stability, the greatest distance in any direction a person can lean away from a midline vertical position without falling, stepping, or reaching for support.

limit setting, a nursing intervention from the Nursing Interventions Classification (NIC) defined as establishing the parameters of desirable and acceptable patient behavior. See also **Nursing Interventions Classification.**

limo-, prefix meaning "hunger": *limophthisis, limosis, limotherapy.*

limp [ME, not firm], an abnormal pattern of ambulation in which the two phases of gait are markedly asymmetric. See also **stance phase of gait, swing phase of gait.**

LINAC, abbreviation for **linear accelerator.**

Lincocin, a trademark for an antibacterial agent **(lincomycin hydrochloride).**

lincomycin hydrochloride /lin′kəmī′sin/, a macrolide antibiotic.

■ INDICATIONS: It is prescribed in the treatment of certain infections caused by susceptible bacteria, especially streptococci and staphylococci.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to clindamycin prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blood disorders, diarrhea, and the development of life-threatening pseudomembranous colitis caused by superinfection.

lindane /lin′dān/, a **gamma-benzene hexachloride.**

■ INDICATIONS: It is prescribed in the treatment of pediculosis and scabies.

■ CONTRAINDICATIONS: It is not usually given to infants or pregnant women and is not applied to the face. Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are neurological damage and aplastic anemia. Topical administration may result in irritation of eyes, skin, and mucosa.

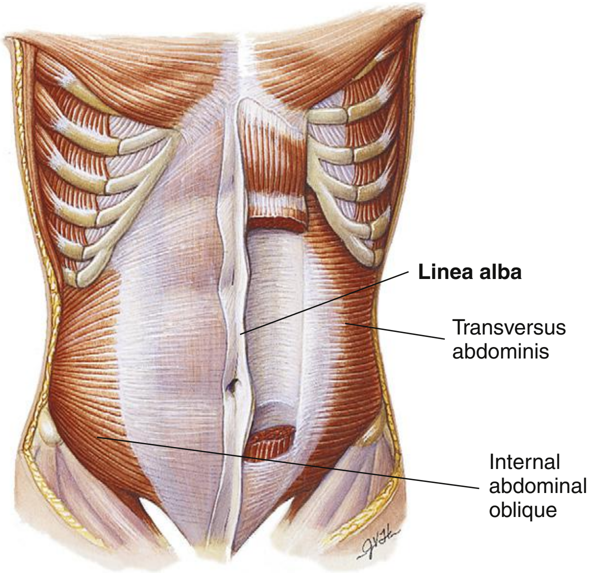
Lindau-von Hippel disease. See **von Hippel-Lindau disease.**

Lindbergh pump [Charles A. Lindbergh, American technician, 1902–1974; ME, *pumpe*], a pump used to preserve an organ of the body by perfusing its tissues with oxygen and other essential nutrients, usually during the transport of an organ from a donor to a recipient. Also called **Carrel-Lindbergh pump.**

line [L, *linea*], **1.** a connection between two points. **2.** a stripe, streak, or narrow ridge, often imaginary, that serves to connect reference points or to separate various parts of the body, as the hairline or nipple line. **3.** a black absorption line in a continuous spectrum passing through a medium. **4.** an accretion line in the enamel of a tooth marking successive layers of calcification. **5.** a catheter or wire that may be inserted in a vein, as in an IV line. **6.** the base line of an electrocardiogram when neither positive nor negative potentials are recorded. **7.** also called **linea.** line of sight. See also **Frankfurt horizontal plane.**

linea /lin′ē·ə/ [L, line], a line defining anatomical features, such as the **linea alba** of the abdomen, the linea albicantes or **linea nigra** seen on the abdomen during pregnancy, or the **linea vitalis** curving across the palm at the base of the thumb.

linea alba [L, *linea,* line, *albus,* white], the white part of the anterior abdominal aponeurosis in the middle line of the abdomen, made of connective tissue representing the fusion of three aponeuroses into a single tendinous band extending from the xiphoid process to the symphysis pubis. It contains the umbilicus. Also called *Hunter's line,* **white line.** Compare **linea semilunaris.**



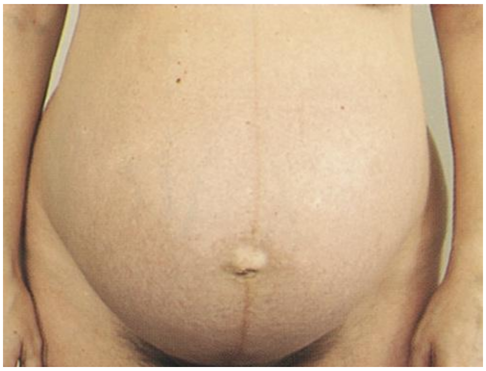
Linea alba *(Thibodeau and Patton, 2003)*

linea arcuata, the curved tendinous band in the sheath of the rectus abdominis below the umbilicus. It is usually derived from the aponeurosis of the transversus abdominis or the obliquus internus, and sometimes from both of those muscles. It inserts into the linea alba. Compare **linea semilunaris.**

linea aspera, the posterior crest of the femur (thigh bone) that extends proximally into three ridges to which are attached various muscles, including the gluteus maximus, pectineus, and iliacus.

lineae albicantes, lines, white to pink or gray, that occur on the abdomen, buttocks, breasts, and thighs and are caused by the stretching of the skin and weakening or rupturing of the underlying elastic tissue. The condition is usually associated with pregnancy, excessive obesity, rapid growth during adolescence, Cushing's syndrome, or prolonged adrenocortical hormone therapy. Also called **stretch marks.**

linea nigra /lin′ē′ənīgrə/, a dark line appearing longitudinally on the abdomen of a pregnant woman during the latter 24 weeks of term. It usually extends from the symphysis pubis midline to the umbilicus and sometimes as far as the sternum.



Linea nigra on the abdomen of a pregnant woman *(Seidel et al, 2011)*

linear /lin′ē·ər/ [L, *linea,* line], pertaining to a line or lines, particularly straight lines.

linear accelerator (LINAC) [L, *linea,* line, *accelerare,* to quicken], an apparatus for accelerating charged subatomic particles, used in radiotherapy, physics research, and the production of radionuclides. A pulsed electron beam generated by an electron gun passes through a long, straight vacuum tube containing alternating hollow electrodes. The electrodes are arranged so that, when their high-frequency potentials are properly varied, the electrons passing through the tube receive successive increments of energy. The electrons are stopped abruptly by a heavy metal target at the end of the tube and directed by a collimator to deliver supervoltage x-rays to the patient receiving radiotherapy.

Linear accelerator *(Kim et al, 2009)*

linear array, a contiguous sequence of identical discrete detectors, either gas-filled ionization chambers or solid-state semiconductors, used with a fan beam x-ray generator. The detectors read off once for each x-ray pulse. The resulting electronic signal is digitized and stored in a computer memory.

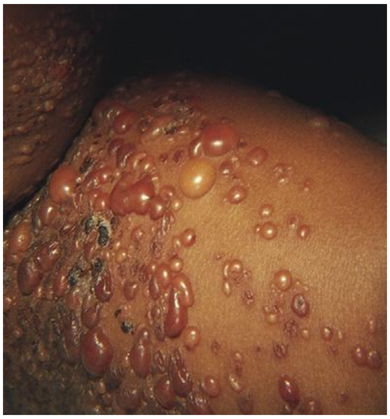
linear energy transfer (LET), the rate at which energy is transferred from ionizing radiation to soft tissue, expressed in terms of kiloelectron volts per micrometer (keV/μm) of track length in soft tissue. The LET of diagnostic x-rays is about 3 keV/μm, whereas the LET of 5 MeV alpha particles is 100 keV/μm.

linear flow velocity, the velocity of a particle carried in a moving stream, usually measured in centimeters per second.

linear fracture, a fracture that extends parallel to the long axis of a bone but does not displace the bone tissue.

linear grid. See **grid.**

linear IgA bullous disease, a condition characterized by linear deposits of immunoglobulin A binding to the area of the lamina lucida. Tense bullae are frequent, and the vesicles are likely to occur on the face, thighs, feet, and flexures. The disease tends to affect women more than men, and half of the patients are under the age of 60. A chronic bullous dermatosis disease of childhood begins in the first 10 years of life with bullae on the trunk, perioral, and pelvic areas but undergoes total remission at adolescence.



Linear IgA bullous disease *(Shah and Laude, 2000)*

linearity /lin′ē·er′itē/, the principle that the density of a radiographic exposure is determined by the product of the current and the exposure time.

linear morphea, linear scleroderma.

linear regression, a statistical procedure in which a straight line is established through a data set that best represents a relationship between two subsets or two methods.

linear scan, an ultrasound scan in which the transducer moves at a constant speed along a straight line at right angles to the ultrasound beam.

linear staining, the use of fluorescein-labeled goat or rabbit antiimmunoglobulins to produce smooth-staining patterns for study by immunofluorescence microscopy.

linear tomography, tomography that produces a blurring pattern consisting of indistinguishable linear streaks or blurs over the focal-plane image. The pattern is caused by elongation of structures outside the focal plane.

linea semilunaris, the slightly curved line on the ventral abdominal wall, approximately parallel to the median line and lying about halfway between the median line and the side of the body. It marks the lateral border of the rectus abdominis and is visible as a shallow groove when that muscle is tensed. Compare **linea alba.**

linea terminalis, a hypothetic line dividing the upper, or false, pelvis, from the lower, or true, pelvis.

linea vitalis. See **linea.**

line compensator, a device that monitors electric power for medical devices such as x-ray equipment and adjusts for voltage fluctuations.

line density, in ultrasonography, the number of scan lines used to generate an image.

line focus principle, the principle that viewing a sloped surface at an angle reduces its apparent size. In an x-ray tube the angling of the anode results in the effective focal spot being smaller than the actual focal spot.

line of demarcation [L, *linea* + *de* + *marcare,* to mark], a line that indicates a change in the condition of tissues, such as the boundary between gangrenous and healthy tissues.

line of gravity, an imaginary line that extends from the center of gravity to the base of support.

line pair (lp), a factor that determines the spatial frequency of CT and radiographic images. It consists of two parallel lines or bars separated by a space. As the number of line pairs per centimeter increases, the fidelity of the image decreases.

line spread function (LSF), a graph obtained from the image of a narrow line, which quantifies the amount of blur produced by an imaging system.

Lineweaver-Burk transformation /lī′nwēvərburk′/ [Hans Lineweaver, American chemist, b. 1907; Dean Burk, American scientist, 1904–1988; L, *transformare,* to change shape], a method of converting experimental data from studies of enzyme activity so that they can be displayed on a linear plot. The linear form is derived by using reciprocals of both sides of the equation.

linezolid /lĭnez′olid/, a synthetic antibacterial of the oxazolidinone class, effective against gram-positive organisms and used for the treatment of community-acquired and nosocomial pneumonia, skin and soft tissue infections, and bacteremia. It is administered orally or intravenously.

lingu-, linguo-, prefix meaning "tongue": *linguiform, lingulectomy, linguodental.*

lingua. See **tongue.**

lingual /ling′gwəl/ [L, *lingua,* tongue], pertaining to or resembling the tongue.

lingual artery [L, *lingua,* tongue], one of a pair of arteries that arises from the external carotid arteries and supplies the tongue and surrounding muscles.

lingual bar, a bar that is installed on the tongue side of the dental arch and connects bilateral parts of a mandibular removable partial denture.

lingual bone. See **hyoid bone.**

lingual crib, an orthodontic appliance consisting of a wire frame suspended behind the maxillary incisors, used to obstruct undesirable thumb and tongue habits that can produce malocclusions, especially in children.

lingual flange, the part of a mandibular denture that occupies the space adjacent to the residual alveolar ridge and next to the tongue.

lingual frenum. See **frenulum of the tongue.**

lingual gingiva [L, *lingua,* tongue, *gingiva,* gum], the gum tissue covering the teeth on the surfaces facing the tongue.

lingual goiter, a tumor at the back of the tongue formed by an enlargement of the primordial thyrolingual duct.

lingualis leukoplakia [L, *lingua,* tongue; Gk, *leukos,* white, *plax,* plate], a chronic inflammatory lesion characterized by smooth thick white patches on the surface of the tongue, generally attributed to excessive use of alcohol and tobacco. The lesions may be a precursor of epithelioma.

lingual nerve, a major branch of the mandibular nerve that carries general sensation from the oral part of the tongue, the mucosa on the floor of the oral cavity, and gingiva associated with the lower teeth. It also carries parasympathetic and taste fibers from the oral part of the tongue that are part of the facial nerve.

lingual occlusion. See **linguoocclusion.**

lingual pain, a pain in the tongue, which may be caused by biting the tongue, heavy metal poisoning, Vincent's stomatitis, or infiltration of the lingual muscles by a neoplasm.

lingual papilla. See **papilla.**

lingual rest, a metallic extension attached to the tongue side of an anterior tooth to provide support or indirect retention for a removable partial denture.

lingual thyroid, residual thyroid tissue at the base of the tongue that failed to descend into the neck during embryologic development.

lingual tonsil, a mass of lymphoid follicles near the root of the tongue. Each follicle forms a rounded eminence containing a small opening leading into a funnel-shaped cavity surrounded by lymphoid tissue.

lingula /ling′gyələ/ [L, small tongue], any anatomical structure that resembles a tongue.

lingula of the lung [L, *lingula,* small tongue; AS, *lungen*], a tonguelike projection from the costal surface of the upper lobe of the left lung.

lingulectomy /ling′gyəlek′təmē/, a surgical excision of the lingula of the left lung.

linguoocclusal, pertaining to or formed by the lingual and occlusal surfaces of a tooth.

linguoocclusion /ling′gwōklō′zhən/ [L, *lingua,* tongue + *occludere,* to close up], malocclusion in which the tooth is leaning toward the tongue from the line of the normal dental arch. Also called **lingual occlusion.**

linguoversion /ling′gwōver′zhən/ [L, *lingua,* tongue + *vertere,* to turn], displacement of a tooth toward the tongue from the line of occlusion.

liniment /lin′imənt/ [L, *linere,* to smear], a preparation, usually containing an alcoholic, oily, or soapy vehicle, that is rubbed on the skin as a counterirritant.

linin /li′nin/ [Gk, *linon,* flax], the faintly staining threads seen in the nuclei of cells, with granules of chromatin attached to the threads. See also **karyolymph.**

linitis /linī′tis/ [Gk, *linon,* flax, *itis,* inflammation], inflammation of cellular tissue of the stomach, as in linitis plastica, seen frequently in adenocarcinoma of the stomach.

linitis plastica, a diffuse fibrosis and thickening of the wall of the stomach, resulting in a rigid, inelastic organ. The layer of connective tissue of the stomach becomes fibrotic and thick, and the stomach wall becomes shrunken and rigid. Causes of this condition include infiltrating undifferentiated carcinoma, syphilis, and Crohn's disease involving the stomach. Also called **leather-bottle stomach.**

linkage /ling′kij/ [Gk, *linke,* connection], **1.** (in genetics) the location of two or more genes on the same chromosome so that they do not segregate independently during meiosis but tend to be transmitted together as a unit. The closer the loci of the genes, the more likely they are to be inherited as a group and associated with a specific trait, whereas the farther apart they are, the greater the chance that they will be separated by crossing over and carried on homologous chromosomes. The concept of linkage, which opposes the independent assortment theory of mendelian genetics, led to the foundation of the modern chromosome theory of genetics. See also **synteny.** **2.** (in psychology) the association between a stimulus and the response it elicits. **3.** (in chemistry) the bond between two atoms in a chemical compound or the lines used to designate valency connections between the atoms in structural formulas.

linkage disequilibrium, a nonrandom association of two genes on the same chromosome.

linkage group, a group of genes that tend to be inherited as a unit because they are located on the same chromosome. Without crossing over, all of the genes on a given chromosome constitute a linkage group, and the number of linkage groups in an organism is equal to the number of autosomes in a haploid cell.

linkage map. See **genetic map.**

linked genes [ME, *linke* + Gk, *genein,* to produce], genes that are located so close together on the same chromosome that they tend to be transmitted as a linkage group.

linker [ME, *linke,* connection], a small segment of synthetic DNA used to join DNA fragments in cloning.

linoleic acid /lin′əlē′ik/ [Gk, *linon,* flax, *oleum,* oil], a colorless to straw-colored essential fatty acid with two unsaturated bonds, occurring in many vegetable oils, such as corn, soy, and safflower oils. Commercially produced linoleic acid is used in margarine and animal feeds.

linolenic acid /lin′ōlen′ik/ [Gk, *linon,* flax, *oleum,* oil], an unsaturated essential fatty acid occurring in triglycerides of canola, soy, linseed, and other vegetable oils.

lio-. See **leio-.**

Lioresal, a trademark for an antispastic agent **(baclofen).**

liothyronine sodium /lī′ōthī′rənēn/, a synthetic thyroid hormone. Also called **triiodothyronine.**

■ INDICATIONS: It is prescribed in the treatment of primary hypothyroidism, myxedema, simple goiter, cretinism, and secondary hypothyroidism.

■ CONTRAINDICATIONS: Hyperthyroidism, thyrotoxicosis, acute myocardial infarction, or known hypersensitivity to this drug prohibits its use. It is used with caution in patients with diabetes mellitus or cardiovascular disease.

■ ADVERSE EFFECTS: Among the serious adverse effects, usually caused by overdosage, are tachycardia, arrhythmias, thyrotoxicosis, nausea, vomiting, hypertension, nervousness, and loss of weight.

liotrix /lī′ətriks/, a uniform mixture of the thyroid hormones T_3 and T_4.

■ INDICATION: It is prescribed in the treatment of hypothyroid conditions.

■ CONTRAINDICATIONS: Most diseases and abnormal conditions of the myocardium or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are symptoms of thyrotoxicosis, including tachycardia, nervousness, insomnia, and fever.

lip [AS, *lippa*], **1.** either the upper or lower fleshy structure surrounding the opening of the oral cavity. **2.** See also **labia.** any rimlike structure bordering a cavity or groove.

LIP, abbreviation for **lymphocytic interstitial pneumonia.**

lip-. See **lipo-.**

lipase /lī′pās, lip′ās/ [Gk, *lipos,* fat; Fr, *diastase,* enzyme], any of several enzymes produced by the organs of the digestive system that catalyze the breakdown of lipids through the hydrolysis of the linkages between fatty acids and glycerol in triglycerides and phospholipids. Normal blood levels of lipase range from 0 to 110 U/L. See also **fat, fatty acid, glycerol, phospholipid, triglyceride.**

lipase test, a blood test whose results are used most often to diagnose acute pancreatitis but also are useful in helping to diagnose renal failure, intestinal infarction or obstruction, and several other conditions.

lipectomy /lipek′təmē/ [Gk, *lipos* + *ektomē,* excision], an excision of subcutaneous fat, as from the abdominal wall. Also called **adipectomy.**

lipedema /lip′ədē′mə/, a condition in which fat deposits accumulate in the lower extremities from the hips to the ankles, accompanied by symptoms of tenderness in the affected areas. Treatment is dietary.

lipemia /lipē′mē·ə/ [Gk, *lipos* + *haima,* blood], chylomicrons in plasma causing the plasma to appear cloudy. It occurs following a heavy or fatty meal or may indicate a metabolic lipid disorder.

lipid /lip′id, lī′pid/ [Gk, *lipos,* fat, *eidos,* form], any of a structurally diverse group of organic compounds that are insoluble in water but soluble in alcohol, chloroform, ether, and other solvents. Some lipids are stored in the body and serve as an energy reserve but are elevated in various diseases such as atherosclerosis. Kinds of lipids include **cholesterol, fatty acids, phospholipids,** and **triglycerides.** The normal concentrations of lipids in serum are total, 400 to 800 mg/dl; cholesterol, 150 to 250 mg/dl; fatty acids, 9 to 15 mM/L; phospholipids, 150 to 380 mg/dl; phospholipid as phosphorus, 9 to 16 mg/dl; and triglycerides, 10 to 190 mg/dl.

lipidosis /lip′idō′sis/ [Gk, *lipos* + *osis,* condition], a general term that includes several rare familial disorders of fat metabolism. The chief characteristic of these disorders is the accumulation of abnormal levels of certain lipids in the body. Kinds of lipidoses are **Gaucher's disease, Krabbe's disease, Niemann-Pick disease,** and **Tay-Sachs disease.**

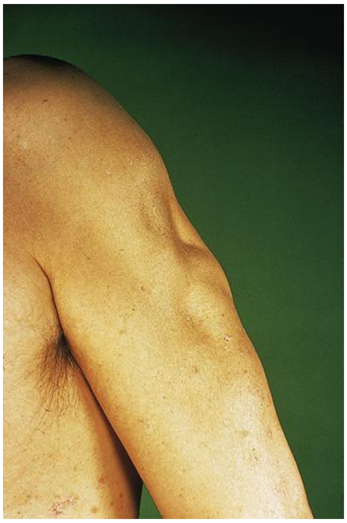
lipid pneumonia, an inflammation of the spongy tissue of the lung caused by inhalation of oil droplets into the alveoli. The condition may result from accidentally inhaling oily medications, milk, or other fatty foods or from swimming in petroleum-contaminated water.

lipiduria /lip′idŏŏr′ē·ə/, the presence of lipids (fatty bodies) in the urine.

lipo-, lip-, prefix meaning "fat": *lipase, lipodystrophy, lipoma.*

lipoatrophic diabetes /lip′ō·atrof′ik/, an inherited disease characterized by a total loss of subcutaneous body fat, insulin-resistant diabetes mellitus, acanthosis nigricans, hypermetabolism, hepatomegaly, and hypertrophied musculature. It is associated with a disorder of the hypothalamus that results in excessive blood levels of growth hormone and adrenocorticotropic-releasing hormones. Also called *congenital total lipodystrophy.*

lipoatrophy /lip′ō·at′rəfē/, a breakdown of subcutaneous fat at the site of an insulin injection. It usually occurs after several injections at the same site. Compare **lipohypertrophy.**



Lipoatrophy at insulin injection site
(Belchetz and Hammond, 2003)

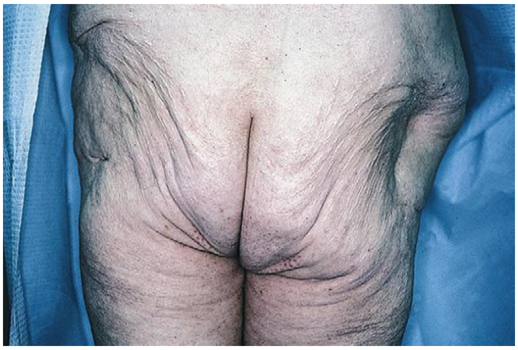
lipocele. See **adipocele.**

lipochondrodystrophy. See **Hurler's syndrome.**

lipochrome /lip′əkrōm/ [Gk, *lipos* + *chroma,* color], any of the naturally occurring pigments that contain a lipid and give a yellow color to fats, such as carotene.

lipodystrophia progressiva /-distrō′fē·ə/ [Gk, *lipos* + *dys,* bad, *trophe,* nourishment; L, *progredior,* to go forth], an abnormal accumulation of fat around the buttocks and thighs and a progressive, symmetric disappearance of subcutaneous fat from areas above the pelvis and on the face. Also called **lipomatosis atrophicans.**

lipodystrophy /lip′ōdis′trəfē/ [Gk, *lipos* + *dys,* bad, *trophe,* nourishment], any abnormality in the metabolism or deposition of fats. Kinds of lipodystrophy are congenital total lipodystrophy, familial partial lipodystrophy, **insulin lipodystrophy,** *membranous lipodystrophy,* and progressive lipodystrophy.



Lipodystrophy *(Callen et al, 2000)*

lip of hip fracture, a break in the posterior lip of the acetabulum, often associated with displacement of the hip.

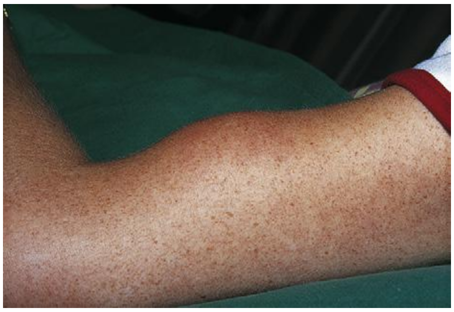
lipofibroma. See **fibrolipoma.**

lipofuscin /lip′əfus′in/, a class of fatty pigments consisting mostly of oxidized fats that are found in abundance in the cells of adults. Lipofuscins accumulate in lysosomes with age.

lipogenesis /-jen′əsis/ [Gk, *lipos,* fat, *genein,* to produce], the production and accumulation of fat.

lipogranuloma /lip′ōgran′yŏŏlō′mə/ *pl. lipogranulomas, lipogranulomata* [Gk, *lipos* + L, *granulum,* little grain; Gk, *oma,* tumor], a nodule of necrotic, fatty tissue associated with granulomatous inflammation or a foreign-body reaction around a deposit of injected material containing an oily substance.

lipohypertrophy /lip′ōhīpur′trəfē/, a build-up of subcutaneous fat tissue at a site where insulin has been injected continuously. Compare **lipoatrophy.**



Lipohypertrophy at insulin injection site
(Belchetz and Hammond, 2003)

lipoic acid /lipō′ik/, a bacterial growth factor found in liver and yeast.

lipoid /lip′oid/, resembling a lipid.

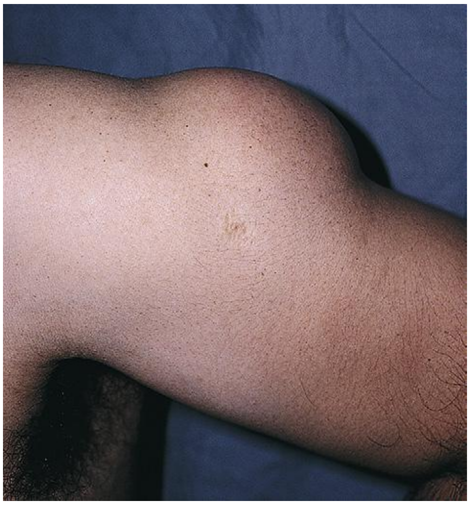
lipoid nephrosis. See **minimal change disease.**

lipolysis /lipol′isis/, the breakdown or destruction of fats.

lipolytic /-lit′ik/, pertaining to the chemical breakdown of fat.

lipolytic digestion, a phase of food digestion in which fat molecules are split into glycerol and fatty acids.

lipoma /lipō′mə/ *pl.* **lipomas, lipomata** [Gk, *lipos* + *oma,* tumor], a benign tumor consisting of mature fat cells. Also called **adipose tumor.** See also **multiple lipomatosis. —lipomatous,** *adj.*



Lipoma *(Callen et al, 2000)*

-lipoma, suffix meaning a "tumor made up of fatty tissue": *angiolipoma, fibrolipoma, osteolipoma.*

lipoma annulare colli, a diffuse, symmetric accumulation of fat around the neck, not a true lipoma. Also called **Madelung's neck.**

lipoma arborescens, a fatty tumor of a joint, characterized by a treelike distribution of fat cells.

lipoma capsulare, a benign neoplasm characterized by the abnormal presence of fat cells in the capsule of an organ.

lipoma cavernosum. See **angiolipoma.**

lipoma diffusum renis. See **lipomatous nephritis.**

lipoma dolorosa. See **lipomatosis dolorosa.**

lipoma fibrosum, a fatty tumor containing masses of fibrous tissue.

lipoma myxomatodes. See **lipomyxoma.**

lipomas. See **lipoma.**

lipoma sarcomatodes. See **liposarcoma.**

lipomata. See **lipoma.**

lipomatosis /lip′ōmətō′sis/ [Gk, *lipos* + *oma,* tumor, *osis,* condition], a disorder characterized by abnormal tumorlike accumulations of fat in body tissues.

lipomatosis atrophicans. See **lipodystrophia progressiva.**

lipomatosis dolorosa, a disorder characterized by the abnormal accumulation of painful or tender fat deposits. Also called **lipoma dolorosa.**

lipomatosis gigantea, a condition characterized by massive deposits of fat.

lipomatosis renis. See **lipomatous nephritis.**

lipomatous /lipō′mətəs/ [Gk, *lipos,* fat, *oma,* tumor], pertaining to or resembling a benign tumor made up of mature fat cells.

lipomatous myxoma, a tumor containing fatty tissue that arises in connective tissue.

lipomatous nephritis, a rare condition in which the renal nephrons are replaced by fatty tissue. Kidney failure may result. Also called **lipoma diffusum renis, lipomatosis renis.**

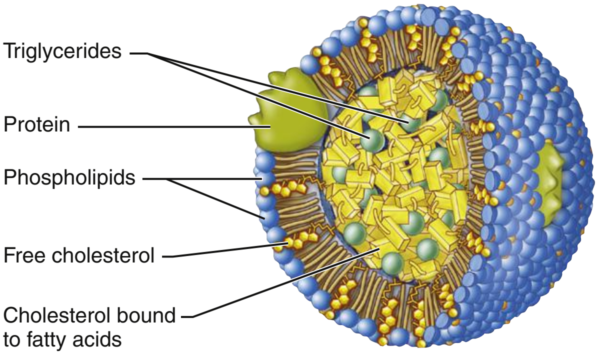
lipometabolism /-metab′əliz′əm/ [Gk, *lipos,* fat, *metabole,* change], the chemical processes involved in building up or breaking down fat molecules.

lipomyoma /-mī·ō′mə/ [Gk, *lipos,* fat; *mys,* muscle, *oma,* tumor], a tumor that combines characteristics of a lipoma and myoma.

lipomyxoma /lip′ōmiksō′mə/ *pl. lipomyxomas, lipomyxomata* [Gk, *lipos* + *myxa,* mucus, *oma,* tumor], a myxoma that contains fat cells. Also called *lipoma myxomatodes.*

lipophilia /-fil′yə/ [Gk, *lipos,* fat, *philein,* to love], a tendency to attract or absorb fat.

lipoprotein /lip′ōprō′tēn/ [Gk, *lipos* + *proteios,* first rank], a conjugated protein in which lipids form an integral part of the molecule. They are synthesized primarily in the liver; contain varying amounts of triglycerides, cholesterol, phospholipids, fat-soluble vitamins, and protein; and are classified according to their composition and density. Practically all of the plasma lipids are present as lipoprotein complexes. The elevation of low-density lipoproteins (LDLs) in plasma is associated with an increased risk of atherosclerosis. Normal adult levels of lipoproteins include high-density lipoproteins, greater than 35 mg/dl; LDLs, 60 to 180 mg/dl; and very low-density lipoproteins, 25% to 50%. Kinds of lipoproteins are **chylomicrons, high-density lipoproteins, low-density lipoproteins,** and **very low–density lipoproteins.**



Lipoprotein *(Patton and Thibodeau, 2010)*

lipoprotein electrophoresis, a blood test performed on patients with rare lipid profiles to predict coronary arteriosclerotic heart disease.

lipoprotein lipase (LPL), an enzyme that plays a key role in breaking down triglycerides present in chylomicrons and very low–density lipoprotein particles, releasing their fatty acids for entry into tissue cells.

lipoproteins test (HDL, LDL, and VLDL), a blood test, performed as part of a lipid profile, to identify persons who are at risk for developing heart disease and to monitor therapy if abnormalities are found. Lipoproteins are considered to be an accurate predictor of coronary heart disease.

liposarcoma /lip′ōsärkō′mə/ *pl. liposarcomas, liposarcomata* [Gk, *lipos* + *sarx,* flesh, *oma,* tumor], a malignant growth of primitive fat cells that occurs in the deep soft tissue of the extremities and retroperitoneum. It is the most common soft tissue sarcoma. Also called **lipoma sarcomatodes.**

liposis. See **lipomatosis.**

liposoluble /-sol′yəbəl/ [Gk, *lipos,* fat; L, *solubilis*], soluble in fats.

liposomal cytarabine, a suspension of cytarabine molecules encapsulated in liposomes. It is a sustained-release preparation that is injected intrathecally in the treatment of meningitis associated with lymphoma.

liposomal daunorubicin, an aqueous solution of the citrate salt of daunorubicin encapsulated within specifically constructed liposomes that shows enhanced selectivity for solid tumors in situ compared with that of the hydrochloride salt. It is administered intravenously in the treatment of advanced Kaposi's sarcoma associated with acquired immunodeficiency syndrome.

liposomal doxorubicin, doxorubicin hydrochloride encapsulated within liposomes, administered intravenously in the treatment of Kaposi's sarcoma associated with AIDS.

liposome /lip′əsōm/ [Gk, *lipos,* fat, *soma,* body], a small, spheric particle consisting of a bilayer of phospholipid molecules surrounding an aqueous solution.

liposuction /-suk′shən/, plastic surgery that removes adipose tissue with a suction pump device. It is used primarily to remove or reduce localized areas of fat around the abdomen, breasts, legs, face, and upper arms where the skin is contractile enough to redrape in a normal manner. Also called **suction lipectomy.**

Liposuction *(LaTrenta, 2004)*

lip reading. See **speech reading.**

-lipsis, -lipse, suffix meaning "to leave out, fail, omit": *eclipsis, ellipsis, menolipsis.*

Liquaemin Sodium, a trademark for an anticoagulant **(heparin sodium).**

liquefaction /lik′wəfak′shən/ [L, *liquere,* to flow, *facere,* to make], the process in which a solid or a gas is made liquid.

liquefactive degeneration /lik′wəfak′tiv/, dissolution of tissues, resulting from hydrolytic enzymes released by leukocytes and tissue cells. It occurs in the skin of patients with lichen planus and lupus erythematosus.

liquid /lik′wid/ [L, *liquere,* to flow], a state of matter, intermediate between solid and gas, in which the molecules move freely among themselves and the substance flows freely with little application of force. Liquids have a fixed volume but assume the shape of the vessel in which they are contained. Compare **fluid.** See also **gas, solid.**

liquid crystal display (LCD), a thin membrane containing liquid crystals, used for displays in computers and monitoring equipment.

liquid diet, a diet consisting of foods that can be served in liquid or strained form but that may include custard, ice cream, pudding, tapioca, and soft-cooked eggs. It is prescribed in acute infections, in acute inflammatory conditions of the GI tract, and for patients unable to consume other soft or semifluid foods, usually after surgery. See also **full-liquid diet.**

liquid glucose, a thick, syrupy, odorless and colorless or yellowish liquid obtained by the incomplete hydrolysis of starch, primarily consisting of dextrose with dextrins, maltose, and water. It is used as a flavoring agent and may be used as a calorie source, chiefly in treating dehydration.

liquid nitrogen. See **cryogen.**

liquid paraffin. See **mineral oil.**

liquid petrolatum. See **mineral oil.**

liquid scintillation counter, a device for measuring radioactivity, usually beta particles, emitted from a sample dispersed in a liquid scintillation cocktail.

liquor /lik′ər/, **1.** any fluid or liquid, such as liquor amnii, the amniotic fluid. **2.** an alcoholic beverage.

liquorice. See **licorice.**

lisdexamfetamine, a central nervous system stimulant.

■ INDICATION: This drug is used to treat attention deficit disorder with hyperactivity.

■ CONTRAINDICATIONS: Hyperthyroidism, hypertension, glaucoma, severe arteriosclerosis, drug abuse, cardiovascular disease, anxiety, anorexia nervosa, breastfeeding, and known hypersensitivity to sympathomimetic amines prohibit the use of this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, headache, dysphoria, irritability, aggressiveness, central nervous system tumor, dependence, addiction, mild euphoria, somnolence, lability, hypertension, decrease in heart rate, MI, growth inhibition, dry mouth, diarrhea, weight loss, impotence, change in libido, and urticaria. Life-threatening side effects include arrhythmias, cardiomyopathy, angioedema, Stevens-Johnson syndrome, and toxic epidermal necrolysis. Common side effects include hyperactivity, insomnia, restlessness, talkativeness, palpitations, tachycardia, and anorexia.

Lisfranc's fracture /lisfrangks′/ [Jacques Lisfranc, French surgeon, 1790–1847], a fracture dislocation of the foot in which one or all of the proximal metatarsals are displaced.

lisp, the mispronunciation of one or more of the sibilant consonant sounds, usually /s/ and /z/.

lissencephalia. See **agyria.**

lissencephaly. See **agyria.**

Listeria monocytogenes /lister′ē·ə mon′ōsītoj′inēz/ [Joseph Lister; Gk, *mono,* single, *kytos,* cell, *genein,* to produce], a common species of gram-positive motile bacilla that cause listeriosis and a noninvasive food-borne diarrheal disease.

listeriosis /listir′ē·ō′sis/ [Joseph Lister; Gk, *osis,* condition], an infectious disease caused by a genus of gram-positive motile bacteria that are nonsporulating. *Listeria monocytogenes* infects shellfish, birds, spiders, and mammals in all areas of the world, but infection in humans is uncommon. It is transmitted by direct contact between infected animals and humans, through the ingestion of contaminated meat and dairy products, by inhalation of dust, or by contact with mud, sewage, or soil contaminated with the organism. The disorder is characterized in mild cases by fever, myalgia, nausea, and diarrhea and in severe cases by circulatory collapse, shock, endocarditis, hepatosplenomegaly, and a dark red rash over the trunk and legs. Fever, bacteremia, malaise, and lethargy are commonly seen. Newborns and immunosuppressed debilitated older people are more vulnerable to infection than are immunocompetent children and young or middle-aged adults. The signs of infection and the severity of the disease vary according to the site of infection and the age and condition of the person. Pregnant women characteristically experience a mild brief episode of illness, but fetal infection acquired through the placental circulation in utero is usually fatal. Infection in the newborn apparently results from exposure to the organism in the birth canal of an infected mother. Meningitis and encephalitis occur in 75% of cases. Treatment may include ampicillin, penicillin, tetracycline, or erythromycin given intramuscularly or intravenously. Trimethoprim-sulfamethoxazole is an alternative. If infection is suspected in a pregnant woman, treatment is begun immediately, even before bacteriological culture of the blood, spinal fluid, or vaginal secretions can confirm the diagnosis. All secretions from the patient may contain the organism. Also called listerosis.

Lister, Joseph [Scottish surgeon, 1827–1912], the surgeon who introduced the use of antiseptic surgery in London hospitals in 1867. Lister operations were performed under a spray of diluted carbolic acid, instruments were dipped in carbolic acid, and wounds were dressed with gauze similarly treated.

Liston's forceps [Robert Liston, Scottish surgeon, 1794–1847], a kind of bone-cutting forceps.

liter (L) /lē′tər/ [Fr], a derived unit of volume equivalent to 1.057 quarts and defined as the volume occupied by a mass of 1 kg of water at standard temperature and pressure.

lith-. See **litho-.**

-lith, suffix meaning "a calculus" or "a stone": *pneumolith, ptyalith, tonsillolith.*

Lithane, a trademark for an antimanic drug **(lithium carbonate).**

lithiasis /lithī′əsis/ [Gk, *lithos,* stone, *osis,* condition], the formation of calculi in the hollow organs or ducts of the body. Calculi are formed of mineral salts and may irritate, inflame, or obstruct the organ in which they form or lodge. Lithiasis occurs most commonly in the gallbladder, kidney, and lower urinary tract. Lithiasis may be asymptomatic, but more often the condition is extremely painful. Surgery may be necessary if the stones cannot be excreted spontaneously. Lower urinary tract calculi often can be dissolved. See also **biliary calculus, cholelithiasis, renal calculus, urinary calculus.**

-lithiasis, suffix meaning "the presence, condition, or formation of stones": *cholelithiasis, uterolithiasis.*

lithium (Li) /lith′ē·əm/ [Gk, *lithos,* stone], a silver-white alkali metal occurring in various compounds such as petalite and spodumene. Its atomic number is 3; its atomic mass is 6.94. Lithium is the lightest known metal and one of the most reactive elements. Traces of lithium ion occur in animal tissue, and it abounds in many alkaline mineral spring waters. Its salts are used in the treatment of manias, but the mechanisms by which these compounds help to stabilize psychological moods are not understood. Lithium carbonate is a salt commonly used for psychiatric purposes in the United States. It has been effective in the prevention of recurrent attacks of manic-depressive illnesses and has helped correct sleep disorders in manic patients, apparently by suppressing the rapid eye movement phases of sleep. Therapeutic concentrations of lithium have no observable psychotropic effects on normal individuals. In manic patients, lithium salts also produce high-voltage slow waves in the electroencephalograph, often with superimposed beta waves. An important feature of the lithium ion is its relatively small gradient of distribution across biological membranes. Patients suffering severe manic attacks are hospitalized so that they can receive proper medical maintenance. Treatments start with large doses of antipsychotic drugs, which are followed by the gradual and safe introduction of lithium therapy. Ideally lithium treatment is prescribed only for patients with normal sodium intake and normal heart and kidney function.

lithium carbonate, an antimanic agent.

■ INDICATION: It is prescribed in the treatment of manic episodes of manic-depressive disorder.

■ CONTRAINDICATIONS: It is used with caution in the presence of renal or cardiovascular disease and is not recommended for children under 12 years of age. Known hypersensitivity to this drug and pregnancy prohibit its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are renal damage, polydipsia and polyuria, and impairment of mental and physical abilities. Retention of sodium and fluid may occur.

lithium fluoride (LiF), a compound commonly used for thermoluminescent dosimetry.

litho-, lith-, prefix meaning "stone or calculus": *litholysis, lithomyl, lithophone.*

Lithobid, a trademark for an antimanic drug **(lithium carbonate).**

lithogenesis /lith′əjen′əsis/ [Gk, *lithos,* stone, *genein,* to produce], the origin of the formation of a calculus.

lithopedion /lith′əpē′dē·ən/ [Gk, *lithos* + *paidion,* child], a fetus that has died during an ectopic pregnancy and has become calcified or ossified. It may remain undiagnosed for decades. Also called **calcified fetus,** *lithopedium,* **ostembryon, osteopedion.**

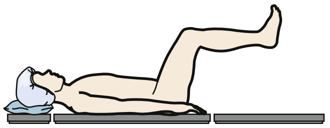
Lithostat /lith′ostat/, a trademark for a preparation of a urease inhibitor used in treatment of kidney stones and urinary tract infections **(acetohydroxamic acid).**

Lithotabs, a trademark for an antimanic drug **(lithium carbonate).**

lithotomy /lithot′əmē/ [Gk, *lithos* + *temnein,* to cut], **1.** the surgical excision of a calculus, especially one from the urinary tract. **2.** a position in operating room in which the patient is supine with legs raised and abducted to expose the perineal region. The legs are placed in stirrups to maintain the position.

lithotomy forceps, a forceps for the extraction of a calculus, usually from the urinary tract.

lithotomy position, the position assumed by the patient lying supine with the hips and the knees flexed and the thighs abducted and rotated externally. Also called **dorsosacral position.**



Standard lithotomy position *(Phillips, 2007)*

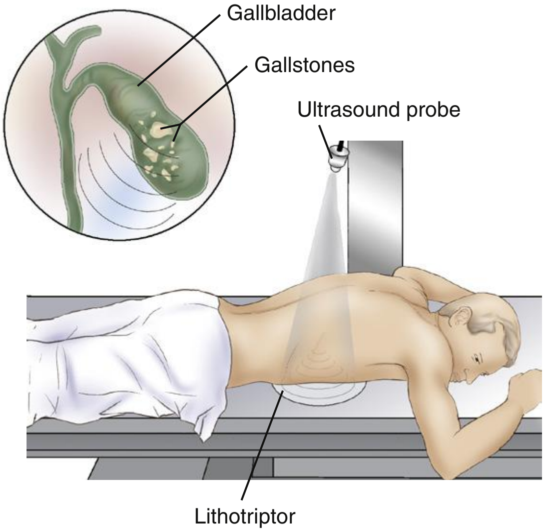
lithotripsy /lith′ətrip′sē/ [Gk, *lithos,* stone, *tribein,* to wear away], a procedure for eliminating a calculus in the renal pelvis, ureter, bladder, or gallbladder. It may be crushed surgically or by using a noninvasive method such as a hydraulic, or high-energy, shock wave or a pulsed dye laser. The fragments may then be expelled or washed out.

lithotrite /lith′ətrīt/ [Gk, *lithos* + L, *terere,* to rub], an instrument for crushing a stone in the urinary bladder. Also called *lithotriptor.* —*lithotrity, n.*

litigant /lit′əgənt/ [L, *litigare,* to go to law], (in law) a party to a lawsuit. See also **defendant, plaintiff.**

litigate /lit′əgāt/, (in law) to carry on a suit or to contest.

litigious paranoia [L, *litigare,* to go to law; Gk, *paranous,* madness], a form of paranoia in which the person seeks legal proof or justification for systematized delusions.



Lithotripsy *(Leonard, 2009)*

litmus paper /lit′məs/ [ONorse, *litmosi,* coloring herb; L, *papyrus,* paper], absorbent paper coated with litmus, a blue dye, that is used to determine pH. Acid substances or solutions turn blue litmus to red. Alkaline substances or solutions do not cause a color change in blue litmus. The pH range is 4.5 (red) to 8.5 (blue).

litter [Fr, *lit,* bed], a stretcher.

Little's disease. See **cerebral palsy.**

Litzmann obliquity. See **asynclitism.**

live attenuated measles virus vaccine /əten′yo͞o·ā′tid/, a vaccine prepared from live strains of measles virus that have been cultured under conditions that cause them to lose their virulence without losing their ability to induce immunity. The vaccine is not recommended for pregnant women or others who may have certain medical conditions that tend to diminish immunity.

live attenuated vaccine, a vaccine prepared from live microorganisms or functional viruses whose disease-producing ability has been weakened but whose immunogenic properties have not.

live birth [AS, *libben,* to be alive; ONorse, *byrth*], the birth of a newborn, irrespective of the duration of gestation, that exhibits any sign of life, such as respiration, heartbeat, umbilical pulsation, or movement of voluntary muscles. A live birth is not always a viable birth.

livedo /livē′dō/ [L, *liveo,* bluish spot], a blue or reddish mottling of the skin that worsens in cold weather and is probably caused by arteriolar spasm. **Cutis marmorata** is a transient form of livedo. See also **livedo reticularis.**

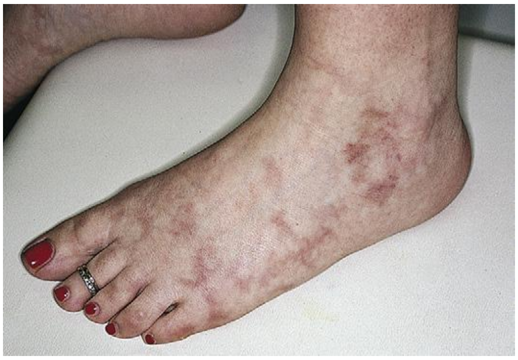
livedo reticularis, a disorder accentuated by exposure to cold and presenting with a characteristic reddish-blue mottling with a typical "fishnet" appearance. The condition involves the entire leg and, less often, the arm. See also **livedo.**

livedo vasculitis. See **segmented hyalinizing vasculitis.**

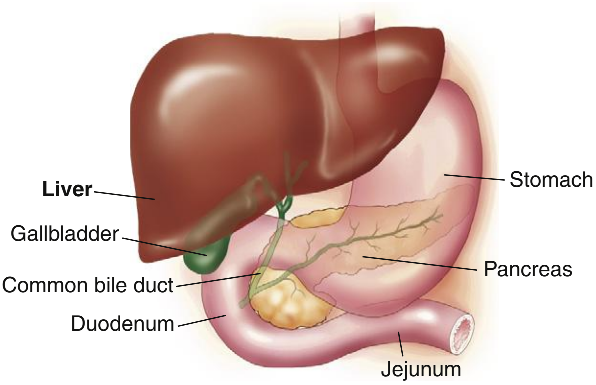
live measles and mumps virus vaccine, a vaccine prepared from live strains of measles and mumps viruses. The vaccine is commonly combined with live rubella viruses as **measles, mumps, and rubella vaccine** and administered to normal infants at the age of 15 months.

live oral poliovirus vaccine, a vaccine prepared from three strains (trivalent) of live polioviruses. Primary immunization with the vaccine usually begins at the age of 2 months.

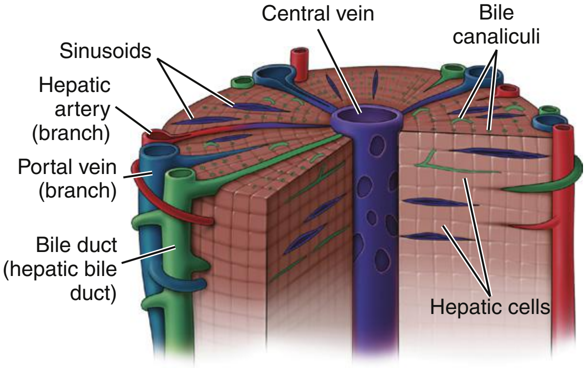
liver [AS, *lifer*], the largest gland of the body and one of its most complex organs. It is located in the upper cranial, right part of the abdominal cavity, occupying almost the entire right hypochondrium and the greater part of the epigastrium. In many individuals it extends into the left hypochondrium as far as the mammary line. It has a soft solid consistency, is shaped like an irregular hemisphere, and is dark reddish-brown. The ventral part of the liver is separated by the diaphragm from the sixth to the tenth ribs on the right side and from the seventh and eighth costal cartilages on the left side. The central section has a deep concavity that fits the vertebral column and the crura of the diaphragm. The liver is divided into four lobes, contains as many as 100,000 lobules, and is served by two distinct blood supplies. The hepatic artery conveys oxygenated blood to the liver, and the hepatic portal vein conveys nutrient-filled blood from the stomach and the intestines. At any given moment the liver holds about 1 pint of blood, or approximately 13% of the total blood supply of the body. The tiny lobules of the organ are composed of polyhedral hepatic cells. These cells communicate with small ducts that connect with larger ducts to form the left and right hepatic ducts that emerge on the caudal surface of the liver. The left and right hepatic ducts converge to form the single hepatic duct, which conveys the bile to the duodenum and gallbladder for storage. More than 500 functions of the liver have been identified. Some of the major functions are the production of bile by hepatic cells; the secretion of glucose, proteins, vitamins, fats, and most of the other compounds used by the body; the processing of hemoglobin for vital use of its iron content; and the conversion of poisonous ammonia to urea. Bile from the liver is stored in the hepatic duct, in numerous blood vessels and in the gallbladder, which is connected to the liver by connective tissue. The liver cells produce about 1 pint of bile daily. The hepatic cells also detoxify numerous ingested substances, such as alcohol, nicotine, and other poisons, as well as various toxic substances produced by the intestine. See also **gallbladder.**



Livedo reticularis *(Callen et al, 2000)*



Liver *(Leonard, 2009)*



Liver lobule *(Herlihy, 2011)*

liver abscess [L, *abscedere,* to go away; AS, *lifer*], an abscess in the liver cells, usually caused by an amebic infection, bacterial infection, or trauma. It is characterized by sweats and chills, pain, nausea, and vomiting.

liver biopsy, a diagnostic procedure in which a special needle is introduced into the liver under local anesthesia to obtain a specimen for pathological examination.

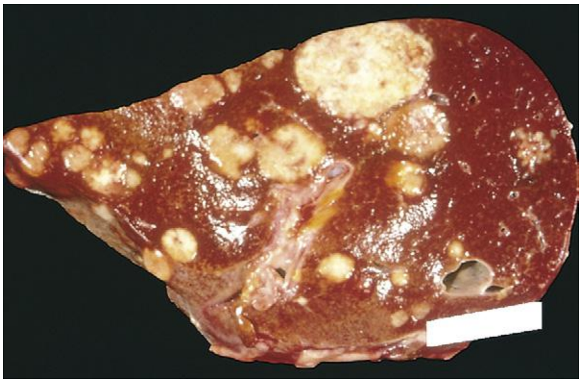
■ METHOD: Before a liver biopsy is performed by a physician, the procedure is explained to the patient, whose baseline vital signs are recorded and who is taught how to inhale and hold the breath during needle insertion. After the patient's possible allergy to the local anesthetic is checked and results of bleeding, clotting, and prothrombin tests are obtained, an analgesic or sedative is administered as ordered. The biopsy is performed with ultrasound visualization. On completion of the biopsy, pressure is applied to the site for 15 minutes. The patient is positioned on the right side for the first 2 hours and remains in a supine position in bed for the next 22 hours. The blood pressure, pulse, and respirations are checked every 15 minutes for the first hour, then every 30 minutes for the next 2 hours, and subsequently every 4 hours or as ordered. The biopsy site is observed every 30 minutes for bleeding, swelling, or increased pain; epigastric or referred shoulder pain may occur. Analgesia and vitamin K are given as ordered, and the recumbent patient is assisted with eating and other activities as needed. A post-biopsy complete blood count is performed.

■ INTERVENTIONS: The health care provider reinforces explanations of the biopsy and its purpose, provides care before and after the procedure, and closely observes the patient for postbiopsy complications such as intraperitoneal hemorrhage, shock, and pneumothorax.

■ OUTCOME CRITERIA: An uneventful liver biopsy is a valuable aid in establishing a diagnosis of hepatic disease, including primary and metastatic malignant neoplastic disease.

liver breath. See **fetor hepaticus.**

liver cancer, a malignant neoplastic disease of the liver. Primary liver cancer is common in Africa and Southeast Asia. Primary tumors are 6 to 10 times more prevalent in men than in women, develop most often in the sixth decade of life, and are associated with cirrhosis of the liver in 70% of the cases. Other risk factors include hemochromatosis, hepatitis, schistosomiasis, exposure to vinyl chloride or arsenic, and possibly nutritional deficiencies. Alcoholism may be a predisposing factor, but nonalcoholic cirrhosis is a greater risk than alcoholic cirrhosis. Aflatoxins in moldy grain and peanuts appear to be linked to high rates of hepatocellular carcinoma in parts of Africa. Characteristics of liver cancer are abdominal bloating, anorexia, weakness, dull upper abdominal pain, ascites, mild jaundice, and a tender enlarged liver; in some cases tumor nodules are palpable on the liver surface. Diagnostic procedures include radioisotope scan, biopsy, and various laboratory studies of liver function. An elevated level of alkaline phosphatase, increased retention of sulfobromophthalein, and the presence of alpha-fetoprotein in the blood suggest liver cancer. Most primary liver tumors are adenocarcinomas, classified as hepatomas, when derived from hepatic cells, and cholangiomas, if they originate in cells of the bile duct. Systemic chemotherapy may result in temporary tumor regression; it may be administered with a surgically implanted infusion pump. Liver transplantation may also be used to treat eligible individuals. Irradiation is very destructive to liver cells and not very toxic to tumor cells in the liver. See also **hepatoma.**



Metastatic liver cancer *(Kumar et al, 2007)*

liver cell carcinoma. See **malignant hepatoma.**

liver disease, any one of a group of disorders of the liver. Characteristics of liver disease are jaundice, anorexia, hepatomegaly, ascites, and impaired consciousness. The exact diagnosis of liver disease is made through a combination of laboratory tests and clinical findings. See also **cholestasis, cirrhosis, hepatitis.**

liver failure [AS, *lifer* + L, *fallere,* to deceive], a condition in which the liver fails to fulfill its function or is unable to meet the demands made on it. Anorexia, fatigue, and weakness are common symptoms of liver cell failure, whereas jaundice indicates a biliary obstruction, and fever may accompany viral or alcoholic liver diseases.

liver flap. See **asterixis.**

liver fluke [AS, *lifer* + *floc*], a parasitic trematode belonging to the class Trematoda, with six genera that may infest the liver. The most important species affecting humans in industrialized countries is ***Clonorchis sinensis,*** which is usually acquired by eating freshwater fish containing the encysted larvae. The larvae are released in the duodenum, enter the common bile duct, and migrate to other bile ducts, the gallbladder, and pancreatic ducts. The liver fluke may survive for many years in the human biliary tree, releasing eggs into the feces. Infestations are most likely to result from ingestion of raw, dried, salted, or pickled freshwater fish and can be prevented by thorough cooking of such fish.

liver function test (LFT), one of several tests used to evaluate various functions of the liver, including metabolism, storage, filtration, and excretion. Kinds of liver function tests include **alanine aminotransferase test, alkaline phosphatase test, prothrombin time,** *serum bilirubin.*

liver scan, a noninvasive technique for visualizing the size, shape, and consistency of the liver and for assessing the liver's functional status. It involves IV injection of a radioactively labeled compound that is readily taken up and trapped in the Kupffer cells of the liver. The radiation emitted by the compound is recorded by a radiation detector and can be photographed with a scintillation camera or x-ray film. Liver scans are useful for diagnosing three-dimensional lesions such as abscesses and tumors, for performing biopsies, and for evaluating hepatomegaly, jaundice, and ascites.

liver segments, the eight regions of the liver based on blood supply and biliary drainage.

liver spot nontechnical. a variably pigmented lentigo occurring on the exposed skin of older Caucasians.

liver transplantation, a treatment for end-stage hepatic dysfunction in which a donor liver is matched in size and blood group to the recipient. The transplanted organ may be introduced as an auxiliary liver or as a total replacement. The procedure requires five anastomoses and many units of blood. Because of a shortage of child-size livers, pediatric transplants often are performed with a segment of an adult liver. Common postoperative complications include acute graft rejection, infection, hepatic complications (bile leakage, abscess formation, hepatic thrombosis), acute renal failure, giant emphysematous blebs, and fungal infections.

livid /liv′id/ [L, *lividus,* bluish], pertaining to an injury that is congested and has a bluish discoloration.

lividity /livid′itē/ [L, *lividus,* bluish], a tissue condition of being red or blue because of venous congestion, as in a contusion.

living-in unit. See **rooming-in.**

living related donor, an organ donor who is a close blood relative of the recipient.

living unrelated donor, an organ donor who is not a close blood relative of the recipient.

living will [AS, *libben* + *willa,* wish], **1.** an advance declaration by a patient that, if determined to be hopelessly and terminally ill, the patient does not want to be connected to life support equipment. See also **durable power of attorney for health care. 2.** a written agreement between a patient and physician to withhold heroic measures if the patient's condition is found to be irreversible. See also **advance directive.**

livor mortis /lī′vər/, a purple discoloration of the skin in some dependent body areas following death as a result of blood cell destruction.

lixiviation. See **leaching.**

lizard /liz′ərd/ [L, *lacerta*], a scaly-skinned reptile with a long body and tail and two pairs of legs. The large Gila monster of Arizona, New Mexico, and Utah and the beaded lizard of Mexico are the only North American lizards known to be venomous. The symptoms of their bites and the recommended treatment are similar to those of the bites from poisonous snakes, except that antivenin is not available.

LLD, abbreviation for **lower level discriminator.**

LLD factor. See **cyanocobalamin.**

LLE, abbreviation for *left lower extremity.*

LLQ, abbreviation for *left lower quadrant* of the abdomen.

LMA, abbreviation for *left mentoanterior fetal position.*

LMD. See **dextran preparation.**

L.M.D., abbreviation for *licensed medical doctor.* See **P.M.D.**

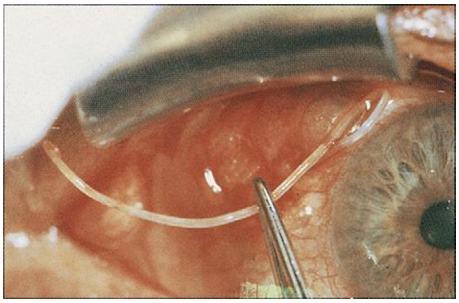
LMFT, abbreviation for **licensed marriage and family therapist.**

LMP, **1.** abbreviation for *last menstrual period.* **2.** abbreviation for *left mentoposterior fetal position.*

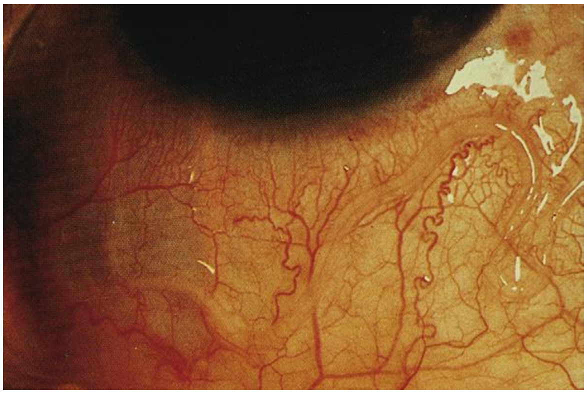
LMT, abbreviation for *left mentotransverse fetal position.*

LMWH, abbreviation for **low-molecular-weight heparin.**

Loa /lo′ə/, a genus of nematodes of the superfamily Filarioidea. *L. loa* is a threadlike species 2.5 to 5 cm long found in West Africa. It inhabits the subcutaneous connective tissue of the human body and is seen especially as an eye worm about the orbit and under the conjunctiva. It causes itching and occasionally edematous swellings (Calabar swellings). The immature forms or microfilariae are diurnal, being found in the peripheral circulation in greatest concentrations during the day.



Loa loa being extracted from under the conjunctiva
(Michelson and Friedlaender, 1996/Courtesy Dr. Jonathan Belmont)



Loa loa *(Conlon and Snydman, 2000)*

LOA, **1.** abbreviation for *left occipitoanterior fetal position.* **2.** abbreviation for **looseness of association.**

load, a departure from normal body values for parameters such as water content, salt concentration, and heat. A positive load indicates a higher-than-normal value, whereas a negative load indicates a below-normal value.

loading, **1.** the administration of a substance in sufficient quantity to test a patient's ability to metabolize or absorb it. **2.** the exertion of force on a muscle or ligament to increase its strength.

loading response stance stage [AS, *lad,* support; L, *responsum,* reply], one of the five stages of the stance phase of walking or gait, specifically associated with the moment when the leg reacts to and accepts the weight of the body. The loading response stance stage is one of the factors in the diagnoses of many abnormal orthopedic conditions and is often studied in conjunction with analyses of the electromyographic activity of the muscles used in walking. Compare **initial contact stance stage, midstance, preswing stance stage, terminal stance.**

loads [AS, *lad,* support], slang. a fixed combination of a sedative hypnotic (glutethimide) and a major opioid analgesic (codeine), which is taken orally by drug abusers for a euphoric effect reported to be similar to that produced by heroin but longer lasting. Toxicity may develop, characterized by nystagmus, slurred speech, seizures, coma, pulmonary edema, or sudden apnea and death. Detoxification of an addicted person is managed under close medical supervision with methadone and phenobarbital, as sudden withdrawal can cause death.

Loa loa /lō′ä lō′ä/, a parasitic worm of western and central Africa that causes loiasis. Also called **eye worm.**

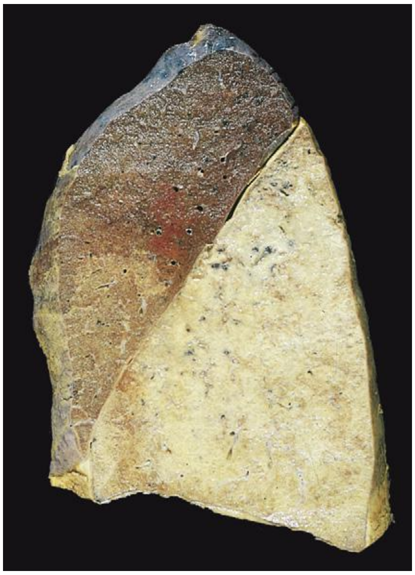
lobar. See **lobe.**

lobar bronchus /lō′bär/ [Gk, *lobos,* lobe, *bronchos,* windpipe], a bronchus extending from a primary bronchus to a segmental bronchus into one of the lobes of the right or left lung.

lobar buds, secondary bronchial buds.

lobar nephronia, acute pyelonephritis.

lobar pneumonia, a severe infection of one or more of the five major lobes of the lungs that, if untreated, eventually results in consolidation of lung tissue. The disease is characterized by fever, chills, cough, rusty sputum, rapid shallow breathing, cyanosis, nausea, vomiting, and pleurisy. ***Streptococcus pneumoniae*** is the usual cause; but ***Klebsiella pneumoniae, Haemophilus influenzae,*** and other streptococci can also produce the disease. If the diagnosis is made early, appropriate antibiotic therapy is highly successful. Complications include lung abscess, atelectasis, empyema, pericarditis, and pleural effusion. Precautions against spread of the contagious disease are important. Because the fatality rate in the elderly and those with underlying systemic illness is high, prophylactic polyvalent pneumococcal vaccine is recommended for them. Compare **bronchopneumonia.**



Lobar pneumonia *(Kumar et al, 2007)*

lobate /lō′bāt/, organized in lobes or rounded divisions. Also **lobular.**

lobe /lōb/ [Gk, *lobos*], **1.** a roundish projection of any structure. **2.** a part of any organ, demarcated by sulci, fissures, or connective tissue, as the lobes of the brain, liver, and lungs. **—lobar, lobular,** *adj.*

lobe-, -lobe, combining form meaning a ‘rounded prominence,’ a lobe: *gonilobe, lobotany, multilobe.*

lobectomy /lōbek′təmē/ [Gk, *lobos* + *ektomē,* excision], the surgical excision of one or more lobes of a lung. It is performed to remove a malignant tumor or large benign tumor and to treat uncontrolled bronchiectasis, trauma with hemorrhage, congenital anomalies, or intractable tuberculosis. Any respiratory infection is cleared before surgery. Administration of antibiotics is begun, and the patient receives a general anesthetic. The chest cavity is entered through a long back-to-front incision (thoracotomy), and the diseased lobe is removed. A large-caliber tube remains in the wound and is connected to a water-sealed drainage system. Oxygen is given after surgery. Vital signs are closely monitored, and deep breathing is encouraged. Blood transfusion may be given, and IV fluids are continued. Pain medication is given. Care is taken that the chest tube remain patent and that the drainage system is sealed and functional. The chest tube is removed 2 to 3 days after surgery. Some compensatory emphysema is expected as the remaining lung tissue overexpands to fill the new space. *—lobectomize, v.*

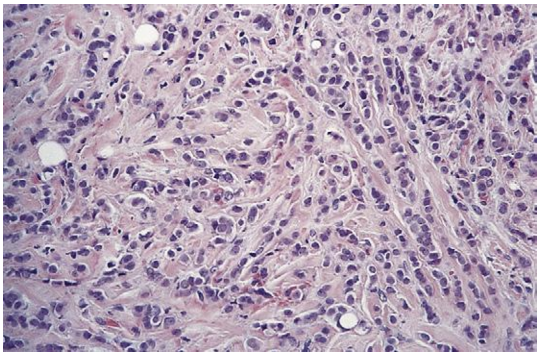
lobe of ear [Gk, *lobos,* lobe; AS, *eare*], the lower part of the auricle that contains no cartilage.

lobotomy /lōbot′əmē/ [Gk, *lobos* + *temnein,* to cut], a neurosurgical procedure (craniotomy) in which the nerve fibers in the bundle of white matter in the frontal lobe of the brain are severed to interrupt the transmission of various affective responses. Severe intractable depression and pain are among the indications for the operation. It is seldom performed, because it has many unpredictable and undesirable effects, including personality change, aggression, socially unacceptable behavior, incontinence, apathy, and lack of consideration for others. Because lobotomy is simple to perform, it was overused in the treatment of mentally ill patients in the past. A cannula is passed through the bony orbit of the eye, and a wire loop is inserted through the cannula to the cingulum. The nerve fibers are severed with the wire loop. Also called **leukotomy.**

lobster claw deformity. See **bidactyly.**

lobular. See **lobate.**

lobular carcinoma /lob′yələr/ [Gk, *lobos* + *karkinos,* crab, *oma,* tumor], a neoplasm that often forms a diffuse mass and accounts for a small percentage of breast tumors. It occurs in the milk lobes of the breast.



Lobular carcinoma *(Fletcher, 2007)*

lobule /lob′yo͞ol/, a small lobe, such as the soft lower pendulous part of the external ear. **—lobular,** *adj.*

loc-, prefix meaning “from a place”: *locomotor, locum, locus.*

LOC, **1.** abbreviation for **level of consciousness. 2.** abbreviation for *loss of consciousness.*

local [L, *locus,* place], **1.** *adj,* pertaining to a small circumscribed area of the body. **2.** *adj,* pertaining to a treatment or drug applied locally. **3.** *n, (informal)* a local anesthetic.

local adaptation syndrome (LAS), the localized response of a tissue, organ, or system that occurs as a reaction to stress. See also **general adaptation syndrome.**

local anaphylaxis [L, *locus,* place; Gk, *ana* + *phylaxis*], a hypersensitivity reaction in which injections of an antigen result in localized swelling and necrosis of the skin and subcutaneous tissues.

local anesthesia, the infiltration of a local anesthetic medication to induce the absence of sensation into a small area of the body. Brief surgical or dental procedures are the most common indications to avoid general anesthesia. The anesthetic may be applied topically to the surface of the skin or membrane or injected subcutaneously or intradermally. Advantages include low cost, ease of administration, low toxicity, and rapid recovery. A conscious patient can cooperate and does not require respiratory support or intubation. In all cases, the recommended dosage of any agent is the smallest possible to achieve the desired effect because toxicity is directly related to the total amount of drug given. Each local anesthetic agent also has a recommended maximum allowable dose that is not safely exceeded. Compare **general anesthesia, regional anesthesia, topical anesthesia.** See also **anesthesia.**

local anesthetic, a medication used to prevent the transmission of impulses through nerves to eliminate sensation in a defined area of the body. It can also prevent motor and autonomic function in this area. The effect is transient (time limited). Drugs available for local anesthesia are classified as members of the ester or the amide family. Specific preparations are available for topical administration, infiltration, and various kinds of regional administration, including field block, regional block, epidural block, and spinal block. People who are sensitive to local anesthetics of one group often can tolerate those of the other group. The vascularity of the injection site, the speed with which the drug is given, the rapidity of action of the drug, and the presence of epinephrine or Neo-Cobefrin in the solution may affect any adverse response.

local area network (LAN), a system of linking together computers and other electronic office equipment within an office or building, permitting shared use of software and/or peripherals. Compare **wide area network.**

local cerebral blood flow (LCBF), in positron emission tomography, a parametric image of blood flow through the brain expressed as milliliters per minute per 100 g of brain tissue.

local cerebral metabolic rate of glucose utilization (LCMRG), in positron emission tomography, a parametric image of brain activity expressed as milligrams of glucose used per minute per 100 g of brain tissue.

local control, the arrest of cancer growth at the site of origin.

local hypothermia, the heating of a local area of tissue to therapeutic temperatures.

local immunity, a state of protection against disease in a particular organ, tissue, or anatomical site, mediated by localized antibodies or lymphoid cells.

local infection [L, *locus,* place, *inficere,* to stain], an infection involving bacteria that invade the body at a specific point and remain there, multiplying, until eliminated.

local infiltration of anesthesia, in dentistry, the deposit of a local anesthetic agent in very close proximity to or within oral tissues, producing a loss of sensation to pain, temperature, and pressure.

localization /lō′kəlīzā′shən/ [L, *locus,* place], **1.** the designation of a particular site for a lesion or organ function. **2.** the determination of the site of a biological function. **3.** the assignment of a position to an object detected by radiography. —*localize, v.*

localization audiometry. See **audiometry.**

localization film [L, *locus,* place; Gk, *izein,* to cause; AS, *filmen,* membrane], a radiographic film taken to confirm a treatment effect or to view the position of an intracavitary or interstitial implant, especially for the purpose of computing the radiation dose delivered.

localized scleroderma. See **morphea.**

localizer image, an image used to localize a specific body part in computed tomography.

localizing symptom. See **symptom.**

local lesion [L, *locus,* place, *laesio,* hurting], **1.** a lesion anywhere on the body that does not spread. **2.** a lesion of the central nervous system characterized by distinctive local symptoms.

local osteolytic hypercalcemia (LOH), a syndrome of malignancy-associated hypercalcemia resulting from the action of locally acting osteolytic factors released in conjunction with tumor deposits adjacent to bone. LOH is frequently caused by multiple myeloma and lung and breast cancer.

local paralysis, a loss of motor control that is confined to a single muscle, muscle group, or part of the body.

local reaction [L, *locus,* place, *re* + *agere,* to act], a reaction to treatment that occurs at the site at which it was administered.

locant /lō′kənt/, a number or letter code that locates the position of an atom, radical, or compound in the structure of a more complex molecule.

location [L, *locus,* place, *atus,* process], a specific place in the memory of a computer where a unit of information is stored.

lochia /lō′kē·ə/ [Gk, *lochos,* childbirth], the discharge that flows from the vagina after childbirth. During the first 2 to 4 days after delivery, the lochia is red or brownish red (called *lochia rubra*) and is made up of blood, endometrial decidua, fetal lanugo, vernix, and sometimes meconium, and it has a fleshy odor. About the third day the amount of blood diminishes. The placental site exudes serous material, erythrocytes, lymph, cervical mucus, and microorganisms from the superficial layer called lochia serosa. During the next 10 to 14 days bacteria appear in large numbers along with mucinous decidual material and epithelial cells, causing the lochia to appear whitish yellow *(lochia alba)*. This may continue for 3 to 6 weeks into the postpartum period. —*lochial, adj.*

loci. See **locus.**

locked-in syndrome [ME, *loc* + Gk, *syn,* together, *dromos,* course], a paralytic condition, caused by bilateral destruction of the medulla oblongata or pons, in which a person may be conscious and alert but unable to communicate except by eye movements or blinking (e.g., pseudocoma). The condition renders the individual unable to speak or move any of the limbs. It is most frequently caused by stroke or central pontine myelinolysis.

locked knee [AS, *loc* + *cneow*], a condition in which the knee is fixed in either a flexed or an extended position, often caused by longitudinal splitting of the medial meniscus. Also called **trick knee.**

locked twins. See **interlocked twins.**

lock forceps. See **point forceps.**

locking point [AS, *loc,* lock; L, *punctum,* puncture], a point on the body at which light pressure can be applied to help a weak or debilitated patient maintain a desired posture or position. A basic locking point is the body's center of gravity, at the level of the second sacral vertebra, where mild pressure can assist a patient in standing or walking erect.

lockjaw. See **tetanus, trismus.**

locomotion [L, *locus,* place, *motio,* movement], movement or the ability to move from one place or position to another.

locomotor [L, *locus* + *motio*], pertaining to locomotion.

locomotor ataxia. See **tabes dorsalis.**

loculate /lok′yŏŏlāt/ [L, *loculus,* little place], divided into small spaces or cavities.

loculation /lok′yəlā′shən/, the presence of numerous small spaces or cavities.

loculus /lok′yŏŏləs/ [L, little place], a small chamber, pocket, or cavity, such as the interior of a polyp.

locum tenens /lō′kəm ten′ənz/ [L, *locus,* place, *tenere,* to hold], a physician who is contacted to work on a temporary basis to fill in for a vacancy, vacation, or extended leave.

locus *pl.* **loci** /lō′sī, lō′kē/ [L, place], a specific place or position, such as the locus of a particular gene on a chromosome.

locus ceruleus [L, *locus,* place, *caeruleus,* sky-blue], a deeply pigmented group of several thousand neurons in the floor of the fourth ventricle. It is part of a major norepinephrine pathway of the central nervous system.

locus of control [L, *locus,* place; Fr, *controle*], a center of perceived responsibility for one's behavior. Individuals with an **internal locus of control** believe that they can control events related to their life, whereas those with an **external locus of control** tend to believe that real power resides in forces outside themselves and determines their life.

locus of infection, a site in the body where an infection originates.

lodoxamide /lo-dok′sämīd/, a mast cell stabilizer that inhibits immediate hypersensitivity, applied topically to the eye as the tromethamine salt for treatment of allergen-induced conjunctivitis, keratitis, and keratoconjunctivitis.

Loeffler's syndrome. See **Löffler's syndrome.**

Loestrin, a trademark for an oral contraceptive containing an estrogen **(ethinyl estradiol)** and a progestin **(norethindrone acetate).**

Löffler's syndrome /lef′lərz/ [Wilhelm Löffler, Swiss physician, 1887–1972], a benign idiopathic disorder marked by episodes of pulmonary eosinophilia, transient opacities in the lungs, anorexia, breathlessness, fever, and weight loss. Recovery is spontaneous and prompt. Also spelled **Loeffler's syndrome.** See also **pulmonary infiltrate with eosinophilia.**

log-, logo-, -log, -logue, combining form meaning "word, speech, thought": *dialog, dialogue, logagnosia, logorrhea.*

logad-, prefix meaning "whites of the eyes": *logadectomy, logaditis, logadoblennorrhea.*

-logia. See **-logy.**

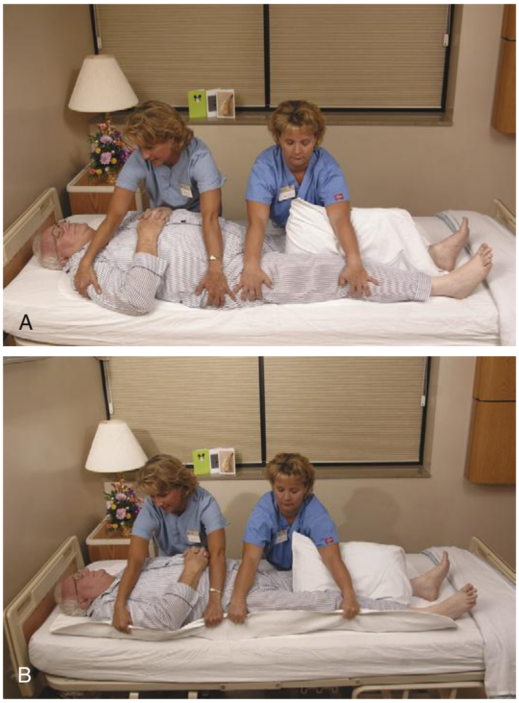
login, the process of permitting access to a computer system by identification of the user's credentials.

logo-. See **log-.**

logoff, a procedure for terminating interaction between a user and a computer. Also called **sign-off.**

logotherapy /log′ōther′əpē/ [Gk, *logos,* word, *therapeia,* treatment], a treatment modality based on the application of humanistic and existential psychology to assist a patient in finding meaning and purpose in life and unique life experiences.

log roll [ME, *logge* + L, *roto,* turn around], a maneuver used to turn a reclining patient from one side to the other or completely over without flexing the spinal column. The arms of the patient are folded across the chest, and the legs extended. A draw sheet under the patient is manipulated by attending health care team members or nursing personnel to facilitate the procedure.



Log roll *(Sorrentino, 2012)*

-logue. See **-log.**

-logy, -logia, a suffix meaning "a science or study of": *mammalogy, metabology, neonatology.*

LOH, abbreviation for **local osteolytic hypercalcemia.**

loiasis /lō·ī′əsis/, a form of filariasis caused by the worm *Loa loa*. The worms may migrate for 10 to 15 years in subcutaneous tissue, producing localized inflammation known as Calabar swellings. Occasionally the migrating worms may be visible beneath the conjunctiva. The disease is acquired through the bite of an infected African deer fly. Treatment with diethylcarbamazine usually results in cure and may also be successful as prophylaxis. See also **filariasis, onchocerciasis.**

loin [ME, *loyn,* flank], a part of the body on each side of the spinal column between the false ribs and the hip bones.

loin pain–hematuria syndrome, a syndrome of intense loin pain, either unilateral or bilateral, lasting from a few days to weeks, followed by hematuria, usually seen in young women; the cause is unknown, but some cases have been linked to treatment with estrogen compounds.

lomefloxacin /lo′mĕflok′säsin/, a broad-spectrum antibiotic effective against a wide range of aerobic gram-negative and gram-positive organisms, used as the hydrochloride salt.

lomefloxacin hydrochloride, the hydrochloride salt of lomefloxacin, administered orally in the treatment of bronchitis and the treatment and prevention of urinary tract infections.

Lomotil, a trademark for an antidiarrheal fixed-combination drug containing an antiperistaltic **(diphenoxylate hydrochloride)** and an anticholinergic **(atropine sulfate).**

lomustine /lōmus′tēn/, an antineoplastic alkylating agent.

■ INDICATIONS: It is prescribed in the treatment of a variety of malignant neoplastic diseases, including brain tumors and Hodgkin's disease.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are bone marrow depression, nausea, and vomiting.

Lonalac, a trademark for a low-sodium nutritional supplement.

loneliness severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of emotional, social, or existential isolation response. See also **Nursing Outcomes Classification.**

long-acting drug [AS, *lang* + L, *agere,* to do; Fr, *drogue,* drug], a pharmacological agent with a prolonged effect because of a formulation resulting in the slow release of the active principle or the continued absorption of small amounts of the dosage of the drug over an extended period.

long-acting insulin, a preparation of insulin modified by an interaction with zinc under specific chemical conditions and supplied as a suspension with a prolonged action. An injection of the preparation takes effect within 8 hours, reaches a peak of action in 16 to 24 hours, and has a duration of action of more than 36 hours. Also called **slow-acting insulin, ultralente insulin.** Compare **intermediate-acting insulin, short-acting insulin.** See also **insulin.**

long-acting thyroid stimulator (LATS), an immunoglobulin, probably an autoantibody, that exerts a prolonged stimulatory effect on the thyroid gland, causing rapid growth of the gland and excess thyroid function, resulting in hyperthyroidism. It is found circulating in the blood of 50% of people with Graves' disease.

long-acting thyroid stimulator protector (LATS-P), an antibody that inhibits the neutralization of long-acting thyroid stimulator and is found in the serum of persons with Graves' disease. LATS-P interferes with the binding of thyroid-stimulating hormone to its receptor on the plasma membrane of thyroid cells. See also **long-acting thyroid stimulator.**

long-arm cast [As, *lang* + *earm,* arm; ONorse, *kasta*], an orthopedic cast applied to immobilize the arm from the hand to the upper arm. It is used in treating fractures of the forearm, elbow, and humerus; for maintaining postoperative positioning of the distal arm, elbow, or upper arm; and for correcting or maintaining the correction of deformities of the distal arm, wrist, or elbow. See also **cast.** Compare **short-arm cast.**

long below-knee (BK) amputation, transtibial amputation in which the division is in the distal third of the tibia. See also **short below-knee amputation.**

long bone, any of the bones that contribute to the height or length of an extremity, particularly the bones of the legs and arms.

longevity /lonjev′itē/ [L, *longus,* long, *aveum,* age], the number of years an average person of a particular age is expected to continue living. It is determined by statistical tables based on mortality rates of various population groups.

longissimus /lonjis′iməs/ [L, longest, very long], a general term denoting a long structure, as a muscle.

longitudinal /lon′jəto͞o′dənəl/ [L, *longitudo,* length], **1.** pertaining to a measurement in the direction of the long axis of an object, body, or organ, such as the longitudinal arch of the foot. **2.** pertaining to a scientific study (nonexperimental research design) that is conducted over a long period of time, such as the Framingham (Massachusetts) Study of heart disease, with data collected from study participants at more than one point in time. Compare **cross-sectional.**

longitudinal diffusion, the diffusion of solute molecules in the direction of flow of the mobile phase.

longitudinal dissociation, the insulation of parallel pathways of cardiac impulses from each other, usually in the atrioventricular junction.

longitudinal fissure [L, *longitudo,* length, *fissura,* cleft], the largest and deepest groove between the medial surfaces of the cerebral hemispheres.

longitudinal presentation [L, *longitudo,* length, *praesentare,* to show], the normal presentation of a fetus, with the long axis of the infant body parallel to that of the mother.

longitudinal sound waves, pressure waves formed by the oscillation of particles or molecules parallel to the axis of wave propagation. The compression and expansion of such waves at high frequencies is the principle on which ultrasonography is based.

long-leg cast, an orthopedic cast applied to immobilize the leg from the toes to the upper thigh. It is used in treating fractures and dislocations of the knee; for maintaining postoperative positioning and immobilization of the knee, distal leg, and ankle; and for correcting or maintaining the correction of the foot, distal leg, and knee. Compare **short-leg cast.** See also **cast.**

long-leg cast with walker, an orthopedic cast applied to immobilize the leg from the toes to the upper thigh in treating certain leg fractures. This type of cast is the same as the long-leg cast but incorporates a rubber walker, enabling the patient to walk while the leg is encased in the cast and when weight-bearing ambulation is allowed. See also **cast.**

long QT syndrome, an inherited cardiac disorder characterized by prolongation of the Q-T interval. The disorder is associated with ventricular tachycardia, cardiac arrhythmias, syncope, and sudden death. Syncopal episodes often occur during physical exercise in young, otherwise healthy persons. This syndrome may also be caused by a variety of drugs.

long-scale contrast, a radiographic image containing a wide range and great number of shades of gray with little difference in the adjacent tones. Also called **low contrast.**

long-term care (LTC), the provision of medical, social, and personal care services on a recurring or continuing basis to persons with chronic physical or mental disorders. The care may be provided in environments ranging from institutions to private homes. Long-term care services usually include symptomatic treatment, maintenance, and rehabilitation for patients of all age groups.

long terminal repeats, identical nucleotide sequences occurring at each end of a proviral genome or a transposon and believed to be essential for integration of the molecule into host DNA.

long-term memory, the ability to recall sensations, events, ideas, and other information for long periods of time without apparent effort. It is generally the last memory store to be destroyed in patients with Alzheimer's disease. Compare **short-term memory.**

long thoracic nerve, one of a pair of supraclavicular branches from the roots of the brachial plexus. It arises by three roots, from the fifth, the sixth, and the seventh cervical nerves. The fibers from the fifth and the sixth cervical nerves join just after they pierce the scalenus medius and are united with the fibers from the seventh cervical nerve at the level of the first rib. Compare **phrenic nerve.**

long thoracic nerve injury, damage to the nerve (C5-7) that innervates the serratus muscle, which anchors the apex of the scapula to the posterior of the rib cage. Symptoms include an abnormally prominent scapula and difficulty in flexing the outstretched arm above the shoulder level, protracting the shoulder, or performing scapula abduction and adduction. See also **winged scapula.**

long tract signs, neurological signs such as clonus, muscle spasticity, or bladder involvement that usually indicate a lesion in the middle or upper parts of the spinal cord or in the brain.

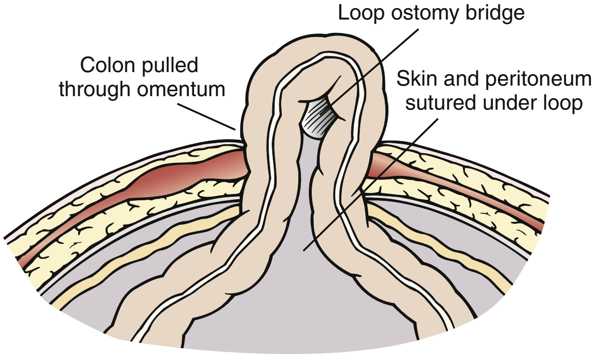
longus capitis, a muscle that flexes the head.

longus colli, a muscle that flexes the neck anteriorly and laterally, with slight rotation to the opposite side.

Loniten, a trademark for an antihypertensive **(minoxidil).**

loop [ME, *loupe*], **1.** a set of instructions in a computer program that causes certain commands to be executed repeatedly if specified criteria are met. **2.** a fine wire which, when energized with electricity, becomes a curved surgical instrument. It is used in loop excision procedures. **3.** curve or bend in a tube or tube-like structure. **4.** See **intrauterine device.**

loop colostomy [ME, *loupe* + Gk, *kolon,* colon, *stoma,* mouth], a type of temporary colostomy performed as part of the surgical treatment for repair of some colon diseases. The procedure involves bringing an intact segment of colon proximal to the repair through an abdominal incision and suturing it onto the abdomen. A stoma is created with both proximal and distal lumens opening into it. The colostomy is reversed after resolution of the original pathology. Also called **double-barrel colostomy.** See also **colostomy irrigation, Hirschsprung's disease.**



Loop ostomy bridge
Colon pulled through omentum
Skin and peritoneum sutured under loop

Loop colostomy *(Lewis et al, 2011/Redrawn from Meeker and Rothrock, 1991)*

loop diuretic. See **diuretic.**

loop excision, the surgical removal of dysplastic tissue cells with a small wire loop. The technique is used in gynecological diagnosis and therapy to remove intraepithelial neoplasms from the uterine cervix. Also called *loop electrical excision procedure*.

loop of Henle /hen′lē/ [ME, *loupe;* [Friedrich Gustave Henle, German anatomist, 1809–1885], the U-shaped part of a renal tubule, consisting of a thin descending limb and a thick ascending limb. Also called **Henle's loop.**

loose anagen hair syndrome, a syndrome of unknown cause, usually seen in children, in which scalp hair can be plucked easily and painlessly during the anagen part of the hair cycle, resulting from defective anchorage of the hair shaft to the follicle. There is also slowing of hair growth.

loose body, a fragment of solid tissue in a body cavity or joint. A kind of loose body is a **joint mouse.**

loose connective tissue. See **connective tissue.**

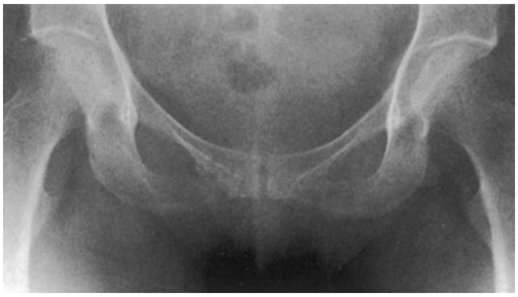
loose fibrous tissue [ME, *lous,* not fastened], a constrictive, pliable fibrous connective tissue consisting of interwoven elastic and collagenous fibers, interspersed with fluid-filled areolae. It is found in adipose tissue, areolar tissue, reticular tissue, and fibroelastic tissue. Compare **dense fibrous tissue.**

looseness of association (LOA) [ME, *lous,* not fastened], (in psychiatry) a disturbance of thinking in which the association of ideas and thought patterns becomes so vague, fragmented, diffuse, and unfocused as to lack any logical sequences or relationship to any preceding concepts or themes. It is a symptom of schizophrenia. When severe, speech may be incoherent. Also called **associative looseness, loosening.**

loosening. See **looseness of association.**

loose-pack joint position, a point in the range of motion of a joint at which articulating surfaces are the least congruent and the supporting structures are the most lax.

Looser's zones /lō′zərz/ [Emil Looser, Swiss physician, 1877–1936], transverse translucent bands, sometimes symmetric, seen radiographically in the cortex of bones affected with osteomalacia or certain other deficiency diseases.



Looser's zones in the pelvis *(Moll, 1997)*

Lo/Ovral, a trademark for an oral contraceptive containing an estrogen **(ethinyl estradiol)** and a progestin **(norgestrel).**

LOP, abbreviation for *left occipitoposterior fetal position.*

loperamide hydrochloride /lōper′əmīd/, an antiperistaltic.

■ INDICATION: It is prescribed in the treatment of diarrhea.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not given to patients in whom constipation must be avoided.

■ ADVERSE EFFECTS: Among the most serious effects are abdominal pain, constipation, nausea, and vomiting.

loph-, prefix meaning "ridge": *lophius, lophodont, lophotrichous.*

Lopid, a trademark for a lipid-regulating agent **(gemfibrozil).**

lopinavir /lopin′ävir/, an HIV protease inhibitor, an orally administered antiviral agent used in combination with ritonavir in the treatment of human immunodeficiency virus infection.

Lopressor, a trademark for a beta-adrenergic receptor blocking agent used in the treatment of hypertension **(metoprolol tartrate).**

Loprox, a trademark for an antifungal (ciclopirox olamine).

loratadine /lärat′ädēn/, a nonsedating antihistamine (H_1-receptor antagonist) used for treatment of allergic rhinitis and chronic idiopathic urticaria and as a treatment adjunct in asthma, administered orally.

lorazepam /lôrā′zəpam/, a benzodiazepine tranquilizer.

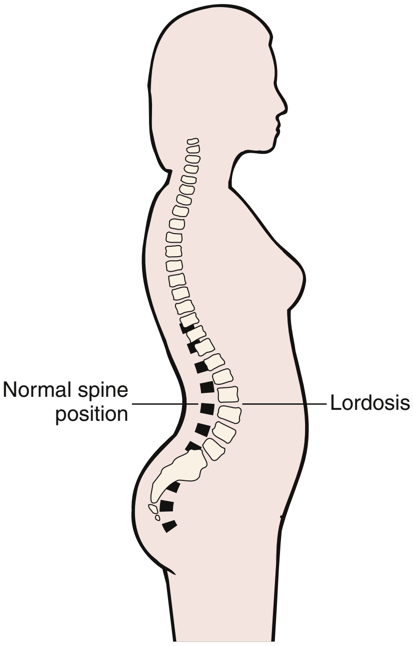
■ INDICATIONS: It is prescribed in the treatment of anxiety, nervous tension, and insomnia and is given intravenously to abort status epilepticus and for preanesthesia.

■ CONTRAINDICATIONS: Acute glaucoma, psychosis, pregnancy, or known hypersensitivity to this drug or to any benzodiazepine prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are drowsiness and fatigue. Withdrawal symptoms may occur on discontinuation of the drug, especially after prolonged use or high dosage.

lordoscoliosis /lôr′dōskō′lē·ō′sis/ [Gk, *lordos,* bent, *skoliosis,* curvature], a combination of lordosis and scoliosis.

lordosis /lôrdō′sis/ [Gk, *lordos,* bent forward, *osis,* condition], an abnormal anterior concavity of the lumbar part of the back.



Lordosis *(Frazier and Drzymkowski, 2009)*

lordotic pelvis /lôrdot′ik/ [Gk, *lordos,* bent forward; L, *pelvis,* basin], a deformed pelvis that bends forward in the lumbar region and is associated with lordosis.

LOS, abbreviation for **length of stay.**

losartan, an antihypertensive.

■ INDICATIONS: It is used to treat hypertension, either alone or in combination with other drugs.

■ CONTRAINDICATIONS: Factors that prohibit the use of this drug are known hypersensitivity to tramadol and second- and third-trimester pregnancy.

■ ADVERSE EFFECTS: Life-threatening effects are cerebrovascular accident and myocardial infarction. Other adverse effects are anxiety, confusion, abnormal dreams, migraine, tremor, vertigo, task perversion, angina pectoris, second-degree atrioventricular block, hypotension, blurred vision, burning eyes, conjunctivitis, anorexia, constipation, dry mouth, flatulence, gastritis, vomiting, impotence, nocturia, urinary frequency, urinary tract infection, anemia, alopecia, dermatitis, dry skin, flushing, photosensitivity, rash, pruritus, sweating, gout, cramps, myalgia, pain, stiffness, congestion, dyspnea, and bronchitis. Common side effects are dizziness, insomnia, arrhythmias, diarrhea, dyspepsia, cough, and upper respiratory infection.

loss of consortium [ME, *lossen,* to lose; L, *consortionis,* companionship], (in law) a claim for damages sought in recompense for the loss of conjugal relations, including society, affection, and assistance, and impairment or loss of sexual relations. Loss of consortium may be charged against a person whose negligence or malfeasance caused injury to the spouse or against a person who caused a marriage to break up.

LOT, abbreviation for *left occipitotransverse fetal position*.

loteprednol /lo′tĕpred′nol/, a corticosteroid applied topically to the conjunctiva in the treatment of seasonal allergic conjunctivitis, postoperative inflammation, and ocular inflammatory disorders.

lotion [L, *lotio,* a washing], a liquid preparation applied externally to protect the skin or to treat a dermatological disorder.

Lotrimin, a trademark for an antifungal **(clotrimazole).**

Lou Gehrig's disease. See **amyotrophic lateral sclerosis.**

Louis-Bar syndrome. See **ataxia-telangiectasia syndrome.**

loupe /lo͞op/ [Fr, magnifying glass], a magnifying lens mounted in a frame worn on the head, as used to examine the eyes.

louse. See **lice.**

louse bite, a minute puncture wound produced by a louse. The louse may transmit typhus, trench fever, and relapsing fever. Secondary infection may result from scratching the affected area. Head and body lice are the most common and are frequently found among schoolchildren. Washing and bathing, application of an approved insecticide, and the washing or cleaning of clothes and bed linens are recommended procedures for treatment and prophylaxis against spread of the infestation. See also **pediculosis.**

louse-borne typhus. See **epidemic typhus.**

low back pain (lbp) [ME, *low* + AS, *baec* + L, *poena,* penalty], local or referred pain at the base of the spine caused by a sprain, a strain, osteoarthritis, ankylosing spondylitis, a neoplasm, or a herniated intervertebral disk. Low back pain is a common complaint and is often associated with poor posture, obesity, sagging abdominal muscles, sitting for prolonged periods of time, or improper body mechanics.

■ OBSERVATIONS: Pain may be localized and static. It may be accompanied by muscle weakness or spasms, or it may radiate down one or both legs, as in sciatica. Pain may be initiated or increased by coughing, sneezing, rising from a seated position, lifting, stretching, bending, or turning. To guard against the pain, the person may decrease the range of motion of the spine. If an intervertebral disk is herniated, deep pressure over the interspace generally causes pain, and flexion of the hip elicits sciatic pain when the knee is extended but not when the knee is flexed (Lasègue's sign).

■ INTERVENTIONS: The patient is placed in a semi-Fowler's position on a firm mattress with the knees flexed and supported. Analgesics, muscle relaxants, tranquilizers, and antiinflammatories may be administered. Dry or moist heat is applied. If a herniated disk is suspected, diagnostic x-ray, MR, CT, and myelographic examinations may be performed, as well as pelvic traction and physiotherapy, consisting of hydrotherapy, diathermy, or the application of hot paraffin. When the acute pain subsides, the patient may increase activity as tolerated, and a corset or back brace may be ordered. The patient is instructed to sit on a straight-backed chair, with the legs uncrossed or extended on a footstool, and to sleep on the side or back with the knees flexed and a small pillow under the head. Before discharge the patient is advised to maintain a normal weight, to follow the ordered exercise program while avoiding fatigue, to wear flat-heeled shoes, and to avoid constipation by using natural laxatives, if required.

■ NURSING CONSIDERATIONS: The nurse encourages the patient to follow the recommended regimen. Correct body mechanics, adequate and appropriate exercise, and the elimination of excess weight are emphasized.

low-birth weight (LBW) infant, a newborn whose weight at birth is less than 2500 g, regardless of gestational age.

low-calcium diet, a diet that restricts the use of calcium and eliminates most dairy foods, all breads made with milk or dry skimmed milk, and deep-green leafy vegetables. It is prescribed for patients with absorptive hypercalciuria. Meats, including beef, lamb, pork, and veal, and poultry, fish, vegetables, legumes, and fruits are recommended.

low-caloric diet, a diet that is prescribed to limit calorie intake, usually to cause a reduction in body weight. Such diets may be designated as very low–calorie, 1000 calorie, or other specific numbers of calories. Exchange lists may be used to allow the patient to select preferred foods from groups of foods categorized as carbohydrate, meat and meat substitutes, and fat.

low cervical cesarean section, a surgical procedure to deliver a baby through a transverse incision in the thin supracervical part of the lower uterine segment, behind the bladder and the bladder flap. This incision bleeds less during surgery and heals with a stronger scar than the higher vertical scar of the classic cesarean section. Compare **extraperitoneal cesarean section.** See also **cesarean section.**

low-cholesterol diet, a diet that restricts foods containing animal fats and saturated fatty acids, including egg yolk, cream, butter, milk, muscle and organ meats, and shellfish. It concentrates instead on poultry, fish, vegetables, fruits, low-fat dairy products, and polyunsaturated fats. The diet is indicated for persons with high serum cholesterol levels, cardiovascular disorders, obesity, hyperlipidemia, hypercholesterolemia, or hyperlipoproteinemia. Also called **cholesterol-restricted diet.** See also **low-saturated-fat diet.**

low contrast. See **long-scale contrast.**

low-density lipoprotein (LDL), a plasma protein provided from very low–density lipoproteins (VLDLs) or by the liver, containing relatively more cholesterol and triglycerides than protein. It is derived in part, if not completely, from the intravascular breakdown of the very low–density lipoproteins and delivers lipids and cholesterol to the body tissues. The high cholesterol content may account for its greater atherogenic potential as compared with the VLDLs.

low-density lipoprotein (LDL) receptor disorder, an inherited disorder transmitted as a dominant trait and characterized by a high level of serum cholesterol, tendinous xanthomas, and early evidence of atherosclerosis, especially of the coronary arteries. Affected individuals at 50 years of age have 3 to 10 times greater risk of ischemic heart disease than the general population. Cholesterol levels are elevated at birth, increase with age, and average 250 to 500 mg/dL in heterozygous adults and 500 to 1000 mg/dL in adults who are homozygous for the gene. Xanthomas begin to appear at 20 years of age and occur most frequently on the Achilles tendon, extensor tendons of the hands, elbows, and tibial tuberosities. In type IIA familial hypercholesterolemia, only low-density lipoprotein (LDL) level is elevated, whereas in type IIB LDL and very low–density lipoprotein levels are increased. The disorder occurs in Caucasians, African-Americans, and Asian-Americans; the prevalence of the gene in the United States is 1:1000. Treatment includes a low-cholesterol and low–saturated fat diet. Cholestyramine may be given to patients with type IIA familial hypercholesterolemia but not to those with type IIB. Also called **familial hypercholesterolemia, hypercholesterolemic xanthomatosis, hyperlipidemia type IIA, hyperlipidemia type IIB.**

low-dose tolerance, a temporary and incomplete immunosuppression induced by the administration of subimmunogenic doses of soluble antigen. The tolerance is achieved in the neonatal period, when lymphoid cells have not matured enough to activate a response.

lower esophageal sphincter, the terminal few centimeters of the esophagus, near the esophagogastric junction, which normally remain constricted except during swallowing and prevent reflux of gastric contents into the esophagus.

lower extremity monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the collection, analysis, and use of patient data to categorize risk and prevent injury to the lower extremities. See also **Nursing Interventions Classification.**

lower extremity suspension [ME, *low* + L, *extremitas* + *suspendere,* to hang], an orthopedic procedure used in the treatment of bone fractures and the correction of orthopedic abnormalities of the lower limbs. Traction equipment, including metal frames, ropes, and pulleys, is used to relieve the weight of the involved lower limb rather than to exert traction pull. Lower extremity suspension may be either unilateral or bilateral and is used in the postoperative, posttraumatic, or postreduction control of edema. Compare **balanced suspension, upper extremity suspension.**

lower level discriminator (LLD), an electronic device used in nuclear medicine to discriminate against all radionuclide pulses whose heights are below a given level.

lower motor neuron dysarthria, a disorder of articulation caused by weakness or paralysis of the articulatory muscles and marked by a rasping, monotonous voice and, in severe forms, shriveling and flaccidity of the tongue and laxness and tremulousness of the lips, seen in advanced cases of lesions of motor nuclei of the lower pons or medulla oblongata. Also called **flaccid dysarthria.**

lower motor neuron paralysis, paralysis resulting from an injury or lesion that damages the cell bodies or axons, or both, of the lower motor neurons, which are located in the anterior horn cells of the spinal cord and the spinal and peripheral nerves. If complete transection of the spinal cord occurs, voluntary muscle control is totally lost. In partial transection, function is altered in varying degrees, depending on the areas innervated by the nerves involved. In lower motor neuron paralysis the reflex arcs are permanently damaged, causing decreased muscle tone and flaccidity, diminished or absent reflexes, absence of pathological reflexes, local twitching of muscle groups (fasciculations), and progressive atrophy of the atonic muscles. Compare **upper motor neuron paralysis.**

lower pole ureter, the ureter draining the lower pole of a duplex kidney.

lower respiratory tract, one of the two divisions of the respiratory system. The lower respiratory tract includes the left and right bronchi and the alveoli where the exchange of oxygen and carbon dioxide occurs during the respiratory cycle. The bronchi divide into smaller bronchioles in the lungs, the bronchioles into alveolar ducts, the ducts into alveolar sacs, and the sacs into alveoli. The alveolar sacs and the alveoli present a total lung surface of about 850 square feet (79 square meters) for the exchange of oxygen and carbon dioxide, which occurs between the most internal alveolar surface and the tiny capillaries surrounding the external alveolar wall. The lower respiratory tract is a continuation of the upper respiratory tract and is a common site of infections, obstructive conditions, and neoplastic disease. Compare **upper respiratory tract.** See also **lung.**

lower respiratory tract infection. See **respiratory tract infection.**

Lowe's syndrome [Charles U. Lowe, American pediatrician, b. 1921], a sex-linked condition in males characterized by progressive mental deterioration, renal tubular dysfunction, and cortical cataracts with or without glaucoma.

low-fat diet [ME, *low;* AS, *faett;* Gk, *diaita,* life-style], a diet containing limited amounts of fat and consisting chiefly of easily digestible foods of high carbohydrate content. It includes all vegetables, lean meats, fish, fowl, pasta, cereals, and whole wheat or enriched bread. Egg yolk and fatty meats are restricted. Meat, eggs, butter and margarine, cream, fried foods, foods prepared in fats, oils, gravy, cheese, peanut butter, nuts, and olives are omitted or restricted. Experts recommend that no more than 30% of one's daily calories should come from fatty foods and that no more than 10% should come from saturated fats. A typical low-fat diet providing approximately 1700 calories per day would contain 85 grams of protein, 220 grams of carbohydrate, and 50 grams of fat. Low-fat diets supply 10% to 15% of total energy as fat and may be indicated in gallbladder disease, obesity, heart disease, malabsorption syndromes, and hyperlipidemia.

low-fat milk, milk containing 1% to 2% fat, making it an intermediate in fat content between whole and skimmed milk.

low-fiber diet. See **low-residue diet.**

low-flow oxygen delivery system, respiratory care equipment that allows the patient to inhale some ambient air along with the delivered oxygen. As the patient's ventilatory pattern changes, different amounts of air are mixed with the constant flow of oxygen, thus causing the inspired oxygen concentration to vary. Also called **variable-performance oxygen delivery system.**

low forceps [ME, *low* + L, *forceps,* pair of tongs], an obstetric operation in which forceps are used to deliver a baby whose head is on the pelvic floor. The procedure is performed most often as an elective procedure to shorten normal labor and to control delivery, usually in conjunction with anesthesia and episiotomy. It is commonly required for the delivery of mothers whose expulsive powers have been weakened by analgesia, anesthesia, or fatigue. Also called **outlet forceps, prophylactic forceps.** Compare **high forceps, mid forceps, natural childbirth, spontaneous delivery.** See also **forceps delivery, obstetric forceps.**

low-grade fever, an oral temperature that is above 98.6° F (37° C) but lower than 100.4° F (38° C) for 24 hours.

low-grade infection [ME, *lah* + L, *gradus,* degree, *inficere,* to stain], a subacute or chronic infection with mild fever and no pus production.

low-level language, a computer language using mathematical logic but requiring precise manipulation of binary numbers.

low-lying placenta. See **placenta previa.**

low-molecular-weight heparin (LMWH), a class of drugs used to prevent potentially fatal blood clots in patients undergoing surgery or patients at risk for blood clots. It has been used to prevent deep vein thrombosis in patients undergoing hip and knee replacements. LMWH has an advantage over regular heparin in that predictable plasma levels are achieved, obviating the need for regular monitoring of prothrombin time and partial thromboplastin time.

Lown-Ganong-Levine (LGL) syndrome /loun′ gənong′ ləvēn′/ [Bernard Lown, American physician, b. 1921; William F. Ganong, American physiologist, b. 1924; S.A. Levine, American physician, 1891–1966], a disorder of the atrioventricular (AV) conduction system marked by ventricular preexcitation. Part or all of the AV nodal connection is bypassed by an abnormal connection between the atria and the bundle of His. The condition may be discovered by routine electrocardiogram or may be seen in association with paroxysmal atrial arrhythmias, supraventricular tachycardia, atrial flutter, and fibrillation. Treatments include the use of antiarrhythmic drugs such as quinidine sulfate, procainamide, and propranolol; surgical interruption of the abnormal pathway; and implantation of a pacemaker. Also called **short-PR-normal-QRS syndrome.** Compare **Wolff-Parkinson-White syndrome.**

low-power field, the low magnification field of vision under a light microscope.

low-protein diet [ME, *lah,* low; Gk, *proteios,* first rank, *diaita,* way of living], a diet proportionally low in protein, usually designed for persons who must restrict protein intake because of a metabolic abnormality associated with kidney failure or liver disease.

low-purine diet, a diet used as adjunct therapy for gout patients who suffer from a painful accumulation of salts of uric acid in the joints. Purine-rich foods are primary sources of uric acid. They include meat, poultry, fish, and particularly organ meats such as liver, kidney, and sweetbreads. Purine-rich foods are replaced in the diet by dairy products, eggs, and some vegetable sources of proteins. Low-purine diets should be a secondary source of treatment, with weight loss and adequate fluid intake being primary. Also called **purine-restricted diet.**

low-residue diet, a diet that leaves a minimal residue in the lower intestinal tract after digestion and absorption. It consists of tender meats, poultry, fish, eggs, white bread, pasta, simple desserts, clear soups, tea, and coffee. Omitted are highly seasoned or fried foods, all fruits and fruit juices, raw vegetables, whole grain cereals and bread, nuts, jams, and usually milk. The diet is prescribed in cases of diverticulitis and GI irritability or inflammation and before and after GI surgery. Because it is lacking in calcium, iron, and vitamins, it should be used only for a limited time or with nutrient supplementation. Physician's orders must read low fiber/low residue because low fiber may not always indicate low residue. Also called **low-fiber diet.**

low-salt diet. See **low-sodium diet.**

low-saturated-fat diet, a diet that limits sources of saturated fats from animal meats, egg yolks, butter, and full-fat dairy foods. Two plant sources of saturated fat, coconut oil and palm oil, must also be limited. See also **low-cholesterol diet.**

low-sodium diet, a diet that restricts the use of sodium chloride plus other compounds containing sodium, such as baking powder or soda, monosodium glutamate, sodium citrate, sodium propionate, and sodium sulfate. It is indicated in hypertension, edematous states (especially when associated with cardiovascular disease), renal or liver disease, and therapy with corticosteroids. The degree of sodium restriction depends on the severity of the condition. Foods included in the diet are eggs, skimmed milk, beef, poultry, lamb, pork, veal, fish, potatoes, green beans, broccoli, asparagus, peas, salad ingredients, and fresh fruits. Many flavoring extracts, spices, and herbs can be used to add taste to the diet. Foods to be avoided include fresh or canned shellfish, ham, bacon, frankfurters, luncheon meats, sausage, cheese, salted butter or margarine, any breads or cereals made with salt, beets, carrots, celery, sauerkraut, spinach, and most canned or frozen foods, except those prepared without sodium (for example, frozen fruits and vegetables). Also to be avoided are many drugs that contain sodium, such as laxatives, sedatives, and alkalizers, and drinking water from a source using a water softener that adds sodium. Also called **low-salt diet, salt-free diet, sodium-restricted diet.**

low-vision therapist, a doctor of optometry or ophthalmology who diagnoses and treats ocular and vision problems that cannot be corrected fully by pharmacological means or surgery, conventional eye glasses, or contact lenses.

loxapine /lok′səpēn/, an antipsychotic agent.

■ INDICATION: It is prescribed in the treatment of schizophrenia.

■ CONTRAINDICATIONS: Parkinson's disease, concurrent administration of central nervous system depressants, liver or kidney dysfunction, severe hypotension, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, liver toxicity, a variety of extrapyramidal reactions, and hypersensitivity reactions.

Loxitane, a trademark for an antipsychotic **(loxapine).**

loxo-, prefix meaning "oblique, slanting": *loxophthalmus, loxotic, loxotomy.*

Loxosceles /loksos′ĕlēz/, a genus of six-eyed spiders, some of which have poisonous bites. *L. laeta* is a brown spider of South America, and *L. reclusa* is the brown recluse spider of North America. See **spider bite.**

lozenge. See **troche.**

lp, abbreviation for **line pair.**

LP, abbreviation for **lumbar puncture.**

LPL, abbreviation for **lipoprotein lipase.**

Lpm, abbreviation for *liters per minute*.

LPN, abbreviation for **licensed practical nurse.**

LPS Act, a California law named for sponsors of the legislation (*L*anterman, *P*etris, and *S*hort) that provides for the protection and treatment of persons judged to be "gravely disabled" and thus unable to provide food, clothing, or shelter for themselves. The legislation was designed to safeguard the constitutional rights of persons threatened with involuntary commitment on the basis of a psychiatric diagnosis. Some other states have similar laws.

Lr, symbol for the element **lawrencium.**

LRN, abbreviation for **Laboratory Response Network.**

LSD, abbreviation for *lysergic acid diethylamide*. See **lysergide.**

LSF, abbreviation for **line spread function.**

L-shaped kidney, a fused kidney in which one renal mass is vertical and the other is inferior to it in a transverse position. This can be either a variety of horseshoe kidney or a type of crossed renal ectopia.

L-spine, abbreviation for **lumbar spine.**

L/S ratio, abbreviation for lecithin/sphingomyelin ratio.

LTB, abbreviation for **laryngotracheobronchitis.**

LTC, abbreviation for **long-term care.**

LTH, abbreviation for *luteotropic hormone*.

L-thyroxine. See **levothyroxine sodium.**

L-Trp, abbreviation for *L-tryptophan*.

Lu, symbol for the element **lutetium.**

lubb /lub/, a syllable used to represent the first heart sound in auscultation, which is longer and has a lower pitch than the second heart sound. See also **heart sound.**

lubb-dupp, an imitation of the two basic sounds heard in the cardiac cycle. Lubb represents the first sound (S_1), which is longer and has a lower pitch and is made by the closure of the mitral and tricuspid valves. It is lower in pitch and lasts slightly longer than the second sound, dupp (S_2), which is made by the closure of the aortic valve.

lubiprostone, a miscellaneous GI agent.

■ INDICATIONS: This drug is used to treat chronic idiopathic constipation.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug and GI obstruction prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, depression, fatigue, insomnia, hypertension, chest pain, abdominal distension, constipation, diarrhea, dry mouth, dyspepsia, flatulence, gastroenteritis, viral gastroesophageal reflux disease, vomiting, fecal incontinence, fecal urgency, urinary tract infection, chest pain, peripheral edema, influenza, pyrexia, viral infection, back pain, arthralgia, muscle cramps, pain in extremities, bronchitis, cough, dyspnea, nasopharyngitis, sinusitis, and upper respiratory infection. Common side effects include headache, nausea, abdominal pain, and eructation.

lubricant /lo͞o′brikənt/ [L, *lubricans,* making slippery], a fluid, ointment, or other agent capable of diminishing friction and making a surface slippery.

lubricating enema /lo͞o′brəkā′ting/ [L, *lubricans,* making slippery; Gk, *enienai,* to send in], an enema used to lubricate the anal canal after surgery for hemorrhoids or to prevent fecal impaction. The enema solution may be made with warm olive or mineral oil. See also **oil retention enema.**

luc-, prefix meaning "light": *lucifugal, lucipetal, lucotherapy.*

-lucent, suffix meaning "light-admitting": *radiolucent, translucent*.

Lucentis, a trademark for **ranibizumab.**

lucid /lo͞o′sid/ [L, *lucidus,* clear], clear, rational, and able to be understood. See also **lucid interval.**

lucid interval, a period of relative mental clarity between periods of irrationality, especially in organic mental disorders such as delirium and dementia.

lucidity /lo͞osid′itē/ [L, *lucidus,* clear], pertaining to clarity of mind, perception, or intelligibility.

lucid lethargy, a mental state characterized by a loss of will; an inability to act, even though the person is conscious and intellectual function is normal. See also **lethargy.**

lucifugal /lo͞osif′yəgəl/, repelled by bright light.

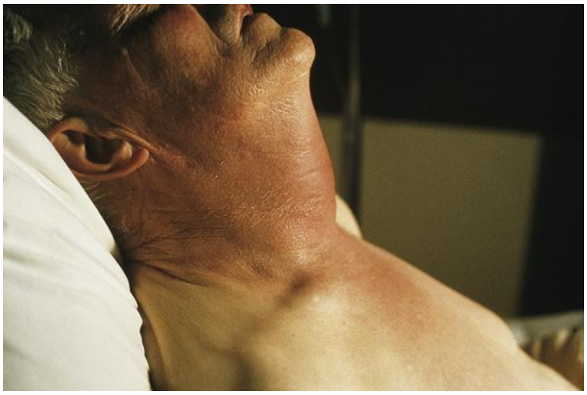
Lucio's leprosy phenomenon [R. Lucio, Mexican physician, 1819–1866], an acute form of diffuse lepromatous infection of the skin, characterized by intensely red, tender plaques, particularly on the legs. The plaques tend to progress to obstructive vasculitis, ulcers, necrosis, and scarring.

lucipetal /lo͞osip′ətəl/, attracted to bright light.

lucotherapy. See **phototherapy.**

Ludiomil, a trademark for an antidepressant **(maprotiline hydrochloride).**

Ludwig's angina /lo͝od′vigz/ [Wilhelm F. von Ludwig, German surgeon, 1790–1865; L, *angina,* quinsy], a severe, potentially life-threatening form of cellulitis in the region of the submandibular gland. Inflammatory edema may distort the floor of the mouth and make swallowing difficult. The glottis and tissue fascial planes may swell suddenly, causing respiratory obstruction. Hospitalization, incision, and drainage along with appropriate antibiotic therapy are the usual treatments.



Ludwig's angina *(Conlon and Snydman, 2000)*

lue-, prefix meaning "syphilis": *luetic, luetin, luetism*.

LUE, abbreviation for *left upper extremity*.

Luer-Lok connection, a connection between extracorporeal equipment for peritoneal dialysis and the intraabdominal catheter, using two rigid tubes that screw together.

Luer-Lok syringe /lo͞o′ərlōk′/, a glass or plastic syringe for injection having a simple screw lock mechanism that securely holds the needle in place. Also called *Luer's syringe*.

lues. See **syphilis.**

luetic. See **syphilitic.**

-luetic, -luic, suffix meaning "syphilis": *antiluetic, heredoluetic, paraluetic*.

luetic aortitis. See **syphilitic aortitis.**

Lufyllin, a trademark for a respiratory smooth muscle relaxant **(dyphylline).**

Lugol's solution [Jean G.A. Lugol, French physician, 1786–1851; L, *solutus,* unbound], an aqueous solution of iodine (5%) and potassium iodide (10%) that paradoxically suppresses thyroid function, used in preparation for thyroidectomy and during treatment of thyrotoxic crisis.

-luic. See **-luetic.**

Lukes-Collins classification [L.J. Lukes; R.D. Collins, 20th century American pathologists], a system of identifying non-Hodgkin's lymphomas according to B cell, T cell, true, and unclassifiable types. B cell types include lymphocytic, plasmacytic, and follicular cell lymphoma and B cell–derived immunoblastic lymphoma. T cell types include T cell–derived immunoblastic lymphoma and convoluted cell lymphoma. True types are of histiocytic origin.

lukewarm bath [ME, *luke* + AS, *wearm, baeth*], a bath in which the temperature of the water is between 90° F and 96° F.

LUL, abbreviation for *left upper lobe* of lung.

lumbago /lumbā′gō/ [L, *lumbus,* loin], pain in the lumbar region caused by a muscle strain, rheumatoid arthritis, osteoarthritis, or a herniated intervertebral disk. Ischemic lumbago, characterized by pain in the lower back and buttocks, is caused by vascular insufficiency, as in terminal aortic occlusion. See also **low back pain.**

lumbar /lum′bər, lum′bär/ [L, *lumbus,* loin], pertaining to the part of the body between the thorax and the pelvis.

lumbar lordosis, the dorsally concave curvature of the lumbar spinal column when seen from the side. Also called *lumbar curvature*.

lumbar nerves, the five pairs of spinal nerves rising in the lumbar region of the vertebral column. They become increasingly large the more caudal their origin and pass laterally and downward under the cover of the psoas major or between its fasciculi and form part of the lumbar plexus. The lumbar sympathetic ganglia follow no fixed pattern, and fusions of adjacent ganglia are common. When occurring separately, lumbar ganglia lie on the corresponding vertebra or the intervertebral disk caudally. The ganglion of the second lumbar segment is the largest and the most constant.

lumbar node, a node in one of the seven groups of parietal lymph nodes serving the abdomen and the pelvis. The lumbar nodes are numerous and are divided into the lateral aortic nodes, preaortic nodes, and retroaortic nodes. They receive the afferent vessels from many different structures, such as the kidneys, the internal reproductive organs, the lateral abdominal muscles, and certain vertebrae, and pass efferents that form lymphatic trunks. Compare **sacral node.** See also **lymph, lymphatic system, lymph node.**

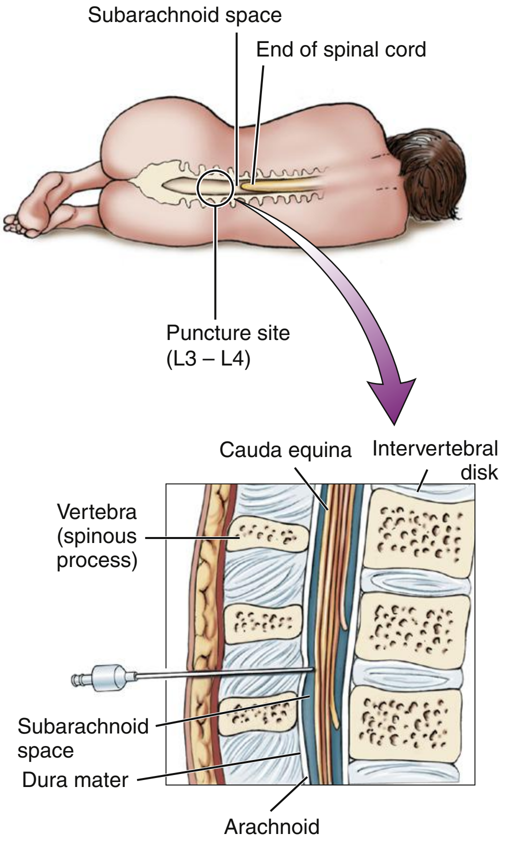
lumbar plexus, a network of nerves formed by the ventral anterior primary divisions of the first three and the greater part of the fourth lumbar nerves. It is located on the inside of the posterior abdominal wall, either dorsal to the psoas major or among its fibers and ventral to the transverse processes of the lumbar vertebrae. The branches of the lumbar plexus are the iliohypogastric, ilioinguinal, genitofemoral, lateral femoral cutaneous, obturator, accessory obturator, and femoral nerves. The iliohypogastric, ilioinguinal, and genitofemoral nerves supply the caudal part of the abdominal wall. The lateral femoral cutaneous, obturator, accessory obturator, and femoral nerves supply the anterior thigh and the middle of the leg. Only 20% of people have the accessory obturator nerve, which comes from the third and the fourth lumbar nerves. Compare **sacral plexus.** See also **lumbosacral plexus.**

lumbar puncture (LP), a diagnostic or therapeutic procedure in which a hollow needle and stylet are introduced into the subarachnoid space of the lumbar part of the spinal canal to obtain cerebrospinal fluid (CSF). Strict aseptic technique is used. Diagnostic indications include measuring of CSF pressure; obtaining CSF for laboratory analysis; and injecting oxygen or a radiopaque substance for radiographic visualization of the structures of the nervous system of the spinal canal and meninges and brain. Therapeutic indications for lumbar puncture include removing blood or pus from the subarachnoid space, injecting sera or drugs, withdrawing CSF to reduce intracranial pressure, introducing a local anesthetic to induce spinal anesthesia, and placing a small amount of the patient's blood in the subarachnoid space to form a clot to patch a hole in the dura to prevent leak of CSF into the epidural space.

■ METHOD: The skin over the interspace of the third and fourth lumbar vertebrae is cleansed. A fenestrated sterile drape is placed over the back, the window over the puncture site. The needle is inserted through the interspace to the subarachnoid space, and the stylet is withdrawn. If the needle is in the proper place, clear, straw-colored CSF will begin to drip out through the needle. Depending on the indication for the procedure, various techniques follow. The pressure of the CSF may be measured with a manometer attached to a catheter and stopcock, or fluid may be withdrawn, visually examined, and sent to the laboratory for chemical or bacteriological analysis.

■ INTERVENTIONS: The nurse may be responsible for obtaining the patient's written permission for the physician to perform a lumbar puncture. If the patient is apprehensive, he or she may be given a sedative one-half hour before the procedure. The techniques to be used and the treatments to be given or the information to be obtained are explained. The patient is placed in a lateral recumbent position, the back as near the edge of the bed as possible. The legs are flexed on the thighs, the thighs are flexed on the abdomen, and the head and shoulders are bent down, curving the spine convexly to afford the greatest space between the vertebrae. If the patient is excessively hairy, a dry shave of the lumbar area is performed before draping the area. After the procedure, significant signs to be observed by the nurse include pain, change in mentation or alertness, leakage of CSF from the puncture site, fever, and urinary retention. The patient is usually kept flat in bed, often in a prone position, for 1 hour after the procedure.

■ OUTCOME CRITERIA: Lumbar puncture is contraindicated if intracranial tumor is suspected and there is evidence of greatly increased intracranial pressure, if there are signs of infection at the site of puncture, or (to avoid a second puncture) if encephalography or myelography is planned in the near future. Infection, leakage of CSF, headache, nausea, vomiting, dysuria, or signs of meningeal irritation occur in approximately 25% of patients.



Lumbar puncture *(Herlihy, 2011)*

lumbar radiculopathy, compression and irritation of nerve roots in the lumbar region, with resultant pain in the lower back and lower limbs.

lumbar reflex. See **erector spinae reflex.**

lumbar region. See **lateral region.**

lumbar rib, a rudimentary rib that articulates with the transverse process of the first lumbar vertebra.

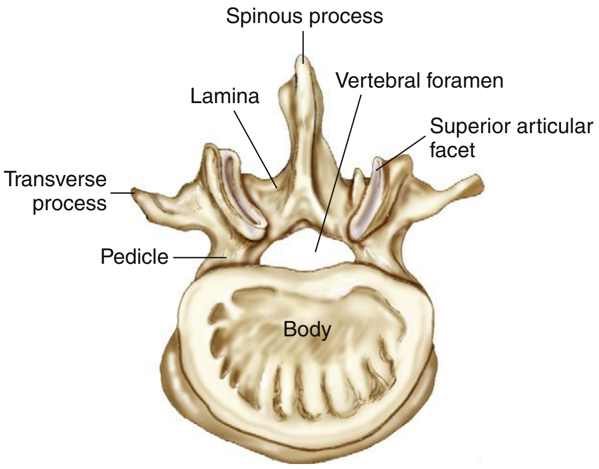
lumbar spine (L-spine), that portion of the spine comprising the lumbar vertebrae.

lumbar subarachnoid peritoneostomy, a surgical procedure to drain cerebrospinal fluid in hydrocephalus, usually in the newborn. It spares the kidney but is a slightly less effective method than a lumbar subarachnoid ureterostomy. The procedure may be used when a temporary shunt is needed. A lumbar laminectomy is performed, and then a polyethylene tube is passed from the subarachnoid space around the flank and into the peritoneum. This procedure is performed to correct a communicating type of hydrocephalus.

lumbar subarachnoid ureterostomy, a surgical procedure to drain cerebrospinal fluid through the ureter to the bladder in hydrocephalus, usually in the newborn. A lumbar laminectomy and a left nephrectomy are performed, after which a polyethylene tube is passed from the lumbar subarachnoid space through the paraspinal muscles and into the free ureter. The procedure is performed to correct a communicating type of hydrocephalus.

lumbar veins, four pairs of veins that collect blood by dorsal tributaries from the loins and by abdominal tributaries from the walls of the abdomen. The lumbar veins are connected by the ascending lumbar vein that runs ventral to the transverse processes of the lumbar vertebrae.

lumbar vertebra, one of the five largest segments of the movable part of the vertebral column, distinguished by the absence of a foramen in the transverse process and by vertebral bodies without facets between the sacrum and thoracic vertebrae. The body of each lumbar vertebra is flattened or slightly concave superiorly and inferiorly and is deeply constricted ventrally at the sides. The spinous process of each is thick, broad, and somewhat quadrilateral. The body of the fifth lumbar vertebra is much deeper ventrally than dorsally and in some individuals is defective, tending to weaken the spinal column. Compare **cervical vertebra, coccygeal vertebra, sacral vertebra, thoracic vertebra.**



Lumbar vertebra *(NAEMT, 2011)*

lumbo-, prefix meaning “loins”: *lumbocolostomy, lumbocostal, lumbosacral.*

lumbocostal /lum′bōkos′təl/, pertaining to the lumbar region and ribs.

lumbodorsal fascia, the extensive subdivision of the vertebral fascia that sheaths the sacrospinalis muscle. It spreads caudally to become the glistening white lumbar aponeurosis and the origin of the latissimus dorsi. Medially it attaches to the sacrum, laterally to the ribs and the intercostal fascia, and cranially to the nuchal ligament. See also **thoracolumbar fascia.**

lumbodorsal fascia. See **thoracolumbar fascia.**

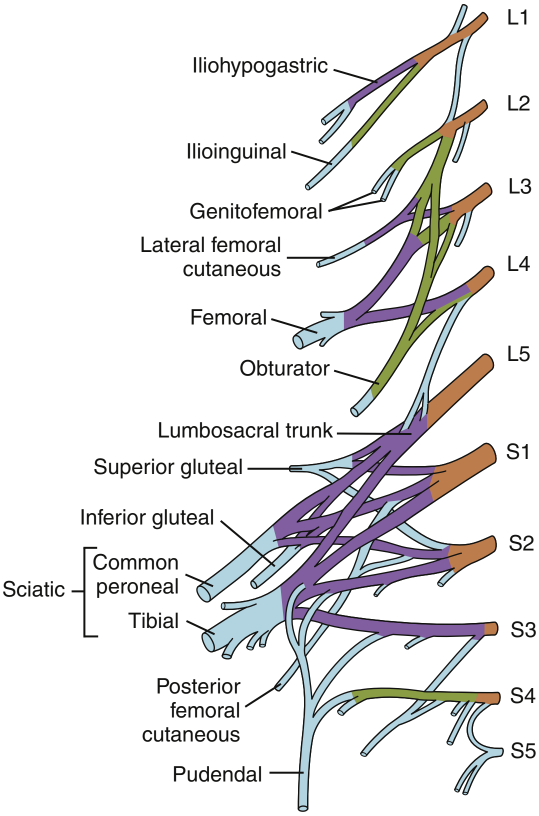
lumbosacral /lum′bōsā′krəl/ [L, *lumbus,* loin, *sacrum,* sacred], pertaining to the lumbar vertebrae and the sacrum. Also **sacrolumbar.**

lumbosacral plexus [L, *lumbus,* loin, *sacrum,* sacred, *plexus,* braided], the combination of all the ventral anterior primary divisions of the lumbar, the sacral, and the coccygeal nerves. The lumbar and sacral plexuses supply the lower limb. The sacral nerves also supply the perineum through the pudendal plexus and the coccygeal area through the coccygeal plexus. See also **lumbar plexus, sacral plexus.**

lumbrical. See **vermiform.**

lumbrical plus deformity /lum′brikəl/, a complication of rheumatoid arthritis in which the lumbricals (muscles in the hands and feet) become contracted. A main effect of the dysfunction is metacarpophalangeal joint flexion and interphalangeal joint extension. Compare **boutonnière deformity.**

lumen /lo͞o′mən/ *pl.* **lumina,** *lumens* [L, light], **1.** a tubular space or the channel within any organ or structure of the body. **2.** a unit of luminous flux that equals the flux emitted in a unit solid angle by a point source of one candle intensity. —*lumenal, luminal, adj.*



Lumbosacral plexus *(Patton and Thibodeau, 2010)*

lumin-, prefix meaning "light": *luminescence, luminiferous, luminophore*.

lumina, luminal. See **lumen.**

luminance, the brightness of a light-emitting source (e.g., a view box or computer monitor).

luminescence /lo͞o′mines′əns/ [L, *lumen,* light, *escens,* beginning], **1.** the emission of light by a material after excitation by some stimulus. **2.** the emission of light by intensifying-screen phosphors after x-ray interaction. See also **thermoluminescent dosimetry.**

luminiferous /lo͞o′minif′ərəs/ [L, *lumen,* light, *ferre,* to bear], pertaining to a medium that will transmit light.

luminophore /lo͞omin′əfôr/, **1.** an organic compound or chemical grouping that emits light. **2.** a substance that emits light when illuminated.

lumpectomy /lumpek′təmē/ [ME, *lump,* mass, *ektomē,* excision], surgical excision of a tumor without removing large amounts of surrounding tissue. See also **breast cancer.**

lumpy jaw [ME, *lump,* mass, *ceowan,* to chew], nontechnical. actinomycosis of cows, caused by infection with *Actinomyces bovis* and not communicable to humans.

lun-, prefix meaning "moon": *lunacy, lunate, lunatism*.

lunar, crescent-shaped.

lunar month /lo͞o′nər/ [L, *luna,* moon; AS, *monath,* month], a period of 4 weeks or 28 days, approximately the time required for the moon to revolve about the earth.

lunate bone /lo͞o′nāt/ [L, *luna,* moon; AS, *ban*], the carpal bone in the center of the proximal row of carpal bones between the scaphoid and triangular bones. It articulates with five bones, the radius proximally, the capitate and the hamate distally, the scaphoid laterally, and the triangular medially. Also called **os lunatum, semilunar bone.**

Lunesta, a trademark for eszopiclone.

lung (L) [AS, *lungen*], one of a pair of light, spongy organs in the thorax, constituting the main component of the respiratory system. The two highly elastic lungs are the main mechanisms in the body for inhaling (inspiring) air, from which oxygen is extracted for the arterial blood system, and for exhaling (expiring) carbon dioxide dispersed from the venous system. The right lung is divided into three lobes; the left lung, two lobes. Each lung is conical and has an apex, a base, three borders, and two surfaces. The apex is rounded and extends into the root of the neck about 4 cm above the first rib. The base of the lung is broad and concave, rests on the convex surface of the diaphragm, and with the diaphragm moves up during expiration and down during inspiration. Each lung is composed of an external serous coat, a subserous layer of areolar tissue, and the parenchyma. The serous coat comprises the thin, visceral pleura. The subserous areolar tissue contains many elastic fibers and invests the entire surface of the organ. The parenchyma is composed of secondary lobules divided into primary lobules, each of which consists of blood vessels, lymphatics, nerves, and an alveolar duct connecting with air spaces. The surfaces of the lungs are partially concave, with a cardiac impression that cradles the heart. The bronchial arteries supply blood to nourish the lungs and are derived from the ventral side of the thoracic aorta or from the aortic intercostal arteries. The bronchial vein is formed at the root of the lung. Most of the blood supplied by the bronchial arteries is returned by the pulmonary veins to the left atrium of the heart. The lungs are pinkish white at birth and darken in later life. The coloring is from carbon granules deposited in the areolar tissue near the surface of the lung. The carbon deposits increase with age. The lungs of men are usually heavier than those of women and usually have a greater capacity. The quantity of air that can be exhaled from the lungs after the deepest inspiration, the vital capacity, averages 3700 cc.

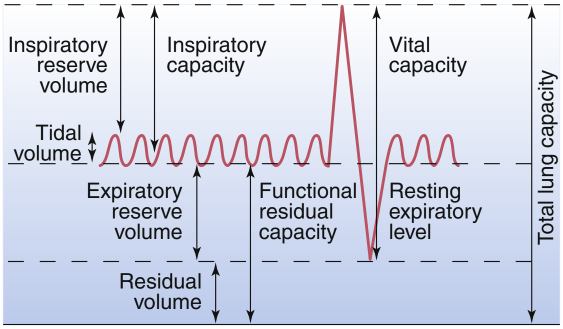
lung abscess [AS, *lungen* + L, *abscedere,* to go away], a complication of an inflammation and infection of the lung, often caused by aspiration of infected material from the mouth. On a chest x-ray, it is characterized by a cavity containing an air-fluid line.

lung agents. See **choking/lung/pulmonary agents.**

lung biopsy, a test to obtain a specimen of pulmonary tissue for histological examination to diagnose pulmonary parenchymal disease, including carcinoma, granuloma, lung diseases caused by toxic exposure, sarcoidosis, and infection.

lung cancer, a pulmonary malignancy attributable in the majority of cases to cigarette smoking. Other predisposing factors are exposure to acronitrile, arsenic, asbestos, beryllium, chloromethyl ether, chromium, coal products, ionizing radiation, iron oxide, mustard gas, nickel, petroleum, uranium, and vinyl chloride. Lung cancer develops most often in scarred or chronically diseased lungs. It is usually far advanced when detected because metastases may precede detection of the primary lesion in the lung. Symptoms of lung cancer include persistent cough, hoarseness, dyspnea, purulent or blood-streaked sputum, chest pain, and repeated attacks of bronchitis or pneumonia. Diagnostic measures include x-ray films, fluoroscopy, tomography, bronchography, angiography, cytological studies of sputum, bronchial washings or brushings, and needle biopsy. Epidermoid cancers and adenocarcinomas each account for approximately 30% of lung tumors; about 25% are small, or oat, cell carcinomas; and 15% are large cell anaplastic cancers. Small cell carcinomas frequently metastasize widely before diagnosis. Surgery is the most effective treatment, but only about 20% are resectable. Lung cancer is essentially incurable unless surgical resection can be accomplished. Thoracotomy is contraindicated if metastases are found in contralateral or scalene lymph nodes. Irradiation is used to treat localized lesions and unresectable intrathoracic tumors and as palliative therapy for metastatic lesions. Radiotherapy may also be administered after surgery to destroy remaining tumor cells and may be combined with chemotherapy. Targeted therapy with drugs such as paclitaxel, carboplatin, irinotecan, and erlotinib has also shown results. Chemotherapy is especially indicated for small cell carcinoma.

lung capacity, a lung volume that is the sum of two or more of the four primary, nonoverlapping lung volumes. Lung capacities are **functional residual capacity, inspiratory capacity, total lung capacity,** and **vital capacity.**



Lung volumes and capacities *(Monahan et al, 2007)*

lung compliance, a measure of the ease of expansion of the lungs and thorax, determined by pulmonary volume and elasticity. A high degree of compliance indicates a loss of elastic recoil of the lungs, as in old age or emphysema. Decreased compliance means that a greater change in pressure is needed for a given change in volume, as in atelectasis, edema, fibrosis, pneumonia, or absence of surfactant. Dyspnea on exertion is the main symptom of diminished lung compliance.

lung fluke [AS, *lungen,* lung, *floc*], a parasitic flatworm of the species *Paragonimus westermani* found throughout Africa, Asia, and Latin America, but rarely in North America. It may enter the body as encysted larvae in crabs and crayfish. Symptoms of infestation include peribronchiolar distress and hemoptysis.

lung scan, a radiographic examination of a lung and its function.

lung surfactant, a detergent-like agent that reduces the surface tension of the liquid film covering the inner lining of the pulmonary alveoli. As an alveolus becomes smaller during expiration, the surfactant becomes more concentrated, further reducing the surface tension and preventing alveolar collapse.

lung transplantation, the transfer of an entire pulmonary organ system to a new site. The procedure may be performed as a combined cardiopulmonary transplantation.

lunula /lo͞on′yələ/ *pl. lunulae* [L, *luna,* moon], a semilunar structure, such as the crescent-shaped pale area at the base of a fingernail or toenail.

lupoid, resembling **systemic lupus erythematosus.**

lupoid hepatitis, an autoimmune form of hepatitis with the histological appearance of chronic active hepatitis. Many patients show lupoid cells in the blood without systemic lupus erythematosus. See also **hepatitis.**

Lupron, a trademark for a parenteral antineoplastic drug **(leuprolide acetate).**

lupus /lo͞o′pəs/ [L, wolf], nontechnical. See **systemic lupus erythematosus.**

lupus anticoagulant, an antibody specific for phospholipoproteins or phospholipid components of coagulation factors, found in patients with systemic lupus erythematosus. It causes an increase in partial thromboplastin time and is associated with arterial and venous thrombosis, fetal loss, and thrombocytopenia.

lupus band test, a direct immunofluorescent method of visualizing a band of immunoglobulins and complement at the dermal-epidermal junction of involved skin in patients with systemic lupus erythematosus.

lupus erythematosus. See **systemic lupus erythematosus.**

lupus erythematosus cell. See **LE cell.**

lupus pernio, a cutaneous form of sarcoidosis, characterized by smooth, shiny plaques on the face, fingers, and toes, clinically resembling frostbite.

lupus vulgaris, a rare cutaneous form of tuberculosis in which areas of the skin become ulcerated and heal slowly, leaving deeply scarred tissue. The disease is not related to systemic lupus erythematosus.

LUQ, abbreviation for *left upper quadrant* of the abdomen.

Luride, a trademark for a chemical prophylactic that reduces dental caries (sodium fluoride).

lusus naturae /lo͞o′səs/ [L, *lusus,* sport, *natura,* nature], a congenital anomaly; teratism.

lute /lo͞ot/ [L, *lutum,* mud], **1.** *n,* a substance such as cement, wax, or clay that coats a surface or joint area to make a tight seal. Also called luting agent. **2.** *v,* to coat or seal with such a substance.

lute-, prefix meaning "yellow": *luteinizing.*

luteal /lo͞o′tē·əl/, pertaining to the corpus luteum or its functions or effects.

luteal hormone [L, *luteus,* yellow; Gk, *hormaein,* to set in motion], a hormone produced by the **corpus luteum.** See also **progesterone.**

luteal phase, the third phase of the human menstrual cycle, when the ovarian follicle that has recently discharged an ovum ruptures and transforms into the corpus luteum, which secretes progesterone. Progesterone acts on the endometrium to build up tissue with a supply of blood for nourishment of the potential embryo. If fertilization and conception do not take place, the estrogen level falls and the menstrual phase begins.

luteal phase deficiency, female infertility or early miscarriage caused by inadequate secretion of progesterone during the luteal phase of the menstrual cycle or poor endometrial lining response to progesterone levels. It is associated with an abnormality in pituitary gland function. Also called *luteal phase defect.*

lutein /lo͞o′tē·in/ [L, *luteus,* yellow], a yellow-red crystalline carotenoid pigment found in plants with carotenes and chlorophylls.

luteinization /lo͞o′tē·inīzā′shən/ [L, *luteus,* yellow], the formation of the corpus luteum from an ovarian follicle that has recently discharged an ovum. The process involves the hypertrophy of the follicular lutein cells and the development of blood vessels and connective tissue at the site.

luteinizing hormone (LH) /lo͞o′tē·inī′zing/ [L, *luteus,* yellow; Gk, *izein,* to cause, *hormein,* to begin activity], a glycoprotein hormone produced by the anterior pituitary gland. It stimulates the secretion of sex hormones by the ovary and the testes and is involved in the maturation of spermatozoa and ova. In men, it induces the secretion of testosterone by the interstitial cells of the testes. Testosterone, together with follicle-stimulating hormone (FSH), induces the maturation of seminiferous tubules and stimulates them to produce sperm. In females, LH, working together with FSH, stimulates the growing follicle in the ovary to secrete estrogen.

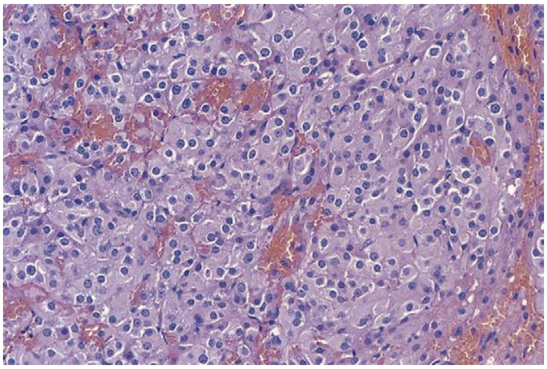
High concentrations of estrogen stimulate the release of a surge of LH, which stimulates ovulation. LH then induces the development of the ruptured follicle into the corpus luteum, which continues to secrete estrogen and progesterone. The normal LH concentration in the plasma of men is less than 11 mIU/mL. In premenopausal women it is less than 25 mIU/mL; at midcycle peak it is greater than three times the baseline concentration; in postmenopausal women it is more than 25 mIU/mL. See also **interstitial cell-stimulating hormone, menstrual cycle.**

luteinizing hormone (LH) and follicle-stimulating hormone (FSH) assay, a blood test used in the evaluation of infertility. An LH assay is an easy way to determine if ovulation has occurred. The LH assay and FSH test also are used to determine whether a gonadal insufficiency is primary (a problem with the ovary or testicle) or secondary (caused by pituitary insufficiency resulting in reduced levels of FSH and LH).

luteinizing hormone–releasing hormone (LH-RH), a neurohormone of the hypothalamus that stimulates and regulates the pituitary gland's release of luteinizing hormone.

luteinizing hormone surge, a sharp increase in serum levels of luteinizing hormone seen around the middle of the menstrual cycle about 1 to 2 days before ovulation.

luteoma /lo͞o′tē·ō′mə/ *pl, luteomas, luteomata* [L, *luteus* + Gk, *oma,* tumor], **1.** a granulosa or theca cell tumor whose cells resemble those of the corpus luteum. **2.** also called **pregnancy luteoma.** a unilateral or bilateral nodular hyperplasia of ovarian lutein cells, occasionally developing during the last trimester of pregnancy.



Luteoma of pregnancy *(Fletcher, 2007)*

luteotrope. See **lactotroph.**

luteotropin. See **prolactin.**

lutetium (Lu) /lo͞otē′shē·əm/ [L, *Lutetia,* Paris], a rare earth metallic element. Its atomic number is 71, and its atomic mass is 174.97.

luting agent. See **lute,** def. 1.

Luvox, a trademark for an antidepressant drug **(fluvoxamine maleate).**

lux (lx), a unit of illumination equivalent to one lumen per square meter of surface when measured at right angles to the direction of the light.

luxated joint /luk′sātid/, a dislocated joint in which there is no contact between articular surfaces.

luxation /luksā′shən/ [L, *luxare,* to dislocate], dislocation.

LV, abbreviation for **left ventricle.**

LVAD, abbreviation for **left ventricular assist device.**

LVN, abbreviation for **licensed vocational nurse.** See **licensed practical nurse.**

LWD, abbreviation for *living with disease*.

lx, abbreviation for **lux.**

lyases /lē′āsez/ [Gk, *lyein,* to loosen; Fr, *disastase,* enzyme], a group of enzymes that reversibly split carbon bonds with carbon, nitrogen, or oxygen without hydrolysis or oxygen reduction reactions. The activity results in two subunits in which one or both may contain a double-bonded carbon. An example of a lyase is deaminase.

lyco-, prefix meaning "wolf": *lycomania, lycorexia*.

lycopene /lī′kəpēn/ [Gk, *lykopersikon,* tomato], a red crystalline unsaturated hydrocarbon that is the carotenoid pigment in tomatoes and various berries and fruits. It is considered the primary substance from which all natural carotenoid pigments are derived. Numerous studies correlate high intake of lycopene-containing foods with reduced incidence of cancer, cardiovascular disease, and macular degeneration.

lycopenemia /lī′kōpēnē′mē·ə/, a condition characterized by a high concentration of the carotenoid pigment lycopene in the blood, the result of ingesting large amounts of tomato products and other lycopene-rich fruits. Lycopenemia patients may develop a yellowish skin color. This term is not in common usage.

lye poisoning /lī/ [AS, *leah,* lye; L, *potio,* drink], the toxic effects of ingesting caustic soda or sodium hydroxide (NaOH), a powerful alkali. If the chemical has a pH above 11.5, the chemical burn damage to the mouth and throat is usually irreversible. An alkali burn can be more serious than an acid burn because an acid is usually neutralized by the tissues it contacts. See also **alkali poisoning.**

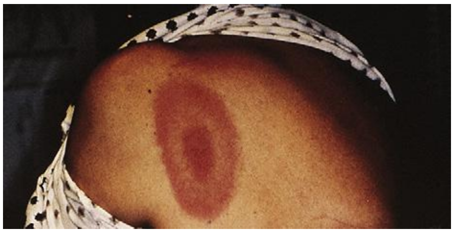
lying-in [AS, *licgan,* lying; L, *in*], **1.** *adj,* designating the time before, during, and after childbirth. **2.** *adj,* designating a hospital that provides care for women in childbirth and the puerperium. **3.** *n,* the condition of being in confinement, or childbed.

Lyme disease /līm/ [Lyme, Connecticut, where originally described], an infection caused by the spirochete, ***Borrelia burgdorferi,*** transmitted by the bite of infected ***Ixodes*** ticks (which are far smaller than dog ticks). In the northeast and north-central United States, the ticks normally feed on the white-footed mouse, the white-tailed deer, or other mammals and birds. Ticks are most likely to spread infection after 2 or more days of feeding. Most commonly, nymph ticks spread the disease because they are smaller than 2 mm in size and are rarely noticed. In contrast, the larger adult ticks are more likely to be found and removed before they have transmitted infection. See also **erythema migrans.**

■ OBSERVATIONS: The disease first manifests itself as a red skin macule or papule at the bite site with accompanying flu-like symptoms, such as headache, fever, chills, muscle aches, and fatigue. These are often missed or ignored by the individual. In about 50% of cases, other lesions develop soon after onset. Lymphadenopathy, neck pains, and hepatosplenomegaly are also often present in early disease. After weeks or months, neurological abnormalities such as meningitis, meningoencephalitis, neuritis, and radiculopathies appear in about 15% of all cases. Myocardial abnormalities such as atrioventricular block, myopericarditis, and cardiomegaly occur in 8% of cases. Joint inflammation, pain, and arthritis develop in 50% of cases as long as 2 years after transmission. Diagnosis is made through clinical examination with evidence of characteristic lesions and a positive enzyme-linked immunosorbent assay (ELISA). Cultures and biopsy of skin lesions and PCR testing of blood gives a definitive diagnosis. However, the lab tests are available only at reference laboratories.

■ INTERVENTIONS: Current treatment centers around the use of oral or intravenous antibiotics. A single dose of doxycycline within 72 hours of an ***Ixodes*** tick bite will prevent development of disease.

■ NURSING CONSIDERATIONS: Nursing for acute disease is focused on rest and monitoring for complications. Education about preventive practices in endemic areas is needed and includes instruction to wear appropriate clothing (long pants tucked in boots) in wooded or grassy areas; use of bug repellent with DEET; keeping grass mowed; keeping woodpiles away from foot-traffic areas and the house; treating pets with tick and flea repellent and keeping pets off furniture; removal of ticks with tweezers; and thorough washing and application of antiseptic to any tick bite. Education is needed about the identification of the ***Ixodes*** tick and instruction to seek immediate treatment for any ***Ixodes*** tick bite or bull's-eye–like rash.



Lyme disease *(Stone and Gorbach, 2000)*

Lyme disease test, a Western blot–specific blood test to isolate the spirochete *Borrelia burgdorferi,* which causes Lyme disease.

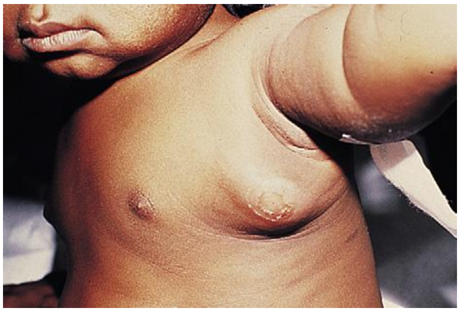
Lyme disease vaccine (recombinant OspA), a preparation of outer surface protein A (OspA), a cell surface lipoprotein of *Borrelia burgdorferi,* produced by recombinant technology; administered intramuscularly for active immunization against Lyme disease.

lymph /limf/ [L, *lympha,* water], a thin watery fluid originating in organs and tissues of the body that circulates through the lymphatic vessels and is filtered by the lymph nodes. Lymph enters the bloodstream at the junction of the internal jugular and subclavian veins. Lymph contains chyle, erythrocytes, and leukocytes, most of which are lymphocytes. See also **chyle, lymphatic system, lymphatic vessels. —lymphatic,** *adj.*

lymph-, lympho-, -lymph, combining form meaning "the lymph": *lymphoduct, neurolymph, perilymph.*

lymphadenectomy, surgical removal of a lymph node or nodes. Also called **lymph node dissection.**

lymphadenitis /limfad′inī′tis, lim′fəd-/ [L, *lympha* + Gk, *aden,* gland, *itis,* inflammation], an inflammatory condition of the lymph nodes, usually the result of systemic neoplastic disease, bacterial infection, or other inflammatory conditions. The nodes may be enlarged, hard, smooth or irregular, and red and may feel hot. The location of the affected node is indicative of the site or origin of disease.



Lymphadenitis *(Cohen, Powderly, and Opal, 2010)*

lymphadenoma, lymphadenoma venerum. See **lymphogranulomatosis.**

lymphadenopathy /limfad′inop′əthē/, any disorder characterized by a localized or generalized enlargement of the lymph nodes or lymph vessels.

lymphadenopathy syndrome (LAS), a persistent, generalized swelling of the lymph nodes. It is often a part of the AIDS wasting syndrome.

lymphangiectasia /limfan′jē·ektā′zhə/ [L, *lympha* + Gk, *angeion,* vessel, *ektasis,* stretching], dilation of the smaller lymphatic vessels, usually resulting from obstruction in the larger vessels, such as in pelvic tuberculosis, mesenteric node metastases, and certain protozoan diseases.

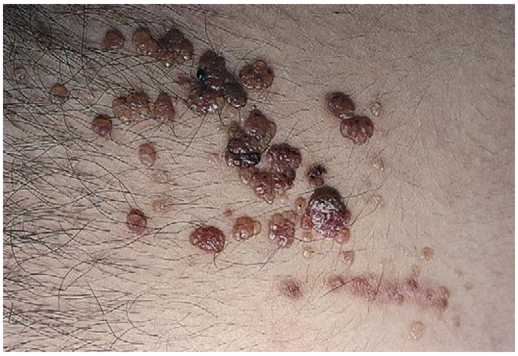
lymphangiogram /limfan′jē·əgram′/ [L, *lympha,* water; Gk, *angeion,* vessel, *gramma,* record], a radiographic visualization of a part of the lymphatic system.

lymphangiography, an x-ray done with contrast dye that is especially useful in patients suspected of having lymphoma, metastatic tumor, or Hodgkin's disease. It is also used to demonstrate the extent and level of lymphatic metastasis, to stage lymphoma patients, to evaluate the results of chemotherapy or radiation therapy, and to evaluate patients with chronic leg swelling.

lymphangioma /limfan′jē·ō′mə/ *pl.* **lymphangiomas, lymphangiomata** [L, *lympha* + Gk, *angeion,* vessel, *oma,* tumor], a benign yellowish-tan tumor on the skin, composed of a mass of dilated lymph vessels. The tumor is removed by excision or electrocoagulation for cosmetic reasons. Also called **angioma lymphaticum.** Compare **hemangioma.**

lymphangioma cavernosum, a tumor formed by dilated lymphatic vessels and filled with lymph mixed with coagulated blood. The lesion, which is often congenital, may cause extensive enlargement of the affected tissue, especially of the tongue and lips. Also called **cavernous lymphangioma.**

lymphangioma circumscriptum, a benign skin lesion that develops from superficial hypertrophic lymph vessels. Most often occurring in children, the lesion is characteristically pigmented and may grow to several centimeters in diameter.



Lymphangioma circumscriptum *(Callen et al, 2000)*

lymphangioma cysticum. See **cystic lymphangioma.**

lymphangiomas. See **lymphangioma.**

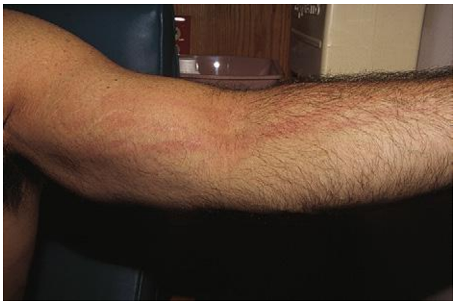
lymphangioma simplex, a growth formed by moderately dilated lymph vessels in a circumscribed area of the skin.

lymphangiomata. See **lymphangioma.**

lymphangiosarcoma /limfan′jē·ō′särkō′mə/ [L, *lympha,* water; Gk, *angeion,* vessel, *sarx,* flesh, *oma,* tumor], a tumor arising from the lymphatic vessels.

lymphangioscintigraphy (LAS) /lim-fan′je-o-sin-tig′rah-fe/, scintigraphic evaluation of primary and secondary by means of radioactive tracers.

lymphangitis /lim′fanjī′tis/ [L, *lympha* + Gk, *angeion*, vessel, *itis*], an inflammation of one or more lymphatic vessels, usually resulting from an acute streptococcal infection of one of the extremities. It is characterized by fine red streaks extending from the infected area to the axilla or groin and by fever, chills, headache, and myalgia. The infection may spread to the bloodstream. Penicillin and hot soaks are usually prescribed; aseptic technique is important to avoid contagion.



Streptococcal lymphangitis *(Stone and Gorbach, 2000)*

lymphatic /limfat′ik/ [L, *lympha* + *icus*, form], **1.** pertaining to the lymphatic system of the body, consisting of a vast network of tubes transporting lymph. **2.** pertaining to any of the vessels associated with the lymphatic network.

lymphatic capillary plexus, one of the numerous networks of lymphatic capillaries that collect lymph from the intercellular fluid and constitute the beginning of the lymphatic system. The lymphatic vessels arise from the capillary plexuses, which vary in size and number in different regions and organs of the body. The capillary networks do not contain lymphatic valves as do the vessels. The plexuses are especially abundant in the dermis of the skin but also lace many other areas, such as the mucous membranes of the respiratory and digestive systems, testes, ovaries, liver, kidneys, and heart. See also **lymphatic system.**

lymphatic follicles of rectum, concentrations of lymphoid tissue in the tunica mucosa of the rectum.

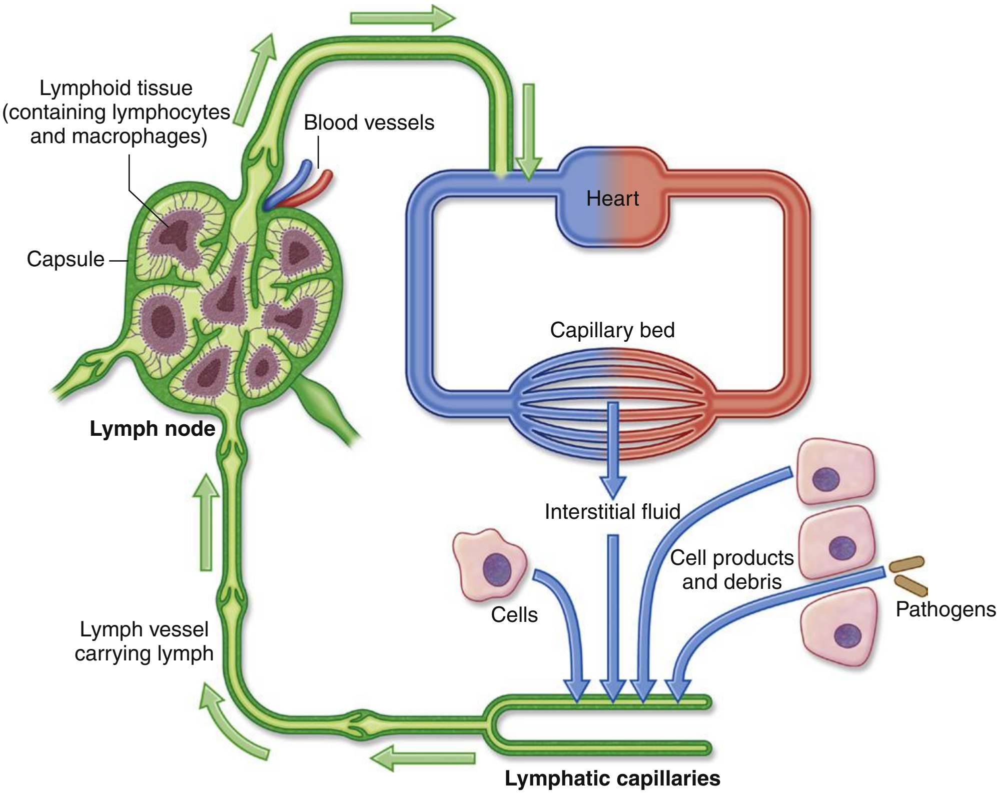
lymphatic follicles of stomach, small lymphocytic aggregates in the interstitial tissue of the lamina propria of the stomach, especially in the pyloric region.

lymphatic leukemia. See **acute lymphocytic leukemia, chronic lymphocytic leukemia.**

lymphatic nodule. See **malpighian body,** def 2.

lymphatic organ [L, *lympha*, water; Gk, *organon*, instrument], any body structure composed of lymphatic tissue, such as the thymus, spleen, tonsils, and lymph nodes.

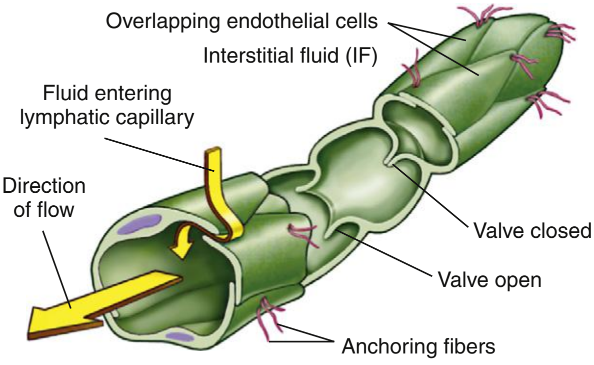
lymphatic system, a vast, complex network of capillaries, thin vessels, valves, ducts, nodes, and organs that helps protect and maintain the internal fluid environment of the entire body by producing, filtering, and conveying lymph and producing various blood cells. The lymphatic network also transports fats, proteins, and other substances to the blood system and restores 60% of the fluid that filters out of the blood capillaries into interstitial spaces during normal metabolism. Small semilunar valves throughout the lymphatic network help to control the flow of lymph and, at



Lymphatic system *(Drake, Vogl, and Mitchell, 2010)* the junction with the venous system, prevent venous blood from flowing into the lymphatic vessels. The lymph collected throughout the body drains into the blood through two ducts situated in the neck. The thoracic duct that rises into the left side of the neck is the major vessel of the lymphatic system and conveys lymph from the whole body, except for the right quadrant, which is served by the right lymphatic duct. Lymph flows into the general circulation through the thoracic duct at a rate of about 125 mL per hour during routine exertion. Various body dynamics such as respiratory pressure changes, muscular contractions, and movements of organs surrounding lymphatic vessels combine to pump the lymph through the lymphatic system. The lymphatic capillaries, which are the beginning of the system, abound in the dermis of the skin, forming a continuous network over the entire body, except for the cornea. The system also includes specialized lymphatic organs, such as the tonsils, the thymus, and the spleen. See also the **Color Atlas of Human Anatomy,** pp. A20-A22, **lymph, lymph node, lymph vessels, spleen, thymus.**

lymphatic vasculitis, a condition of blood vessel necrosis in which the vessels acquire fibrinoid deposits and are infiltrated by lymphocytes. It is associated with graft-versus-host disease.

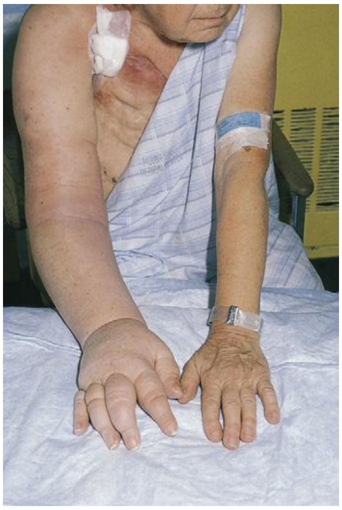
lymphatic vessels [L, *lympha,* water, *vascellum,* little vase], Fine, thin-walled, transparent valved channels distributed through most tissues. They are often distinguished by their beaded appearance, which is caused by an irregular lumen. The collecting branches form two systems, one generally running with the superficial veins and the other below the deep fascia and including the intestinal lacteals. Lymphatics resemble veins but have more valves, have thinner walls, and contain lymph nodes. They drain through a thoracic duct and a right lymphatic duct into the venous system near the base of the neck. They include three layers: intima, media, and adventitia.



Lymphatic vessel *(Thibodeau and Patton, 2010)*

lymph cell. See **lymphocyte.**

lymphedema /lim′fidē′mə/ [L, *lympha* + Gk, *oidema,* swelling], a primary or secondary condition characterized by the accumulation of lymph in soft tissue and the resultant swelling caused by inflammation, obstruction, or removal of lymph channels. Congenital lymphedema (Milroy's disease) is a hereditary disorder characterized by chronic lymphatic obstruction. Lymphedema praecox occurs in adolescence, chiefly in females, and causes puffiness and swelling of the lower limbs, apparently because of hyperplastic development of lymph vessels. Secondary lymphedema may follow surgical removal of lymph channels in mastectomy, obstruction of lymph drainage caused by malignant tumors, or the infestation of lymph vessels with adult filarial parasites. Lymphedema of the lower extremities begins with mild swelling of the foot, gradually extends to the entire limb, and is aggravated by prolonged standing, pregnancy, obesity, warm weather, and the menstrual period. The disorder has no cure, but lymph drainage from the extremity can be improved if the patient sleeps with the foot of the bed elevated 4 to 8 inches, wears elastic stockings, and takes moderate exercise regularly. Light massage in the direction of the lymph flow and thiazide diuretics may be prescribed. Constricting clothing and salty or spicy foods that increase thirst are contraindicated. Surgery may be performed to remove hypertrophied lymph channels and disfiguring tissue. *—lymphedematose, lymphedematous, adj.*



Lymphedema *(Swartz, 2009)*

lymph node [L, *lympha* + *nodus,* knot], one of the many small oval structures that filter the lymph and fight infection and in which lymphocytes, monocytes, and plasma cells are formed. The lymph nodes are of different sizes, some as small as pinheads, others as large as lima beans. Each node is enclosed in a capsule, is composed of a lighter-colored cortical part and a darker medullary part, and consists of closely packed lymphocytes, reticular connective tissue laced by trabeculae, and three kinds of sinuses: subcapsular, cortical, and medullary. Lymph flows into the node through afferent lymphatic vessels that open into the subcapsular sinuses. Most lymph nodes are clustered in areas such as the mouth, the neck, the lower arm, the axilla, and the groin. The lymphatic network and nodes of the breast are especially crucial in the diagnosis and treatment of breast cancer. Also called **lymph gland.**

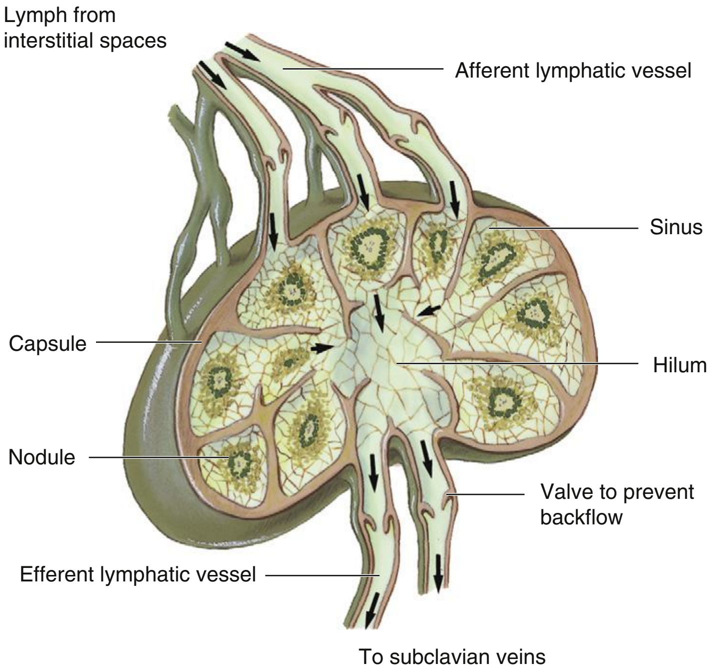
lymph node dissection. See **lymphadenectomy.**

lymph nodule [L, *lympha,* water, *nodulus,* small knot], any of the small densely packed spheric nodes or aggregations of lymph cells embedded in the reticular meshwork of the lymphatic system, mainly in the tonsils, spleen, and thymus.

lympho-. See **lymph-.**

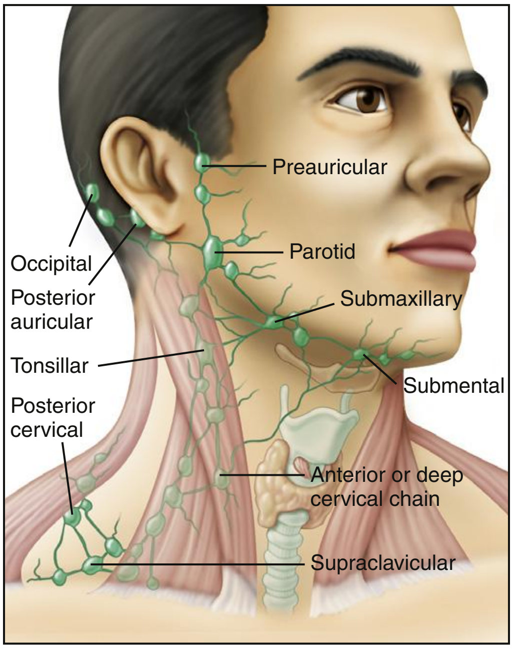
lymphoblast /lim′fəblast′/, a large, immature cell that develops into a lymphocyte after an antigenic or mitogenic challenge. *—lymphoblastic, adj.*

lymphoblastic lymphoma, lymphoblastic lymphosarcoma, lymphoblastoma. See **poorly differentiated lymphocytic malignant lymphoma.**



Lymph from interstitial spaces
Afferent lymphatic vessel
Sinus
Capsule
Hilum
Nodule
Valve to prevent backflow
Efferent lymphatic vessel
To subclavian veins

Lymph node *(Applegate, 2011)*



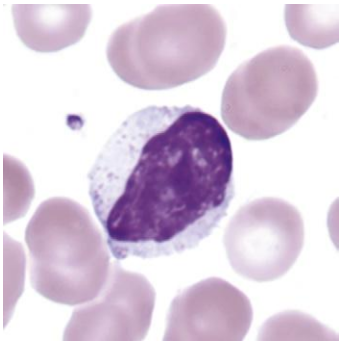
Preauricular
Occipital
Parotid
Posterior auricular
Submaxillary
Tonsillar
Submental
Posterior cervical
Anterior or deep cervical chain
Supraclavicular

Cervical lymph nodes *(Harkreader, Hogan, and Thobaben, 2007)*

lymphocele /lim′fəsēl/, a tumor that contains lymph from injured lymph vessels. This term is not in common usage. Also called *lymphocyst*.

Lymphocryptovirus /lim′fokrip′tovi′rus/, a genus of herpesviruses that includes the Epstein-Barr virus and species affecting nonhuman primates.

lymphocyte /lim′fəsīt/ [L, *lympha* + Gk, *kytos*, cell], a family of mononuclear, nonphagocytic white blood cells that circulate in blood, lymph, and peripheral lymphatic tissues. Lymphocytes are categorized as B and T lymphocytes and natural killer cells and are responsible for humoral and cellular immunity and tumor surveillance. Also called **lymph cell,** *lymphocyst*. See also **lymphokine.** —*lymphocytic, adj*.



Lymphocyte *(Carr and Rodak, 2008)*

lymphocyte activation, the stimulation of lymphocytes by antigens or mitogens, rendering them metabolically active and causing them to differentiate into effector cells.

lymphocyte immune globulin, an immunosuppressant. Also called *antithymocyte*.

■ INDICATIONS: It is used to prevent rejection of organ transplants and to treat aplastic anemia.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: When this drug is used in renal transplants, life-threatening effects include seizures and anaphylaxis. Other adverse effects include fever, headache, dizziness, weakness, faintness, rash, pruritus, urticaria, wheals, diarrhea, nausea, vomiting, epigastric pain, chest pain, hypertension, and tachycardia. When the drug is used to treat aplastic anemia, seizures are a life-threatening effect. Other adverse effects include fever, chills, headache, lightheadedness, encephalitis, postviral encephalopathy, bradycardia, myocarditis, irregularity, nausea, and abnormal liver function tests.

lymphocyte immunophenotyping, a blood test used to detect the progressive depletion of CD4 T lymphocytes, which is associated with an increased likelihood of clinical complications from AIDS. Test results can also indicate if an AIDS patient is at risk for developing opportunistic infections.

lymphocyte transformation, **1.** the morphological changes accompanying lymphocyte activation, in which small, resting lymphocytes are transformed into large, active lymphocytes (lymphoblasts). **2.** an in vitro immunity test process in which a patient's lymphocytes are placed in a culture with an antigen. The rate of transformation, in terms of proliferation and enlargement of T memory cells, is measured by the uptake of radioactive thymidine by the lymphocytes, indicating protein synthesis.

lymphocytic choriomeningitis /lim′fəsit′ik/ [L, *lympha* + Gk, *kytos,* cell, *chorion,* skin, *meninx,* membrane, *itis,* inflammation], an arenavirus infection of the meninges and the cerebrospinal fluid. It is caused by the lymphocytic choriomeningitis virus and characterized by fever, headache, and stiff neck often complicated by aseptic meningitis. The infection occurs primarily in young adults, most often in the fall and winter months. Recovery usually takes place within 2 weeks.

lymphocytic gastritis, chronic gastritis with large numbers of T lymphocytes in the epithelium of the stomach, sometimes associated with celiac disease or ***Helicobacter pylori*** infection.

lymphocytic hypophysitis, the massive infiltration of the pituitary gland by lymphocytes and plasma cells, with destruction of the normal parenchyma. The disorder is believed to have an autoimmune basis.

lymphocytic interstitial pneumonia (LIP), a diffuse respiratory disorder characterized by fibrosis and accumulation of lymphocytes in the lungs. It is commonly associated with lymphoma and may progress to lymphoma.

lymphocytic leukemia. See **acute lymphocytic leukemia, chronic lymphocytic leukemia.**

lymphocytic lymphoma, lymphocytic lymphosarcoma. See **well-differentiated lymphocytic malignant lymphoma.**

lymphocytic thyroiditis. See **Hashimoto's disease.**

lymphocytoma. See **well-differentiated lymphocytic malignant lymphoma.**

lymphocytopenia /lim′fōsī′təpē′nē·ə/ [L, *lympha* + Gk, *kytos,* cell, *penes,* poor], a decreased number of lymphocytes in the peripheral circulation, associated with immunodeficiency, neoplasm, or chemotherapy. Compare **alymphocytosis.** See also **agranulocyte.**

lymphocytosis /lim′fōsītō′sis/, a proliferation of lymphocytes, as occurs in certain chronic diseases and during convalescence from acute infections.

lymphocytotoxic antibody /lim′fōsītətok′sik/, an antibody that induces the cell-killing activity of killer lymphocytes on combining with a certain antigen.

lymphocytotrophic /-trof′ik/, having an affinity for lymphocytes.

lymphoderma perniciosa. See **leukemia cutis.**

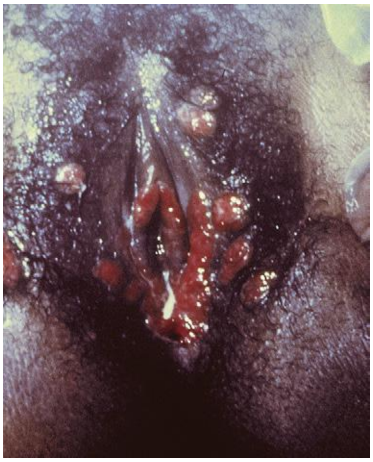
lymphoepithelioma /lim′fō·ep′ithē′lē·ō′mə/ [L, *lympha* + Gk, *epi,* above, *thele,* nipple, *oma,* tumor], a poorly differentiated neoplasm developing from the epithelium overlying lymphoid tissue in the nasopharynx. It occurs most frequently in young people of Asian origin. Also called *lymphoepithelial carcinoma*.

lymphogenesis /-jen′əsis/, the formation of lymph.

lymphogenous leukemia. See **acute lymphocytic leukemia, chronic lymphocytic leukemia.**

lymphogranulomatosis /-gran′yəlō′mətō′sis/ [L, *lympha,* water, *granulum,* small grain + Gk, *oma,* tumor, *osis,* condition], an infectious granuloma of the lymphatic system. The term is used to identify several inflammatory, granulomatous or sarcomatous disorders, such as **Hodgkin's disease, lymphadenoma, lymphadenoma venereum,** and **sarcoidosis.**

lymphogranuloma venereum (LGV) /-gran′yəlō′mə/ [L, *lympha* + *granulum,* small grain; Gk, *oma,* tumor; L, *Venus,* goddess of love], a sexually transmitted disease caused by a strain of the bacterium *Chlamydia trachomatis* that primarily infects the lymphatics. It is characterized by ulcerative genital lesions, marked swelling of the lymph nodes in the groin, headache, fever, and malaise. Ulcerations of the rectal wall occur less commonly. The disease is diagnosed by isolating the organism from an infected node and demonstrating LGV antibodies by serological blood test. Doxycycline is usually prescribed for the patient and any person with whom there has been sexual contact. When changing dressings, aseptic technique is used. Also called **lymphopathia venereum.** See also ***Chlamydia.***



Lymphogranuloma venereum *(Conlon and Snydman, 2000)*

lymphography. See **lymphangiography.**

lymphoid /lim′foid/ [L, *lympha,* water; Gk, *eidos,* form], pertaining to lymph or lymphatics.

lymphoid aplasia, failure of development of lymphoid tissue, as in severe combined immunodeficiency.

lymphoid interstitial pneumonia (LIP), a form of pneumonia involving the lower lobes with extensive alveolar infiltration by mature lymphocytes, plasma cells, and histiocytes. It is associated with human immunodeficiency virus infection, especially in children; dysproteinemia; and Sjögren's syndrome. This is an AIDS-defining illness in children.

lymphoid leukemia. See **acute lymphocytic leukemia, chronic lymphocytic leukemia.**

lymphoidocytic leukemia. See **stem cell leukemia.**

lymphoid ring. See **Waldeyer's throat ring.**

lymphoid system, the lymphoid tissue of the body considered collectively. It can be divided into primary (or central) lymphoid tissues—the thymus and bone marrow, where lymphocytes differentiate from stem cells—and secondary (or peripheral) tissues—the lymph nodes, spleen, and gut-associated lymphoid tissue (tonsils, Peyer's patches)—where lymphocytes take part in immune responses.

lymphoid tissue [L, *lympha,* water; Gk, *eidos,* form; OFr, *tissu*], tissue that consists of lymphocytes on a framework of reticular cells and fibers, as the tonsils and adenoids.

lymphokine /lim′fōkīn/ [L, *lympha* + Gk, *kinesis,* motion], one of the chemical factors produced and released by T lymphocytes that attract macrophages to the site of infection or inflammation and prepare them for attack. Kinds of lymphokines include *chemotactic factor,* **cytokine,** *lymphotoxin, migration inhibiting factor,* and **mitogenic factor.**

lymphokine-activated killer (LAK) cells, nonspecific cytotoxic cells that are generated in the presence of interleukin-2 and the absence of antigen. They are distinct from human natural killer cells, peripheral T lymphocytes, or memory cytotoxic thymus-derived lymphocytes. LAK cell infusions have been used investigationally for the treatment of cancer.

lympholysis /limfol′əsis/ [L, *lympha* + Gk, *lysein,* to loosen], cellular destruction of lymphocytes, especially of certain ones in the process of an immune response. **—***lympholytic, adj.*

lymphoma /limfō′mə/ *pl. lymphomas,* **lymphomata** [L, *lympha* + Gk, *oma,* tumor], a type of neoplasm of lymphoid tissue that originates in the reticuloendothelial and lymphatic systems. It is usually malignant but in rare cases may be benign. It usually responds to treatment. Two main kinds of lymphomas are Hodgkin's disease and non-Hodgkin's lymphoma (NHL). A third form, Burkitt's lymphoma, is rare in North America but relatively common in Central Africa. A rare form of lymphoma is mycosis fungoides, a chronic T cell variation of the disease affecting the skin and internal organs. It is an insidious disorder, beginning as a plaquelike pruritic rash that spreads through the skin and becomes nodular and systemic. The various lymphomas differ in degree of cellular differentiation and content, but the manifestations are similar in all types. Hodgkin's disease lymphomas tend to affect young adults but usually respond to recently developed types of therapy. The NHL type usually strikes patients around middle age and can be more difficult to treat. Characteristically the appearance of a painless enlarged lymph node or nodes is followed by weakness, fever, weight loss, and anemia. With widespread involvement of lymphoid tissue, the spleen and liver usually enlarge and GI disturbances, malabsorption, and bone lesions frequently develop. Men are more likely than women to develop lymphoid tumors. There has been a dramatic increase in the incidence of acquired immunodeficiency syndrome–related NHL, which is attributed to prolonged survival of such patients related to the availability of antiretroviral agents. Treatment for lymphoma includes intensive radiotherapy, chemotherapy, and biological therapies, including interferon and monoclonal antibodies. Kinds of lymphoma include **Burkitt's lymphoma, giant follicular lymphoma, histiocytic malignant lymphoma, Hodgkin's disease,** and **mixed cell malignant lymphoma.** Formerly called **leukosarcoma. —lymphomatoid,** *adj.*

-lymphoma, suffix meaning a "tumor or neoplastic disorder of lymphoid tissue": *adenolymphoma, angiolymphoma, cystadenolymphoma.*

lymphoma staging, a system for classifying lymphomas according to the extent of the disease for the purpose of treatment and prognosis. Stage I is characterized by the involvement of a single lymph node region or one extralymphatic organ or site. Stage II is characterized by the involvement of two or more lymph node regions on the same side of the diaphragm or a localized involvement of an extralymphatic organ or site plus one or more node regions on the same side of the diaphragm. In stage III, lymph nodes on both sides of the diaphragm are affected, and there may be involvement of the spleen or localized involvement of an extralymphatic organ or site. Stage IV is typified by diffuse or disseminated involvement of one or more extralymphatic organs or sites with or without associated lymph node involvement.

lymphomata, lymphomatoid. See **lymphoma.**

lymphomatoid granulomatosis /limfō′mətoid/, a condition of unknown cause in which lymphocytes and plasma cells infiltrate the blood vessels, producing an angiocentric lesion. It most often affects the lungs, causing chest pains, cough, and shortness of breath. See also **Wegener's granulomatosis.**

lymphopathia venereum. See **lymphogranuloma venereum.**

lymphopenia. See **lymphocytopenia.**

lymphopoiesis /-pō·ē′sis/ [L, *lympha,* water; Gk, *poien,* to make], formation and production of lymphocytes, primarily in peripheral lymphoid tissue. **—lymphopoietic** /-pō·et′ik/, *adj.*

lymphoproliferative /-prōlif′ərətiv′/ [L, *lympha,* water, *prolles,* offspring, *ferre,* to bear], pertaining to the proliferation of lymphoid tissue.

lymphoproliferative syndrome induced, a group of malignant neoplasms associated with infections by human T cell lymphotropic virus type I. The neoplasms arise from the clonal proliferation of lymphoid cells. They may originate in the bone marrow, as lymphoid leukemias, or in extramedullary sites, as lymphomas. The most common lymphoid leukemias include lymphoblastic leukemia, which can be rapidly fatal if untreated.

lymphoreticular malignancy /-retik′yələr/, a disease of the lymphoreticular system commonly associated with cell-mediated immune deficiencies in which patients have a scarcity of normal white blood cells. It is one cause of hypogammaglobulinemia.

lymphoreticular system, the tissues of the lymphoid and reticuloendothelial systems considered together as one system.

lymphoreticulosis /-retik′yəlō′sis/ [L, *lympha* + *reticulum,* little net; Gk, *osis,* condition], subacute granulomatous inflammation of lymphoid tissue with proliferation of macrophages. The disorder is characterized by the formation of an ulcerated papule at the site of the scratch, fever, and tender lymphadenopathy, sometimes progressing to suppuration. Also called **cat-scratch fever.**

lymphorrhagia, an escape of lymph from a damaged vessel.

lymphorrhoid /limfôr′oid/, a dilated lymph vessel.

lymphosarcoma. See **non-Hodgkin's lymphoma.**

lymphosarcoma cell leukemia /-särkō′mə/ [L, *lympha* + Gk, *sarx,* flesh, *oma,* tumor], a malignancy of blood-forming tissues characterized by many lymphosarcoma cells in the peripheral circulation that tend to infiltrate surrounding tissues. These cells are extremely immature and larger and more reticulated than lymphocytes. The disease may accompany lymphoma or exist as a separate entity with bone marrow involvement. Also called **lymphoblastic lymphoma.**

lymphoscintigraphy /-sintig′rəfē/, a diagnostic technique using scintillation scanning of technetium-99m antimony trisulfide colloid in a noninvasive test for primary and secondary lymphedema. The radiopharmaceutical is injected subcutaneously in the interdigital space of the hands and feet.

lymphotrophy /limfot′rəfē/, the nourishment of cells by lymph, particularly in areas lacking adequate blood vessels. This term is not in common usage.

lymph sinuses [L, *lympha,* water, *sinus,* hollow], continuous small endothelial-lined spaces just below the capsule of the lymph node. The sinuses slow the flow of lymph through the nodes.

lymph vessels. See **lymphatic system.**

lyo-, prefix meaning "to loosen or dissolve": *lyogel, lyophobe, lyotropic.*

Lyon hypothesis /lī′ən/ [Mary L. Lyon, English geneticist, b. 1925], a hypothesis stating that only one of the two X chromosomes in a female is functional, the other having become inactive early in development. Either the maternal or the paternal X chromosome may be inactivated in any given cell. Therefore an X-linked trait may be expressed by some cells and not by others.

lyonization /lī′ənīzā′shən/ [Mary L. Lyon; Gk, *izein,* to cause], the process of random inactivation of one of the X chromosomes in the cells of females to compensate for the presence of the double X gene dose. See also **Lyon hypothesis.**

Lyon's ring [Mary L. Lyon], a type of congenital uropathy in females in which submeatal or distal urethral stenosis causes enuresis, dysuria, and recurring infections. The disorder is treated surgically.

lyophilic /lī′ōfil′ik/ [Gk, *lyein,* to dissolve, *philein,* to love], pertaining to substances having an affinity for stability, in solution. Lyophilic substances are used to stabilize colloids.

lyophilize, to freeze-dry a substance under vacuum conditions.

Lyrica, a trademark for **pregabalin.**

Lys, abbreviation for **lysine.**

lysate /lī′sāt/, a product of dissolution of matter by lysis, as in the destruction of proteins by hydrolysis.

lyse, to cause or produce disintegration of a compound, substance, or cell. See **lysis.**

-lyse. See **-lyze.**

lysemia /līsē′mē·ə/, an obsolete term for the disintegration of red blood cells, accompanied by the release of hemoglobin in the plasma.

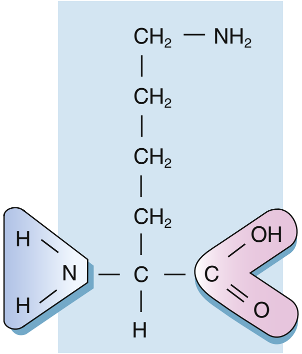
lysergide /līsur′jīd/, a psychotomimetic, semisynthetic derivative of ergot that acts at multiple sites in the central nervous system from the cortex to the spinal cord. In susceptible individuals, as little as 20 to 25 mg of the potent drug may cause pupillary dilation, increased blood pressure, hyperreflexia, tremor, muscle weakness, piloerection, and increased body temperature. Larger doses also produce dizziness, drowsiness, paresthesia, euphoria or dysphoria, and synesthesias. Colors may be heard, sounds visualized, and time is felt to pass slowly. Psychological dependence may develop, and use of lysergide is associated with significant hazards such as panic, serious depression, paranoid behavior, and prolonged psychotic episodes. Also called *(slang)* **acid, LSD** (an abbreviation of the original German name, *Lyserg-Säure-Diäthylamid,* (*lysergic acid diethylamide*). See also **hallucinogen.**

Lysholm method, any of several techniques for positioning a patient for radiographic examination of the cranial base, the mastoid and petrous regions of the temporal bone, the optic foramen, and the orbital fissure.

lysin /lī′sin/, a specific complement-fixing antibody that initiates the lysis of cells.

-lysin, suffix meaning a "cell-dissolving antibody": *antilysin, betalysin, paralysin.*

lysine (Lys) /lī′sēn, lī′sin/, an essential amino acid needed for proper growth in infants and for maintenance of nitrogen balance in adults. See also **amino acid, protein.**



Chemical structure of lysine

lysine intolerance, a congenital disorder resulting in the inability to hydrolyse the essential amino acid lysine because of an enzyme deficiency or defect. The disorder is characterized by weakness, vomiting, and coma. It is treated by adjusting the protein content of the diet, restricting foods especially high in lysine. See also **lysinemia.**

lysinemia /lī′sinē′mē·ə/, a condition caused by an inborn error of metabolism and resulting in the inability to hydrolyze the essential amino acid lysine because of an enzyme defect or deficiency. It is characterized by muscle weakness and mental retardation. See also **lysine intolerance.**

lysine monohydrochloride, a salt of the amino acid lysine, used as a dietary supplement to increase the use of vegetable proteins such as those of corn, rice, and wheat.

lysinogen /līsin′əjən/, an antigen that stimulates the production of a specific lysin.

lysinurea /lī′sino͝or′ē·ə/, the presence of lysine in the urine.

lysinuria /li′snu′re·ä/, an aminoaciduria consisting of excessive lysine in the urine, such as in hyperlysinemia.

lysis /lī′sis/ [Gk, *lysein,* to loosen], **1.** destruction or dissolution of a cell or molecule through the action of a specific agent. Cell lysis is frequently caused by a lysin.—*lytic, adj.* **2.** gradual diminution in the symptoms of a disease. Compare **crisis. 3.** surgery performed to free adhesions of tissues. See also **adhesiotomy. —lyse,** *v.*

-lysis, suffix meaning a "breaking down or detachment": *cytolysis, dialysis, osteolysis.*

lyso-, prefix meaning "dissolution": *lysocephalin, lysotype, lysozyme.*

Lysodren, a trademark for an antineoplastic **(mitotane).**

lysogenesis /lī′səjen′əsis/ [Gk, *lysein,* loosening, *genein,* to produce], the formation of lysins, or antibodies that cause partial or complete dissolution of the target cell.

lysokinase /lī′sōkī′nās/, an enzyme that serves as an activating agent for the production of plasmin.

lysosomal storage disease. See **inborn lysosomal disease.**

lysosome /lī′səsōm/ [Gk, *lysein* + *soma,* body], a cytoplasmic, membrane-bound particle that contains hydrolytic enzymes that function in intracellular digestive processes. The organelles are found in most cells but are particularly prominent in leukocytes and the cells of the liver and kidney. If the hydrolytic enzymes are released into the cytoplasm, they cause self-digestion of the cell. Thus lysosomes may play an important role in certain self-destructive diseases characterized by the wasting of tissue, such as muscular dystrophy.

lysotype /lī′sətīp/, a bacterial species type determined by its reaction to certain phages.

lysozyme /lī′səzīm/ [Gk, *lysein* + *en,* within, *zyme,* ferment], an enzyme with antiseptic actions that destroys some foreign organisms. It is found in granulocytic and monocytic blood cells and is normally present in saliva, sweat, breast milk, and tears.

lysso-, prefix meaning “rabies or hydrophobia”: *lyssodexis, lyssoid, lyssophobia*.

-lyte, **1.** suffix meaning “electrolyte”: *ampholyte*. **2.** suffix meaning a “substance capable of or resulting from decomposition”: *cytolyte, sarcolyte*.

lytes /līts/, an informal abbreviation of *electrolytes*, especially the levels of potassium, sodium, phosphorus, magnesium, and calcium in the blood, as determined by laboratory testing.

-lytic, suffix meaning “to produce decomposition”: *fibrillolytic, leukolytic, myelolytic*.

-lyze, -lyse, suffix meaning “to produce decomposition”: *bacteriolyze, hemolyze, paralyze*.

M

m, **1.** abbreviation for **meter.** **2.** abbreviation for **milli-.** **3.** symbol for **muscle.** **4.** abbreviation for **minim.**

M, **1.** abbreviation for **mega-.** **2.** abbreviation for **molar.**

M_r, symbol for **relative molecular mass.** See **molecular mass.**

mA, abbreviation for **milliampere.**

MA, abbreviation for **mental age.**

M.A., abbreviation for *Master of Arts* degree.

MAA, abbreviation for **methacrylic acid.**

Maass, Clara [1876–1901], an American nurse who volunteered for military service at the outbreak of the Spanish-American War, after training and working at the Newark German Hospital, which has since been renamed for her. She worked at army camps where soldiers were dying of yellow fever and then volunteered to go to Havana to participate in experiments to determine the cause of that disease. She was bitten by a mosquito and died 10 days later of yellow fever. She was one of the first nurses to be inducted into the Hall of Fame of the American Nurses Association.

MAB, abbreviation for **monoclonal antibody.**

mabp, abbreviation for *mean arterial blood pressure*.

MAC, **1.** abbreviation for **membrane attack complex.** **2.** abbreviation for **microcystic adnexal carcinoma.** **3.** abbreviation for **midupper arm circumference.** **4.** abbreviation for **minimum alveolar concentration.** **5.** abbreviation for *Mycobacterium avium complex*. See ***Mycobacterium avium* complex disease.**

MAC awake, end-tidal concentration of an inhaled anesthetic agent at which 50% of patients appropriately respond to verbal commands (such as "open your eyes"). It applies only to inhalation agents and is affected by medical comorbidities, age, hypothermia, narcotic administration and sedatives.

mace /mās/, the oil-containing, red, fibrous wrapping of the nutmeg kernel. Dried and ground, it is used as an aromatic spice and flavoring. Historical medicinal uses include the treatment of gastrointestinal disorders and as an analgesic; however, there are no clinical trials supporting its effectiveness. Compare **Mace.**

Mace, a trademark for a chemical agent that causes tearing and eye pain. The name is an abbreviation formed by letters in *m*ethylchloroform-2-chloro*ace*tophenone, which is dispersed from a pressurized container to immobilize an attacker.

macerate /mas′ərāt/ [L, *macerare,* to soften], to soften something solid by wetting or soaking.

maceration /-ā′shən/, **1.** the softening and breaking down of skin resulting from prolonged exposure to moisture. **2.** in histology, the softening of a tissue by soaking, especially in acids, until the connective tissue fibers are dissolved so that the tissue can be teased apart. **3.** in obstetrics, the degenerative changes with discoloration and softening of tissues and eventual disintegration of a fetus retained in the uterus after its death.

Machado-Joseph disease /mächä′dō jō′səf/ [Machado and Joseph, afflicted families], a progressive degenerative disease of the central nervous system occurring in families of Portuguese-Azorean descent, having a variety of forms and inherited as an autosomal-dominant trait. There are four major types: *Type I,* with pyramidal and extrapyramidal deficits; *Type II,* with cerebellar, pyramidal, and extrapyramidal deficits; *Type III,* with cerebellar deficits and distal sensorimotor neuropathy; and *Type IV,* with parkinsonism and distal sensory neuropathy. Also called **Azorean disease, Joseph disease, Portuguese-Azorean disease.**

machinery murmur. See **Gibson's murmur.**

machismo /mächis′mō/, (in psychology) a concept of the male that includes both desirable traits of courage and fearlessness and the dysfunctional behaviors of heavy drinking, seduction of women, and domineering and abusive spouse behavior.

Machover Draw-a-Person Test. See **Draw-a-Person (DAP) Test.**

Machupo. See **Bolivian hemorrhagic fever.**

Macleod, John J., (1876–1935), Scottish physiologist and co-winner, with Sir Frederick G. Banting, of the 1923 Nobel prize for medicine and physiology, for their discovery of insulin. See also **Banting, Sir Frederick G.**

macrencephaly /mak′rənsef′əlē/ [Gk, *makros,* large, *enkephalos,* brain], a congenital anomaly characterized by abnormal largeness of the brain. See also **macrocephaly.** **—macrencephalic,** *adj.*

macro-, makro-, prefix meaning "large, or abnormal size": *macrobiosis, macrocardius, macrophage*.

macroadenoma /mak′rōad′ənō′mə/, a glandular tumor more than 10 mm in diameter.

macroamylase /-am′ilās/, a form of serum amylase in which the enzyme is bound to a globulin. Because the resulting complex is too large for renal clearance, plasma amylase levels are increased. The elevated amylase level may not be harmful but may be diagnostic of other disorders, such as pancreatitis or biliary tract disease.

macroamylasemia /mak′rō·am′ilāsē′mē·ə/, the presence of macroamylase in the blood.

macrobiosis /-bī·ō′sis/ [Gk, *makros,* long, *bios,* life], a long life.

macrobiotic diet /-bī·ot′ik/, a restrictive dietary regimen consisting of grains and unprocessed foods.

macroblepharia /mak′rōblifer′ē·ə/ [Gk, *makros* + *blepharon,* eyelid], the condition of having abnormally large eyelids.

macrocephaly /mak′rōsef′əlē/ [Gk, *makros* + *kephale,* head], a congenital anomaly characterized by abnormal largeness of the head and brain in relation to the rest of the body, resulting in some degree of mental and growth retardation. The head is more than two standard deviations above the average circumference size for age, sex, race, and period of gestation, with excessively wide fontanels; the facial features are usually normal. The condition may be caused by some defect in formation during embryonic development, or it may be the result of progressive degeneration processes, such as Schilder's disease, Greenfield's disease, or congenital lipoidosis. In macrocephaly there is symmetric overgrowth at the head without increased intracranial pressure, as differentiated from hydrocephalus, in which the lateral, asymmetric growth of the head is caused by excessive accumulation of cerebrospinal fluid, usually under increased pressure. Specific diagnostic tests may be necessary to differentiate the two conditions. Treatment is primarily symptomatic, with nursing care concentrated specifically on helping parents learn to care for a brain-damaged child. Also called *macrocephalia*, **megalocephaly.** Compare **microcephaly.** See also **hydrocephalus. —macrocephalic, macrocephalous,** *adj*., **macrocephalus,** *n*.

macrocyte /mak′rəsīt/ [Gk, *makros* + *kytos*, cell], an erythrocyte that exceeds 9 µm in diameter on a peripheral blood film, associated with a MCV greater than 100 fL. Macrocytes are seen in liver disease, alcoholism, megaloblastic anemia with folate or cobalamin deficiency, and in myelodysplastic syndromes. Compare **microcyte.** See also **macrocytic anemia.**

macrocytic /mak′rōsit′ik/ [Gk, *makros* + *kytos* + L, *icus*, form], (of a cell) larger than normal, such as the erythrocytes in macrocytic anemia.

macrocytic anemia, anemia characterized by impaired erythropoiesis and macrocytes on a peripheral blood film. Macrocytic anemia is seen in liver disease, alcoholism, megaloblastic anemia with folate or cobalamin deficiency, and in myelodysplastic syndromes. Compare **microcytic anemia.**

macrocytosis /mak′rōsītō′sis/ [Gk, *makros* + *kytos* + *osis*, condition], abnormal proliferation of macrocytes in the peripheral blood film. See also **anisocytosis.**

Macrodantin, a trademark for a urinary antibacterial **(nitrofurantoin).**

Macrodex, a trademark for a plasma expander (dextran).

macrodrip /mak′rōdrip/ [Gk, *makros* + AS, *drypan*, to fall in drops], (in IV therapy) an apparatus that is used to deliver measured amounts of IV solutions at specific flow rates based on the size of drops of the solution. The size of the drops is controlled by the fixed diameter of a plastic delivery tube. Different macrodrips deliver 10, 15, or 20 drops per milliliter of solution. Macrodrips are not usually used to deliver a small amount of IV solution or to keep a vein open because the interval between drips is so long that a clot may form at the tip of the IV catheter. Compare **microdrip.**

macroelement, a chemical element required in relatively large quantities for the normal physiological processes of the body. Macroelements include carbon, hydrogen, oxygen, nitrogen, potassium, sodium, calcium, chloride, magnesium, phosphorus, and sulfur. See also **macronutrient.**

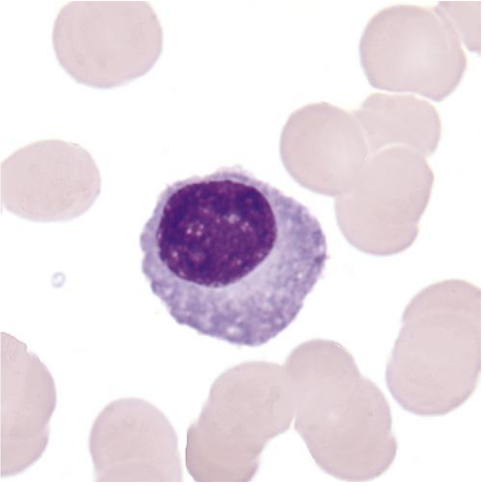
macrogamete /-gam′ēt/ [Gk, *makros* + *gamete*, spouse], a large nonmotile female gamete of certain thallophytes and sporozoa, specifically the malarial parasite *Plasmodium*. It corresponds to the ovum of the higher animals and is fertilized by the smaller, motile male gamete. Compare **microgamete.**

macrogametocyte /-gamē′təsīt/ [Gk, *makros* + *gamete* + *kytos*, cell], an enlarged merozoite that undergoes meiosis to form the mature female gamete during the sexual phase of the life cycle of certain thallophytes and sporozoa, specifically the malarial parasite ***Plasmodium.*** Macrogametocytes are found in the red blood cells of a person infected with the malarial parasite, but they must be ingested by a female *Anopheles* mosquito to complete the maturation process and develop into macrogametes.

macrogenitosomia /mak′rōjen′itōsō′mē·ə/ [Gk, *makros* + L, *genitalis*, genitalia; Gk, *soma*, body], a congenital condition in which the genitalia are abnormal because of an excess of androgen during fetal development. It is characterized in boys by enlarged external genitalia and in girls by pseudohermaphroditism.

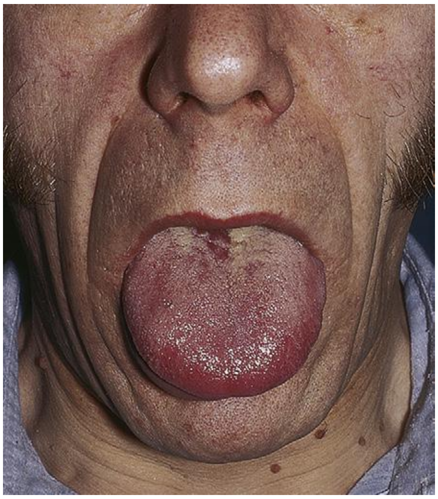
macroglobulin /-glob′yəlin/, a globular serum protein with a molecular mass above 400 kilodaltons, such as the proteinase inhibitor alpha$_2$-macroglobulin. See also **immunoglobulin M.**

macroglobulinemia /mak′rōglob′yŏŏlinē′mē·ə/ [Gk, *makros* + L, *globulus*, small ball; Gk, *haima*, blood], plasma presence of a high molecular-weight globulin such as alpha-2-macroglobulin or an immunoglobulin of the IgM isotype. Macroglobulins raise plasma viscosity and are associated with monoclonal gammopathies of undetermined significance, Also spelled *macroglobulinaemia*. Also called **Waldenström's macroglobulinemia.** See also **multiple myeloma.**



Macroglobulinemia *(Carr and Rodak, 2008)*

macroglossia /mak′rōglos′ē·ə/ [Gk, *makros* + *glossa*, tongue], an excessively large tongue. It is seen in certain syndromes of congenital defects, including Down syndrome.



Macroglossia *(Belchetz and Hammond, 2003)*

macrognathia /mak′rōnā′thē·ə/ [Gk, *makros* + *gnathos,* jaw], an abnormally large growth of the jaw. Compare **micrognathia. —macrognathic,** *adj.*

macrolide antibiotic. See **antibiotic.**

macromolecule /-mol′əkyo͞ol/ [Gk, *makros* + L, *moles,* mass], a molecule of colloidal size, such as a protein, nucleic acid, or polysaccharide usually produced via polymerization. **—macromolecular,** *adj.*

macronodular adrenal disease /-nod′yələr/, a form of Cushing's syndrome characterized by massively enlarged adrenal glands.

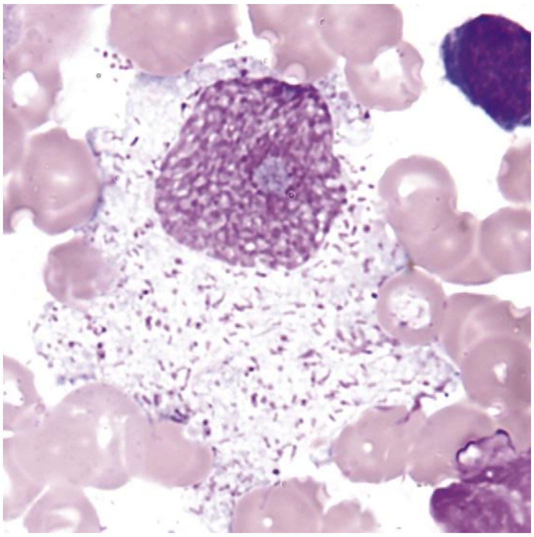
macronucleus /-no͞o′klē·əs/ [Gk, *makros* + L, *nucleus,* nut], **1.** a large nucleus that occupies a relatively large portion of the cell. **2.** (in protozoa) the larger of two nuclei in each cell, governing cell metabolism and growth as opposed to the micronucleus, which functions in sexual reproduction.

macronutrient /-no͞o′triənt/ [Gk, *makros* + L, *nutriens,* food that nourishes], nutrient required in the greatest amounts: carbohydrate, protein, fat or lipid, and water. See also **macroelement.**

macroovalocyte /mak′rō·o′välosīt/, an enlarged, oval erythrocyte seen in megaloblastic anemia.

macropenis, abnormal largeness of the penis. Also called **macrophallus**, *megalopenis*.

macrophage /mak′rəfāj/ [Gk, *makros* + *phagein,* to eat], a granular mononuclear phagocyte that circulates as a monocyte in the blood and resides in all tissues. Macrophages recognize and engulf foreign materials and present fragments or epitopes on their membranes to initiate an immune response. Macrophages have many names, for instance histiocytes, reticuloendothelial cells, Kupffer cells in the liver, littoral cells in the spleen. Macrophages are the single most abundant cell in the human body, more numerous than skin cells or red blood cells. See also **Kupffer cells, phagocyte, reticuloendothelial system.**



Macrophage *(Carr and Rodak, 2008)*

macrophage activating factor (MAF) [Gk. *makros,* large, *phagein,* to eat; L, *activus,* active, *facere,* to make], a lymphokine released from a sensitized leukocyte that induces changes in the appearance and function of macrophages and makes them active against certain antigens.

macrophage colony–stimulating factor (M-CSF), a glycoprotein growth factor that induces committed bone marrow stem cells to differentiate and mature into mononuclear phagocytes.

macrophage migration inhibiting factor [Gk, *makros,* large; *phagein,* to eat; L, *migrare,* to wander, *inhibere,* to restrain, *facere,* to make], a lymphokine produced by leukocytes that immobilizes macrophages after contact with an antigen. Also called **leukocyte migration inhibition factor,** *macrophage inhibition factor (MIF).*

macrophallus. See **macropenis.**

macroprolactinoma /-prōlak′tinō′mə/, a prolactin-secreting pituitary tumor more than 10 mm in diameter that causes serum prolactin levels higher than 500 ng/mL. Bromocriptine is used with some success to shrink tumor size before surgery. Frequent monitoring of endocrine status is indicated for the remainder of the patient's life after therapy.

macropsia /makrop′sē·ə/ [Gk, *makros,* large, *opsis,* vision], hallucination in which objects seem larger than they actually are. It may be related to seizure activity, a retinal abnormality, or migraine.

macroreentry circuit /mak′rōrē·en′trē/ [Gk, *makros* + L, *re,* again; Fr, *entree,* entry], a relatively large pathway for the reactivation of myocardial tissue by the same impulse. Examples include a reentry circuit that uses one bundle branch for anterograde conduction and another for retrograde conduction to produce the highly malignant bundle branch reentry ventricular tachycardia. Another circuit runs between the top and bottom of the right atrium and produces atrial flutter.

macroscopic /-skop′ik/ [Gk, *makros,* large, *skopein,* to view], large enough to be examined with the naked eye. Compare **microscopic**.

macroscopic anatomy. See **gross anatomy.**

macroshock, shock from an electric current of 1 mA or greater. Currents from 1 to 15 mA produce a tingling sensation and some muscle contraction, those from 15 to 100 mA can cause a painful shock, those from 100 to 200 mA can cause cardiac fibrillation or respiratory arrest, and those above 200 mA may produce rapid burning and destruction of tissue.

macrosis /makrō′sis/ [Gk, *makros,* large, *osis,* condition], an increase in the size or volume of an object.

macrosomia. See **gigantism.**

macrostomia. See **cleft cheek.**

macrotear /-ter/, significant damage to soft tissues caused by acute trauma.

macula /mak′yələ/ *pl.* **maculae** [L, spot], a small pigmented area or a spot that appears separate or different in color from the surrounding tissue.

macula adherens. See **desmosome.**

macula albida [L, *macula,* spot, *albidare,* to make white], small white areas in the serous membranes of the pericardium or in the peritoneum or pleura. Also called **milk patch, tache laiteuse** /täsh′latœks′/.

macula atrophica, a condition of cutaneous atrophy characterized by the appearance of small glistening white spots on the skin.

macula cerulea. See **blue spot,** def. 1.

macula densa [L, *macula,* spot, *densus,* thick], a thickening in the wall of a distal tubule of the kidney nephron at a point where it is in contact with the afferent glomerulus and in direct opposition to the juxtaglomerular cells. It may be part of a negative-feedback system for sodium.

maculae. See **macula.**

macula folliculi, a spot on the wall of an ovary where a mature follicle will rupture to release an ovum.

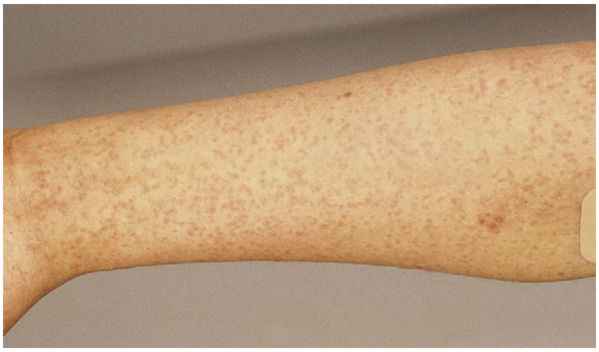
macula lutea, an oval yellow spot at the optical "center" of the retina 2 mm from the optic nerve. It contains a pit, no blood vessels, and the fovea centralis, which contains only retinal cones. Central high-acuity vision occurs when an image is focused directly on the fovea centralis of the macula lutea. Also called *(informal)* **macula.**

macular. See **macule.**

macular degeneration (MD) /mak′yələr/ [L, *macula,* spot, *degenerare,* to deviate], a progressive deterioration of the maculae of the retina associated with abnormal retinal pigment epithelium, new vessel formation that can progress to blindness. Treatment includes intraocular injection of antiangiogenic factors, laser, and vitamins.

macular dystrophy, any of a variety of eye disorders that damage the central part of the retina. Several of the disorders are related to gene mutations that affect older adults, including Sorsby's fundus dystrophy, caused by an excessive growth of blood vessels through the basal membrane, which thickens and bleeds. See also **macular degeneration.**

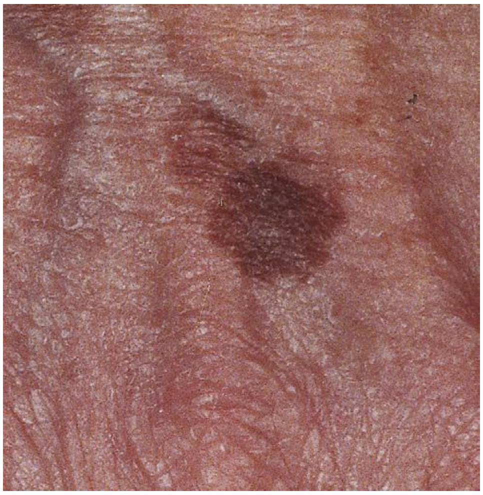
macular rash [L, *macula,* spot; OFr, *rasche*], a skin eruption in which the lesions are flat and less than 1 cm in diameter.



Macular rash in a person with rubella
(Cohen, Powderly, and Opal, 2010)

macula solaris [L, *macula,* spot, *solaris,* sun], a freckle.

macule /mak′yo͞ol/ [L, *macula,* spot], **1.** a small flat blemish or discoloration that is level with the skin surface. Examples are freckles and some rashes. Compare **papule. 2.** a gray scar on the cornea that is visible without magnification. **—macular,** *adj.*



Macule *(du Vivier, 2002/Courtesy Dr. Ellen Wald, University of Wisconsin Children's Hospital)*

maculopapular rash /mak′yəlōpap′yələr/ [L, *macula,* spot, *papula,* pimple; OFr, *rasche*], a skin eruption characterized by distinctive macules and papules.

maculopathy /mak′yəlop′əthē/ [L, *macula,* spot; Gk, *pathos,* disease], a form of macular disease primarily involving the macula lutea.

MAD, abbreviation for **multiple autoimmune disorder.**

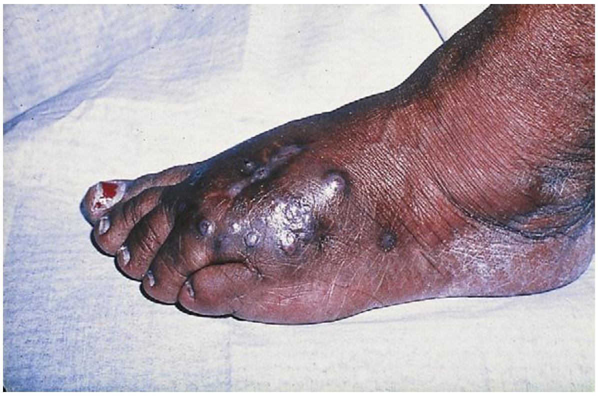
mad cow disease. See **bovine spongiform encephalopathy.**

Madelung's neck. See **lipoma annulare colli.**

mad hatter's disease. See **mercury poisoning.**

Madigan prostatectomy, a type of perineal prostatectomy.

Madura foot /maj′o͞or′e/ [Madura, India; AS, *fot,* foot], a progressive destructive tropical fungal infection of the foot. Also called *maduromycosis*. See also **mycetoma.**



Madura foot *(du Vivier, 2002/Courtesy Dr. Rod Hay)*

maedi/visna virus, a lentivirus that is the causal agent of a type of pneumonia in sheep.

MAF, abbreviation for **macrophage activating factor.**

mafenide acetate /maf′ənīd/, a topical antibiotic.

■ INDICATION: It is prescribed in the treatment of second- and third-degree burns to prevent infection by microorganisms such as ***Pseudomonas aeruginosa.***

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to sulfonamide prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypersensitivity reactions and superinfections, particularly by ***Candida albicans.***

Maffucci's syndrome, a congenital disorder characterized by the proliferation of cartilage at the ends of long bones and by benign, blood-filled tumors of the skin or viscera. See also **cavernous hemangioma, enchondromatosis.**

magaldrate /mag′əldrāte/, an antacid containing a combination of magnesium and aluminum compounds.

■ INDICATIONS: It is prescribed in the treatment of hypersensitivity and stomach upset associated with heartburn, sour stomach, or acid indigestion.

■ CONTRAINDICATIONS: It may alter the absorption of several drugs, such as tetracycline.

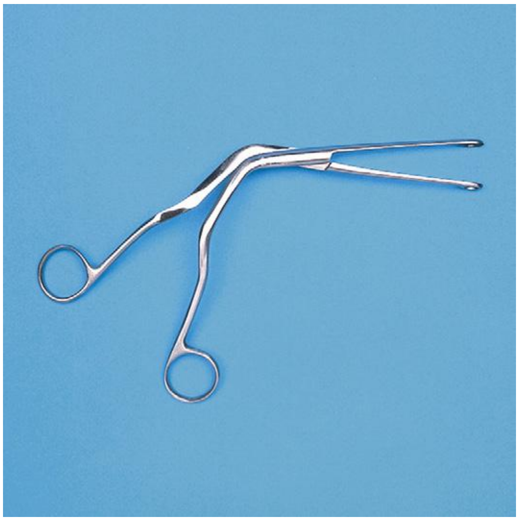
■ ADVERSE EFFECTS: A change in bowel function may occur.

Magendie's law. See **Bell's law.**

magical thinking /maj′ikəl/, (in psychology) a belief that merely thinking about an event in the external world can cause it to occur. It is regarded as a form of regression to an early phase of development. It may be part of ideas of reference, considered normal in those instances, or may reach delusional proportions when the individual maintains a firm conviction about the belief, despite evidence to the contrary. It may be seen in schizophrenia.

magic-bullet approach [Gk, *magikos,* sorcerer; Fr, *boulette,* small ball; L, *ad,* toward, *prope,* near], **1.** a therapeutic or diagnostic method that makes use of a specific relationship between a drug and a disease or organ. **2.** (in clinical medicine) the administration of a specific drug to cure or ameliorate a given disease or condition. **3.** (in traditional diagnostic radiology) the administration of a specific dye to facilitate the radiographic visualization of a given organ, such as the IV injection of a specific dye for renal studies. **4.** (in nuclear medicine) the administration of a specific radionuclide tagged to an appropriate carrier to provide a scintillation camera image of a given organ or structure, such as the use of a substance containing phosphate and technetium for bone scanning.

Magill forceps, angled forceps used to guide a tracheal tube into the larynx or a nasogastric tube into the esophagus under direct vision. It is also used to place pharyngeal packs and remove foreign bodies.



Magill forceps *(Sanders, 2012)*

Maglinte tube, an intestinal tube used in the management of small bowel obstruction. It includes a balloon preventing reflux of bowel contents into the stomach.

magnesemia /mag′nəsē′mē·ə/, the presence of magnesium in the blood.

magnesia magma. See **milk of magnesia.**

magnesium (Mg) /magnē′sē·əm, magnē′zhəm/ [Gr, magnesia; L, lodestone], a silver-white mineral element. Its atomic number is 12; its atomic mass is 24.32. Magnesium occurs abundantly in nature, always in combination with other elements. It is obtained chiefly by the electrolysis of fused salts containing magnesium chloride or by the thermal reduction of magnesia and is used in photography, metallurgy, and various pharmaceuticals such as magnesium sulfate. Magnesium is the second most abundant cation of the intracellular fluids in the body. It is essential for many enzyme activities and the interaction of intracellular particles and binding of macromolecules to subcellular organelles, such as the binding of messenger ribonucleic acid to ribosomes. It also is important to neurochemical transmissions and muscular excitability. The body of the average 145-pound adult contains about 2000 mEq of magnesium, about 50% of which is in the bones, 45% existing as intracellular cations, and about 5% in the extracellular fluid. Absorption of magnesium occurs in the upper small bowel by means of an active process closely related to the transport system for calcium. Magnesium is excreted mainly by the kidney. Renal excretion of magnesium increases during diuresis induced by ammonium chloride, glucose, and organic mercurials. Magnesium affects the central nervous, neuromuscular, and cardiovascular systems. Insufficient magnesium (hypomagnesemia) in extracellular fluid increases the release of acetylcholine and can cause changes in cardiac and skeletal muscle. Some of the conditions that can produce hypomagnesemia are diarrhea, steatorrhea, chronic alcoholism, and diabetes mellitus. Hypomagnesemia may occur in newborns and infants who are fed cow's milk or artificial formulas, apparently because of the high phosphate/magnesium ratio in such diets. Hypomagnesemia is often treated with parenteral fluids containing magnesium sulfate or magnesium chloride. Excess magnesium (hypermagnesemia) in the body can slow the heartbeat, and concentrations greater than 15 mEq/L can produce cardiac arrest in diastole. Excess magnesium also causes vasodilation by direct effects on the blood vessels and by ganglionic blockade. Hypermagnesemia is usually caused by renal insufficiency and is manifested by hypotension, electrocardiographic changes, muscle weakness, sedation, and a confused mental state.

magnesium alginate, the magnesium salt of alginic acid, administered orally as a component of an antacid in the treatment of gastroesophageal reflux disease. It combines with gastric acid to form a viscous gel, which floats on top of the gastric contents and acts as a physical barrier to reflux.

magnesium chloride, an electrolyte replenisher and a pharmaceutical necessity for hemodialysis and peritoneal dialysis fluids.

magnesium gluconate, the gluconate salt of magnesium, administered orally in the prevention of hypomagnesemia.

magnesium lactate, the lactate salt of magnesium, administered orally in the prevention of hypomagnesemia.

magnesium salicylate, the magnesium salt of salicylic acid, used as an analgesic, antipyretic, antiinflammatory, and antirheumatic. It is administered orally.

magnesium silicate, $MgSiO_3$, a silicate salt of magnesium. The most common hydrated forms found in nature are asbestos and talc.

magnesium sulfate, a salt of magnesium.

■ INDICATIONS: It is prescribed parenterally to prevent seizures, especially in preeclampsia and acute nephritis in children, and orally to treat constipation and heartburn and to correct magnesium deficiency.

■ CONTRAINDICATIONS: It is used with caution in patients with renal impairment or hypersensitivity to the drug. Respiratory depression, severe cardiac myopathy, heart block, or symptoms of appendicitis or fecal impaction prohibit its use. It is also prohibited in patients in toxemia of pregnancy during the 2 hours before labor.

■ ADVERSE EFFECTS: The most serious adverse effect is circulatory collapse from excessive serum concentrations of magnesium. Respiratory depression, confusion, and muscle weakness also may occur.

magnesium test, a blood test used to measure levels of magnesium, an electrolyte that is critical in nearly all metabolic processes. Abnormal levels may indicate renal insufficiency, chronic renal disease, uncontrolled diabetes, diabetic acidosis, Addison's disease, hypothyroidism, malnutrition, malabsorption, hypoparathyroidism, and alcoholism.

magnetic field /magnet′ik/ [Gk, *magnesia,* lodestone; AS, *feld*], the region around any magnet in which its effects can be detected.

magnetic field therapy, the placement of magnets directly on the skin, stimulating living cells and increasing blood flow by ionic currents created from polarities on the magnets. Trigger points for magnets are acupuncture points where the action of the magnets serves to activate the tendinomuscular system to readily and widely transmit electrical stimuli. Magnets also increase tissue oxygen perfusion by decreasing vascular resistance, decreasing nerve cell firing, and stimulating various cellular structures. Common physiological responses include vasodilation, analgesia, antiinflammatory action, spasmolytic activity, accelerated healing, and antiedema activity. In addition to the FDA-approved use of pulsed magnetic fields for the treatment of nonunion fractures, it has been tried for a large number of other conditions, usually self-administered by patients.

magnetic flux (N), a quantitative measure of a magnetic field.

magnetic lines of force [Gk, *magnesia,* lodestone; L, *linea,* line, *fortis,* strong], theoretical lines of magnetism that surround a magnet or fill a magnetic field. The presence of the magnetic force along the imaginary lines can be demonstrated by inserting a sensitive material such as iron filings into the lines of magnetic effect.

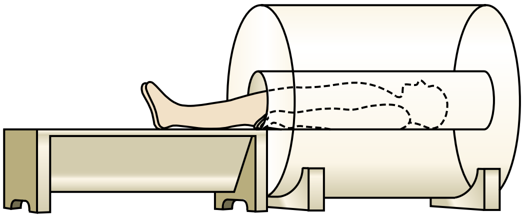
magnetic moment [Gk, *magnesia,* lodestone, *momentum,* movement], a measure of the net magnetic field produced by an elementary particle or an atomic nucleus spinning about its own axis. Such fields are similar to the field surrounding a bar magnet and are the basis for magnetic resonance imaging.

magnetic permeability, the ratio of the magnetism induced in a body to the strength of the magnetic field of induction. See also **permeability.**

magnetic resonance (MR), a phenomenon in which the atomic nuclei of certain materials placed in a strong, static magnetic field absorb radio waves supplied by a transmitter at particular frequencies. The energy of the radio waves promotes the nuclei from a low-energy state, in which the nuclear spin is aligned parallel to the magnetic field, to a higher-energy state, in which the nuclear spin has a component transverse or opposed to the field. These nuclei occasionally revert to the lower-energy state by emitting photons at characteristic (resonance) frequencies, providing information about the local magnetic field at the nuclei. The rate at which the nuclei revert, or relax, to the lower-energy state when the source of radio waves is turned off is another important factor. See also **relaxation time.**

magnetic resonance angiography, the use of special MR imaging pulses to visualize the vascular system and identify regions of nonflowing blood. It may be performed with or without contrast agents.

magnetic resonance imaging (MRI) [Gk, *magnesia,* lodestone, *resonare,* to sound again, *imago,* image], medical imaging based on the resonance of atomic nuclei in a strong magnetic field. The field causes those nuclei with an odd number of protons to align and rotate around the axis of the field. Application of a radiofrequency pulse causes the protons to resonate. When the pulse is terminated, the protons "relax" back toward equilibrium. As they do so, they release energy that is detected as a radio signal. Analysis of the amplitude and frequency of the signal yields information about the number and position of nuclei in the tissue, from which the image is produced. MRI is the method of choice for a growing number of disease processes. Among its advantages are its superior soft-tissue contrast resolution, ability to image in multiple planes, and lack of ionizing radiation hazards. MRI is regarded as superior to computed tomography for most central nervous system abnormalities, particularly those of the posterior fossa, brainstem, and spinal cord. It has also become an important tool in musculoskeletal and pelvic imaging. The procedure usually does not require a contrast medium but may use an IV injection of gadolinium. About 15% of patients require an anxiolytic to overcome claustrophobia during MRI, and children may need a sedative as well. Patients must remain motionless for high-quality imaging. Images also may be degraded by motions related to heart contractions, respiration, and bowel peristalsis. Contraindications to MRI are pacemakers, metallic aneurysm clips, and some metallic prostheses and foreign objects. Also called **zeugmatography.** Compare **open magnetic resonance imaging.** See also **magnetic resonance.**



Closed magnetic resonance imaging (MRI)

(Phillips, 2012)

magnetic resonance urography, imaging of the urinary tract using magnetic resonance imaging, such as to detect obstructions and dilations during pregnancy when other methods are ineffective or undesirable.

magnetic susceptibility, a measure of the ability of a substance to become magnetized.

magnetization /mag′nətīzā′shən/ [Gk, *magnesia,* lodestone; Gk, *izein,* to cause], the magnetic polarization of a material produced by a magnetic field (magnetic moment per unit volume).

magnetron /mag′nətron/ [Gk, *magnesia,* lodestone, *trum,* device], a source of microwave energy used in medical linear accelerators to accelerate electrons to the therapeutic energies.

magnification /mag′nifikā′shən/, (in psychology) cognitive distortion in which the effects of one's behavior are magnified. See also **minimization.**

magnification factor, the size of a radiographic, photographic, or microscopic image divided by the object size. In radiography, it is equal to the source-to-image receptor distance divided by the source-to-object distance.

MAHA, abbreviation for **microangiopathic hemolytic anemia.** It is characterized by schistocytes in the peripheral blood film.

Mahaim fiber [I. Mahaim, twentieth century French physician, 1897–1965], one of the conductive tracts in cardiac tissue running between the atrioventricular (AV) node or the AV bundle and the muscle of the ventricular septum. The fibers conduct early excitation impulses.

Mahoney, Mary Eliza, (1845–1926), the first African-American nurse. Mahoney did private nursing in the Boston area and was active in furthering intergroup relationships and improving the role of the African-American nurse in the community. A medal in her name, established after her death, was first presented in 1936. It is given to an African-American nurse in recognition of outstanding contribution to the nursing profession.

main en griffe. See **clawhand.**

mainframe computer [OE, *maegen,* strength, *framian,* to progress; L, *computare,* to count], a large general-purpose computer system for high-volume data processing tasks. It may support large numbers of users simultaneously. Compare **microcomputer, minicomputer.**

mainstreaming /mān′strēming/ [OE, *maegan,* strength; ME, *strem*], **1.** the system of educating children with disabilities in regular classrooms, with special assistance as needed. **2.** the return of persons recovering from mental illness to the community.

maintenance, **1.** providing a stable state over a long period of time as distinguished from a short-term remedial or prophylactic effect; as in a drug or treatment plan. **2.** in anesthesia, the surgical or procedural period of anesthesia delivery, in which a combination of inhaled agents and adjunct medications are administered to allow an appropriate surgical field or procedural conditions.

maintenance dose /mān′tənəns/ [Fr, *maintenir,* to uphold; Gk, *dosis,* giving], the amount of drug required to keep a desired mean steady-state concentration in the tissues.

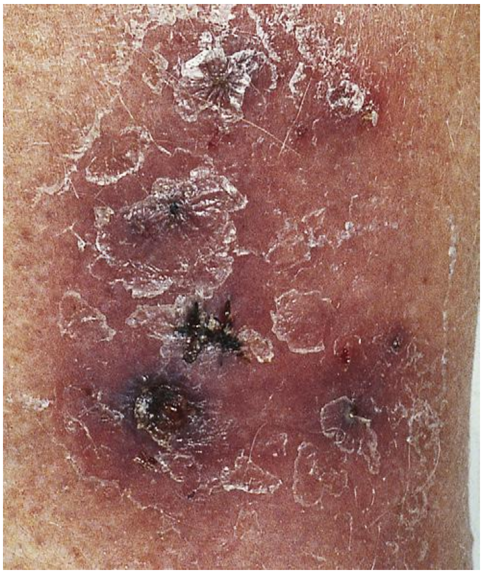
Mainz pouch, any of several continent urinary diversion surgeries using a section of the rectum and sigmoid colon to create a pouch for maintenance of continence.

maitake, an herbal product derived from a mushroom that is native to Japan.

■ USES: It is used as an immunostimulant and as a treatment for diabetes, hypertension, high cholesterol, and obesity. It is probably safe, but there is no reliable information related to efficacy.

■ CONTRAINDICATIONS: It is not recommended during pregnancy and lactation, in children, or in those with known hypersensitivity until more information is available.

Majocchi's granuloma /mäjok′ēz/ [Domenico Majocchi, Italian dermatologist, 1849–1929; L, *granulum,* small grain; Gk, *oma,* tumor], a rare type of tinea corporis that involves the follicle and affects the lower legs. It is caused by the fungus *Trichophyton,* which infects the hairs of the affected site and raises spongy granulomas. The lesions persist for 3 to 4 months and are gradually absorbed, or they necrose, often leaving deep scars. Also called **trichophytic granuloma.**



Majocchi's granuloma *(du Vivier, 2002)*

major affective disorder. See **major depressive disorder.**

major connector, a metal plate or bar used for joining the two halves of a removable partial denture.

major depressive disorder, a major disorder of mood characterized by a persistent dysphoria, anxiety, irritability, fear, brooding, appetite and sleep disturbances, weight loss, psychomotor agitation or retardation, decreased energy, feelings of worthlessness or guilt, difficulty in concentrating or thinking, possible delusions and hallucinations, and thoughts of death or suicide. The disorder, which occurs in children, adolescents, and adults, may develop over a period of days, weeks, or months. Episodes may occur in clusters or singly, separated by several years of normality. The causes of the disorder are multiple and complex and may involve biological, psychological, interpersonal, and sociocultural factors that lead to an unidentifiable intrapsychic conflict. Treatment includes use of antidepressants and electroconvulsive therapy, followed by long-term psychotherapy. Nursing care is needed to ensure adequate nutrition, appropriate balance of fluid intake and output, good personal hygiene, and protection of the patient from self-injury. Also called **major affective disorder, unipolar disorder.** See also **bipolar disorder, depression, dysthymic disorder.**

Major Diagnostic Category, a group of similar diagnosis-related groups, such as all those affecting a given organ system of the body.

major duodenal papilla, the common entrance in the duodenum for the bile and pancreatic ducts. See also **minor duodenal papilla.**

major histocompatibility antigen, one of a group of proteins encoded by genes of the major histocompatibility complex on chromosome 6.

major histocompatibility complex. See **HLA complex.**

major hysteria. See **mass hysteria.**

major medical insurance, insurance coverage designed to offset the costs of prolonged or catastrophic illness and injury. Most major medical insurance policies are written to pay a certain percentage of costs up to a predetermined figure, beyond which payment is in full up to a maximum amount, at which point payment ceases. Many require the insured to pay a specified initial, or deductible, amount.

major renal calyx. See **renal calyx.**

major surgery, a surgical procedure that is extensive, involving removal of organs, and/or life-threatening.

major vestibular glands. See **Bartholin's gland.**

making weight, (in sports medicine) the practice of rapid weight loss based on the belief that training at a heavier body weight, then dropping weight shortly before competition, gives an athlete an advantage.

makro. See **macro-.**

mal /mal, mäl/ [L, *malus,* bad], an illness or disease, such as grand mal or petit mal.

mal-, prefix meaning "bad, poor, or abnormal": *maladjustment, malalignment, malignant*.

malabsorption /mal′əbsôrp′shən/ [L, *malus* + *absorbere,* to swallow], impaired absorption of nutrients from the GI tract. It occurs in celiac disease, sprue, dysentery, diarrhea, inflammatory bowel disease, and other disorders. It may result from an inborn error of metabolism, malnutrition, or any chemical or anatomical condition of the digestive system that prevents normal absorption. See also **inborn error of metabolism, malnutrition.**

malabsorption syndrome, a complex of symptoms resulting from disorders in the intestinal absorption of nutrients, characterized by anorexia, weight loss, abdominal bloating, muscle cramps, bone pain, and steatorrhea. Anemia, weakness, and fatigue occur because iron, folic acid, and vitamin B_{12} are not absorbed in sufficient amounts. Among the many conditions causing this syndrome are gastric or small bowel resection, celiac disease, tropical sprue, Whipple's disease, intestinal lymphangiectasia, and cystic fibrosis. Treatment and prognosis are determined by the underlying condition. See also **celiac disease, cystic fibrosis, hypoproteinemia, tropical sprue.**

malacia /məlā′shə/ [Gk, *malakia,* softness], **1.** a morbid softening or sponginess in any part or any tissue of the body. **2.** a craving for spicy foods, such as mustard, hot peppers, or pickles. **—malacic,** *adj.*

-malacia, suffix meaning the "softening of tissue": *cardiomalacia, esophagomalacia, tracheomalacia.*

malacic. See **malacia.**

malaco-, prefix meaning "a condition of abnormal softness": *malacoplakia, malacosarcosis.*

maladaptation /mal′adəptā′shən/ [L, *malus* + *adaptatio*], faulty intrapersonal adjustment to stress or change. It may involve a failure to make necessary changes in the desires, values, needs, and attitudes or an inability to make necessary adjustments in the external world. Illness often provokes maladaptive behavior that worsens the problems accompanying the illness. **—maladaptive,** *adj.*

maladjusted /mal′adjus′tid/ [L, *malus,* bad, *adjuxtare,* to bring together], appearing unable to maintain effective relationships needed to fit into the environment and showing irritability, depression, and other psychogenic conditions.

malady /mal′ədē/ [ME, *maladie,* sick], a disease or illness.

malaise /malāz/ [Fr, discomfort], a vague uneasy feeling of body weakness, distress, or discomfort, often marking the onset of and persisting throughout a disease.

malalignment /mal′əlīn′mənt/ [L, *malus* + *ad,* to, *linea,* line], a failure of parts of the body to align normally, such as the teeth in the dental arch.

malar /mā′lər/ [L, *mala,* cheek], pertaining to the cheek or the cheekbone.

malaria /məler′ē·ə/ [It, *mal,* bad, *aria,* air], a severe infectious illness caused by one or more of at least four species of the protozoan genus ***Plasmodium.*** The disease is transmitted from human to human by a bite from an infected ***Anopheles*** mosquito. Malarial infection can also be spread by blood transfusion from an infected patient or by the use of a contaminated or an infected hypodermic needle. Although the endemic disease is limited largely to tropical areas of South and Central America, Africa, and Asia, a number of new cases are introduced into the United States by refugees, military personnel, and travelers returning from malarial areas. See also **double quartan fever.**

■ OBSERVATIONS: Malaria is characterized by chills and fever, anemia, an enlarged spleen, myalgia, arthralgia, weakness, and vomiting. Splenomegaly, anemia, thrombocytopenia, hypoglycemia, pulmonary or renal dysfunction, and neurosis may also occur. *P. falciparum, P. ovale,* or *P. vivax* parasites penetrate the erythrocytes of the human host, where they mature, reproduce, and burst out periodically. Malarial paroxysms occur at regular intervals, coinciding with the development of a new generation of parasites in the body. Because the life cycle of the infecting parasite varies according to species, the clinical patterns of chills and fever vary, as do the course and severity of the disease. Bouts of malaria usually last from 1 to 4 weeks, with attacks occurring less frequently as the disease progresses. Relapse is common, and the disease can persist for years.

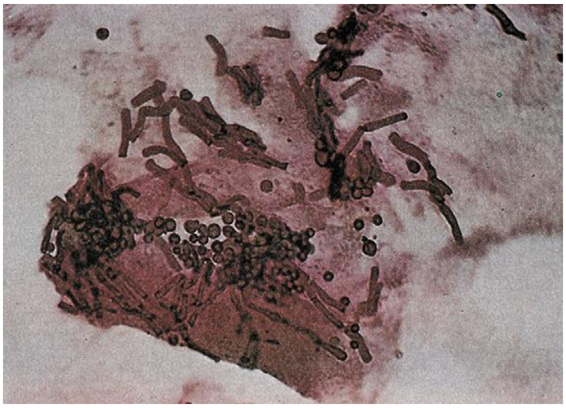
■ INTERVENTIONS: Malaria prophylaxis involves the administration of chloroquine, tetracycline, doxycycline, or mefloquine. Treatment for active malaria includes the administration of chloroquine, quinine, tetracycline, clindamycin, doxycycline, mefloquine, primaquine, sulfonamides, or pyrimethamine. See also **antimalarial, biduotertian fever, blackwater fever, falciparum malaria, quartan malaria, tertian malaria. —malarial,** *adj.*

malarial hemoglobinuria. See **blackwater fever.**

malarial parasite /məler′ē·əl/ [It, *mal aria,* bad air; Gk, *parasitos,* guest], one of four known species of *Plasmodium* that may be injected into the human bloodstream by an anopheline mosquito to begin the cycle of malarial disease.

Malarone /mal′ah-rōn/, a trademark for a combination preparation of **proguanil** and **atovaquone,** an antimalarial agent.

Malassezia /mal′əsē′zē·ə/ [Louis C. Malassez, French physiologist, 1842–1910], a genus of fungi. *Malassezia furfur*, the species normally found on human skin, can cause tinea versicolor in susceptible hosts (previous name: *Pityrosporum oviculare*). *M. ovalis* is a nonpathogenic organism found in sebaceous areas. Formerly called ***Pityrosporum* ovale.**



Malassezia furfur *(Murray et al, 2002)*

malathion, a widely used organophosphorus insecticide used in dilute topical applications for lice.

malathion poisoning /malā′thē·on, məl′əthī′on/, a toxic condition caused by the ingestion or absorption through the skin of malathion, an organophosphorus insecticide. Symptoms include vomiting, nausea, salivation, tearing, abdominal cramps, headache, dizziness, weakness, confusion, convulsions, and respiratory difficulties. Malathion is much less toxic than parathion and is the only organophosphorus insecticide approved for household use.

malaxation, the act of manipulating a mass of material. See **pétrissage.**

Malayan pit viper venom. See **ancrod.**

mal del pinto. See **pinta.**

mal de Meleda /mal·də mel′ədä/ [Fr, *meleda,* sickness], a chronic autosomal-recessive form of keratoderma of the palms and soles of the feet, in which the hyperkeratosis spreads to involve the dorsal aspects of the hands and feet and other areas of the body, with erythematous, scaling, malodorous cutaneous lesions that may cause deep fissuring. Also called **Meleda disease.**

mal de mer. See **kinesia.**

male [L, *mas*], **1.** *adj,* pertaining to the sex that produces sperm cells and fertilizes the female egg to beget offspring; masculine. **2.** *n,* a male person.

male catheterization, the passage of a catheter through the male urethra for the purpose of draining the urinary bladder or instilling a medication. A French size 14 catheter is usually determined for adult men unless the physician orders a larger size. The male patient is placed in a supine position with the legs extended. The catheter is inserted 17.5

to 22.5 cm or until urine flows. Sterile technique is important throughout the procedure to prevent the introduction of infectious organisms into the bladder.

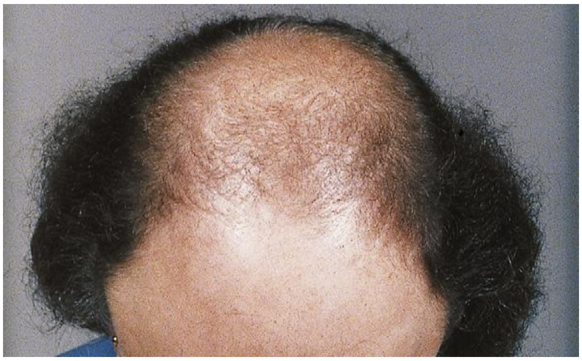
■ OUTCOMES: The expected outcome is drainage of urine from the bladder and relief of bladder distension and discomfort. Unexpected outcomes include the absence of urine because of an inability to advance the catheter through the urethra to the bladder. Catheter insertion should never be forced. The male may also experience ongoing discomfort despite catheter patency, which may be a result of urethral spasm, bladder infection, or balloon inflation when the balloon is not entirely in the bladder. Leakage of urine around the catheter may indicate that the catheter size is too small or that the balloon is inadequately inflated.

male climacterium. See **male menopause.**

male factor infertility, infertility of a couple caused by a problem in the male's reproductive system, such as anejaculation, aspermatogenesis, or azoospermia.

male menopause [L, *mas,* male, *men,* month; Gk, *pauein,* to cease], a late middle-age psychogenic condition affecting some men, who experience anxiety over diminished potency, increased fatigue, thinning and graying hair, and other signs of aging. Also called **male climacterium.**

male pattern alopecia [L, *mas,* male; ME, *patron* + Gk, *alopex,* fox mange], a common form of baldness in males, beginning at the frontal scalp and spreading gradually until only a fringe remains around the back of the head. Individual differences are determined by heredity, androgenic stimulation, and aging. Also called *male pattern baldness*.



Male pattern alopecia *(du Vivier, 2002)*

male reproductive system assessment, an evaluation of the condition of the patient's genitalia, reproductive history, and past and present genitourinary infections and disorders.

■ METHOD: In a relaxed professional interview the procedures to be conducted are explained and the patient is reassured that his privacy will be scrupulously maintained. He is questioned about his offspring; sexual activity; the existence of nocturia, urgency, frequency, dysuria, urethral discharge, hernia, or genital sores; discomfort or pain in the groin, lower back, or legs; and past treatment for epididymitis, gonorrhea, herpes genitalis, hydrocele, nonspecific urethritis, orchitis, prostatitis, syphilis, and varicocele. The examiner, while inspecting the genitalia, observes universal precautions as indicated by the condition. The penis is examined for swelling, inflammation, and lesions such as herpes vesicles or syphilitic sores, chancres, or scars. Anomalies that may be noted include hypospadias or epispadias, resulting from failed closure of the urethra; elongation of the foreskin constricting the urinary meatus; or swelling of the glans caused by a retracted, tight foreskin. The urethral orifice is inspected for a purulent or bloody discharge, and the scrotum is observed for symmetry and shape; in elderly or debilitated men the scrotum may be elongated and flat. The normally smooth testes, epididymis, and spermatic cords are palpated for the presence of beading and varicosities and the size, location, and consistency of any scrotal mass. Fluid felt around the testes may be seen by darkening the room and illuminating the scrotum with a flashlight. Wrapping the flashlight with clear plastic wrap, which is changed between patients, decreases the risk of bacteria transfer. The patient is asked to cough or bear down to reveal a hernia, and the abdomen is palpated above the symphysis pubis to determine whether the bladder is distended. The inguinal lymph nodes are palpated, and the amount and distribution of pubic hair are observed. The prostate may be examined with the patient in the Sims' knee-chest position or lithotomy position, but, when possible, the patient should stand bent at a right angle over a table as the examiner's well-lubricated gloved forefinger sweeps the rectal circumference and palpates the lobes and medial sulcus of the gland. The size, consistency, and any localized nodule suggesting a neoplasm of the normally smooth, firm prostate are carefully noted, and the findings are recorded as on a clock dial with the symphysis pubis representing 12 o'clock. When additional studies are indicated, a smear is prepared from the first urine voided after massage of the prostate. Primary screening for prostatic cancer includes the digital rectal examination and a blood test for PSA. Prostatic acid phosphatase is also assessed if prostatic cancer is suspected. Diagnosis is usually established by a biopsy. The assessment includes laboratory studies of any discharge from the penis. A Gram-stained smear usually confirms or rules out a diagnosis of gonorrhea. A fluorescent-tagged antibody method may be required if the result is equivocal. Cultures may be needed to determine whether nonspecific urethritis is caused by *Escherichia coli, Pseudomonas, Staphylococcus, Streptococcus,* or organisms of other pathogenic genera. Syphilis may be diagnosed by the Venereal Disease Research Laboratories serological test, but the fluorescent treponemal antibody-absorption test is the most sensitive and specific diagnostic measure. If infertility is a problem, examinations of multiple semen samples are conducted. Each specimen collected after 3 days of abstinence is inspected in the laboratory to determine whether the volume of the ejaculate approximates the normal 2 to 5 mL average and whether the semen has a pH of 7.7 and a sperm count of 60 to 150 million per milliliter.

■ INTERVENTIONS: The health care provider conducts the interview and examination, assembles the results of laboratory studies, and urges the patient to inform his sex partner, or partners, if an infectious disease is diagnosed. Throughout the assessment the health care provider recognizes that the patient may be reluctant to discuss his symptoms and activities and may be sensitive about the necessary procedures.

■ OUTCOME CRITERIA: A careful, understanding evaluation of the male patient's reproductive system helps to establish the diagnosis and plan the treatment and aids in allaying the patient's anxiety. The assessment also serves as a public health measure by encouraging the reporting of a sexually transmitted disease to the patient's contacts and proper authorities.

male sexual dysfunction, impaired or inadequate ability of a man to carry on his sex life to his own satisfaction. Symptoms include difficulties in starting and maintaining an erection, premature ejaculation, inability to ejaculate, and loss of desire. Compare **female sexual dysfunction.** See also **impotence, premature ejaculation, sexual dysfunction.**

male sterility [L, *mas* + *sterilis,* barren], the inability of a man to produce sperm. Causes may include environmental factors, such as exposure to heat or radiation, or physiological factors, such as undescended testes, varicocele, prolonged fever, endocrine disorders, cancer chemotherapy, vasectomy, and abuse of alcohol or marijuana. See also **infertility.**

male urethra, a canal extending from the neck of the bladder to the urinary meatus, measuring about 20 cm in length, and presenting a double curve when the penis is flaccid. It is divided into proximal (sphincteric) and distal (conduit) or posterior (prostatic and membranous) and anterior (bulbar and penile).

malfeasance /malfē′zəns/ [Fr, *malfaire,* to do evil], performance of an unlawful, wrongful act. Compare **misfeasance, nonfeasance.**

malformation /mal′fôrmā′shən/ [L, *malus,* bad, *forma,* shape], an anomalous structure in the body. See also **congenital anomaly.**

malfunction /mal′fungk′shən/ [L, *malus,* bad, *functio,* performance], **1.** *n,* the inability to function normally. **2.** *v,* not to function normally.

Malgaigne's fracture of pelvis /malgā′nyəz/ [Joseph F. Malgaigne, French surgeon, 1806–1865], breaks in multiple pelvic bones, including the pubic rami and the wing of the ipsilateral ilium or the sacrum, with associated upper displacement of the hemipelvis.

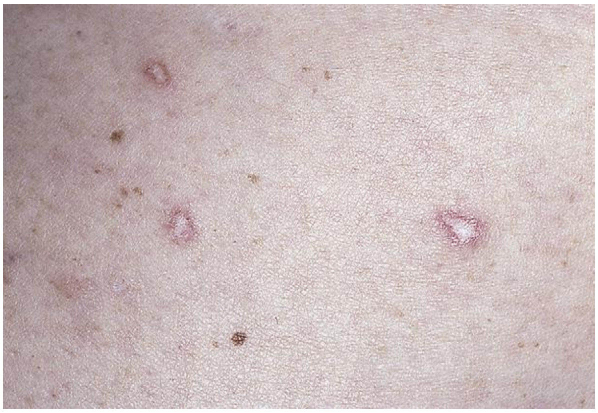
malicious prosecution /məlish′əs/ [L, *malitia,* wickedness, *prosequi,* to pursue], (in law) a suit begun in malice and pursued without sufficient cause. It is usually an action for damages. Malicious prosecution is a wrongful civil proceeding, and a person who takes an active part in initiating or continuing it is subject to liability.

malign /məlīn′/ [ME, *malignen,* deceptive], to show ill will or maliciousness; to act viciously; to harm.

malignant /məlig′nənt/ [L, *malignus,* bad disposition], **1.** tending to become worse and to cause death. See also **virulent. 2.** (describing a cancer) anaplastic, invasive, and metastatic. **—malignancy,** *n.*

malignant astrocytoma, a high-grade astrocytoma, such as **glioblastoma multiforme.**

malignant atrophic papulosis, a form of cutaneous lymphocytic vasculitis. The skin disease shows erythematous papules with characteristic porcelain-white centers and elevated borders. The early signs are followed by perforated intestinal ulcers, leading to peritonitis, occluded arterioles, and progressive neurological disability. Also called **Degos' disease.**



Malignant atrophic papulosis *(Callen et al, 2000)*

malignant dysentery [L, *malignus,* bad disposition; Gk, *dys,* bad, *enteron,* bowel], a potentially fatal form of dysentery in which symptoms are severe.

malignant edema. See **anthrax.**

malignant endocarditis. See **bacterial endocarditis.**

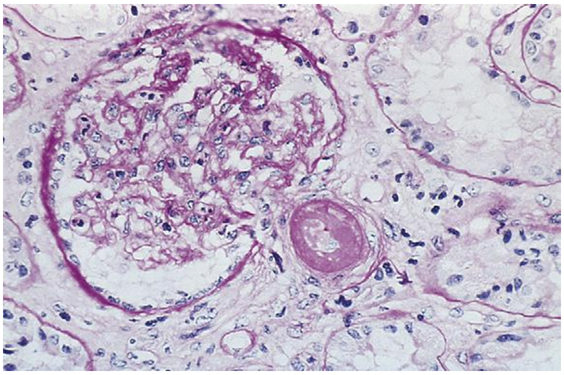
malignant ependymoma. See **ependymoblastoma.**

malignant granuloma [L, *malignus,* bad disposition, *granulum,* little grain, *oma,* tumor], a malignant lymphoma, such as Hodgkin's disease, or a lymphosarcoma.

malignant hemangioendothelioma. See **angiosarcoma.**

malignant hepatoma, a primary liver cancer. Also called **hepatocarcinoma, hepatocellular carcinoma, liver cell carcinoma.** See also **hepatoma, liver cancer.**

malignant hypertension, the most lethal form of hypertension. It is a fulminating condition characterized by severely elevated blood pressure that commonly damages the intima of small vessels, the brain, the retina, the heart, and the kidneys. It affects more African-Americans than Caucasians and may be caused by a variety of factors, such as stress, genetic predisposition, obesity, use of tobacco, use of oral contraceptives, high intake of sodium, sedentary lifestyle, renal disease, and aging. Many patients with this condition exhibit signs of hypokalemia and alkalosis and have aldosterone secretion rates even higher than those associated with primary aldosteronism. Also called **accelerated hypertension.** See also **essential hypertension.**



Malignant hypertension: kidney disease *(Kumar et al, 2010/Courtesy Dr. H. Rennke, Brigham and Women's Hospital, Boston, Massachusetts)*

malignant hyperthermia (MH), a rare genetic hypermetabolic condition characterized by severe hyperthermia and rigidity of the skeletal muscles, occurring in affected people exposed to inhalation anesthetics and succinylcholine. It is a life threatening emergency and must be treated immediately. Treatment includes discontinuation of the inhalational anesthetic, the administration of dantrolene sodium, administration of 100% oxygen, cooling, cessation of surgery, and correction of acidosis and hyperkalemia. Patients susceptible to malignant hyperthermia must be informed of the condition and susceptible relatives screened. The family is referred to the Malignant Hyperthermia Registry of the Malignant Hyperthermia Association of the United States (MHAUS). Individuals with confirmed malignant hyperthermia should wear a medical alert wrist band. Compare **neuroleptic malignant syndrome.**

malignant hyperthermia precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention or reduction of hypermetabolic response to pharmacological agents used during surgery. See also **Nursing Interventions Classification.**

Malignant Hyperthermia Association of the United States, an organization to promote optimum care and scientific understanding of malignant hyperthermia and related disorders. It maintains a hotline for information that is available in the United States and Canada at 1-800-MH-HYPER, or 1-800-644-9737, and outside the United States at 001-1-315-464-7079.

malignant malnutrition. See **kwashiorkor.**

malignant melanoma. See **melanoma.**

malignant mesenchymoma, a sarcoma that contains mesenchymal elements.

malignant mole. See **melanoma.**

malignant neoplasm, a tumor that tends to grow, invade, and metastasize. The tumor usually has an irregular shape and is composed of poorly differentiated cells. If untreated, it may result in death.

malignant neuroma. See **neurosarcoma.**

malignant pustule. See **anthrax.**

malignant transformation, the changes that a normal cell undergoes as it becomes a cancerous cell. See also **carcinogenesis.**

malignant tumor, a neoplasm that characteristically invades surrounding tissue, metastasizes to distant sites, and contains anaplastic cells. A malignant tumor may cause death if treatment does not intervene.

malingering /məling′gəring/ [Fr, *malingre,* puny, weak], a willful and deliberate feigning of the symptoms of a disease or injury to gain some consciously desired end. **—malinger,** *v.,* **malingerer,** *n.*

malleable /mal′ē·əbəl/ [L, *malleare,* to beat], able to be pressed, hammered, or otherwise forced into a shape without breaking.

mallei. See **malleus.**

malleolar fold, one of two folds, the anterior and posterior, on the surface of the tympanic membrane. See also **pars flaccida.**

malleolus /məlē′ələs/ *pl.* **malleoli** [L, little hammer], a rounded bony process, such as the protuberance on each side of the ankle.

malleolus fibulae. See **external malleolus.**

mallet deformity [ME, *maillet,* maul], a loss of the ability to extend the distal joint of a finger or toe. It may be caused by severe damage, such as rupture of the terminal tendon. See also **hammer finger, hammer toe.**

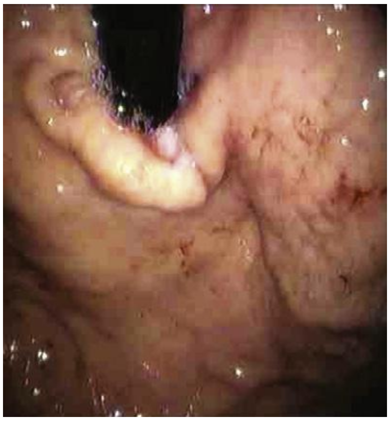
mallet finger. See **hammer finger.**

mallet fracture, a fracture in which the dorsal base of a distal phalanx of the hand or foot is torn away. The fracture disrupts the associated extensor apparatus and causes dropped flexion of the distal segment.

malleus /mal′ē·əs/ *pl.* **mallei** [L, hammer], one of the three ossicles in the middle ear, resembling a hammer with a head, neck, and three processes. It is connected to the tympanic membrane and transmits sound vibrations to the incus, which communicates with the stapes. Compare **incus, stapes.** See also **middle ear.**

Mallory body /mal′ərē/ [Frank B. Mallory, American pathologist, 1862–1941; AS, *bodig,* body], an eosinophilic cytoplasmic inclusion, alcoholic hyalin, found in the liver cells. It is typically, but not always, associated with acute alcoholic liver injury. See also **cirrhosis.**

Mallory-Weiss syndrome [G. Kenneth Mallory, American pathologist, 1900–1986; Soma Weiss, American physician, 1899–1942], a condition characterized by massive bleeding after a tear in the mucous membrane at the junction of the esophagus and the stomach. The laceration is usually caused by protracted vomiting, most commonly in alcoholics or in people whose pylorus is obstructed. The esophageal tear is located by esophagoscopy or arteriography. Surgery is usually necessary to stop the bleeding. After repair the prognosis is excellent.



Mallory-Weiss syndrome *(Goldman et al, 2012)*

malnutrition /mal′no͞otrish′ən/ [L, *malus,* bad, *nutrire,* to nourish], any disorder of nutrition. It may result from an unbalanced, insufficient, or excessive diet or from impaired absorption, assimilation, or use of foods. Compare **deficiency disease.**

malocclusion /mal′əklo͞o′zhən/ [L, *malus* + *occludere,* to shut up], abnormal contact between the teeth of the upper jaw and those of the lower jaw. See also **Angle's Classification of Malocclusion (modified), occlusion.**

malonic acid $(CH_2(COOH)_2)$ /məlō′nik/, a white, crystalline, highly toxic substance used as an intermediate compound in the production of barbiturates; a dicarboxylic acid.

malpighian body /malpig′ē·ən/ [Marcello Malpighi, Italian physician, 1628–1694; AS, *bodig,* body], **1.** the renal corpuscle, which includes a glomerulus with Bowman's capsule. **2.** also called **lymphatic nodule,** lymphoid tissue surrounding the arteries of the spleen.

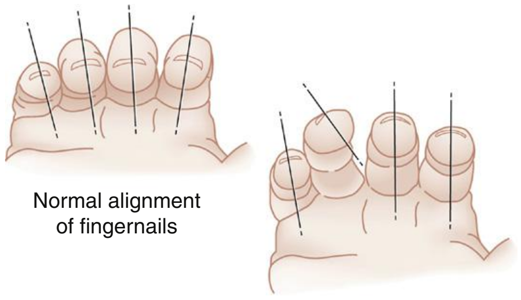
malpighian corpuscle [Marcello Malpighi; L, *corpusculum,* little body], one of a number of small, round, deep-red bodies in the cortex of the kidney, each communicating with a renal tubule. Malpighian corpuscles average about 0.2 mm in diameter, with each capsule composed of two parts: a central glomerulus and a glomerular capsule. The corpuscles are part of a filtering system through which nonprotein components of blood plasma enter the tubules for urinary excretion. Also called **malpighian body, renal corpuscle.**

malposition /mal′pəzish′ən/, a wrong or faulty placement of a body part, such as in an untreated fracture.

malpractice /malprak′tis/ [L, *malus* + Gk, *praktikos,* practical], (in law) professional negligence that is the proximate cause of injury or harm to a patient, resulting from a lack of professional knowledge, experience, or skill that can reasonably be expected in others in the profession in similar circumstances or from a failure to exercise reasonable care or judgment in the application of professional knowledge, experience, or skill. The four necessary elements of negligence essential to maintain a medical malpractice claim are duty, breach of duty, damages/injury, and causal connection between the breach and the injury.

malpresentation /malpres′əntā′shən/ [L, *malus,* bad, *praesentare,* to show], an abnormal position of the fetus in the birth canal.

malrotated kidney, a kidney that failed to rotate properly during its ascent from the pelvis in prenatal development, usually with the hilum facing anteriorly instead of anteromedially.



Normal alignment of fingernails
Alignment of fingernails with malrotation of ring finger

Malrotation

(Marx et al, 2006/Redrawn from Jobe MT, Calandruccio JH: Fractures, dislocations and ligamentous injuries IN Canale and Beaty, 2008)

malrotation /mal′rōtā′shən/, **1.** any abnormal rotation of an organ or body part, such as the vertebral column or a tooth. **2.** a failure of the intestinal tract or other viscera to undergo normal rotation during embryonic development.

malt /môlt/ [AS, *mealt*], a preparation obtained from germinated grain, such as barley, that contains partially degraded starch and protein with nutritive and digestive properties.

Malta fever. See **brucellosis.**

maltitol /mawl′tĭtol/, a hydrogenated, partially hydrolyzed starch used as a sweetener.

malt soup extract, an extract of malt from barley grains, containing also a small amount of polymeric carbohydrates, proteins, electrolytes, and vitamins, administered orally as a bulk-forming laxative.

malunion /malyo͞o′nyən/ [L, *malus* + *unus,* one], an imperfect union of previously fragmented bone or other tissue. Causes of bone malunion include osteomyelitis and improper immobilization of a fracture.

mamillary body /mam′iler′ē/ [L, *mammilla,* nipple; AS, *bodig,* body], either of the two small round masses of gray matter in the hypothalamus located close to one another in the interpeduncular space. They may be involved with olfactory reflexes.

mamm-, prefix meaning "mammary gland or the breast": *mammectomy, mammogram, mammotropic*.

mamma. See **mammary glands.**

mammary /mam′ərē/ [L, *mamma,* breast], pertaining to the breast.

mammary duct. See **lactiferous duct.**

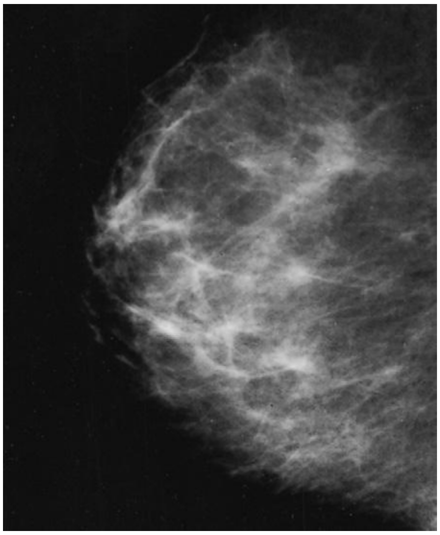
mammary glands [L, *mamma,* breast, *glans,* acorn], lactiferous glands within the breasts. Glandular tissue forms a radius of lobes containing alveoli, each lobe having a system of ducts for the passage of milk from the alveoli to the nipple. The central part of the breast is filled with glandular tissue. Also called **breast, mamma.** See also **lactation.**

mammary papilla. See **nipple.**

mammary region, the part of the pectoral region surrounding the mammary gland.

mammogram /mam′əgram/ [L, *mamma* + Gk, *gramma,* record], an x-ray film of the soft tissues of the breast.

mammography /mamog′rəfē/, the radiographic examination of the soft tissues of the breast. It is used to identify various benign and malignant neoplastic processes and may show conclusively that a lesion is malignant. Routine mammography reduces the breast cancer mortality rate by 25% to 35% in asymptomatic women in middle age. The baseline mammographic examination is recommended at 35 years of age. The National Cancer Institute recommends a yearly mammogram for women between 50 and 75 years of age. After 75 years of age, routine mammography screening depends on a woman's overall health. Because of newer techniques using lower doses of radiation, the advantage of having regular mammograms greatly outweighs the risk of radiation exposure.



Mammogram

Mammography Quality Standards Act (MQSA), an act passed into law in the United States in 1992, which requires all mammography facilities to be accredited.

mammoplasty /mam′əplas′tē/ [L, *mamma* + Gk, *plassein,* to mold], plastic reshaping of the breasts, performed to reduce or lift large or sagging breasts, to enlarge small breasts, or to reconstruct a breast after removal of a tumor. To reduce the size of the breasts and raise them, excess tissue is removed from the underside of the breasts. The breast is then lifted, and the nipple drawn through an opening in an overhanging skin flap. To enlarge a breast, a saline-filled or silicone gel prosthesis is inserted in a pocket formed beneath the breast on the chest wall. The complications after surgery are infection and, with the use of foreign body implants, rejection by tissues. The nurse observes the nipples for signs of vascular insufficiency or congestion, applies a firm supporting breast binder or brassiere, and instructs the patient to limit use of her arms to lift herself.

mammothermography /mam′ōthərmog′rəfē/ [L, *mamma* + Gk, *therme,* heat, *graphein,* to record], a diagnostic procedure in which the breast is examined for abnormal growths by means of a heat-sensitive probe that detects regional differences in blood flow. Compare **mammography.** See also **thermography.**

mammotroph. See **lactotroph.**

man-, prefix meaning "hand": *manoptoscope, manual, manudynamometer.*

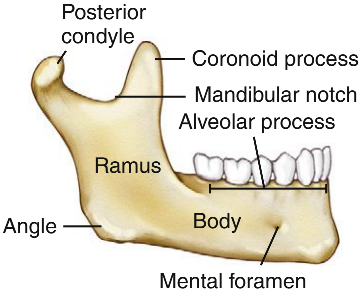
managed care, a health care system with administrative control over primary health care services in a medical group practice. The intention is to eliminate redundant facilities and services and to reduce costs. Health education and preventive medicine are emphasized. Patients may pay a flat fee for basic family care but may be charged additional fees for secondary care services. The system of managed care evolved after World War II from the traditional fee for service, in which the patient paid the physician directly for services performed; through a shift toward health insurance organizations, which paid physicians and hospitals from premiums paid by the patients to the insurers; to the advent in the 1960s of government programs, such as Medicare and Medicaid. In the 1980s another economic shift, originating in California, led to the concept of health maintenance organizations (HMOs), with large corporations initially negotiating with groups of health care workers for financing of medical and hospital expenses of the corporation's employees. HMOs also began enrolling individual patients and by the mid-1990s challenged the survival of the traditional insurance systems. See also **health maintenance organization.**

managed care organization (MCO), an organization that combines the functions of health insurance, delivery of care, and administration. Examples include the independent practice association, third-party administrator, management service organization, and physician-hospital organization.

management service organization (MSO), an entity that under contract provides services such as a facility, equipment, staffing, contract negotiation, administration, and marketing. Services may be provided to solo practitioners or groups. Approaches to establishment of the MSO include the hospital-related MSO; the provider-of-care, hospital-related, tax-exempt clinic MSO; and the nonprofit, hospital-sponsored equity MSO.

Mandelamine, a trademark for an antibacterial agent (methenamine mandelate).

mandible /man′dibəl/ [L, *mandere,* to chew], a large U-shaped bone constituting the lower jaw. It contains the lower teeth and consists of a horizontal part, a body, and two perpendicular rami that join the body at almost right angles. The body of the mandible is curved, somewhat resembling a horseshoe, and has two surfaces and two borders. The superior border of the mandible contains sockets for the 16 lower teeth. The inferior border provides a groove for the facial artery. Compare **maxilla.** **—mandibular,** *adj.*



Mandible

mandibular arch /mandib′yələr/ [L, *mandere,* to chew, *arcus,* bow], the first visceral arch from which the lower jawbone develops.

mandibular block, regional anesthesia of the lower jaw produced by injection of a local anesthetic near the mandibular division of the trigeminal nerve.

mandibular canal [L, *mandere,* to chew + *canalis,* channel], a passage or channel that extends from the mandibular foramen on the medial surface of the ramus of the mandible to the mental foramen. It holds mandibular blood vessels and a part of the mandibular branch of the trigeminal nerve.

mandibular foramen, the opening on the medial surface of the ramus for the transmission of the inferior alveolar nerve and vessels.

mandibular fossa [L, *mandere,* to chew, *fossa,* ditch], a prominent depression in the inferior surface of the squamous part of the temporal bone at the base of the zygomatic process, in which the condyle of the mandible rests. Also called **glenoid cavity, glenoid fossa.**

mandibular nerve, the largest of the three branches of the trigeminal nerve. Its branches innervate the ear, the cheek, the skin and mucous membrane of the lower lip, the skin of the chin, the teeth and related gingivae, the tongue, and the muscles of the cheek and jaw.

mandibular notch, a depression in the inferior border of the mandible, anterior to the attachments of the masseter muscle, where the external facial muscles cross the inferior border of the mandible. It is a landmark that may be accentuated by arrested condylar growth and other developmental disturbances of the mandible.

mandibular process [L, *mandere,* to chew, *processus*], **1.** the upper alveolar part of the mandible. **2.** the projection of the upper posterior part of the ramus of the mandible bearing the condyle.

mandibular ramus [L, *mandere,* to chew, *ramus,* branch], a broad quadrilateral part of the mandible projecting upward from the posterior end of the body behind the lower teeth. It has two surfaces, four borders, and two processes.

mandibular reflex [L, *mandere,* to chew, *reflectere,* to bend back]. See **jaw jerk.**

mandibular retrusion, mandibular retroposition. See **retrognathia.**

mandibular sling, the connection between the mandible and the maxilla, formed by the masseter and the pterygoideus at the angle of the mandible. When the mouth is opened and closed, the mandible moves around a center of rotation formed by the mandibular sling and the sphenomandibular ligament.

mandibular spine, a protuberance on the mandibular ramus to which the sphenomandibular ligament is attached.

mandibular symphysis, a small vertical ridge that marks the fusion of the left and right parts of the mandible.

mandibular torus, a nonneoplastic external bony overgrowth of bone caused by genetics and environmental conditions such as bruxism. Tori are located bilateral or unilateral in the area of the lower canine and first premolar regions. Tori can appear radioopaque in radiographic or dental images. No treatment is necessary unless there is interference with chewing, recurring trauma, or placement of a dental prosthesis. See also **torus palatinus, palatine torus.**

mandibulofacial dysostosis /mandib′yəlofā′shəl/ [L, *mandere* + *facies,* face; Gk, *dys,* bad, *osteon,* bone], an abnormal hereditary condition characterized by an antimongoloid slant of the palpebral fissures, coloboma of the lower lid, micrognathia and hypoplasia of the zygomatic arches, and microtia. Evidence indicates that this disorder is transmitted as an autosomal-dominant trait. The condition occurs in the complete form as Franceschetti's syndrome and in the incomplete form as Treacher Collins' syndrome. See also **dysostosis.**

Mandol, a trademark for a cephalosporin antibiotic **(cefamandole nafate).**

mandras foot. See **paraactinomycosis.**

mandrel /man′drəl/ [Fr, *mandrin,* boring tool], the shaft of an object, such as a dental polishing disk, cutting device, or sharpening stone, that is inserted into a handpiece or lathe and supports the object while it rotates.

maneuver /məno͞o′vər/ [Fr, *manœvre,* action], **1.** an adroit or skillful manipulation or procedure. **2.** (in obstetrics) a manipulation of the fetus, performed to aid in delivery. Also spelled **manoeuvre.**

mangafodipir /mang′gäfo′dĭpir/, a contrast-enhancing agent used to improve the images obtained in magnetic resonance imaging of hepatic lesions, administered intravenously as the trisodium salt.

manganese (Mn) /mang′gənēs/ [L, *manganesium,* associated with magnesium], a common metallic element found in trace amounts in tissues of the body, where it aids in the functions of various enzymes. Its atomic number is 25; its atomic mass is 54.938.

manganese nodule, a small node produced by microbial reduction of manganese oxides.

mange /mānj/, a cutaneous disease of domestic and wild animals caused by skin-burrowing mites. See also **scabies.**

mani-, prefix meaning "mental aberration or madness": *mania, maniaphobia.*

mania /mā′nē·ə/ [Gk, madness], a mood characterized by an unstable expansive emotional state; extreme excitement; excessive elation; hyperactivity; agitation; overtalkativeness; flight of ideas; increased psychomotor activity; fleeting attention; and sometimes violent, destructive, and self-destructive behavior, delusions, or hallucinations.

-mania, -manic, **1.** suffix meaning a "state of mental disorder." **2.** suffix meaning "a state of psychosis": *hypermania, melanomanic.*

-maniac, **1.** suffix meaning a "person exhibiting a type of psychosis": *kleptomaniac, narcomaniac, toxicomaniac.* **2.** suffix meaning a "person revealing an inordinate interest in something": *ergomaniac, nymphomaniac, opiomaniac.*

manic. See **mania.**

manic depressive. See **bipolar disorder.**

manifest deviation. See **eye deviation.**

manifest image. the change on an x-ray film that becomes visible when the latent image undergoes appropriate chemical processing.

manipulation /mənip′yəlā′shən/ [L, *manipulare,* to work with the hands], the skillful use of the hands in therapeutic or diagnostic procedures, such as palpation, reduction of a dislocation, turning a fetus, or various treatments in physical therapy and osteopathy. A kind of manipulation is **conjoined manipulation.** See also **massage.**

mannitol /man′itol/, a poorly metabolized sugar used as an osmotic diuretic and in kidney function tests.

■ INDICATIONS: It is prescribed to promote diuresis, decrease intraocular and intracranial pressure, promote the excretion of poisons and other toxic wastes, and evaluate renal function.

■ CONTRAINDICATIONS: Pulmonary edema, dehydration, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are pulmonary edema, heart failure, hyponatremia, headache, vomiting, and confusion.

mannose /man′ōs/, a monosaccharide sugar of the aldose group, found as part of many glycolipids and glycoproteins.

mannosidosis /man′ō·si·dō′sis/, a lysosomal storage disease caused by an enzymatic defect in the metabolism of mannose-containing glycoproteins, resulting in accumulation of oligosaccharides. Characteristics include coarse facies, upper respiratory congestion and infections, profound mental retardation, hepatosplenomegaly, cataracts, radiographic signs of skeletal abnormalities, and gibbus deformity. Mannosidosis is divided into type I (infantile onset) and type II (juvenile-adult onset).

Mann-Whitney test, Mann-Whitney U test. See **rank sum test.**

manoeuvre. See **maneuver.**

manometer /mənom′ətər/ [Gk, *manos,* thin, *metron,* measure], a device for measuring the pressure of a fluid, consisting of a tube marked with a scale and containing a relatively incompressible fluid, such as mercury. The level of the fluid in the tube varies with the pressure of the fluid being measured. Kinds of manometers are *aneroid manometer* and **sphygmomanometer.**

-manometer, suffix meaning "an instrument to measure pressure": *sphygmomanometer.*

manometry /mənom′ətrē/ [Gk, *manos,* thin, *metron,* measure], **1.** the science of pressure movements of liquids or gases. **2.** a technique for measuring changes in the pressure of a gas or liquid that result from a biological or chemical action.

Mansonella /man′sənel′ə/, a genus of nematodes of the superfamily Filarioidea, found in Central and South America and Africa. *M. ozzardi* and *M. perstans* are two species that parasitize humans and cause mild symptoms. See also **mansonellosis.**

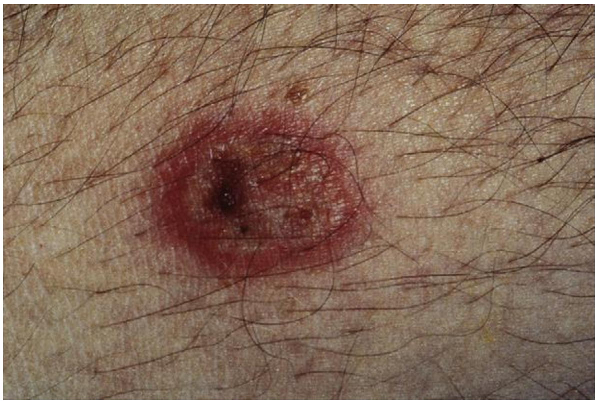
Mansonella perstans /akan ′thōkī′lənē′ mə /, a long, threadlike worm usually found in Africa. It commonly infects wild and domestic animals and occasionally invades the bloodstream of humans, causing a rash, muscle and joint pains, various neurological disorders, and nodules in the subcutaneous tissues. The larvae are also found in the cerebrospinal fluid of affected patients.

Mansonella ozzardi /man′sənel′ə/, a parasitic worm that is indigenous to much of Latin America and the Caribbean islands. It is a relatively benign nematode that infects humans, sometimes causing hydrocele or lymphadenopathy. The larvae live in the bloodstream, and adult worms are found in the visceral mesenteries. The intermediate hosts are biting flies of the genus *Culicoides.*

mansonellosis /man′sənelō′sis/, a rare tropical infectious disease caused by nematodes of the genus ***Mansonella.*** It can cause skin rashes, muscle and joint pains, neurological disorders, and skin lumps. It is mainly found in Africa. The parasite is transmitted through the bite of small flies. Also called **acanthocheilonemiasis.**

mantle cell lymphoma /man′təl/, a rare form of non-Hodgkin's lymphoma having a usually diffuse pattern. It mainly affects people over 50 years of age and runs an indolent course, although it may metastasize to the spleen or liver. See also **non-Hodgkin's lymphoma.**

Mantoux test /mantōō′/ [Charles Mantoux, French physician, 1877–1947], a tuberculin skin test that consists of intradermal injection of a purified protein derivative of the tubercle bacillus. A hardened, raised red area of 8 to 10 mm, appearing 24 to 72 hours after injection, is a positive reaction. This method is the most reliable means of testing tuberculin sensitivity. See also **tuberculin test.**



Positive Mantoux test *(Conlon and Snydman, 2000)*

manual lymph drainage, the application of light rhythmic strokes, similar to those used in effleurage, to the skin and superficial fascia in the direction of the heart to increase the drainage of lymph from the involved structures.

manual rotation /man′yōō·əl/ [L, *manualis,* hand, *rotare,* to turn], an obstetric maneuver in which a baby's head is turned by hand from a transverse to an anteroposterior position in the birth canal to facilitate delivery. Compare **forceps rotation.**

manubrial. See **manubrium.**

manubriosternal articulation /məno͞o′brē·ōstur′nəl/ [L, *manubrium,* handle; Gk, *sternum,* chest; L, *articularis,* joints], the fibrocartilaginous connection between the manubrium and the body of the sternum. This joint usually closes by 25 years of age. Compare **xiphisternal articulation.**

manubrium /məno͞o′brē·əm/ [L, handle], the most anterior of the three bones of the sternum, presenting a broad quadrangular shape that narrows caudally at its articulation with the superior end of the body of the sternum. The pectoralis major and the sternocleidomastoideus are attached to the manubrium. Compare **xiphoid process.** **—manubrial,** *adj.*

manudynamometer /man′o͞odī′nəmom′ətər/ [L, *manus,* hand; Gk, *dynamis,* force, *metron,* measure], a device for measuring the force or extent of thrust.

manus. See **hand.**

many-tailed bandage [AS, *manig,* many, *taegel,* tail; Fr, *bande,* strip], **1.** a broad, evenly shaped bandage with both ends split into strips of equal size and number. As the bandage is placed on the abdomen, chest, or limb, the ends may be overlapped and secured. **2.** an irregularly shaped bandage with torn or cut ends that are secured together. See also **Scultetus binder.**

MAO, **1.** abbreviation for **monoamine oxidase. 2.** abbreviation for **maximal acid output.**

MAOI, abbreviation for **monoamine oxidase inhibitor.**

MAO inhibitor, abbreviation for **monoamine oxidase inhibitor.**

Maolate, a trademark for a skeletal muscle relaxant (chlorphenesin carbamate).

MAP, **1.** abbreviation for *medical aid post*. **2.** abbreviation for **mean arterial pressure.**

map distance. See **map unit.**

maple bark disease [AS, *mapul* + ONorse, *bark* + L, *dis,* opposite of; Fr, *aise,* ease], a hypersensitivity pneumonitis caused by exposure to the mold *Cryptostroma corticale,* found in the bark of maple trees. In the susceptible person the condition may be acute, accompanied by fever, cough, dyspnea, and vomiting, or chronic, characterized by fatigue, weight loss, dyspnea on exertion, and a productive cough. Although differential diagnosis may be difficult, a thorough occupational history may reveal the cause and source of exposure. In an acute or severe case a short course of prednisone may be used to control the symptoms; avoiding exposure to the bark prevents further reaction.

maple syrup urine disease [AS, *mapul* + Ar, *sharab* + Gk, *ouron,* urine], an inherited metabolic disorder in which an enzyme necessary for the breakdown of the amino acids valine, leucine, and isoleucine is lacking. The disease is usually diagnosed in infancy. It is recognized by the characteristic maple syrup odor of the urine and by hyperreflexia. Stress, fever, and infection aggravate the condition. Treatment includes a diet avoiding these amino acids and occasionally dialysis to remove excess protein. Also called **branched chain ketoaciduria.**

mapping [L, *mappa,* napkin], the process of locating the relative position of genes on a chromosome through the analysis of genetic recombination. Distances between genes in a linkage group are expressed in map units or morgans. Also called **chromosome mapping.**

maprotiline hydrochloride /maprō′tilēn/, a tetracyclic antidepressant similar to the tricyclics.

■ INDICATION: It is prescribed for the treatment of depression.

■ CONTRAINDICATIONS: It is used with caution in conditions in which anticholinergics are contraindicated, in seizure disorders, and in cardiovascular disorders. Concomitant administration of monoamine oxidase inhibitors, recent myocardial infarction, or known hypersensitivity to this drug prohibits its use.

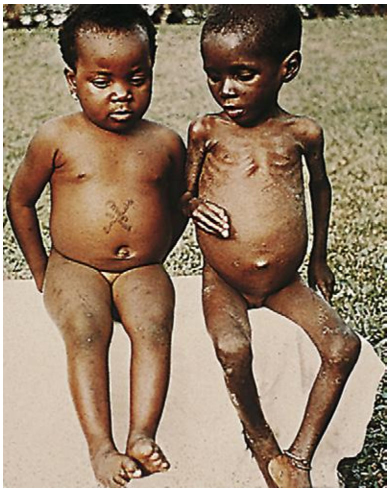
■ ADVERSE EFFECTS: Among the more serious adverse effects are sedation and anticholinergic side effects. A variety of GI, cardiovascular, and neurological reactions (including convulsions) may occur. Like the tricyclics, it is involved in many potential drug interactions.

map unit [L, *mappa,* napkin, *unus,* one], an arbitrary unit of measure used to express the distance between genes on a chromosome. It is calculated from the percentage of recombinations that occur between specific genes so that 1% of crossing over represents one unit on a genetic map, or approximately the number of new combinations that can be detected. The measurement is accurate only for small distances because double crossovers do not appear as new recombinations. Also called **map distance.** See also **morgan.**

marasmic kwashiorkor /məraz′mik/ [Gk, *marasmos,* a wasting; Afr], a malnutrition disease, primarily of children, resulting from the deficiency of both calories and protein. The condition is characterized by severe tissue wasting, dehydration, loss of subcutaneous fat, lethargy, and growth retardation. See also **kwashiorkor, marasmus.**

marasmoid /mərāz′moid/, resembling marasmus.

marasmus /məraz′məs/ [Gk, *marasmos,* a wasting], a condition of extreme malnutrition and emaciation, occurring chiefly in young children. It is characterized by progressive wasting of subcutaneous tissue and muscle. Marasmus results from a lack of adequate calories and proteins and is seen in children with failure to thrive and in individuals in a state of starvation. Less commonly it results from an inability to assimilate or use protein because of a defect in metabolism. Care of the marasmic child involves the reestablishment of fluid and electrolyte balance, followed by the slow and gradual addition of foods as they are tolerated. See also **kwashiorkor.**



The child on the right exhibits marked muscle wasting with no oedema, characteristic of marasmus. The other child pictured does not have a nutritional deficiency. *(Shetty, 2006)*

marathon encounter group /mer′əthon/ [Marathon, Greece; L, *in,* in, *contra,* against; Fr, *groupe*], an intensive group experience that accelerates self-awareness and promotes personal growth and behavioral change through the continuous interaction of group members for a period ranging from 16 to more than 40 hours. See also **encounter group.**

maraviroc, an antiretroviral.

■ INDICATION: This drug is used to treat CCR5-tropic HIV in combination with other antiretroviral agents.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, depression, disturbances in consciousness, peripheral neuropathy, paresthesia, dysesthesia, fever, gingival hyperplasia, diarrhea, constipation, dyspepsia, rash, urticaria, pruritus, folliculitis, joint pain, leg pain, muscle cramps, cough, upper respiratory infection, sinusitis, bronchitis, pneumonia, and herpes virus. Life-threatening side effects include MI, cardiac ischemia, orthostatic hypotension, viral meningitis, pseudomembranous colitis, hepatotoxicity, bronchospasm, and respiratory obstruction.

Marax, a trademark for a fixed-combination respiratory drug containing a smooth muscle relaxant **(theophylline),** an adrenergic (epHEDrine sulfate), and an antihistamine **(hydrOXYzine hydrochloride).**

marble bones. See **osteopetrosis.**

Marburg virus disease /mär′bərg/, a severe febrile viral disease characterized by rash, hepatitis, pancreatitis, and severe GI hemorrhages. The disease is caused by the Marburg virus, a member of the Filoviridae family, which also includes the Ebola virus. An epidemic in Marburg, Germany, in 1967 was apparently caused by infected imported African green monkeys. The disease may be transmitted to hospital personnel by improper handling of contaminated needles or from hemorrhagic lesions of patients. The diagnosis is made through serological abnormalities. There is no effective treatment. Also called **hemorrhagic fever.** See also **Ebola virus disease.**

Marcaine Hydrochloride, a trademark for a local anesthetic **(bupivacaine hydrochloride).**

march /märch/, the progression of electrical activity through the motor cortex.

Marchesani's syndrome. See **Weill-Marchesani syndrome.**

march foot [Fr, *marcher,* to walk; AS, *fot*], an abnormal condition of the foot caused by excessive use, such as in a long march. The forefoot is swollen and painful, and one or more of the metatarsal bones may be broken. See also **stress fracture.**

march fracture. See **metatarsal stress fracture.**

march hemoglobinuria, a rare abnormal condition, characterized by the presence of hemoglobin in the urine, that occurs after strenuous physical exertion or prolonged exercise, such as marching or distance running. See also **hemolysis.**

Marchiafava-Micheli disease /mär′kyəfä′və mikā′lē/ [Ettore Marchiafava, Italian physician, 1847–1935; F. Micheli, Italian physician, 1872–1929], a rare disorder of unknown origin characterized by episodic hemoglobinuria, which occurs usually, but not always, at night.

Marchi's globule /mär′kēz/ [Vittoria Marchi, Italian physician, 1851-1908], fragments and particles of broken-up myelin that stain by Marchi's method, seen in degeneration of the spinal cord. See also **globule.**

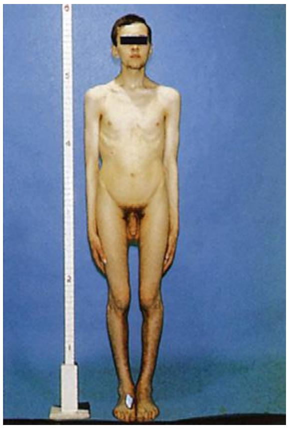
Marchi's method, a laboratory staining procedure for demonstrating degenerated nerve fibers. The tissue specimen is first fixed in a solution of potassium bichromate (Müller's fluid), which prevents normal nerve fibers from being stained with osmic acid; osmic acid is then applied as a definitive black stain for abnormal nerve fibers.

Marcus Gunn pupil sign [Robert Marcus Gunn, English ophthalmologist, 1850–1909], paradoxic dilation of the pupils in an ophthalmological examination in response to afferent visual stimuli. In a dark room a beam of light is moved from one eye to the other. Normal miosis is caused by the consensual pupil reaction when the normal eye is illuminated, but as the light is moved to the opposite, abnormal eye, the direct reaction to light is weaker than the consensual reaction; hence both pupils dilate.

Marcus Gunn's syndrome. See **jaw-winking.**

Marezine, a trademark for an antiemetic **(cyclizine hydrochloride).**

Marfan's syndrome /märfäNz′/ [Bernard-Jean A. Marfan, French pediatrician, 1858–1942], a hereditary condition that affects the musculoskeletal system and is often associated with abnormalities of the cardiovascular system and the eyes. Inherited as an autosomal-dominant trait, Marfan's syndrome affects men and women equally. Its major musculoskeletal effects include muscular underdevelopment, ligamentous laxity, joint hypermobility, and bone elongation. The extremities of individuals with Marfan's syndrome are very long and spiderlike, with arachnodactyly. Most adult patients are over 6 feet (1.8 meters) tall and have asymmetric skulls. Funnel chest is common, and a lateral curvature of the spine may develop and increase during years of rapid vertebral growth, with kyphoscoliosis developing to varying degrees. The severe ligamental laxity and joint hypermobility associated with Marfan's syndrome may be seen by radiographic examination and often result in pes valgus and back knee. Pathological alterations of the cardiovascular system appear to produce fragmentation of the elastic fibers in the media of the aorta, which may lead to aneurysm. Ocular changes include a variety of disorders, including dislocation of the lens. No specific treatment is available, and symptomatic management of the associated problems is the usual alternative. Resulting deformities, such as kyphoscoliosis, may be treated with orthoses or surgery, as indicated.



Marfan's syndrome *(Moll, 1997)*

margin, **1.** the mechanical preparation of a ledge to which a dental restoration meets natural tooth structure. Margins may occur above the gingiva (supragingival) and/or below the gingiva (subgingival). Compare **bevel, butt, shoulder, chamfer. 2.** See **border.**

marginal gingiva /mär′jənəl/ [L, *margo,* margin, *gingiva,* gum], the uppermost part of the free gingiva. It overlaps the neck and base of the crown of the tooth.

marginal gyrus [L, *margo,* margin; Gk, *gyros,* turn], the superior frontal convolution on the surface of the cerebral hemispheres.

marginal peptic ulcer [L, *margo,* margin; Gk, *peptein,* to digest; L, *ulcus,* ulcer], an ulcer that develops postoperatively at the surgical anastomosis of the stomach and jejunum. See also **peptic ulcer.**

marginal placenta previa, placenta previa in which the placenta is implanted in the lower uterine segment, with its margin touching or spreading to some degree over the internal os of the uterine cervix. During labor as the cervix dilates, bleeding may occur from the separation of the edge of the placenta from the uterus beneath it. Bleeding may be so scant as to pose no clinical problem. In some cases, frank severe hemorrhage may occur, but the pressure of the presenting part of the baby is often sufficient to act as a tamponade, arresting the hemorrhage. Diagnosis of marginal placenta previa may be suggested by the apparent location of the placenta on ultrasonic visualization. Cesarean section is not usually necessary. See also **placenta previa.**

marginal ridge, an elevation of enamel that forms the proximal boundary of the occlusal surface of a tooth.

marginal sinus [L, *margo* + *sinus,* hollow], a sinus that may encircle the placenta. Also called **placental sinus.**

marginal sinus rupture, a detachment of the placenta from the implantation site. It may be complete, partial, or marginal in abruptio placentae.

margin of safety, an index of a drug's effectiveness and safety. It is calculated as the amount of drug that is lethal to 1% of animals (LD_1) divided by the amount of drug that causes a beneficial effect in 99% of the animals (ED_{99}). See also **dose-response relationship.**

Marie's hypertrophy [Pierre Marie, French neurologist, 1853–1940; Gk, *hyper,* excess, *trophe,* nourishment], chronic enlargement of the joints caused by periostitis. Also called **hypertrophic pulmonary osteopathy.**

Marie-Strümpell arthritis, Marie-Strümpell disease. See **ankylosing spondylitis.**

marijuana. See **cannabis.**

Marin Amat's syndrome [Manuel Marin Amat, Spanish ophthalmologist, b. 1879], an involuntary facial movement in which the eyes close when the mouth opens or when the jaws move in mastication. The phenomenon results from a facial nerve paralysis. Also called *inverse Marcus Gunn's syndrome*.

Marinesco-Sjögren syndrome /mārēnes′kōshur′gren/ [Georges Marinesco, Romanian neurologist, 1863–1938; Karl Gustav Torsten Sjögren, Swedish physician, 1896–1974], a hereditary syndrome transmitted as an autosomal-recessive trait, consisting of cerebellar ataxia; mental and somatic growth retardation; congenital cataracts; inability to chew; thin brittle fingernails; and sparse, incompletely keratinized hair.

Marinol, a trademark for an oral antiemetic **(dronabinol).**

marital rape [L, *rapere,* to seize], forcible sexual intercourse with a spouse.

marital therapy, a type of family therapy aimed at understanding and treating one or both members of a couple in the context of a distressed relationship, but not necessarily addressing the discordant relationship itself. In the past the term has also been used more restrictively as synonymous with marriage therapy, but that is increasingly considered a subset of marital therapy. Also called **couples' therapy.**

mark [AS, *mearc*], any nevus or birthmark.

marker gene. See **genetic marker.**

markers [AS, *mearc*], body language movements that serve as indicators and punctuation marks in interpersonal communication.

mark:space ratio. See **duty cycle.**

Maroteaux-Lamy syndrome /märōtō′ lämē′/ [Pierre Maroteaux, French physician, b. 1926; Maurice Emile Joseph Lamy, French physician, 1895–1975], a mucopolysaccharidosis characterized biochemically by the predominance of the mucopolysaccharide dermatan sulfate in the urine and the presence of coarse granules in the leukocytes and clinically by Hurler-like signs with normal intelligence. There are three clinical forms: the severe or classic form shows Hurler-like symptoms (see **Hurler's syndrome**); the intermediate form has the same phenotype as **pseudo-Hurler polydystrophy;** and the mild form is difficult to distinguish from the **Scheie's syndrome.** Also called *mucopolysaccharidosis VI*.

Marplan, a trademark for an antidepressant **(isocarboxazid).**

marriage therapy, a subset of marital therapy that focuses specifically on enhancing and preserving the bond of marriage between two people.

marrow. See **bone marrow.**

Marseilles fever /märsālz′, märsā′/ [Marseille, France; L, *febris,* fever], a disease endemic around the Mediterranean, in Africa, in the Crimea, and in India, caused by *Rickettsia conorii* transmitted by the brown dog tick *(Rhipicephalus sanguineus)*. Characteristic symptoms are chills, fever, an ulcer covered with a black crust at the site of the tick bite, and a rash appearing on the second to fourth day. Also called **boutonneuse fever, Bruch's disease, Conor's disease, escharonodulaire, Indian tick fever, Kenya fever.**

Marshall-Marchetti-Krantz procedure, a surgical procedure performed to correct stress incontinence. The vesicourethropexy involves a retropubic incision and suturing of the urethra, vesicle neck, and bladder to the posterior surface of the pubic bone. Also called **Marshall-Marchetti operation.**

marsupialize /märso͞o′pē·əlīz/ [L, *marsupium,* pouch; Gk, *izein,* to cause], to form a pouch surgically to treat a cyst when simple removal would not be effective, such as in a pancreatic or a pilonidal cyst. The cyst sac is opened and emptied. Its edges are sutured to adjacent tissues, and a drain is left in place. Secretions decrease over a period of several months and may eventually cease.

Martinsen, Kari, a nursing theorist who proposed a philosophy of caring in reaction to social and health care inequalities and what she considered nursing's uncritical adoption of science as the basis for nursing. It involves a collectivist vision of humanity in which the individual is dependent upon the community and creation, or nature, and caring rather than control should be the guiding philosophy. As it relates to nursing, caring is simultaneously relational, practical, and moral. Caring involves concrete action based on education and training, without which concern for the patient is mere sentimentality.

Martorell's syndrome. See **Takayasu's arteritis.**

MAS, abbreviation for **mobile arm support.**

mAs, abbreviation for **milliampere-second.**

masculine /mas′kyəlin/ [L, *masculinus,* male], having the characteristics of a male.

masculinization /mas′kyəlin′īzā′shən/ [L, *masculinus* + Gk, *izein*, to cause], the normal development or induction of male sex characteristics. See also **virilization. —masculinize,** *v*.

MASER /mā′sər/, abbreviation for *microwave amplification by stimulated emission of radiation*.

MASH /mash/, abbreviation for *mobile army surgical hospital*.

mask [Fr, *masque*], **1.** *v*, to obscure, as in symptomatic treatment that may conceal the development of a disease. **2.** *v*, to cover, as does a skin-toned cosmetic that may hide a pigmented nevus. **3.** *n*, a cover worn over the nose and mouth to prevent inhalation of toxic or irritating materials, to control delivery of oxygen or anesthetic gas, or (by medical personnel) to shield a patient during aseptic procedures from pathogenic organisms normally exhaled from the respiratory tract. Surgical masks are worn by workers to help control the operating room environment during a patient procedure.

Mask *(Courtesy Medline Industries, Mundelein, Illinois)*

masked facies. See **parkinsonian facies.**

masked residue, the amino acid part of a peptide that is not accessible for activity after a condensation reaction.

mask image, a radiographic image made either before or immediately after contrast material has been injected but before it reaches the anatomical site being examined. The image thus produced is stored in a computer and displayed on a video monitor. It is then subtracted electronically from a series of additional images. The technique enhances the image of the tissues being studied. See also **remasking.**

masking, **1.** the covering or concealing of a disorder by a second condition. An example is a person's beginning a weight-loss diet while an undiagnosed wasting disease such as cancer has developed. The loss of body weight is attributed to the diet, masking the disease and delaying diagnosis and treatment. **2.** the unconscious display of a personality trait that conceals a behavioral aberration.

masking agent, a cosmetic preparation for covering nevi, surgical scars, and other blemishes. Masking agents are generally composed of a flesh-colored pigment in a lotion or cream base.

masklike facies [Fr, *masque* + L, *facies*, face], an immobile expressionless face with staring eyes and slightly open mouth. It is sometimes associated with parkinsonism or psychiatric conditions.

mask of pregnancy. See **chloasma.**

Maslow's hierarchy of needs /mas′lōz/ [Abraham H. Maslow, American psychiatrist, 1908–1970; Gk, *hierarches*, position of authority; AS, *nied*, obligation], (in psychology) a hierarchic categorization of the basic needs of humans. The most basic needs on the scale are the physiological or biological needs, such as the need for air, food, or water. Of second priority are the safety needs, including protection and freedom from fear and anxiety. The subsequent order of needs in the hierarchic progression are the need to belong, to love, and to be loved; the need for self-esteem; and ultimately the need for self-actualization. To progress from one need to another, the more basic need must first be satisfied.

masochism /mas′ōkiz′əm/ [Leopold von Sacher-Masoch, Austrian author, 1836–1895], pleasure or gratification derived from receiving physical, mental, or emotional abuse. The maltreatment may be inflicted by another person or by oneself. It may involve a need to experience emotional or physical pain, in reality or fantasy, to become sexually aroused. Also called **passive algolagnia.** Compare **sadism.** See also **algolagnia, sadomasochism. —masochistic,** *adj*.

masochist /mas′ōkist/ [Leopold von Sacher-Masoch], a person who derives pleasure or gratification from masochistic acts or abuse. Compare **sadist.** See also **masochism.**

masochistic personality. See **self-defeating personality disorder.**

mass (*m*) [L, *massa*], **1.** the physical property of matter that gives it weight and inertia. **2.** (in pharmacology) a mixture from which pills are formed. **3.** an aggregate of cells clumped together, such as a tumor. Compare **weight.** See also **inertia.**

mass action law, **1.** the mathematical description of reversible reactions that attain equilibrium, generally regarded as applicable to competitive assay. **2.** the rate of a chemical reaction that is proportional to the active masses of the resulting substances.

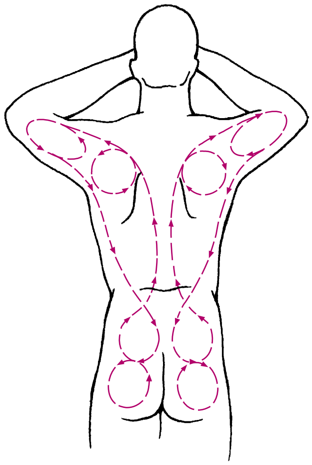
massage^1 /məsäzh, məsäj′/ [Fr, *masser*, to stroke], the manipulation of the soft tissue of the body through stroking, rubbing, kneading, or tapping, to increase circulation, to improve muscle tone, and to relax the patient. The procedure is performed either with the bare hands or through some mechanical means, such as a vibrator. The most common sites for massage are the back, knees, elbows, and heels. Care is taken not to massage inflamed areas, particularly of the extremities, because of the danger of loosening blood clots. Open wounds and areas of rash, tumor, or excessive sensitivity are avoided. Even if the extremities (legs) are not inflamed, they should not be massaged if the client has been immobilized for an extended period of time. The procedure is performed with the patient prone or on the side, comfortably positioned, with an emollient lotion or cream applied to the area to be massaged. The caregiver's hands are warm, and excessive pressure is avoided to prevent pain or injury. Kinds of massage are **cardiac massage, effleurage, flagellation, friction, frôlement, pétrissage, tapotement,** and **vibration.**

massage^2**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as stimulation of the skin and underlying tissues with varying degrees of hand pressure to decrease pain, produce relaxation, and/or improve circulation. See also **Nursing Interventions Classification.**

-massage, suffix meaning a "therapeutic kneading of the body": *electromassage, hydromassage, phonomassage*.

massage therapist, a person who performs massages to relieve pain and enhance healing.

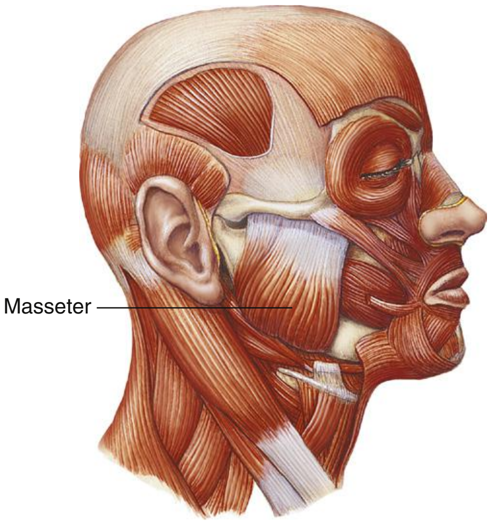
massage therapy, the manipulation of the soft tissues of the body for the purpose of normalizing them, thereby enhancing health and healing. Massage therapy includes a



Back massage pattern *(Potter et al, 2011)*

number of methods, such as acupressure, classical Western massage, and shiatsu.

masseter /masē′tər/ [Gk, one who chews], the thick rectangular muscle in the cheek that functions to close the jaw. It is one of the four muscles of mastication. The masseter is innervated by the masseteric nerve from the mandibular division of the trigeminal nerve.



Masseter *(Patton and Thibodeau, 2010)*

masseteric nerve, a branch of the anterior trunk of the mandibular nerve that penetrates and supplies the masseter muscle.

mass fragment [L, *massa,* lump, *frangere,* to shatter], (in mass spectrometry) a degraded part of a molecule containing one or more charges.

mass hysteria [ME, *maiour,* great; Gk, *hystera,* womb], an episode of psychogenic illness affecting a large group of individuals at the same time. Examples include the witchcraft trials of the 17th century and the irrational mass reaction to the 1938 radio show based on H.G. Wells' science-fiction novel, *War of the Worlds*. Also called **collective hysteria, epidemic hysteria, major hysteria, mass panic, mass psychogenic illness.**

massive lung collapse, a condition in which an entire lung or one of its lobes becomes airless, frequently as a result of an obstruction in a bronchus.

massive transfusion syndrome [L, *multus,* many, *plica,* fold, *transfundere,* to pour through; Gk, *syn,* together, *dromos,* course], a hemorrhagic reaction to massive transfusions of platelet-poor stored blood. For an adult, transfusion of 10 units of blood in a 24-hour period is a massive transfusion. Platelet concentrates and/or fresh frozen plasma may be given to correct the deficiency.

mass number (A), the sum of the number of protons and neutrons in the nucleus of an atom or isotope. See also **atomic number.**

mass panic, mass psychogenic illness. See **major hysteria.**

mass reflex, an abnormal condition, seen in patients with transection of the spinal cord, characterized by a widespread nerve discharge. Stimulation below the level of the lesion results in flexor muscle spasms, incontinence of urine and feces, priapism, hypertension, and profuse sweating.

■ OBSERVATIONS: A mass reflex may be triggered by scratching or other painful stimulus to the skin, overdistension of the bladder or intestines, cold weather, prolonged sitting, or emotional stress. Muscle spasms may be so violent as to propel the patient off a bed or stretcher.

■ INTERVENTIONS: Medications to reduce mass reflexes include diazepam, dantrolene, chlordiazepoxide, and meprobamate. Hubbard baths and exercises in warm water also help. Occasionally chordotomy, rhizotomy, peripheral nerve transection, or tenotomy may be necessary.

■ NURSING CONSIDERATIONS: Nurses should avoid stimulating areas that trigger mass reflexes and should be prepared to accept them when they occur and to explain the cause to the patient. It is important to prevent decubitus ulcers and bladder infections in paraplegic and tetraplegic patients because they may also serve as triggers to initiate mass reflexes.

mass spectrometer, an analytic instrument for identifying a substance by sorting a stream of charged particles (ions) according to their mass. The sorting is usually accomplished by deflecting a stream of charged particles into a semicircular path as it enters a magnetic field and ultimately strikes a photographic plate or a photomultiplier tube sensor.

mass spectrometry, (in chemistry) a technique for the analysis of a substance in which the molecule is subjected to bombardment by high-energy electrons or atoms to cause ionization and fragmentation to give a series of ions in the gas phase that constitutes the fragmention pattern observed by using a mass spectrometer. A molecule can frequently be identified just on the basis of its mass spectrum. See also **spectrometry, spectrophotometry.**

mass spectrum, a characteristic pattern obtained from a mass spectrometer.

mass transfer, the movement of mass from one phase to another.

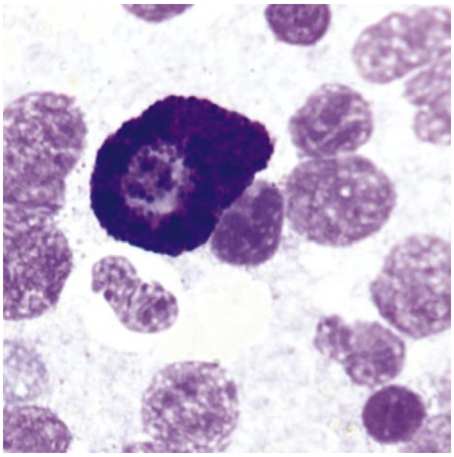
mass transfer-area coefficient (MTAC), the permeability of a dialysis membrane multiplied by the available area of the membrane, calculated as the clearance rate by diffusion when there is no ultrafiltration and when there is not yet any solute in the dialysate.

MAST, abbreviation for **military antishock trousers.**

mast-. See **masto-.**

mastalgia /mastal′jə/ [Gk, *mastos,* breast, *algos,* pain], pain in the breast caused by congestion or "caking" during lactation, an infection, or fibrocystic disease, especially during or before menstruation, or by advanced cancer. The early stages of breast cancer are rarely accompanied by pain. **—mastalgic,** *adj.*

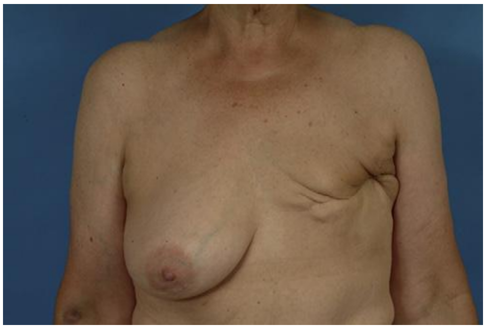
mast cell [Ger, *Mast,* fattening; L, *cella,* storeroom], a constituent of connective tissue containing large basophilic granules that contain heparin, serotonin, bradykinin, and histamine. These substances are released from the mast cell in response to injury, inflammation, and infection.



Mast cell in bone marrow *(Carr and Rodak, 2009)*

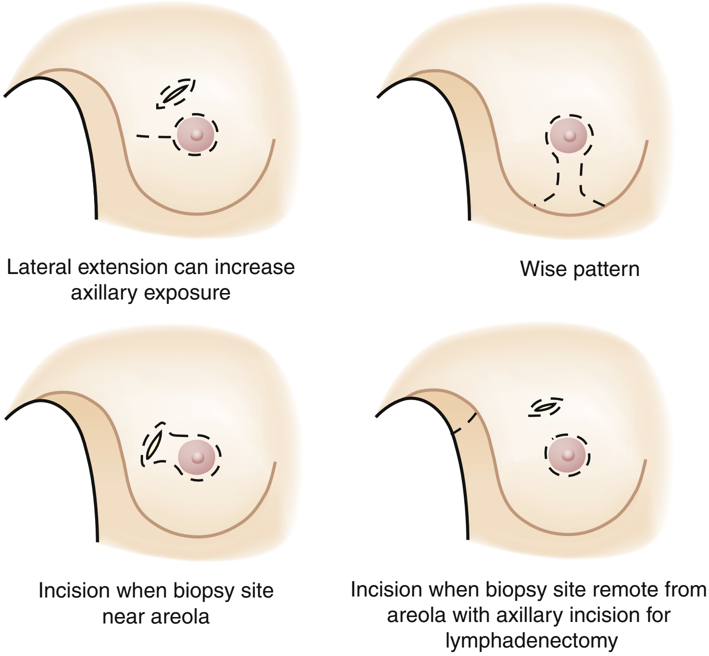
mast cell leukemia, a malignant neoplasm of leukocytes characterized by connective tissue mast cells in circulating blood.

mast cell tumor [Ger, *Mast,* fattening; L, *cella,* storeroom; L, *tumor*], a connective tissue tumor composed of mast cells. Granules of the cells stain metachromatically with toluidine blue.



Modified radical mastectomy *(Hammond, 2007).*

mastectomy /mastek′təmē/ [Gk, *mastos,* breast, *ektomē,* excision], the surgical removal of one or both breasts, most commonly performed to remove a malignant tumor. In a simple mastectomy the breast is removed without lymph node dissection. In a radical mastectomy some of the muscles of the chest are removed with the breast, together with lymph nodes in the axilla. In a modified radical mastectomy the involved breast and all axillary contents (axillary, pectoral, and superior apical nodes) are removed, but the pectoral muscles are preserved. The tumor is biopsied before the mastectomy. If the specimen shows a malignancy, the tumor and adjacent tissues are removed in one piece. At the end of the surgical procedure a drainage catheter is placed in the wound. The nurse inspects the wound for swelling or excessive bleeding and encourages the patient to deep breathe. The affected arm is positioned with the hand pointed upward or on pillows so that the hand is higher than the lower arm, with the lower arm above heart level. Hand and wrist movements and elbow flexion and extension are begun within 24 hours and performed regularly. The patient may be fitted with a prosthesis when the wound is completely healed



Lateral extension can increase axillary exposure
Wise pattern
Incision when biopsy site near areola
Incision when biopsy site remote from areola with axillary incision for lymphadenectomy

Different incisions for patients undergoing mastectomy *(Townsend et al, 2008)* or at the time of the mastectomy. Emotional support and counseling are essential. See also **breast cancer, modified radical mastectomy, radical mastectomy, simple mastectomy.**

master problem list, a list of a patient's problems that serves as an index to his or her record. Each problem, the date when it was first noted, the treatment, and the desired outcome are added to the list as each becomes known. Thus the list provides an ongoing guide for reviewing the health status and planning the care of the patient. See also **SOAP.**

master's degree program in nursing, a postgraduate program in a school of nursing in a university setting that grants the degree Master of Science in Nursing to successful candidates. Most programs include theory of nursing and techniques in nursing research as integral parts of the curriculum. The degree may be awarded for work in maternal-newborn nursing, medical-surgical nursing, pediatric nursing, psychiatric nursing, or other fields. Nurses with this degree function in leadership roles in clinical nursing, as consultants in various settings, in faculty positions in schools of nursing, and as nurse practitioners in various specialties.

mastery /mas′tərē/ [L, *magister,* chief], command or control of a situation.

-mastia. See **-mazia.**

mastication /mas′tikā′shən/ [L, *masticare,* to chew], chewing, tearing, or grinding food with the teeth while it becomes mixed with saliva. See also **bolus, digestion, ptyalin.**

masticatory apparatus. See **masticatory system.**

masticatory movement /mas′tikətôr′ē/, motion of the lower jaw in chewing.

masticatory surface. See **occlusal surface.**

masticatory system [L, *masticare,* to chew; Gk, *systema*], the combination of structures involved in chewing, including the jaws, teeth and supporting structures, mandibular and maxillary musculature, temporomandibular joints, tongue, lips, cheeks, oral mucosa, blood supply, and cranial nerves. Also called **masticatory apparatus.** Compare **stomatognathic system.**

mastigophora, protozoa having flagella. See also **protozoon.**

mastigophoran /mas′tĭgof′ärahn/, any member of the subphylum Mastigophora. Also called *mastigote*.

mastitis /mastī′tis/ [Gk, *mastos*, breast, *itis*, inflammation], an inflammatory condition of the breast, usually caused by streptococcal or staphylococcal infection. **Acute mastitis,** most common in the first 2 months of lactation, is characterized by pain, swelling, redness, axillary lymphadenopathy, fever, and malaise. If it is untreated or inadequately treated, abscesses may form. Antibiotics, rest, analgesia, and warm soaks are usually prescribed. Usually breastfeeding may continue. **Chronic tuberculous mastitis** is rare; when it occurs, it represents extension of tuberculosis from the lungs and ribs beneath the breast.

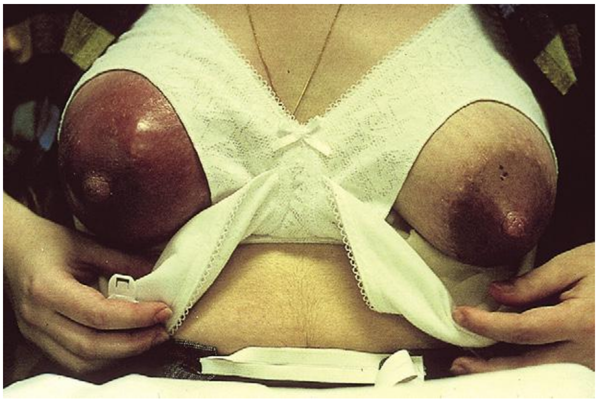
masto-, mast-, prefix meaning "breast": *mastochondroma, mastologist, mastoplasia*.

mastocarcinoma /mas′təkär′sinō′mə/, carcinoma of the mammary gland.

mastocyte. See **mast cell.**

mastocytoma /mas′təsītō′mə/, a tumor that contains mast cells.

mastocytosis /mas′təsītō′sis/ [Ger, *Mast,* fattening; Gk, *kytos,* cell, *osis,* condition], local or systemic overproduction of mast cells, which in rare instances may infiltrate liver, spleen, bones, the GI system, and skin. Systemic mastocytosis may precede mast cell leukemia.



Mastitis *(Zitelli and Davis, 2007/Courtesy Dr. J. Newman, FRCPC, Hospital for Sick Children)*

mastoid /mas′toid/ [Gk, *mastos,* breast, *eidos,* form], **1.** pertaining to the mastoid process of the temporal bone. **2.** breast-shaped.

mastoid-, prefix meaning "mastoid process": *mastoidectomy*.

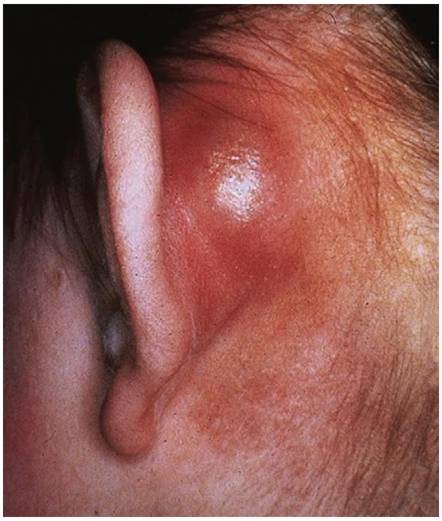
mastoid antrum, a cavity continuous with mastoid cells. It is separated from the middle cranial fossa above by the tegmen tympani.

mastoid cells [Gk, *mastos,* breast, *eidos,* form; L, *cella,* storeroom], air cells in the mastoid process of the temporal bone. Also called *mastoid air cells*.

mastoidectomy /mas′toidek′təmē/ [Gk, *mastos* + *eidos,* form, *ektomē,* excision], surgical excision of a part of the mastoid part of the temporal bone, frequently performed to treat cholesteatoma. It may also be performed to treat chronic suppurative otitis media or mastoiditis when systemic antibiotics are ineffective. Often done as part of reconstructive procedure and classified as simple modified radical. Entry is made through the ear canal or from behind the ear. In a simple mastoidectomy with the patient under general anesthesia, diseased bones of the mastoid are removed while the ossicles, eardrum, and canal wall are left intact and the eardrum is incised to drain the middle ear. Topical antibiotics are then instilled in the ear. In a radical procedure the eardrum and most middle ear structures are removed. The stapes is left intact so that a hearing aid may be used. The opening to the eustachian tube is plugged. In a modified radical procedure the eardrum and some of the ossicles are saved, and the patient hears better than after a radical mastoidectomy. After surgery any bright red blood on the dressing may indicate hemorrhage. A stiff neck or disorientation may signal the onset of meningitis. Dizziness is usual and may be expected to last for several days.

mastoid fontanel, a posterolateral fontanel that is usually not palpable. See also **fontanel.**

mastoiditis /mas′toidī′tis/ [Gk, *mastos* + *eidos,* form, *itis,* inflammation], an infection of one of the mastoid bones, usually an extension of a middle ear infection. It is characterized by earache, fever, headache, and malaise. Swelling of the mastoid process often displaces the pinna anteriorly and inferiorly. The infection is difficult to treat, often requiring antibiotic administered intravenously for several days. Children are most often affected. Residual hearing loss may follow the infection.



Mastoiditis *(Stone and Gorbach, 2000/ Courtesy Dr. N. Blevins, New England Medical Center)*

mastoid process, the irregular conic projection of the caudal, posterior part of the temporal bone, serving as the attachment for various muscles, including the sternocleidomastoideus, splenius capitis, and longissimus capitis. A hollow section of the process contains air cells that are distinguished from a large, irregular tympanic antrum in the superior anterior part of the process. See also **temporal bone.**

mastopathy /mastop′əthē/, any disease of the breast.

mastopexy, a reconstructive procedure in cosmetic surgery to lift the breasts.

masturbation /mas′tərbā′shən/ [L, *masturbari,* to masturbate], sexual activity in which the penis or clitoris is stimulated, usually to orgasm, by means other than coitus. It is performed at least occasionally by most people and is considered to be normal and harmless. **—masturbate,** *v.,* **masturbatic, masturbatory,** *adj.*

-masty. See **-mazia.**

mat, **1.** abbreviation for **maternity. 2.** abbreviation for **maturity. 3.** abbreviation for **maternal.**

matched group. See **group.**

matching layer, a layer of material placed in front of an ultrasound transducer to improve the efficiency of energy transfer into and out of a patient.

materia /mətir′ē·ə/, matter or material, such as materia medica.

materia alba /mətir′ē·ə· al′bə/ [L, white matter], a whitish or cream-colored cheesy mass deposited around the necks of the teeth, composed of food debris, mucin, and dead epithelial cells. It is usually associated with poor oral hygiene.

material fact /mətir′ē·əl/ [L, *materia,* matter, *factum*], **1.** (in law) a fact that establishes or refutes an element essential to the complaint, charge, or defense. The presence of a material fact in a case being tried precludes granting of a summary judgment. **2.** a fact that would be important to a reasonable person in deciding whether to engage in a transaction or not.

materia medica (mat. med.), **1.** the study of the origins, preparation, uses, and effects of drugs and other substances used in medicine. **2.** a substance or a drug used in medical treatment.

matern., **1.** abbreviation for **maternal. 2.** abbreviation for **maternity.**

maternal (mat, matern.) /mətur′nəl/ [L, *maternus,* motherhood], **1.** inherited, derived, or received from a mother. **2.** motherly in behavior. **3.** related through the mother's side of the family, such as a maternal grandfather.

maternal and child health (MCH) services, various facilities and programs organized for the purpose of providing medical and social services for mothers and children. Medical services include prenatal and postnatal services, family planning care, and pediatric care in infancy.

maternal antibody, an antibody transmitted from mother to fetus via the placenta. Such antibodies can provide immunity for the fetus and the newborn for up to 6 months after birth. They may also cause hemolytic anemia in newborns in cases of Rh or ABO blood group incompatibility between mother and child.

maternal-child attachment. See **maternal-infant bonding.**

maternal-child separation syndrome. See **separation anxiety.**

maternal death, the death of a woman during the childbearing cycle.

maternal deprivation syndrome [L, *maternus,* motherhood, *deprivare,* to deprive; Gk, *syn,* together, *dromos,* course], a condition characterized by developmental retardation that occurs as a result of physical or emotional deprivation. It is seen primarily in infants. Typical symptoms include lack of physical growth, with weight below the third percentile for age and size; malnutrition; pronounced withdrawal; silence; apathy; irritability; and a characteristic posture and body language, featuring unnatural stiffness and rigidity with a slow response reaction to others. Causes of the syndrome are usually multiple and complex, involving such factors as parental indifference; emotional instability or insecurity of the mother; lack of or delayed development of the mother-child attachment process; unrealistic expectations or disappointment concerning the sex, appearance, or adaptability of the child; or unfavorable socioeconomic conditions within the family. Treatment often requires hospitalization, especially in cases of severe malnutrition. Care includes assessment of the family situation, and treatment often involves psychotherapy, counseling, or special nursing instruction to help the parents learn to deal with and provide for the child. The nature and extent of the effects of the condition on later physical, emotional, intellectual, and social development vary considerably and depend on the age at which deprivation occurs, the degree and duration of the situation, the child's constitutional makeup, and the substituted care that is provided. Emotionally deprived children often remain below normal in intellectual development, fail to learn acceptable social behavior, and are unable to form trusting, meaningful relationships with others. In severe cases of early and prolonged deprivation, the damage to an infant may be irreversible. See also **failure to thrive.**

maternal effect. See **maternal inheritance.**

maternal immunity, protection against disease acquired by a fetus through the passage of maternal antibodies via the placenta. See also **maternal antibody.**

maternal-infant bonding, the complex process of attachment of a mother to her newborn. Disastrous effects of the disruption or absence of this attachment have long been known. The specific steps in its development and the factors that disturb or encourage it have been identified and described by anthropologists, pediatricians, psychologists, nurses, midwives, and sociologists. The process begins before birth as the parents plan for the pregnancy or discover that the mother is pregnant. The mother feels fetal movement, begins to accept the fetus as an individual, and makes plans for the baby after birth. In the first minutes and hours after birth, a sensitive period occurs during which the baby and the mother become intimately involved with each other through behaviors and stimuli that are complementary and provoke further interactions. The mother touches the baby and holds it en face to achieve eye-to-eye contact. The infant looks back eye to eye. The mother speaks in a quiet high-pitched voice. The mother and the baby move in turn to the voice and sounds of the other, a process known as entrainment, which can be likened to a dance. The infant's movements constitute a response to the mother's voice, and she is encouraged to continue the process. The secretion of oxytocin and prolactin by the maternal pituitary gland is stimulated by the baby's sucking or licking of the mother's breasts; T and B lymphocytes and macrophages are given to the baby in the mother's milk, promoting resistance to infection. The child is also colonized by the normal flora of the mother's skin and nasal passages, improving the baby's ability to fend off infection. Physically the mother provides her body heat for the baby's warmth and comfort. Thus the extended contact in the newborn period satisfies physical and emotional needs of the mother and baby. Experts have made the following recommendations to increase the development of maternal-infant bonding: The special needs of the mother are assessed before delivery; the parents attend classes to prepare them for labor, delivery, and the puerperium; and discussions are held regarding the stresses of pregnancy and the postpartum period. In labor and delivery a companion is encouraged to stay with the mother. After the baby is born, silver nitrate drops or other medications are not placed in the baby's eyes until the mother and the baby have had time to be together en face, with eye contact for an extended period, because the drops cause a film to form over the eyes, dimming vision. During the first hour after birth the parents and the infant are not separated and are given as much privacy as possible. Skin-to-skin contact is encouraged; various methods may be used to maintain an ambient temperature adequate to maintain the baby's temperature. On the postpartum unit the mother and the baby are kept together for at least 5 hours a day, but optimally for 24 hours a day in a 24-hour rooming-in care unit. The entire family is allowed to visit. The mother has responsibility for the care of her baby, with consultation available from a midwife or a nurse. The staff does not criticize the mother's performance because it is to the baby's inestimable benefit that the mother believes that her baby is the best, most beautiful, and most perfect baby in the world and that she feels able to care for her baby.

maternal inheritance, the transmission of traits or conditions controlled by cytoplasmic factors within the ovum that are not self-replicating and are determined by genes within the nucleus. An example of such a characteristic is the direction of coiling in the shells of snails. Also called **maternal effect.**

maternal inheritance mendelism. See **inheritance.**

maternal microchimerism, persistence of cells derived from the mother in her offspring. It may play a role in autoimmune disease in the children.

maternal mortality, **1.** the death of a woman as a result of childbearing. **2.** the number of maternal deaths per 100,000 live births. The statistic excludes women who die from ruptured ectopic pregnancy or any other condition in which there was no birth (stillbirth, septic abortion).

maternal placenta [L, *maternus,* motherhood, *placenta,* flat cake], the part of the placenta that develops from the decidua basalis of the uterus and is usually shed along with the fetal elements.

maternal screen testing, a blood or urine screen for birth defects and genetic disorders, administered in early pregnancy. It is most important for women over 35 years of age and those who have previously delivered children with birth defects.

maternal serum alpha-fetoprotein (MSAFP) test, a test of a pregnant woman's blood designed to indicate an increased risk for fetal open neural tube defects, such as spina bifida. It may also indicate an increased risk for Down syndrome. See also **alpha-fetoprotein.**

maternal status: antepartum, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which maternal well-being is within normal limits from conception to the onset of labor. See also **Nursing Outcomes Classification.**

maternal status: intrapartum, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which maternal well-being is within normal limits from onset of labor to delivery. See also **Nursing Outcomes Classification.**

maternal status: postpartum, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which maternal well-being is within normal limits from delivery of placenta to completion of involution. See also **Nursing Outcomes Classification.**

maternity cycle [L, *maternus,* motherhood; Gk, *kyklos,* circle], the antepartal, intrapartal, and postpartal periods of pregnancy and the puerperium, from conception to 6 weeks after birth.

maternity (mat, matern.) /mətur′nitē/ [L, *maternus,* motherhood], motherhood; the character and quality of a mother.

maternity nursing, nursing care provided to women and their families during pregnancy and parturition and through the first days of the puerperium. Increasingly postpartum maternity nursing includes the supervision of the mothers' care of their newborns in rooming-in units and may include care of normal newborns in a nursery when they are not with their mother. Maternity nursing includes extensive instruction of mothers in the usual behavior and needs of a newborn, in expected patterns of growth and development of the infant during the first week, and in details of care needed by the mother during the first weeks after birth. Breastfeeding, bottle feeding, baby baths, perineal care, umbilical care, nutrition, and danger signs of the puerperium are usually taught by the maternity nurse. Observation for abnormal conditions, such as thrombophlebitis, mastitis, and other infections, is an ongoing concern in the puerperium. Intrapartum maternity nursing involves the care of mothers in labor and delivery, as well as high-risk nursing, emotional support in labor and delivery, and ongoing observation for the onset of abnormal signs or symptoms. Often pregnant women with medical problems associated with pregnancy are cared for on a special high-risk antepartum unit by specially educated maternity nurses.

mat gold [Fr, *mat,* dull; AS, *geolu,* yellow], a noncohesive form of pure gold. Also called **crystal gold, sponge gold.** See also **gold foil.**

mating /mā′ting/ [D, *mate,* companion], the pairing of individuals of the opposite sex, primarily for purposes of reproduction.

mat. med., abbreviation for **materia medica.**

matrifocal family /mat′rifō′kəl/ [L, *mater,* mother, *focus,* hearth, *familia,* household], a family unit composed of a mother and her children. Biological fathers may have a temporary place in the family during the first years of the children's lives, but they maintain a more permanent position in their own original families.

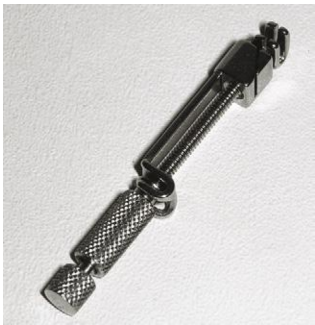
matrix /mā′triks, mat′riks/ [L, womb], **1.** an intercellular substance. **2.** also called **ground substance,** a basic substance from which a specific organ or kind of tissue develops. **3.** a form used in shaping a tooth surface in dental procedures. **4.** (in analytical chemistry) material of no interest in an analysis that may have an effect on the analysis. **5.** a rectangular arrangement of elements into rows and columns, often used to display a digital image.

matrix band, a cylindrical copper or stainless steel band or short tube that is seated over a tooth. The band may be filled with impression compound, which flows into a prepared cavity in order to obtain an impression, or it may be used to aid in the placement and contouring of restorative materials. See also **matrix retainer.**

matrix holder. Also called *Tofflemire matrix retainer.* See **matrix retainer.**

matrix metalloproteinase, any of a group of endopeptidases that hydrolyze proteins of the extracellular matrix.

matrix retainer, a mechanical device used to secure the ends of a matrix band around a tooth. The band provides a substitute wall where a part of the tooth is missing and helps to compact a restoration into a prepared tooth cavity after the carious lesion has been removed. Also called **matrix holder.** See also **retainer.**



Matrix retainer *(Bird and Robinson, 2012)*

matrix size, the number of pixels allocated to each linear dimension in a digital image.

matrix unguis. See **nailbed.**

matroclinous inheritance /mātrō′klinəs/ [L, *mater,* mother; Gk, *klinein,* to incline], a form of heredity in which the traits of the offspring have been transmitted from the mother.

matter [L, *materia*], **1.** anything that has mass and occupies space. **2.** any substance not otherwise identified as to its constituents, such as gray matter, pus, or serum exuding from a wound.

Mattis Dementia Rating Scale (DRS), a widely used tool for evaluation of cognitive function dementia in adults over the age of 55 years who have brain dysfunction. It measures overall cognitive functioning on five subscales and can be used at lower ability levels than can be tested by most other methods. There is also an extensively revised version (DRS-2).

Matulane, a trademark for an antineoplastic **(procarbazine hydrochloride).**

maturation /mach′ərā′shən/ [L, *maturare,* to ripen], **1.** the process or condition of attaining complete development. In humans it is the unfolding of full physical, emotional, and intellectual capacities that enable a person to function at a higher level of competency and adaptability within the environment. **2.** the final stages in the meiotic formation of germ cells in which the number of chromosomes in each cell is reduced to the haploid number characteristic of the species. See also **meiosis, oogenesis, spermatogenesis. 3.** suppuration. **—maturate,** *v.*

maturational crisis /mach′ərā′shənəl/, a transitional or developmental period within a person's life, such as puberty, when psychological equilibrium is upset.

mature /məcho͝or′/ [L, *maturus,* ripe], **1.** *v,* to become fully developed; to ripen. **2.** *adj,* fully developed or ripened.

mature cataract. See **ripe cataract.**

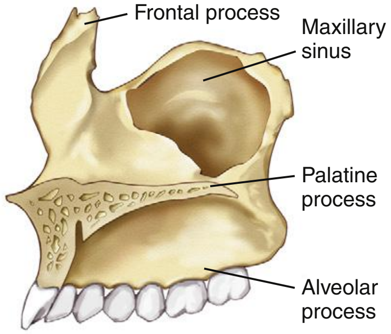
mature cell leukemia. See **polymorphocytic leukemia.**

maturity (mat) /məcho͞o′ritē/ [L, *maturus,* ripe], **1.** a state of complete growth or development, usually designated as the period of life between adolescence and old age. **2.** the stage at which an organism is capable of reproduction.

maturity-onset diabetes. See **type 2 diabetes mellitus.**

max, **1.** abbreviation for *maxima.* **2.** abbreviation for *maximum.*

maxilla /maksil′ə/ *pl.* **maxillae** [L, *mala,* jaw], one of a pair of large bones (often referred to as one bone) that form the upper jaw and teeth, consisting of a pyramidal body and four processes: the zygomatic, frontal, alveolar, and palatine.



Maxilla

-maxilla, suffix meaning "upper jaw or the bones composing it": *intermaxilla, submaxilla, supermaxilla.* **—maxillae.** See **maxilla.**

maxillary /mak′səler′ē/ [L, *maxilla,* upper jaw], pertaining to the upper jawbone.

maxillary arch [L, *maxilla,* upper jaw, *arcus,* bow], the curved bony ridge of the upper jawbone, in the shape of a horseshoe, including the dentition and supporting structures.

maxillary artery [L, *maxilla,* upper jaw; Gk, *arteria,* airpipe], either of two larger terminal branches of the external carotid arteries that rise from the neck of the mandible near the parotid gland and divide into six branches, supplying the deep structures of the face.

maxillary fossa. See **canine fossa.**

maxillary nerve, the second division of the trigeminal nerve, a purely sensory nerve that branches into a zygomaticotemporal branch, a zygomaticofacial branch, and the large infraorbital nerve, which in turn has multiple branches that supply the face.

maxillary process [L, *maxilla,* upper jaw, *processus*], **1.** the alveolar process of the upper jaw that contains the tooth sockets. **2.** the frontal process that extends upward to articulate with the frontal and nasal bones. **3.** the palatine process that helps form the hard palate. **4.** the zygomatic process, or anterior surface, that articulates with the zygomatic bone.

maxillary retroposition, maxillary retrusion. See **retrognathia.**

maxillary sinus, one of a pair of large air cells forming a pyramidal cavity in the body of the maxilla. The apex of each sinus extends into the zygomatic arch, and its floor, formed by the alveolar process, is usually 1 to 10 mm below the floor of the nose. In the adult the volume of the sinus averages 14.75 cc. The mucous membrane of the sinus is continuous with that of the nasal cavity. In the fourth month of gestation the embryonic sinus appears as a shallow groove on the medial surface of the bone. It does not reach full size until after the second teething. Also called **antrum of Highmore.** Compare **ethmoidal air cell, frontal sinus, sphenoidal sinus.**

maxillary tuberosity, a rounded eminence on the posterior surface of the body of the maxilla, behind the root of the third molar through which the posterior superior alveolar nerve enters the maxilla. It becomes prominent after the eruption and growth of the third molars.

maxillary vein, one of a pair of deep veins of the face, accompanying the maxillary artery and passing between the condyle of the mandible and the sphenomandibular ligament. Each maxillary vein is a tributary of the internal jugular and external jugular veins.

maxillodental /mak′silōden′təl/, pertaining to or affecting the upper jaw and teeth.

maxillofacial /mak′silōfā′shəl/ [L, *maxilla*, upper jaw, *facies*, face], pertaining to the maxilla and face.

maxillofacial dysostosis. See **maxillofacial syndrome.**

maxillofacial prosthesis [L, *maxilla*, upper jaw, *facies*, face], a prosthetic replacement for part, or all, of the upper jaw, nose, or cheek. It is applied when surgical repair alone is inadequate.

maxillofacial surgery. See **oral and maxillofacial surgery.**

maxillofacial syndrome, a congenital defect of fetal ossification characterized by anteroposterior shortening of the maxilla and various other anomalies, including mandibular prognathism, slanting of the eyes, and malformation of the auricles. Also called **maxillofacial dysostosis.**

maxillofacial trauma, injury to the jaw and face. Fractures requiring reconstructive surgery tend to occur most frequently in motor vehicle collisions and short falls.

maxillolacrimal suture /-lak′riməl/, a line of union between the anterior border of the lacrimal bone and the frontal process of the maxilla. Also called **lacrimomaxillary suture.**

maxillomandibular /maksil′ōmandib′yo͞olər/, pertaining to the upper and lower jaws.

maxillomandibular fixation [L, *maxilla*, upper jaw, *mandere*, to chew, *figere*, to fasten], stabilization of fractures of the face or jaw by temporarily connecting the maxilla and mandible by wires, elastic bands, or metal splints. See also **elastic-band fixation, nasomandibular fixation.**

maxillomandibular relation. See **jaw relation.**

maxillotomy /mak′silot′əmē/ [L, *maxilla*, upper jaw; Gk, *tomē*, a cutting], surgical sectioning of the maxilla that allows movement of all or a part of the maxilla into the desired position.

maximal acid output (MAO), on the pentagastrin test, the output of gastric acid for 1 hour after administration of pentagastrin, expressed as mmoL/hr.

maximal breathing capacity. See **maximum breathing capacity.**

maximal diastolic membrane potential, the most negative transmembrane potential achieved by a cardiac cell during repolarization. Also called **maximum diastolic potential.**

maximal expiratory flow rate (MEFR), the rate of the most rapid flow of gas from the lungs during a forced expiration after a full inspiration. Also called *maximal expiratory flow.*

maximal expiratory flow. See **maximal expiratory flow rate.**

maximal expiratory pressure (MEP), the greatest pressure of expired air achieved by a person after a full inspiration.

maximal midexpiratory flow rate (MMFR), the rate of the most rapid flow of gas during the middle half (in terms of volume) of a forced expiration after a full inspiration. It is measured in pulmonary function tests to detect and evaluate chronic obstructive pulmonary diseases, such as bronchitis, emphysema, and asthma.

maximal treadmill test (MTT), an exercise stress test in which subjects increase their heart rate during exercise to 80% to 90% of the maximal rate, which is estimated from each subject's age and sex. Newer methods of stress testing produce the same physiological effect of exercise on the heart without using exercise. These tests use drugs such as dipyridamole to "stress" the heart.

maximum breathing capacity (MBC) /mak′səməm/ [L, *maximus*, greatest; AS, *braeth* + L, *capacitas*], the maximum volume of gas that a person can inhale and exhale per minute by breathing as quickly and deeply as possible. Also called **maximal breathing capacity.**

maximum diastolic potential. See **maximal diastolic membrane potential.**

maximum expiratory flow, maximum expiratory flow rate. See **maximal expiratory flow rate.**

maximum inspiratory pressure (MIP) /mak′səməm/ [L, *maximus*, greatest, *inspirare*, to breathe in, *premere*, to press], the maximum pressure within the alveoli of the lungs that occurs during a full inspiration.

maximum intensity projection (MIP), a three-dimensional image processing method used in computed tomography and magnetic resonance.

maximum oxygen uptake, the greatest volume of oxygen that can be absorbed from the lungs by the blood. Also called **aerobic capacity.**

maximum permissible dose (MPD, M.P.D.). See **effective dose equivalent limit.**

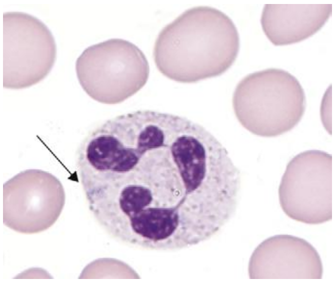
maximum voluntary isometric contraction (MVIC), the peak force produced by a muscle as it contracts while pulling against an immovable object.

maximum voluntary ventilation (MVV), the maximum volume of gas that a person can inhale and exhale by voluntary effort per minute by breathing as quickly and deeply as possible. It is measured in pulmonary function tests.

maxofacial surgery, posttrauma and/or reconstructive and plastic surgery to the jaws and midface region. See also **dentistry.**

Mayer's reflex /mā′ərz/ [Karl Mayer, Austrian neurologist, 1862–1932], a normal reflex elicited by grasping the ring finger and flexing it at the metacarpophalangeal joint of a person whose hand is relaxed with thumb abducted. The normal responses are adduction and apposition of the thumb. The reflex is absent in disease of the pyramidal system.

May-Hegglin anomaly, a rare autosomal-dominant inherited blood cell disorder characterized by thrombocytopenia and granulocytes with blue-colored ribonucleic acid containing cytopathic inclusions similar to Döhle's bodies.



May-Hegglin anomaly *(Carr and Rodak, 2008)*

Mayo scissors. See **scissors.**

-mazia, -mastia, -masty, suffix form meaning "(condition of the) breasts": *macromazia, pleomazia, polymazia*.

mazindol /mā′zindōl/, an anorexiant.
- ■ INDICATION: It is prescribed over a short term to decrease appetite in the treatment of exogenous obesity.
- ■ CONTRAINDICATIONS: Glaucoma, history of drug abuse, concomitant use of a monoamine oxidase inhibitor, or known hypersensitivity to this drug prohibits its use.
- ■ ADVERSE EFFECTS: Among the more serious adverse effects are insomnia, palpitation, dizziness, dry mouth, tachycardia, and hypersensitivity reactions.

mazo-, prefix meaning "breast": *mazodynia, mazology, mazopexy*.

mb, abbreviation for *millibar.*

M.B., abbreviation for *Bachelor of Medicine*.

mbar, abbreviation for *millibar.*

MBC, abbreviation for **maximum breathing capacity.**

MBD, M.B.D., abbreviation for **minimal brain dysfunction.** See **attention deficit disorder.**

mbp, abbreviation for *mean blood pressure*.

mbt, abbreviation for *mean body temperature*.

mc, **1.** abbreviation for *millicycle*. **2.** abbreviation for **millicurie.**

mC, abbreviation for **millicoulomb.**

Mc, abbreviation for *megacycle*.

MC, **1.** abbreviation for *medical certificate*. **2.** abbreviation for *Medical Corps*.

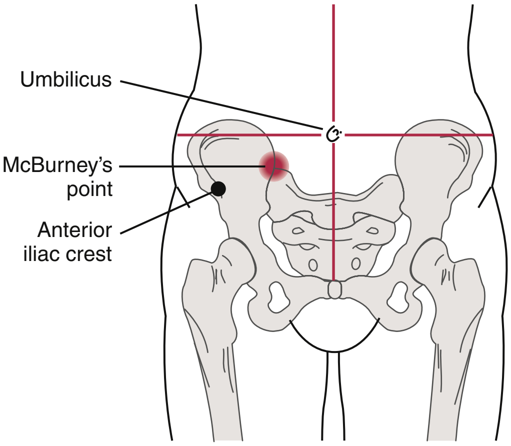
MCAD, abbreviation for *medium-chain acyl-CoA dehydrogenase,* an enzyme involved in degradation of medium-chain length fatty acids. Deficiency of the enzyme *(MCAD deficiency)* is characterized by recurring episodes of hypoglycemia, vomiting, and lethargy, with urinary excretion of medium-chain dicarboxylic acids, minimal ketogenesis, and low plasma and tissue levels of carnitine.

McArdle's disease /məkär′dəlz/ [Brian McArdle, English neurologist, 1911–2002], an inherited glycolic storage disease marked by an absence of myophosphorylase B and abnormally large amounts of glycogen in skeletal muscle. It is milder than other glycogen storage diseases, characterized by muscle fatigability and stiffness after exercise. The only treatment is avoidance of exercise. Also called **glycogen storage disease, type V.** See also **glycogen storage disease.**

MCAT, abbreviation for **Medical College Admission Test.**

McBurney's incision /makbur′nēz/ [Charles McBurney, American surgeon, 1845–1913], a surgical wound that begins 2 to 5 cm above the anterior superior iliac spine and runs parallel to the external oblique muscle of the abdomen. This incision is used for an appendectomy.

McBurney's point [Charles McBurney; L, *pungere,* to puncture], a site of extreme sensitivity in acute appendicitis, situated in the normal area of the appendix midway between the umbilicus and the anterior iliac crest in the right lower quadrant of the abdomen. See also **appendical reflex, appendicitis.**



McBurney's point *(Monahan et al, 2007)*

McBurney's sign [Charles McBurney], a reaction of the patient indicating severe pain and extreme tenderness when McBurney's point is palpated. Such a reaction indicates appendicitis.

McCall's festoon /məkôlz′/, (in dentistry) a ring-shaped enlargement of the gingival margin on the vestibular surface (buccal or labial) of canines and premolars. It may be associated with occlusal trauma.

McCune-Albright syndrome. See **Albright's syndrome.**

MCFA, abbreviation for **medium-chain fatty acid.**

mcg, abbreviation for **microgram.**

MCH, **1.** abbreviation for **maternal and child health services.** **2.** abbreviation for *mean corpuscular hemoglobin*.

M.Ch., abbreviation for *Master of Surgery.*

MCHC, abbreviation for **mean cell hemoglobin concentration.**

mCi, abbreviation for **millicurie.**

mCi-hr, abbreviation for *millicurie hour.*

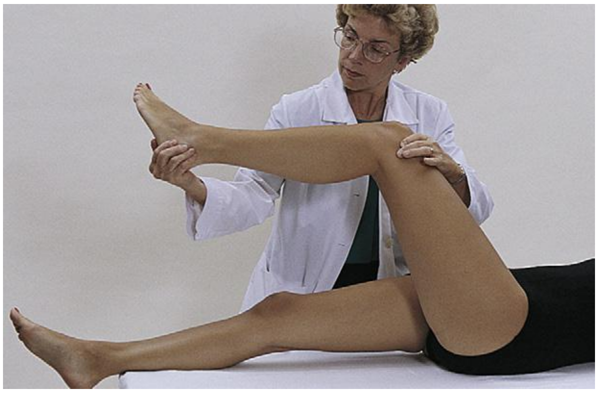
McManus, R. Louise, (1896–1993), a nurse who established the first national testing service for the nursing profession, currently the second largest educational testing program in the nation. She was also instrumental in developing a means of evaluating the nursing programs in community and junior colleges, and she established a center for education in nursing research at Teachers College, Columbia University.

McMillan, Mary, (1880-1959), early American physical therapist and a founder of the American Physical Therapy Association. She was educated in England and was employed at the Children's Hospital in Liverpool treating patients with poliomyelitis and spastic paralysis. She returned to America in 1915 and became an influential force in the development of the profession of physical therapy.

McMurray's sign /makmur′ēz/ [Thomas P. McMurray, English surgeon, 1887–1949], an audible click heard when rotating the tibia on the femur, indicating injury to meniscal structures.

McMurray's test, as the patient lies supine with one knee fully flexed, the examiner rotates the patient's foot fully outward while the knee is slowly extended; a painful "click" indicates a tear of the medial meniscus of the knee joint; if the click occurs when the foot is rotated inward, the tear is in the lateral meniscus.

MCO, abbreviation for **managed care organization.**



Testing for McMurray's sign *(Wilson and Giddens, 2009)*

M component, an abnormal immunoglobulin that appears in large numbers in patients with macroglobulinemia, heavy chain disease, and multiple myeloma.

MCP, abbreviation for **metacarpophalangeal.**

M-CSF, abbreviation for **macrophage colony-stimulating factor.**

MCTD, abbreviation for **mixed connective tissue disease.**

MCV, abbreviation for *mean corpuscular volume*.

Md, symbol for the element **mendelevium.**

MD, **1.** abbreviation for **muscular dystrophy. 2.** abbreviation for **macular degeneration.**

M.D., abbreviation for *Doctor of Medicine*. See **physician.**

MDA, **1.** abbreviation for *Muscular Dystrophy Association*. **2.** abbreviation for *methylenedioxyamphetamine*.

MDEC tube, a multipurpose diagnostic and enteroclysis triple lumen intestinal tube used in the management of small bowel disorders. The largest lumen is for suction or fluid instillation, the medium lumen provides access for suction, and the smallest lumen is used to inflate the balloon preventing migration of intestinal fluids. The tip of the tube is weighted.

MDI, abbreviation for **metered dose inhaler.**

MDMA, abbreviation for *3,4-methylenedioxymethamphetamine*.

MDR, abbreviation for **minimum daily requirement.**

M.D.V., abbreviation for *Doctor of Veterinary Medicine*. Also called **DVM.**

Me, abbreviation for **methyl.**

MEA, abbreviation for **multiple endocrine adenomatosis.**

Meals on Wheels, a program designed to deliver hot meals to elderly, physically disabled, or other people who lack the resources to provide nutritionally adequate meals for themselves on a daily basis.

mean [ME, *mene,* in the middle], occupying a position midway between two extremes of a set of values or data. The arithmetic mean is a value that is derived by dividing the total of a set of values by the number of items in the set. The geometric mean is a value between the first and last of a set of values organized in a geometric progression. Compare **median, mode.**

mean arterial pressure (MAP), the arithmetic mean of the blood pressure in the arterial part of the circulation, it is calculated by adding the systolic pressure reading to two times the diastolic reading and dividing the sum by 3.

mean cell hemoglobin concentration (MCHC), the average percentage of hemoglobin per red blood cell computed as the ratio of the hemoglobin to the hematocrit. The MCHC adult reference interval is 32% to 36% in adults.

mean cell hemoglobin (MCH), an estimate of the mass of hemoglobin in an average erythrocyte, computed as the ratio of the hemoglobin concentration and the red blood cell count. The MCH reference interval is 28 to 32 picograms. See also **hypochromic anemia, iron deficiency anemia.**

mean cell volume (MCV), average volume of each red cell, computed as the ratio of hematocrit to the red blood cells count. The MCV reference interval is 80 to 100 fL.

mean marrow dose (MMD), the estimated average annual somatic radiation received by each person in the United States. The figure is 77 mrad and represents a weighted average for people exposed to radiation and those not exposed during the period. It is expressed in terms of bone marrow because irradiation of that tissue is assumed to be a cause of leukemia.

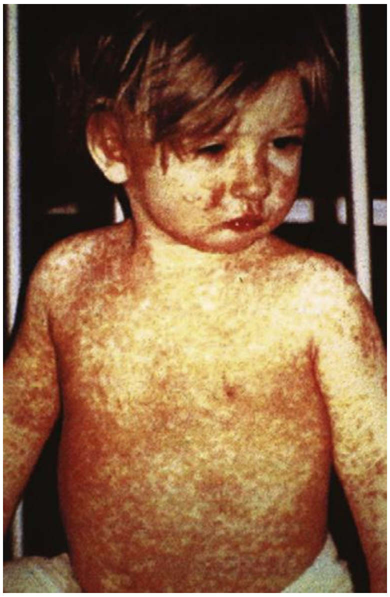
mean platelet volume (MPV) test, a blood test that measures the volume of a large number of platelets as determined by an automated analyzer. The MPV is very useful in the differential diagnosis of thrombocytopenic disorders.

measles /mē′zəlz/ [ME, *meseles,* skin spots], an acute, highly contagious viral disease involving the respiratory tract and characterized by a spreading maculopapular cutaneous rash. It occurs primarily in young children who have not been immunized and in teenagers or young adults who are inadequately immunized. Measles is caused by a paramyxovirus and is transmitted by direct contact with droplets spread from the nose, throat, and mouth of infected people, usually in the prodromal stage of the disease. Indirect transmission by uninfected people or contaminated articles is unusual. Diagnosis is confirmed by the identification of Koplik's spots on the buccal mucosa and by serological examination. Also called **morbilli, rubeola.** See also **roseola infantum, rubella.**

■ OBSERVATIONS: An incubation period of 7 to 14 days is followed by the prodromal stage, characterized by fever, malaise, coryza, cough, conjunctivitis, photophobia, anorexia, and the pathognomonic Koplik's spots, which appear 1 to 2 days before onset of the rash. Pharyngitis and inflammation of the laryngeal and tracheobronchial mucosa develop, the temperature may rise to 103° F or 104° F (39.4° C to 40° C), and there is marked granulocytic leukopenia. The papules of the rash first appear as irregular brownish pink spots around the hairline, the ears, and the neck, then spread rapidly within 24 to 48 hours to the trunk and extremities, becoming red, maculopapular, and dense and giving a blotchy appearance. Within 3 to 5 days the fever subsides and the lesions flatten, turn a brownish color, and begin to fade, causing a fine desquamation, especially over heavily affected areas.

■ INTERVENTIONS: Routine treatment consists of bed rest, antipyretics, appropriate antimicrobials to control secondary bacterial infection, and, when necessary, application of calamine lotion, corn starch solution, oatmeal, baking soda, or cool water to relieve itching. Preventive measures include active immunization with measles virus vaccine after the infant is 1 year of age. A booster is recommended at 4 to 6 years of age. Passive immunization with immune serum globulin is recommended for unvaccinated individuals exposed to the disease. One attack of the disease confers lifelong immunity.

■ NURSING CONSIDERATIONS: Bed rest, isolation, and quiet activity are recommended as long as fever and rash persist. Acetaminophen, fluids, cool sponge baths, nose drops, and cough medication may be necessary to counteract fever and respiratory symptoms. Bright sunlight may be irritating to the eyes. Special attention is given to the care and cleansing of the eyes and skin, especially in cases of severe papular eruption. An important nursing function is instruction of the parents in the proper home care of the child, because most cases are not serious enough to require hospitalization. The disease is usually benign, and mortality is rare. Complications sometimes occur. The most common are otitis media, pneumonia, bronchiolitis, obstructive laryngitis, laryngotracheitis, and occasionally encephalitis and appendicitis. Rarely, but most gravely, the virus causes subacute sclerosing panencephalitis several years after the acute attack of measles has occurred.



Measles *(Marx et al, 2010)*

measles and rubella virus vaccine live, an active immunizing agent.

■ INDICATIONS: It is prescribed for immunization against measles and rubella.

■ CONTRAINDICATIONS: Immunosuppression, concomitant administration of corticosteroids, tuberculosis, known or suspected pregnancy, hypersensitivity to neomycin (e.g., eggs, chicken, or chicken feathers), neoplasms of the lymphatic system or bone marrow, or active infection prohibits its use. It should not be given for 3 months after the use of whole blood, plasma, or immune serum globulin, or for 1 month before or after immunization with other live virus vaccines, except mumps vaccine.

■ ADVERSE EFFECT: The most serious adverse effect is anaphylaxis.

measles immune globulin. See **immune gamma globulin.**

measles, mumps, and rubella virus vaccine live (MMR), an active immunizing agent.

■ INDICATIONS: It is prescribed for simultaneous immunization against measles, mumps, and rubella.

■ CONTRAINDICATIONS: Immunosuppression, concomitant administration of corticosteroids, tuberculosis, hypersensitivity to neomycin, neoplasms of the lymphatic system or bone marrow, known or suspected pregnancy, or acute infection prohibits its use. It is not given for 3 months after the use of whole blood, plasma, or immune serum globulin, and it is not given for 1 month before or after immunization with other live virus vaccines.

■ ADVERSE EFFECT: The most serious adverse effect is anaphylaxis.

measles virus, a paramyxovirus that is the cause of measles.

measurement /mezh′ərment/ [L, *mensura*], the determination, expressed numerically, of the extent or quantity of a substance, energy, or time. See also **International Unit, metric system.**

measure of central tendency, (in descriptive statistics) an indication of the middle point of distribution for a particular group. Measures include the mean average score, the median or middle score of distribution, and the mode, the most frequently occurring measure.

measure of variability, (in descriptive statistics) a mathematical determination of how much the performance of the group as a whole deviates from the mean or median. The most frequently used measure of variability is the standard deviation.

meatal /mē·ā′təl/ [L, *meatus,* channel], pertaining to a meatus.

meatal stenosis, a constriction or narrowing of the urinary meatus, seen most often in boys or men as a complication of circumcision and meatitis.

meatorrhaphy /mē′ətôr′əfē/ [L, *meatus,* channel; Gk, *rhaphe,* suture], the suturing of the cut end of the urethra to the glans penis after surgery to enlarge the urethral meatus.

meatoscopy /mē′ətos′kəpē/ [L, *meatus* + Gk, *skopein,* to look], the visual examination of any meatus, especially the urethra, usually performed with the aid of a speculum or endoscope.

meatus /mē·ā′təs/ *pl.* **meatuses** [L, channel], an opening or tunnel through any part of the body, such as the external acoustic meatus that leads from the external ear to the tympanic membrane.

meatus acusticus externus. See **external acoustic meatus.**

meatus acusticus internus. See **internal acoustic meatus.**

meatuses. See **meatus.**

Mebaral, a trademark for a sedative used as an anticonvulsant **(mephobarbital).**

mebendazole /məben′dəzōl/, an anthelmintic.

■ INDICATIONS: It is prescribed in treatment of pinworm, whipworm, roundworm, and hookworm infestations.

■ CONTRAINDICATIONS: Pregnancy or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are abdominal pain and diarrhea.

MEC, abbreviation for *minimum effective concentration,* or the minimum inhibitory concentration that allows a drug to be active. The drug is effective at any level above this threshold value.

mecamylamine hydrochloride /mek′əmil′əmēn/, a ganglionic blocking agent (antihypertensive).

■ INDICATION: It is prescribed in the management of severe essential hypertension and uncomplicated malignant hypertension.

■ CONTRAINDICATIONS: Coronary or cerebrovascular insufficiency, recent myocardial infarction, uremia, pyelonephritis, glaucoma, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are orthostatic hypotension, paralytic ileus, urinary retention, and cycloplegia. The incidence of side effects is very high because the drug reduces all autonomic activity.

mecasermin, a biological response modifier and insulin-like growth factor.

■ INDICATIONS: This drug is used to treat growth failure in children with severe primary insulin-like growth factor–1 deficiency or with growth hormone (GH) gene deletion who have developed neutralizing antibodies to GH.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or benzyl alcohol, closed epiphyses, active or suspected neoplasia, and IV use prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, dizziness, cardiac valvulopathy, cardiac murmur, ear pain, otitis media, abnormal tympanometry, papilledema, visual impairment, vomiting, thymus hypertrophy, hypoglycemia, bruising, lipohypertrophy, hypersensitivity reactions, arthralgia, joint pain, snoring, and tonsillar hypertrophy. Life-threatening side effects include seizures, hypoglycemia, ketosis, hypothyroidism, apnea, and antibodies to growth hormone.

mechanical advantage [Gk, *mechane,* machine; L, *abante,* superior position], the ratio of the output force developed by a muscle to the input force applied to the body structure that the muscle moves. Variations in the sizes of muscles and the lengths of bones in different individuals partially account for the differences in mechanical advantage and physical capabilities, such as speed and strength, among body types.

mechanical condenser, a device that delivers automatically controlled impacts for condensing restorative material in the filling of tooth cavities. It may be spring activated, pneumatic, or electrically controlled. Also called **automatic mallet condenser.**

mechanical dead airspace [Gk, *mechane* + AS, *dead* + Gk, *aer* + L, *spatium*], the volume of air that fills the breathing circuits of a mechanical ventilator. The mechanical dead space may be increased if necessary to control hypocapnia and respiratory alkalosis.

mechanical heart-lung, a device connected to the circulatory system to maintain oxygenated blood flow during surgery that requires interruption of normal heart-lung functions, such as open heart surgery. See also **blood pump.**

mechanical restraint [Gk, *mechane* + L, *restringere,* to confine], a device made of fabric that hinders a patient's movement, such as a safety vest, hand and wrist straps, mittens, and a stretcher equipped with belts. See also **restraint.**

mechanical vector. See **vector.**

mechanical ventilation management: invasive, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient receiving artificial breathing support through a device inserted into the trachea. See also **Nursing Interventions Classification.**

mechanical ventilation management: non-invasive, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient receiving artificial breathing support that does not necessitate a device inserted into the trachea. See also **Nursing Interventions Classification.**

mechanical ventilation response: adult, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the alveolar exchange and tissue perfusion are effectively supported by mechanical ventilation. See also **Nursing Outcomes Classification.**

mechanical ventilation weaning response: adult, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the respiratory and psychological adjustment to progressive removal of mechanical ventilation. See also **Nursing Outcomes Classification.**

mechanical ventilatory weaning, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient to breathe without the aid of a mechanical ventilator. See also **Nursing Interventions Classification.**

mechanism /mek′əniz′əm/, **1.** an instrument or process by which something is done, results, or comes into being. **2.** a machine or machinelike system. **3.** a stimulus-response system. **4.** a habit or drive.

mechanism of injury, the circumstance in which an injury occurs, for example, sudden deceleration, wounding by a projectile, or crushing by a heavy object.

mechanism of labor. See **cardinal movements of labor.**

mechano-, prefix meaning "mechanical": *mechanocyte, mechanotherapy, mechanothermy.*

mechanoreceptor /mek′ənō′risep′tər/ [Gk, *mechane,* machine; L, *recipere,* to receive], any sensory nerve ending that responds to mechanical stimuli, such as touch, pressure, sound, and muscular contractions. See also **proprioceptor.**

mechlorethamine hydrochloride /mek′lôreth′əmēn/, an antineoplastic alkylating agent. Also called **nitrogen mustard.**

■ INDICATIONS: It is prescribed in the treatment of a variety of neoplasms, especially lymphomas, and of malignant effusions.

■ CONTRAINDICATIONS: Bone marrow depression, pregnancy, infection, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are bone marrow depression and inflammation caused by extravasation at the site of injection. Nausea, vomiting, and alopecia also may occur.

Meckel's cartilage /mek′elz/ [Johann Friedrich Meckel, German anatomist, 1781–1833], a cartilaginous bar in the embryo. From it or its sheath, the sphenomandibular ligament, the malleus, and the incus develop. Also called *Meckel's rod.*

Meckel's diverticulum [Johann F. Meckel], an anomalous sac protruding from the wall of the ileum between 30 and 90 cm from the ileocecal sphincter. It is congenital, resulting from the incomplete closure of the yolk stalk, and occurs in 1% to 2% of the population. The diverticulum is usually asymptomatic, but the condition is suggested by signs of appendicitis in infancy; by sudden and painless bleeding in the sac, usually in childhood; or by symptoms of intestinal obstruction. Symptomatic diverticula are most commonly resected. Surgical resection of asymptomatic diverticula is also recommended to prevent potential diverticulitis, obstruction, and blood loss. Many Meckel's diverticula are discovered incidentally during surgery for other causes and on postmortem examination.

Meckel's diverticulum nuclear scan, a nuclear scan to detect Meckel's diverticulum.

meclizine hydrochloride /mek′lizēn/, an antihistamine.

■ INDICATION: It is prescribed in the prevention and treatment of motion sickness.

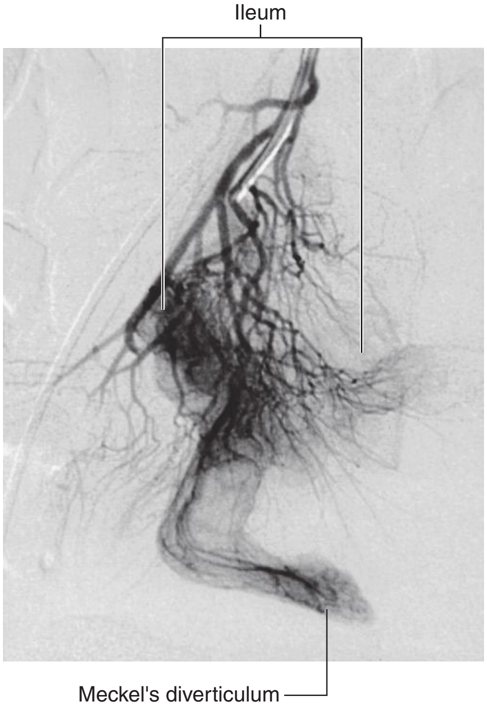
■ CONTRAINDICATIONS: Newborns and lactating mothers are not given this drug. Asthma or known hypersensitivity to it prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are drowsiness, skin rash, hypersensitivity reactions, dry mouth, tachycardia, and nervousness.

meclofenamate sodium /mek′lōfen′əmāt/, a nonsteroidal antiinflammatory agent.

■ INDICATIONS: It is prescribed in the treatment of rheumatoid arthritis, osteoarthritis dysmenorrhea, and other mild to moderate pain.

■ CONTRAINDICATIONS: Known hypersensitivity to aspirin or to nonsteroidal antiinflammatory drugs prohibits its use. It is used with caution in patients who have upper GI disease or impaired renal function.



Meckel′s diverticulum: associated vasculature
(Drake, Vogl, and Mitchell, 2010)

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI distress, peptic ulcers, dizziness, rashes, and tinnitus. This drug interacts with many other drugs.

Meclomen, a trademark for an antiinflammatory agent **(meclofenamate sodium).**

mecocephaly. See **scaphocephaly.**

meconium /mikō′nē·əm/ [Gk, *mekon,* poppy], a material that collects in the intestines of a fetus and forms the first stools of a newborn. It is thick and sticky, usually greenish to black, and composed of secretions of the intestinal glands, some amniotic fluid, and intrauterine debris, such as bile pigments, fatty acids, epithelial cells, mucus, lanugo, and blood. With ingestion of breast milk or formula and proper functioning of the GI tract, the color, consistency, and frequency of the stools change by the third or fourth day after the initiation of feedings. The presence of meconium in the amniotic fluid during labor may indicate fetal distress and may lead to a lack of oxygen and developmental delays.

meconium aspiration, the inhalation of meconium by a fetus or newborn. It can block the air passages and cause failure of the lungs to expand or other pulmonary dysfunction, such as pneumonia or emphysema.

meconium ileus, obstruction of the small intestine in the newborn caused by impaction of thick, dry, tenacious meconium, usually at or near the ileocecal valve. Symptoms include abdominal distension, vomiting, failure to pass meconium within the first 24 to 48 hours after birth, and rapid dehydration with associated electrolyte imbalance. The condition results from a deficiency in pancreatic enzymes and is the earliest manifestation of cystic fibrosis. In uncomplicated cases in which perforation, volvulus, or atresia does not occur, the obstruction may be relieved by giving enemas with a contrast medium, such as a hypertonic solution of meglumine diatrizoate and sodium diatrizoate, under fluoroscopy. Fluid is replaced intravenously to prevent dehydration. If two or three enemas do not dislodge the obstruction, surgery is necessary. See also **meconium plug syndrome.**

Meconium

meconium periorchitis, a rare condition seen in infant boys after meconium peritonitis has healed, characterized by a hydrocele of meconium in the scrotum that gradually hardens and often resolves spontaneously in time.

meconium peritonitis, peritonitis resulting from perforation of the bowel into the peritoneal cavity in utero or shortly after birth. This causes escape of the meconium into the peritoneal cavity. It occurs most often as a complication of meconium ileus in cystic fibrosis.

meconium plug syndrome, obstruction of the large intestine in the newborn caused by thick, rubbery meconium that may fill the entire colon and part of the terminal ileum. Symptoms include failure to pass meconium within the first 24 to 48 hours after birth, abdominal distension, and vomiting if complete intestinal blockage occurs. A barium enema indicates the presence of a plug and in most cases dislodges it from the bowel wall. Subsequent gentle saline solution enemas may be needed to expel it. The condition may be an indication of Hirschsprung's disease or cystic fibrosis. See also **meconium ileus.**

med, **1.** abbreviation for *medical*. **2.** abbreviation for **medicine. 3.** abbreviation for *minimum effective dose*. **4.** abbreviation for **median.**

MED, **1.** abbreviation for *minimal effective dose*. **2.** abbreviation for **minimal erythema dose.** See **threshold dose.**

medcard /med′kärd/, (in nursing) a small card listing the name, dose, and schedule of administration of each patient's medications, used in dispensing drugs to each patient.

medevac, abbreviation for *medical evacuation*.

MEDEX /med′eks/, **1.** an educational program accredited by the American Medical Association for training military personnel with medical experience to become physician's assistants. **2.** a physician's assistant who has gained medical experience during military service and further training in a physician's assistant program.

medi-, medio-, prefix meaning "middle": *medialecithal, medicinerea, mediotarsal*.

media. See **medium.**

medial /mē′dē·əl/ [L, *medius,* middle], **1.** pertaining to, situated in, or oriented toward the midline of the body. **2.** pertaining to the tunica media, the middle layer of a blood vessel wall. Also **mesial.**

medial antebrachial cutaneous nerve, a nerve of the arm that arises from the medial cord of the brachial plexus, medial to the axillary artery. Near the axilla a cutaneous branch emerges to supply the skin over the biceps almost as far as the elbow. It descends on the ulnar side of the arm and divides into the anterior branch and the ulnar branch. The anterior branch is the larger of the two branches, innervating the skin as far as the wrist. The ulnar branch descends as far as the wrist, innervates the skin, and communicates with branches of the ulnar nerve. Compare **medial brachial cutaneous nerve.**

medial arteriosclerosis. See **Mönckeberg's arteriosclerosis.**

medial brachial cutaneous nerve, a nerve of the arm arising from the medial cord of the brachial plexus and distributed to the medial side of the arm. It passes through the axilla, pierces the deep fascia in the middle of the arm, and supplies the skin of the arm as far as the olecranon. Compare **medial antebrachial cutaneous nerve.**

medial calcaneal nerve, a nerve that is often multiple and originates from the tibial nerve near the ankle and descends onto the medial side of the heel. It innervates skin on the medial surface and sole of the heel.

medial calcific sclerosis. See **Mönckeberg's arteriosclerosis.**

medial cerebellar nucleus. See **fastigial nucleus.**

medial circumflex femoral artery, an artery that passes medially around the shaft of the femur and near the margin of the adductor brevis, giving off a small branch, which enters the hip joint through the acetabular notch and anastomoses with the acetabular branch of the obturator artery, then divides into two major branches deep to the quadratus femoris muscle. One of these branches ascends to the trochanteric fossa and connects with branches of the gluteal and lateral circumflex femoral arteries. The other branch passes laterally to participate with other arteries to form an anastomotic network of vessels around the hip.

medial cuneiform bone, the largest of three cuneiform bones of the foot, situated on the medial side of the tarsus, between the scaphoid bone and the first metatarsal. It serves as the attachment for various ligaments, the tendons of the tibialis anterior, and the peroneus longus. It articulates with the scaphoid, the intermediate cuneiform, and the first and second metatarsals. Also called **internal cuneiform bone.**

medial fibroplasia, the most common of the various nonatherosclerotic lesions characterized on an angiogram by the string-of-beads sign (areas of the artery wall having protruding aneurysms alternating with stenosis and thinning).

medial geniculate body, one of a pair of areas on the posterior dorsal thalamus that relay auditory impulses from the lateral lemniscus to the auditory cortex.

medialis /mē′dē·ā′lis/ [L, *medius,* middle], pertaining to the middle or to the median plane.

medial labial frenulum, a fold of mucosa on the inner surface of both lips that connects the lip to the adjacent gum.

medial malleolus, the rounded process of the tibia forming the internal surface of the ankle joint. Also called **internal malleolus.**

medial palpebral arteries, small branches of the ophthalmic artery that supply the medial area of the upper and lower eyelids.

medial pectoral nerve, a branch of the brachial plexus that, with the lateral pectoral nerve, supplies the pectoral muscles. It joins the lateral pectoral nerve to form a loop around the artery before ending deep in the pectoralis minor. The loop branches to supply the pectoralis minor and the pectoralis major. Compare **lateral pectoral nerve.**

medial plantar nerve, the major sensory nerve in the sole of the foot. It innervates skin on most of the anterior two thirds of the sole and adjacent surfaces of the medial three and one-half toes, including the great toe. It also innervates three intrinsic muscles: the abductor hallucis, flexor digitorum brevis, and first lumbrical.

medial posterior intertransverse muscles of neck, small muscles passing between the posterior tubercles of adjacent cervical vertebrae, close to the vertebral body, innervated by posterior primary rami of spinal nerves and acting to bend the vertebral column laterally.

medial puboprostatic ligament, a thickening of the superior fascia of the pelvic diaphragm in the male that extends laterally from the prostate to the tendinous arch of the pelvic fascia and continues forward and medially from the tendinous arch to the pubis.

medial pubovesical ligament, the medial branch of the pubovesical ligament in the female, a forward continuation of the tendinous arch of the pelvic fascia to the pubis.

medial rotation, a turning toward the midline of the body. Compare **lateral rotation.** See also **rotation.**

medial umbilical ligament, a remnant of the embryological urachus that continues from the apex of the bladder superiorly up the anterior abdominal wall to the umbilicus.

median (med) /mē′dē·ən/ [L, *medius,* middle], (in statistics) the number representing the middle value of the scores in a sample. In an odd number of scores arrayed in ascending order, it is the middle score. In an even number of scores so arrayed, it is the average of the two central scores.

median antebrachial vein /an′tēbrā′kē·əl/, a superficial vein of the upper limb that drains the venous plexus on the palmar surface of the hand. It ascends on the ulnar side of the anterior forearm and at its terminus joins the median cubital vein. One of the veins of the median cubital complex commonly anastomoses with the deep veins of the forearm. The anastomosis holds the superficial vein in place and makes it a practical choice for venipuncture. Compare **basilic vein, cephalic vein, dorsal digital vein.**

median aperture of fourth ventricle, an opening between the roof of the fourth ventricle and the subarachnoid space.

median arcuate ligament, a tendinous arch that connects the crura of the diaphragm, crossing anteriorly to the aorta at approximately the level of the twelfth thoracic vertebra.

median atlantoaxial joint, one of three points of articulation of the atlas and the axis. The median atlantoaxial joint is a pivot articulation among the dens, the axis, and the ring of the atlas and involves five ligaments. It allows rotation of the axis and the skull, the extent of rotation limited by the alar ligaments.

median basilic vein, one of the superficial veins of the upper limb, often formed as one of two branches from the median cubital vein. The median basilic vein courses across the palmar surface of the forearm near the elbow and is commonly used for venipuncture, phlebotomy, or IV infusion. Compare **basilic vein.**

median cephalic vein, a vein sometimes present as the lateral branch, ending in the cephalic vein, of a bifurcation of the median antebrachial vein.

median cleft facial syndrome. See **frontonasal dysplasia.**

median effective dose (ED_{50}), the dose of a drug that may be expected to cause a specific intensity of effect in half of the patients to whom it is given.

median glossitis. See **median rhomboid glossitis.**

median jaw relation, any jaw relation that exists when the mandible is in the median sagittal plane.

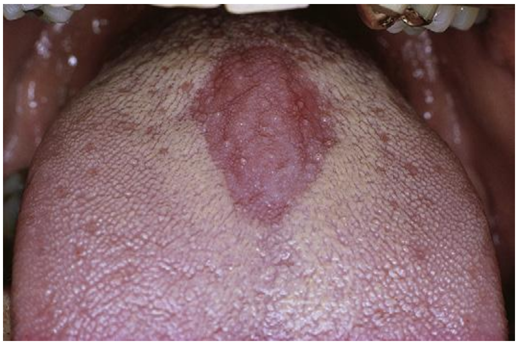
median lethal dose (MLD, LD_{50}), the amount of a substance or of radiation sufficient to kill one half of a population of organisms within a specified period.

median nerve, one of the terminal branches of the brachial plexus that extends along the radial parts of the forearm and the hand and supplies various muscles and the skin of these parts. It arises from the brachial plexus by two large roots, one from the lateral and one from the medial cord. The roots unite to form the trunk of the nerve that courses down the arm with the brachial artery. The median nerve usually has no branches above the elbow. It has a few articular branches to the elbow joint and muscular branches to the forearm; the anterior interosseous nerve; the palmar branch; the muscular branch in the hand; the first, second, and third palmar digital nerves; and the proper digital nerves. Compare **musculocutaneous nerve, radial nerve, ulnar nerve.**

median palatine suture, the line of junction between the horizontal parts of the palatine bones that extends from both sides of the skull to form the posterior part of the hard palate.

median plane, a vertical plane that divides the body into right and left halves and passes approximately through the sagittal suture of the skull. Also called **cardinal sagittal plane, midsagittal plane.** Compare **frontal plane, sagittal plane, transverse plane.**

median rhomboid glossitis, a red, depressed, diamond-shaped area on the dorsum of the tongue, frequently irritated by alcohol, hot drinks, or spicy foods. The condition most often occurs in adult men and may be caused by candidiasis. Also called **rhomboid glossitis.**



Median rhomboid glossitis
(Regezi, Sciubba, and Jordan, 2008)

median sternotomy, a chest surgery technique in which an incision is made from the suprasternal notch to below the xiphoid process. The sternum is then opened with a saw and a sternal retractor is inserted. Closure requires reunion of the sternum with stainless steel sutures. The procedure is used in coronary artery bypass and valve replacement operations. Compare **anterolateral thoracotomy, posterolateral thoracotomy.**

median toxic dose (TD_{50}), the dosage that may be expected to cause a toxic effect in half of the patients to whom it is given.

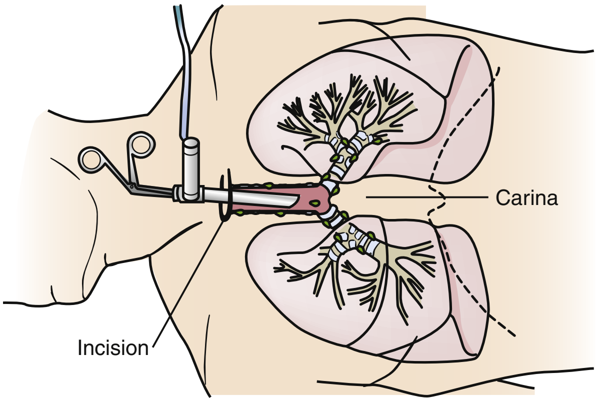
mediastina. See **mediastinum.**

mediastinal /mē′dē·əstī′nəl/ [L, *mediastinus*, midway], pertaining to a median septum or space between two parts of the body, such as the interval between the pleural sacs.

mediastinal cyst, a congenital cyst arising in the mediastinum.

mediastinitis, an inflammation of the mediastinum.

mediastinoscopy /mē′dē·as′tinos′kəpē/ [L, *mediastinus*, midway; Gk, *skopein*, to view], an examination of the mediastinum through an incision in the suprasternum, by using an endoscope with light and lenses.



Mediastinoscopy *(Phillips, 2012)*

mediastinum /mē′dē·əstī′nəm/ *pl.* **mediastina** [L, *mediastinus*, midway], a part of the thoracic cavity in the middle of the thorax, between the pleural sacs containing the two lungs. It extends from the sternum to the vertebral column and contains all the thoracic viscera except the lungs. It is enclosed in a thick extension of the thoracic subserous fascia and is divided into the **anterior mediastinum, middle mediastinum, posterior mediastinum,** and **superior mediastinum. —mediastinal,** *adj.*

mediate /mē′dē·āt/ [L, *medio*, in the middle], **1.** *v*, to cause a change, as in stimulation by a hormone. **2.** *v*, to settle a dispute, as in collective bargaining. **3.** *adj*, situated between two places, things, parts, or terms. **4.** *n*, (in psychology) an event that follows one process or event and precedes another; for example, in the process of cognition, perception follows stimulation and precedes thinking. **—mediating,** *adj.*, **mediator,** *n.*

mediated transport, the movement of a solute across a membrane with the assistance of a transport agent, such as a protein, that is specific for certain solutes.

mediate percussion. See **percussion.**

medic, abbreviation for **paramedic.**

Medicaid /med′ikād/, a U.S. federally funded state-operated program of medical assistance to people with low incomes, authorized by Title XIX of the Social Security Act. Under broad federal guidelines, the individual states determine benefits, eligibility, rates of payment, and methods of administration.

Medicaid mill, *(informal)* a health program or facility that solely or primarily serves people eligible for Medicaid. Such facilities are found mainly in depressed areas where few other health services are available.

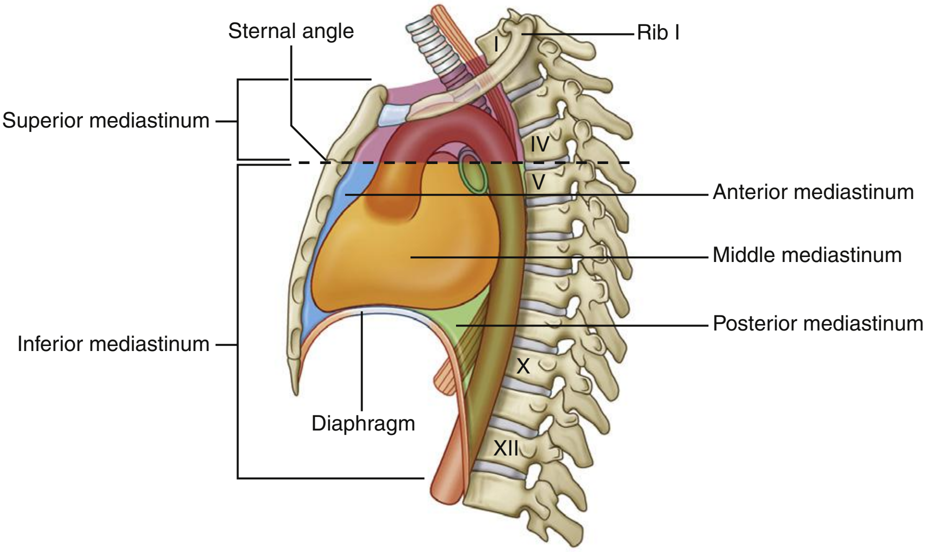
medical. See **medicine.**

medical abortion. See **abortion.**

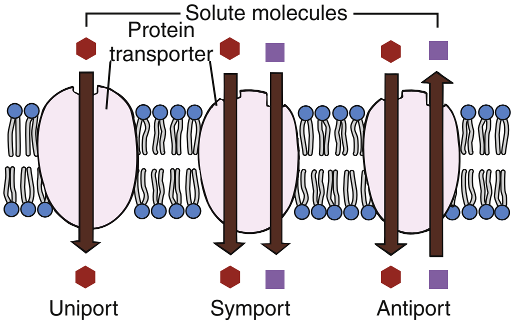
medical antishock trousers. See **military antishock trousers.**

medical assistant [L, *medicare*, to heal, *assistere*, to stand by], a person who, under the direction of a physician, performs various routine administrative and nontechnical clinical tasks in a hospital, clinic, or similar facility.

medical care, the provision by a physician of services related to the maintenance of health, prevention of illness, and treatment of illness or injury.



Mediastinum *(Drake, Vogl, and Mitchell, 2010)*



Mediated transport *(Huether and McCance, 2008)*

medical care plan [L, *medicare,* to heal; OE, *caru,* sorrow, *planus,* floor], a long-range program of professional medical guidance designed to meet specific health objectives. Compare **nursing care plan.**

medical center, **1.** a health care facility. **2.** a hospital, especially one staffed and equipped to care for many patients and for a large number of kinds of diseases and dysfunctions, using sophisticated technology.

Medical College Admission Test (MCAT), an examination taken by persons applying to medical school. The score attained is an important criterion for acceptance. Basic science, intellectual ability, and mathematical and verbal aptitude and knowledge are tested.

medical consultation, a procedure whereby, on request by one physician, another physician reviews a patient's medical history, examines the patient, and makes recommendations as to care and treatment. The medical consultant often is a specialist with expertise in a particular field of medicine.

medical corpsman /kōr′man/ [L, *medicare,* to heal, *corpus,* body], **1.** a member of a military medical unit. **2.** See **paramedic.**

medical decision level, the concentration of analyte, or body fluid sample being analyzed, at which some medical action is indicated for proper patient care. There may be several medical decision levels for a given analyte.

medical diagnosis [L, *medicare* + Gk, *dia,* through, *gnosis,* knowledge], the determination of the cause of a patient's illness or suffering by the combined use of physical examination, patient interview, laboratory tests, review of the patient's medical records, knowledge of the cause of observed signs and symptoms, and differential elimination of similar possible causes.

medical diathermy [L, *medicare* + *dia,* through, *therme,* heat], the application of high-frequency electrical currents to generate therapeutic heat in diseased tissues.

medical directive, a general term for documents that provide direction on the type of care a person desires. See also **advance directive, living will.**

medical director, a physician who is usually employed by a hospital to serve in a medical and administrative capacity as head of the organized medical staff. He or she also may serve as liaison for the medical staff with the hospital's administration and governing board.

medical emergency kit, a package of drugs and devices that may be used to deal with life-threatening medical situations. The kit may include positive pressure ventilation equipment, an oxygen tank, cardiac and other medications, airway management supplies, dressings, IV fluids, suction, and splints.

medical engineering, a field of study of biomedical engineering and technological concepts applied to develop equipment and instruments required in health care delivery.

Medic Alert, a nonprofit U.S. organization that maintains a huge data base of information about individuals who are taking one or more medications for a chronic disorder. The database also includes emergency telephone numbers for physicians treating the patients and provides bracelets or pendants to alert paramedics, interns, or other emergency medical personnel of the medical condition and prescription drugs taken by the patient, who may be unconscious or confused after an accident or episode of illness. Medic Alert maintains access to the database for emergency medical personnel through a 24-hour telephone service.

Medic Alert ® bracelet *(Chapleau, 2004)*

medical ethics [L, *medicare* + Gk, *ethikos*], the moral conduct and principles that govern members of the medical profession.

medical examiner. See **coroner.**

medical futility, **1.** a judgment that further medical treatment of a patient would have no useful result. **2.** a medical treatment whose success is possible although reasoning and experience suggest that it is highly improbable.

medical genetics. See **clinical genetics.**

medical history. See **health history.**

Medical home, a setting for the provision of primary health care characterized by a patient-centered philosophy. Members of the health care team collaborate to optimize and coordinate care for patients and their families.

medical illustrator, an artist who creates visual material designed to record and communicate medical, biological, and related knowledge. A medical illustrator requires a strong foundation in biology, anatomy, physiology, pathology, general medicine, and the visual arts. Today most medical illustrators use a computer to create their work.

medical indigency /in′dijen′sē/, the lack of financial reserves adequate to pay for medical care, especially that of a person or family able to manage other basic living expenses.

medical induction of labor. See **induction of labor.**

medical ionization. See **iontophoresis.**

medical jurisprudence [L, *medicare* + *jus,* law, *prudentia,* knowledge], the interaction of medicine with civil and criminal law.

medical laboratory technician (MLT), a person who, under the supervision of a medical technologist or physician, performs microscopic and bacteriological tests of human blood, tissue, and fluids for diagnostic and research purposes. Medical laboratory technicians are educated in a 2-year associate degree program. Also called **clinical laboratory technician**.

medical model, the traditional approach to the diagnosis and treatment of illness as practiced by physicians in the Western world since the time of Koch and Pasteur. The physician focuses on the defect, or dysfunction, within the patient, using a problem-solving approach. The medical history, physical examination, and diagnostic tests provide the basis for the identification and treatment of a specific illness. The medical model is thus focused on the physical and biological aspects of specific diseases and conditions. Nursing differs from the medical model in that the patient is perceived primarily as a person relating to the environment holistically; nursing care is formulated on the basis of a holistic nursing assessment of all dimensions of the person (physical, emotional, mental, and spiritual) that assumes multiple causes for the problems experienced by the patient. Nursing care then focuses on all dimensions, not just physical.

medical nutrition therapy, the assessment of the nutrition status of a patient followed by nutrition therapy ranging from diet modification to administration of enteral or parenteral nutrition. Compare **diet therapy.**

medical outcomes study, an evaluation of comparable medical care approaches and their relative prognoses.

medical pathology [L, *medicare* + Gk, *pathos,* disease, *logos,* science], the study of diseases not readily treated by surgical procedures.

medical physics. See **health physics.**

medical record [L, *medicare* + ME, *recorden,* to report], that part of a client's health record that is made by physicians and is a written or transcribed history of various illnesses or injuries requiring medical care, inoculations, allergies, treatments, prognosis, and frequently health information about parents, siblings, occupation, and military service. The record may be reviewed by a physician in diagnosing the condition. See also **chart.**

medical record administrator, a person who oversees maintenance of records of patients' medical histories, diagnoses, treatment, and outcome for a condition that meets medical, administrative, legal, ethical, regulatory, and institutional requirements.

medical record technician, a health professional responsible for maintaining components of health information systems consistent with the medical, administrative, ethical, legal, accreditation, and regulatory requirements of the health care delivery system.

medical secretary, a person who prepares and maintains medical records and performs related secretarial duties.

medical snatch bag, *(informal)* a light, compact, waterproof, and shockproof container of emergency medical equipment for advanced prehospital care. It should provide all that is required to relieve an obstructed airway, provide artificial ventilation, arrest hemorrhage from a peripheral site, and establish an IV access for infusion.

medical social worker. See **social worker.**

medical sonographer. See **sonographer.**

medical staff, physicians and dentists who are approved and given privileges to provide health care to patients in a hospital or other health care facility. Medical staff personnel may work full time or part time and may be employed by the facility or granted admitting privileges to practice.

medical staff, courtesy, physicians and dentists who meet certain qualifications of the medical staff of a hospital but who admit patients only occasionally or act as consultants. They are ineligible to participate in medical staff activities.

medical staff, honorary, physicians and dentists, usually retired, who are recognized by the hospital medical staff for their noteworthy contributions but who may not admit patients to the hospital or participate in medical staff activities.

medical-surgical nursing, the nursing care of adult patients whose conditions or disorders are treated medically, pharmacologically, or surgically.

medical technologist. See **clinical laboratory scientist/medical technologist.**

medical transcriptionist, a health professional who prepares a written record of patient data dictated by a physician. A **certified medical transcriptionist** is one who has met the qualifying standards of the American Association of Medical Transcription.

medical vagotomy. See **pharmacological vagotomy.**

medical waste, any discarded biological product such as blood or tissue removed from operating rooms, morgues, laboratories, or other medical facilities. The term may also be applied to bedding, bandages, syringes, and similar materials that have been used in treating patients and to animal carcasses or body parts used in research. Medical waste is regulated at the state and local levels.

Medical Women's International Association (M.W.I.A.), an international professional organization of women physicians.

medicamentosus /med′ikəmen′tōsəs/ [L, *medicamentum,* drug], pertaining to a drug, particularly to an adverse reaction attributed to a medication.

Medicare /med′iker/, **1.** a federally funded national health insurance program in the United States for people over 65 years of age or who meet other criteria. The program is administered in two parts. Part A provides basic protection against costs of medical, surgical, and psychiatric hospital care. Part B is a voluntary medical insurance program financed in part from federal funds and in part from premiums contributed by enrollees. Medicare enrollment is generally offered to people 65 years of age or older who are entitled to receive Social Security or railroad retirement benefits. Individuals under age 65 can be eligible if they are disabled or have end-stage renal disease. **2.** (in Canada) the name of the national health insurance program.

medicate /med′ikāt/ [L, *medicare,* to heal], to treat an illness by administering drugs.

medicated bougie /med′ikātid/ [L, *medicare,* to heal; Fr, candle], a bougie containing a medicated agent. See also **bougie.**

medicated enema, a medication administered via an enema. It is usually used preoperatively with patients scheduled for bowel surgery or may be used to treat infections locally.

medicated tub bath, a therapeutic bath in which medication is dispersed in water, usually in the treatment of dermatological disorders.

■ METHOD: The amount of medication and the amount and temperature of the water are specified in the order for the bath. The water is run, the medication is added, and the solution is stirred with a bath thermometer to disperse the medication while testing the water temperature, usually between 96° F (35.6° C) and 100° F (37.8° C) but possibly as high as 103° F (39.4° C), as in the treatment of psoriasis vulgaris. Most medicated baths are prescribed as half-hour treatments. A folded towel or waterproof pillow is placed behind the head, and a towel is draped over the shoulders to enhance the patient's comfort. In certain conditions the patient may be asked to scrub affected areas with a brush and washcloth. In others the patient is instructed not to scrub at all. After the bath the skin is patted dry and any ointment, cream, or other topical prescription is applied.

■ INTERVENTIONS: The reason for the treatment is explained to the patient, and instructions are given not to get out of the tub without assistance and not to add water without calling the nurse. If the patient is to scrub the affected areas, the necessary equipment is taken to the bath. The tub is thoroughly scrubbed and rinsed before and after the treatment.

■ OUTCOME CRITERIA: The medicated bath is usually soothing, relaxing, and comforting for the patient. Close attention to instructing the patient fully and to ensuring comfort during the procedure improves compliance with the treatment.

medication /med′ikā′shən/ [L, *medicare,* to heal], **1.** a drug or other substance that is used as a medicine. **2.** the administration of a medicine.

medication administration, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing, giving, and evaluating the effectiveness of prescription and nonprescription drugs. See also **Nursing Interventions Classification.**

medication administration: ear, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and instilling otic medications. See also **Nursing Interventions Classification.**

medication administration: enteral, a nursing intervention from the Nursing Interventions Classification (NIC) defined as delivering medications through a tube inserted into the gastrointestinal system. See also **Nursing Interventions Classification.**

medication administration: eye, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and instilling ophthalmic medications. See also **Nursing Interventions Classification.**

medication administration: inhalation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and administering inhaled medications. See also **Nursing Interventions Classification.**

medication administration: interpleural, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration of medication through an interpleural catheter for reduction of pain. See also **Nursing Interventions Classification.**

medication administration: intradermal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and giving medications via the intradermal route. See also **Nursing Interventions Classification.**

medication administration: intramuscular (IM), a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and giving medications via the intramuscular route. See also **Nursing Interventions Classification.**

medication administration: intraosseous, a nursing intervention from the Nursing Interventions Classification (NIC) defined as insertion of a needle through the bone cortex into the medullary cavity for the purpose of short-term, emergency administration of fluid, blood, or medication. See also **Nursing Interventions Classification.**

medication administration: intraspinal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the administration and monitoring of medication via an established epidural or intrathecal route. See also **Nursing Interventions Classification.**

medication administration: intravenous (IV), a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and giving medications via the intravenous route. See also **Nursing Interventions Classification.**

medication administration: nasal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and giving medications via nasal passages. See also **Nursing Interventions Classification.**

medication administration: oral, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and giving medications by mouth. See also **Nursing Interventions Classification.**

medication administration: rectal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and inserting rectal suppositories. See also **Nursing Interventions Classification.**

medication administration: skin, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and applying medications to the skin. See also **Nursing Interventions Classification.**

medication administration: subcutaneous, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and giving medications via the subcutaneous route. See also **Nursing Interventions Classification.**

medication administration: vaginal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing and inserting vaginal medications. See also **Nursing Interventions Classification.**

medication administration: ventricular reservoir, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration and monitoring of medication through an indwelling catheter into the lateral ventricle of the brain. See also **Nursing Interventions Classification.**

medication error, any incorrect or wrongful administration of a medication, such as a mistake in dosage or route of administration, failure to prescribe or administer the correct drug or formulation for a particular disease or condition, use of outdated drugs, failure to observe the correct time for administration of the drug, or lack of awareness of adverse effects of certain drug combinations. Causes of medication error may include difficulty in reading handwritten orders, confusion about different drugs with similar names, and lack of information about a patient's drug allergies or sensitivities. When the nurse is in doubt, administration of a drug should be delayed until specifically authorized by a physician.

medication management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of safe and effective use of prescription and over-the-counter drugs. See also **Nursing Interventions Classification.**

medication order, a written order by a physician, dentist, nurse practitioner, or other designated health professional for a medication to be dispensed by a pharmacy for administration to a patient.

medication prescribing, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prescribing medication for a health problem. See also **Nursing Interventions Classification.**

medication reconciliation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as comparison of the patient's home medications with the admission, transfer, and/or discharge orders to ensure accuracy and patient safety. See also **Nursing Interventions Classification.**

medication response, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as therapeutic and adverse effects of prescribed medication. See also **Nursing Outcomes Classification.**

medicinal restraint. See **chemical restraint.**

medicinal treatment, therapy of disorders based chiefly on the use of appropriate pharmacological agents.

medicine (med) [L, *medicina,* art of healing], **1.** a drug or a remedy for illness. **2.** the art and science of the diagnosis, treatment, and prevention of disease and the maintenance of good health. **3.** the art or technique of treating disease without surgery. Two major divisions of medicine are academic medicine and clinical medicine. Some of the many branches of medicine are **environmental medicine, family medicine, forensic medicine, internal medicine,** and **physical medicine. —medical,** *adj.*

medicolegal /med′ikōlē′gəl/ [L, *medicina,* art of healing, *lex,* law], pertaining to both medicine and law. Medicolegal considerations are a significant part of the process of making many patient care decisions and determining definitions and policies for the treatment of mentally incompetent people and minors, the performance of sterilization or therapeutic abortion, and the care of terminally ill patients. Medicolegal considerations, decisions, definitions, and policies provide the framework for informed consent, professional liability, and many other aspects of current practice in the health care field.

Medigap /med′igap/, a health insurance policy sold by a private insurance company to fill gaps in coverage of a person's original Medicare plan.

Medihaler-Epi, a trademark for an adrenergic (epINEPHrine bitartrate).

mediocarpal /mē′dē·ōkär′pəl/ [L, *medius,* middle; Gk, *karpos,* wrist], between the two rows of bones of the carpus. Also called **midcarpal.**

mediolateral /mē′dē·ō·lat′ər·əl/ [L. *medius,* middle + *latus,* side], pertaining to the middle and to one side.

meditation /med′itā′shən/ [L, *meditari,* to consider], a state of consciousness in which the individual eliminates environmental stimuli from awareness so that the mind has a single focus, producing a state of relaxation and relief from stress. A wide variety of techniques are used to clear the mind of stressful outside interference.

meditation facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating a person to alter his/her level of awareness by focusing specifically on an image or thought. See also **Nursing Interventions Classification.**

meditation therapy, a method of achieving relaxation and consciousness expansion by focusing on a mantra or a key word, sound, or image while eliminating outside stimuli from one's awareness.

Mediterranean fever. See **brucellosis.**

Mediterranean lymphoma. See **immunoproliferative small intestine disease.**

medium /mē′dē·əm/ *pl.* **media** [L, *medius,* middle], a substance through which something moves or through which it acts. A **contrast medium** is a substance that has a density different from that of body tissues, permitting visual comparison of structures when used with imaging techniques such as x-ray film. A **culture medium** is a substance that provides a nutritional environment for the growth of microorganisms or cells. A **dispersion medium** is the substance in which a colloid is dispersed. A **refractory medium** is the transparent tissues and fluid of the eye that refract light.

medium-chain fatty acid (MCFA), a fatty acid having a chain length roughly 8 to 12 carbons long. It is absorbed directly into the portal blood, bypassing the lymphatic system.

medium-chain triglyceride (MCT), a glycerine ester combined with medium-chain triglycerides distinguished from other triglycerides by having 8 to 10 carbon atoms. Once hydrolyzed, these fatty acids can be absorbed directly into the portal system. MCTs in foods are usually high in calories and easily digested.

medius /mē′dē·əs/ [L], in the middle; a term used in reference to a structure lying between two other structures that are anterior and posterior, superior and inferior, or internal and external in position.

MEDLARS /med′lärs/, abbreviation for *Medical Literature Analysis and Retrieval System,* a computerized literature retrieval service of the National Library of Medicine in Bethesda, Maryland. MEDLARS contains more than 4,500,000 references to medical articles in professional journals and books published since 1966. The references are made available on request to more than 1000 hospitals, universities, government agencies, and other interested parties throughout the world by means of a network of computer terminals. The references are filed in 15 data bases, including MEDLINE, TOXLINE, CHEMLINE, RTECS, CANCERLIT, and EPILEPSYLINE. See also **MEDLINE.**

MEDLINE /med′līn/, a National Library of Medicine computer data base that covers over 600,000 references to biomedical journal articles published currently and in the 2 preceding years. The files duplicate the contents of the monthly and annual volumes of the *Unabridged Index Medicus,* also published by the National Library of Medicine, which indexes medical reports from more than 3000 professional journals in more than 70 countries.

MedRC, abbreviation for *medical reserve corps*.

Medrol, a trademark for a glucocorticoid (methylPREDNISolone disodium phosphate).

Medrol Acetate, a trademark for a glucocorticoid (methylPREDNISolone acetate).

medroxyPROGESTERone acetate /medrok′sēprōjes′tərōn/, a progestin.

■ INDICATIONS: It is prescribed in endometrial and renal carcinomas and in the treatment of menstrual disorders caused by hormone imbalance. It is given as a depot injection for contraception (Depo-Provera).

■ CONTRAINDICATIONS: Known or suspected pregnancy, thrombophlebitis, embolism, stroke, liver dysfunction, cancer of the breast or genitals, abnormal vaginal bleeding, missed abortion, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are thrombophlebitis, pulmonary embolism, stroke, hepatitis, and cerebral thrombosis.

medrysone /med′risōn/, a glucocorticoid that decreases the infiltration of leukocytes at the site of inflammation. It is used topically in the eye as an antiinflammatory agent.

Med.Sc.D., abbreviation for *Doctor of Medical Science*.

Med Tech, abbreviation for *medical technician*.

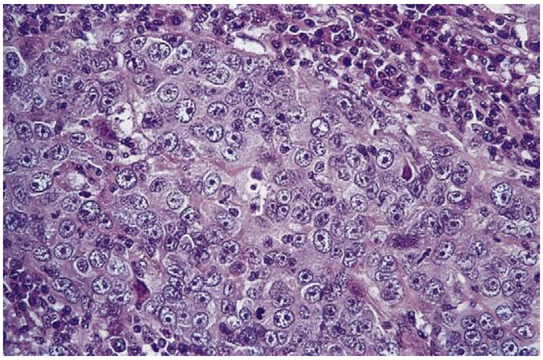
medulla /mədul′ə/ *pl.* **medullas, medullae** [L, marrow], **1.** the most internal part of a structure or organ, such as the renal medulla. **2.** See **medulla oblongata.**

medulla oblongata, a bulbous continuation of the spinal cord just above the foramen magnum and separated from the pons by a horizontal groove. It is one of three parts of the brainstem and mainly contains white substance with some mixture of gray substance. The medulla contains the cardiac, vasomotor, and respiratory centers of the brain. Medullary injury or disease often proves fatal. Compare **mesencephalon, pons.** Also called *(informal)* **medulla.**

medulla of the kidney [L, *medulla,* marrow; ME, *kidenei*], a part of the parenchyma of the kidney, beneath the cortex, including the renal pyramids and columns. It contains few, if any, glomeruli. An inner layer contains the papillae, and the outer part, which extends as far as the arcuate vessels, contains the thick ascending limbs of the loop of Henle.

medullary /med′əler′ē, mədul′erē, med′yəler′ē/ [L, *medulla,* marrow], **1.** pertaining to the medulla of the brain. **2.** pertaining to the bone marrow. **3.** pertaining to the spinal cord. Also **medullar.**

medullary carcinoma, a soft malignant neoplasm of the epithelium containing little or no fibrous tissue. Also called **carcinoma medullare, carcinoma molle, encephaloid carcinoma.**



Medullary carcinoma *(Fletcher, 2007)*

medullary chemoreceptor. See **central chemoreceptor.**

medullary cystic disease, a chronic familial disease of the kidney, characterized by the slow onset of uremia. The disease appears in young children or adolescents, who pass large volumes of dilute urine with greater than normal amounts of sodium. Hemodialysis is the usual treatment for the disease as the uremia progresses and becomes severe. See also **uremia.**

medullary fold. See **neural fold.**

medullary groove. See **neural groove.**

medullary nerve sheath. See **nerve sheath.**

medullary plate. See **neural plate.**

medullary sponge kidney, a congenital defect of the kidney leading to cystic dilation of the collecting tubules. People with this defect often develop a kidney stone or an infection of the kidney caused by urinary stasis. The condition is diagnosed by urographic techniques. Treatment includes drugs to acidify the urine and a diet low in calcium and high in fluids to discourage formation of stones.

medullary tube. See **neural tube.**

medullas. See **medulla.**

medulla spinalis. See **spinal cord.**

medullated /med′yəlā′tid/ [L, *medulla,* marrow], enclosed by a marrowlike substance, such as the myelin sheath of a nerve fiber.

medullated neuroma. See **fascicular neuroma.**

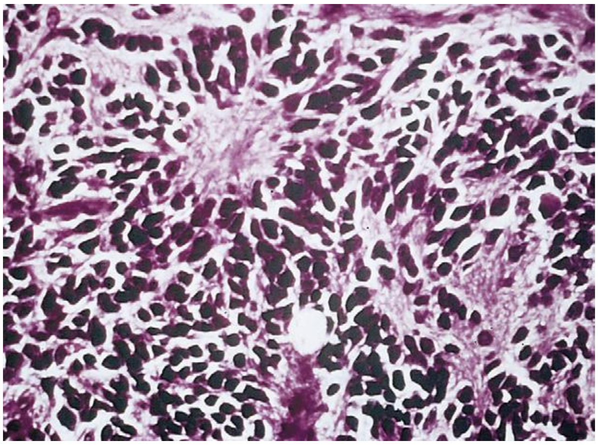
medulloblastoma /mədul′ōblastō′mə/ [L, *medulla* + Gk, *blastos,* germ, *oma,* tumor], a poorly differentiated malignant neoplasm composed of tightly packed cells of spongioblastic and neuroblastic lineage. The tumor usually arises in the cerebellum, occurs most frequently at 5 to 9 years of age, and affects more boys than girls. Medulloblastomas are extremely radiosensitive and grow rapidly. The prognosis is poor.

medulloepithelioma. See **neurocytoma.**

mefenamic acid /mef′ənam′ik/, a nonsteroidal antiinflammatory agent and analgesic.

■ INDICATIONS: It is prescribed in the treatment of mild to moderate pain, including dysmenorrhea.

■ CONTRAINDICATIONS: GI ulceration or inflammation, impaired renal function, or known hypersensitivity to this



Medulloblastoma *(Kumar, Abbas, and Fausto, 2005/Courtesy Dr. Elisabeth Rushing, Department of Pathology, University of Texas Southwestern Medical Center)*

drug prohibits its use. It is prescribed with caution for patients with asthma.

■ ADVERSE EFFECTS: Dyspepsia and diarrhea are the most common adverse effects. Other GI symptoms, dizziness, drowsiness, or skin rash occasionally occurs. Severe blood dyscrasias develop rarely.

mefloquine /mef′ləkēn/, an antimalarial for the prophylaxis and treatment of malaria caused by chloroquine-resistant strains of *Plasmodium falciparum*, or *P. vivax*.

Mefoxin, a trademark for a cephalosporin antibiotic **(cefoxitin sodium).**

MEFR, abbreviation for **maximal expiratory flow rate.**

mega-, megalo-, mego-, **1.** prefix meaning "great or huge": *megacardia, megacoccus, megadyne*. **2.** a quantity one million times a given unit: *megahertz*.

megabladder. See **megalocystis.**

megacaryocyte. See **megakaryocyte.**

Megace, a trademark for an antineoplastic progestational agent **(megestrol acetate).**

megacolon /meg′əkōlən/ [Gk, *megas* + *kolon*, colon], abnormal massive dilation of the colon that may be congenital, toxic, or acquired. Congenital megacolon **(Hirschsprung's disease)** is caused by the absence of autonomic ganglia in the smooth muscle wall of the colon. Toxic megacolon is a grave complication of ulcerative colitis and may cause perforation of the colon, septicemia, and death. Colonoscopy and surgery are the usual treatments for toxic and congenital megacolon. Acquired megacolon is the result of a chronic refusal to defecate, which usually occurs in children who are psychotic or mentally retarded. The colon becomes dilated by an accumulation of impacted feces. Laxatives, enemas, and psychiatric treatment are often necessary.

megacycle. See **megahertz.**

megacystis, an abnormally enlarged urinary bladder. Also called **megabladder**, **megalocystis**.

megadose /meg′ədōs/, a dose that greatly exceeds the amount usually prescribed or recommended.

megadyne /meg′ədīn/, a unit of force equal to one million dynes.

megaesophagus /meg′ə·isof′əgəs/ [Gk, *megas* + *oisophagos*, gullet], abnormal dilation of the lower segments of the esophagus caused by distension resulting from the failure of the cardiac sphincter to relax and allow the passage of food into the stomach. See also **achalasia.**

megahertz (MHz) /meg′əhurts/ [Gk, *megas*, large, *hertz*, a number of cycles per second], a unit of frequency equal to a million cycles per second. Also called **megacycle.** See also **hertz.**

megakaryocyte /meg′əker′ē·əsīt′/ [Gk, *megas*, large, *karyon*, nut, *kytos*, cell], bone marrow cell measuring 35 to 160 µm in diameter and having a multilobed nucleus. Megakaryocytes are platelet precursors. Also spelled **megacaryocyte.** See also **platelet. —megakaryocytic,** *adj*.

megakaryocytic leukemia /meg′əker′ē·ōsit′ik/ [Gk, *megas* + *karyon*, nut, *kytos*, cell], a rare malignancy of blood-forming tissue in which megakaryocytes proliferate in the bone marrow and circulate in the blood in large numbers.

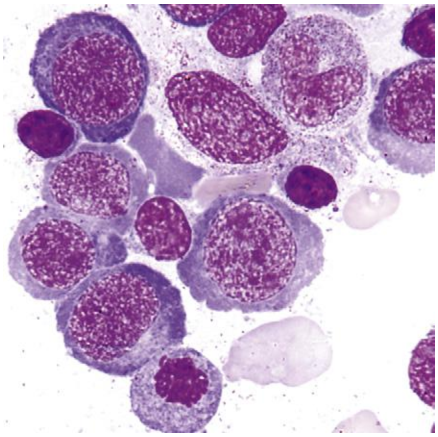
megalencephaly /meg′əlensef′əlē/ [Gk, *megas* + *enkephalos*, brain], a condition characterized by pathological parenchymal overgrowth of the brain. In some cases generalized cerebral hyperplasia is associated with mental retardation or a brain disorder, such as epilepsy. Also called **macrencephaly. —megalencephalic, megalencephalous,** *adj*.

-megalia. See **-megaly.**

megalo-. See **mega-.**

megaloblast /meg′əlōblast′/ [Gk, *megas* + *blastos*, germ], abnormally large nucleated immature erythrocyte that develops in the bone marrow in megaloblastic anemias associated with deficiency of vitamin B12, or folic acid. **—megaloblastic,** *adj*.

megaloblastic anemia /-blas′tik/, a hematologic disorder characterized by the production of macrocytes in folate and vitamin B12 deficiency. See also **nutritional anemia, pernicious anemia.**



Megaloblastic anemia *(Carr and Rodak, 2008)*

megalocephaly. See **macrocephaly.**

megalocornea, an inherited disorder in which the corneal diameter is enlarged. It may be associated with congenital glaucoma.

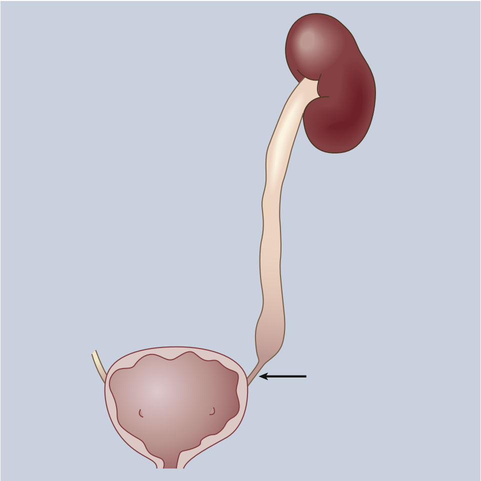
megalocystis /meg′əlōsis′tis/ [Gk, *megas* + *kystis*, bag], an abnormal condition primarily affecting girls, characterized by an enlarged and thin-walled bladder. Surgical reduction of the size of the bladder or diversion of urine through the ileum may correct the condition. Also called **megabladder, megacystis.**

megalocyte /meg′əlōsīt/, an extremely large erythrocyte. This term is not in common usage.

megalocytic interstitial nephritis, an early stage of malacoplakia of the urinary tract in which there are no Michaelis-Gutmann bodies.

megalomania /meg′əlōmā′nē·ə/ [Gk, *megas* + *mania*, madness], an abnormal mental state characterized by delusions of grandeur in which one believes oneself to be a person of great importance, power, fame, or wealth. Also called **grandiosity.** See also **mania.**

megaloureter /meg′əlōyo͝orē′tər/ [Gk, *megas* + *oureter*, ureter], an abnormal condition characterized by marked dilation of one or both ureters, resulting from dysfunctional peristaltic action of the smooth muscle in the ureters. Treatment may include surgical resection. Also called **megaureter.**



Megaloureter *(Goldman et al, 2008)*

-megaly, -megalia, suffix meaning an "enlargement of a (specified) body part": *cardiomegaly, dactylomegaly, gastromegaly.*

megaureter. See **megaloureter.**

megaureter-megacystis syndrome, chronic ureteral dilation associated with hypotonia and dilation of the bladder and gaping of the ureteral orifices, permitting vesicoureteral reflex of urine and resulting in chronic pyelonephritis.

megavitamin therapy /-vī′təmin/, a type of treatment that involves the administration of large doses of certain vitamins and minerals.

megestrol acetate /məjes′trōl/, an antineoplastic progestational agent.

■ INDICATIONS: It is prescribed to treat endometrial cancer and more commonly to palliate advanced endometrial and breast cancer. It is also used to stimulate appetite and to promote weight gain in cachexia patients.

■ CONTRAINDICATION: Hypersensitivity to the drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include edema and breakthrough bleeding.

mego. See **mega-.**

meibomian cyst. See **chalazion.**

meibomian gland /mēbō′mē·ən/ [Heinrich Meibom, German physician, 1638–1700], one of several sebaceous glands that secrete sebum from their ducts on the posterior margin of each eyelid. The glands are embedded in the tarsal plate of each eyelid. Also called **palpebral gland, tarsal gland.**

Meige's disease /mezh′əz/ [Henri Meige, French physician, 1866–1940], **1.** also called **Brueghel's syndrome.** dystonia of facial and oromandibular muscles with blepharospasm, grimacing mouth movements, and protrusion of the tongue, usually occurring in older women. **2.** See **Milroy's disease.**

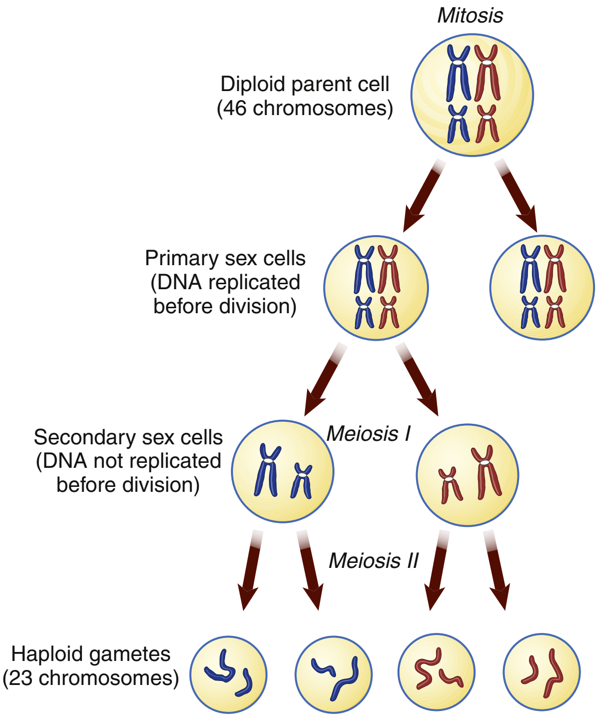
Meigs' syndrome /megz/ [Joe V. Meigs, American gynecologist, 1892–1963], ascites and hydrothorax associated with a fibroma of the ovaries or other pelvic tumor.

meio. See **mio-.**

meiocyte /mī′əsīt/ [Gk, *meiosis*, becoming smaller, *kytos*, cell], any cell undergoing meiosis.

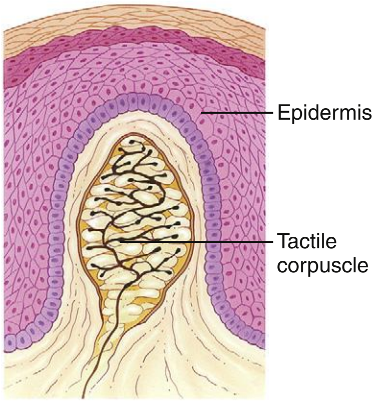
meiogenic /mī′əjen′ik/ [Gk, *meiosis* + *genein*, to produce], producing or causing meiosis.

meiosis /mī·ō′sis/ [Gk, becoming smaller], the division of a sex cell as it matures into two and then four haploid cells. The nucleus of each receives one half of the number of chromosomes present in the somatic cells of the species. Also called **reduction division.** Compare **mitosis.** See also **anaphase, metaphase, oogenesis, prophase, spermatogenesis, telophase. —meiotic** /mī·ot′ik/, *adj*.



Meiosis *(Patton and Thibodeau, 2010)*

Meissner's corpuscle /mīs′nərz/ [Georg Meissner, German anatomist, 1829–1905; L, *corpusculum*, little body], any one of a number of small, special pressure-sensitive sensory end organs with a connective tissue capsule and tiny stacked plates in the dermis of the hand and foot, the front of the forearm, the skin of the lips, the mucous membrane of the tongue, the palpebral conjunctiva, and the skin of the mammary papilla. A single nerve fiber penetrates each oval capsule, spirals through the interior, and ends as a globular mass. Also called **tactile corpuscle.** Compare **Golgi-Mazzoni corpuscles, Krause's corpuscles.**



Meissner's corpuscle *(Patton and Thibodeau, 2010)*

Meissner's plexus [Georg Meissner; L, *plaited*], small aggregations of ganglion cells located in the submucosa of the intestine.

mel-, melo, prefix meaning "limb or limbs": *melalgia, phocomelia*.

melan-. See **melano-.**

melancholia /mel′angkō′lē·ə/ [Gk, *melas,* black, *chole,* bile], a severe form of depression. Also called *melancholy*. See also **depression, major depressive disorder.** **—melancholic,** *adj*.

melaniferous /mel′ənif′ərəs/ [Gk, *melas,* black; L, *ferre,* to bear], pertaining to a black pigment.

melanin /mel′ənin/ [Gk, *melas,* black], a black or dark brown pigment that occurs naturally in the hair, skin, and iris and choroid of the eye. See also **melanocyte.**

melanin test, a test for detecting melanin in the urine of patients with malignant melanomas.

melanism /mel′əniz′əm/ [Gk, *melas,* black], an abnormal deposit of dark brown to black melanin pigment in the skin, hair, and other tissues. Also called **melanosis.**

melano-, melan-, mel-, prefix meaning "black": *melanoderm, melanoleukoderma, melanophore*.

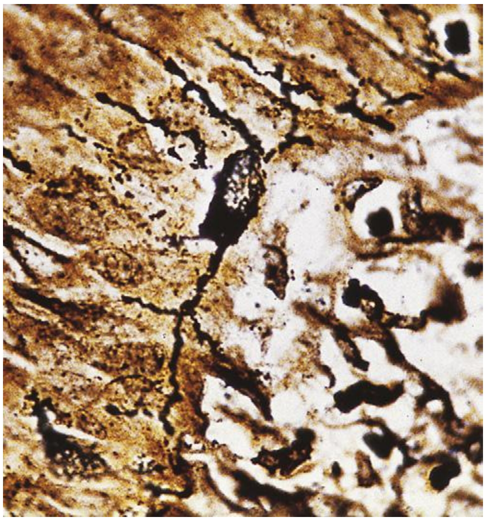
melanoameloblastoma /mel′ənō·am′əlōblastō′mə/, a benign neoplasm appearing as a blue-black lesion on the anterior maxilla of infants. The growth is of neuroectodermal origin and consists of small round undifferentiated tumor cells and larger melanin-producing cells. Also called **melanotic neuroectodermal tumor of infancy.**

melanoblast /mel′ənōblast′/ [Gk, *melas,* black, *blastos,* germ], an epithelial tissue cell containing black granules. It develops into a melanocyte from the neural crest and migrates to various parts of the body during the early stages of embryonic life before becoming a mature melanocyte capable of forming melanin.

melanoblastoma /mel′ənō·blastō′mə/, a tumor of poorly differentiated melanin-producing cells.

melanocarcinoma /-kär′sinō′mə/, a malignant melanoma.

melanocyte /mel′ənōsīt′, məlen′ōsīt/ [Gk, *melas* + *kytos,* cell], a body cell capable of producing melanin. Melanocytes are distributed throughout the basal cell layer of the epidermis and form melanin pigment from tyrosine, an amino acid. Melanin granules are then transferred to adjacent basal cells and to hair. Melanocyte-stimulating hormone from the pituitary controls the amount of melanin produced.



Melanocyte *(du Vivier, 2002)*

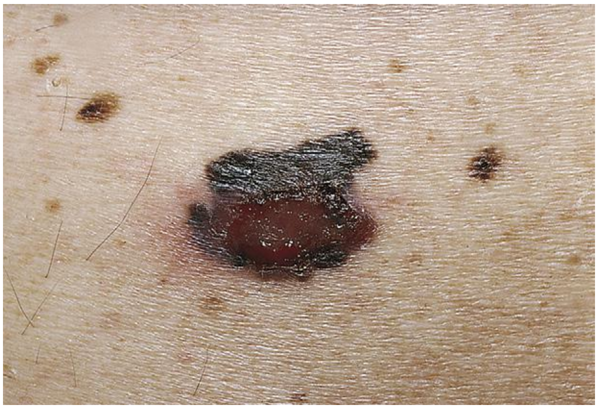
melanocyte-stimulating hormone (MSH), a polypeptide hormone, secreted by the pars intermedia of the pituitary gland, that controls the intensity of pigmentation in pigmented cells. It is synthesized on the same large precursor polypeptide as adrenocorticotropic hormone and the enkephalins.

melanocytic nevus /-sit′ik/, a congenital pigmented lesion of the skin caused by a disorder involving melanocytes.

melanoderma /mel′ənōdur′mə/ [Gk, *melas* + *derma,* skin], any abnormal darkening of the skin caused by increased deposits of melanin or the salts of iron or silver.

melanoma /mel′ənō′mə/ *pl.,* **melanomas, melanomata** [Gk, *melas* + *oma,* tumor], any of a group of malignant neoplasms that originate in the skin and that are composed of melanocytes. A melanocytic nevus may be acquired or congenital. The congenital melanocytic nevus is regarded as more likely to develop into a malignant melanoma, primarily because of its larger size. Smaller melanomas tend to develop from a pigmented nevus over several months or years. They may be sporadic and occur most commonly in fair-skinned people having light-colored eyes. A previous sunburn increases a person's risk. Any black or brown spot having an irregular border; pigment appearing to radiate beyond that border; a red, black, and blue coloration observable on close examination; or a nodular surface is suggestive of melanoma and is usually excised for biopsy. Melanomas are most commonly located on the upper back and lower legs of fair-skinned individuals and on the palms of the hands and insoles of the feet of dark-skinned individuals. Melanomas may metastasize and are among the most malignant of all skin cancers. Prognosis depends on the kind of melanoma; its size, depth of invasion, and location; and the age and condition of the patient. Because of the occurrence of melanomas and melanocytic nevi in certain families, a familial atypical mole and melanoma syndrome has been designated. It is defined by the occurrence of melanoma in one or more first- or second-degree relatives, a large number of moles, and moles that demonstrate certain cellular features. Patients with the syndrome have a high lifetime risk of development of melanoma. Kinds of melanoma are *amelanic melanoma,* **benign juvenile melanoma, lentigo maligna melanoma, nodular melanoma, primary**

cutaneous melanoma, and **superficial spreading melanoma.** Compare **blue nevus.** See also **Hutchinson's freckle.**



Malignant melanoma *(Callen et al, 2000)*

melanomatosis /-mətō′sis/, **1.** a condition characterized by many widespread melanoma lesions. **2.** the development of melanomas throughout the body.

melanosis. See **melanism.**

melanosis coli /mel′ənō′sis/, an abnormal condition in which the mucous membrane of the colon is pigmented with melanin.

melanosome /mel′ənōsōm′/, one of the oval pigment granules within melanocytes that synthesize melanin.

melanotic carcinoma /mel′ənot′ik/, a malignant pigmented skin cancer.

melanotic neuroectodermal tumor of infancy. See **melanoameloblastoma.**

melanuria /mel′ənŏŏr′ē·ə/, urine that has a dark color caused by the presence of melanin or other pigments.

melasma. See **chloasma.**

melasma gravidarum /məlaz′mə/ [Gk, *melas,* black; L, *gravida,* pregnant], a dark pigment or discoloration that may appear on the skin of pregnant women, caused by estrogen and progesterone stimulation of melanin. It is most commonly seen in olive-skinned women.

MELAS syndrome, abbreviation for *mitochondrial encephalopathy, lactic acidosis,* and *stroke-like episodes,* constituting a familial syndrome of maternal (mitochondrial) inheritance.

melatonin, a dietary supplement, also known as N-acetyl-5-methoxytryptamine.

■ USES: It is used for jet lag and insomnia, for cancer protection, and as an oral contraceptive. Melatonin is effective for treating jet lag and has shown benefit when used in combination therapy for various cancers. It is not very effective for insomnia. There are insufficient data related to its efficacy for other uses.

■ CONTRAINDICATIONS: It is not recommended during pregnancy and lactation, in children, or in those with autoimmune disease or known hypersensitivity to this product.

Meleda disease. See **mal de Meleda.**

melena /məlē′nə, məl′əna/ [Gk, *melas,* black], abnormal black tarry stool that has a distinctive odor and contains digested blood. It usually results from bleeding in the upper GI tract and is often a sign of peptic ulcer or small bowel disease. See also **gastrointestinal bleeding.**

melena neonatorum [Gk, *melas,* black, *neos,* new; L, *natus,* born], the passage of dark tarry stools by a newborn. The cause is usually the alteration of blood pigment associated with hemorrhage. Normal meconium stools are greenish to black.

meli-, prefix meaning "sweet, or related to honey": *melicera, melitagra, melitoptyalism.*

-melia, suffix meaning "limbs": *acromelia, dolichomelia, phocomelia.*

melioidosis /mel′ē·oidō′sis/ [Gk, *melis,* distemper, *eidos,* form, *osis,* condition], an infection caused by the gram-negative bacillus *Burkholderia pseudomallei. Acute melioidosis* is fulminant and usually characterized by pneumonia, empyema, lung abscess, septicemia, and liver or spleen involvement. *Chronic melioidosis* is associated with osteomyelitis, multiple abscesses of the internal organs, and development of fistulas from the abscesses. The disease, most commonly seen in China and Southeast Asia, is acquired by direct contact with infected animals. Human-to-human transmission is unlikely. Treatment using chloramphenicol, sulfonamides, or tetracycline for several months is usually successful.

Melkersson-Rosenthal syndrome /mel′kərson rō′zentäl/ [Ernst Gustaf Melkersson, Swedish physician, 1898–1932; Curt Rosenthal, German psychiatrist, 1892-1937], an autosomal-dominant condition usually beginning in childhood or adolescence, characterized chiefly by chronic noninflammatory facial swelling, localized particularly to the lips, with recurrent facial palsy and sometimes fissured tongue. Associated ophthalmic symptoms include lagophthalmos, blepharochalasis, swollen eyelids, burning sensation of the eyes, corneal opacities, retrobulbar neuritis, and exophthalmos. Also called *Melkersson's syndrome.*

Mellaril, a trademark for an antipsychotic agent (thioridazine).

melon-seed body /mel′ən/, a small, fibrous, loose body in a joint or tendon sheath.

meloxicam /mĕlok′sĭkam/, a nonsteroidal antiinflammatory drug used in the treatment of osteoarthritis. It is administered orally.

melphalan /mel′fəlan/, an antineoplastic alkylating agent.

■ INDICATIONS: It is prescribed in the treatment of malignant neoplastic diseases, including palliative treatment of multiple myeloma and nonresectable ovarian carcinoma.

■ CONTRAINDICATIONS: Pregnancy, recent exposure to antineoplastic medication or to radiation, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are bone marrow depression, nausea, and vomiting.

melting, **1.** the liquefaction effect of heat. **2.** the thermal denaturation of double-stranded deoxyribonucleic acid into two component strands. **3.** conversion of the solid to the liquid phase.

melting point (mp) [AS, *meltan* + L, *punctus,* pricked], a characteristic temperature at which the solid and liquid forms of a substance are in equilibrium. The mp of ice is 32° F, or 0° C, at one atmosphere pressure.

memantine, an anti-Alzheimer agent.

■ INDICATIONS: This drug is used to treat moderate to severe dementia in Alzheimer's disease.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include somnolence, headache, hallucinations, hypertension, vomiting, constipation, rash, coughing, dyspnea, back pain, fatigue, and pain. Common side effects include dizziness and confusion.

membrana tectoria /membrā′nə/ [L, *membrana,* thin skin, *tectorium,* a covering], **1.** also called **occipitoaxial ligament,** the broad, strong ligament covering the dens and helping to connect the axis to the occipital bone of the skull. **2.** a spiral membrane projecting from the vestibular lip of the cochlea over the organ of Corti.

membrana tympani. See **tympanic membrane.**

membrane /mem′brān/ [L, *membrana,* thin skin], a thin layer of tissue composed of epithelial cells and connective tissue that covers a surface, lines a cavity, or divides a space in the body. The principal kinds of membranes are **mucous membrane, serous membrane, skin,** and **synovial membrane.**

membrane attack complex (MAC), a cluster of complement components that creates a pore in the plasma membrane of a cell, leading to the lysis of a cell.

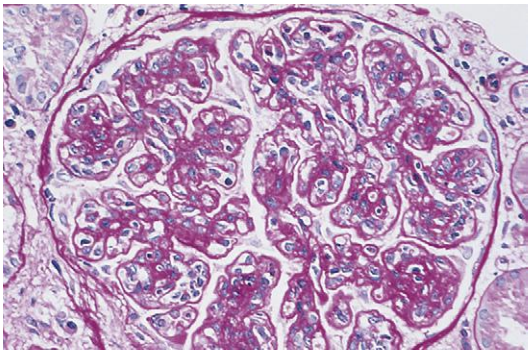
membrane conductance, the degree of permeability of a cellular membrane to certain ions; the reciprocal of the membrane resistance.

membrane diffusion coefficient, a factor that relates the quantitative characteristics of alveolar-capillary membranes to total pulmonary diffusing capacity.

membrane potential [L, *membrana* + *potentia*], the difference in electrical polarization or charge between two sides of a membrane or cell wall. Also called **electric potential gradient.**

membrane responsiveness, the relationship between the membrane potential of a myocardial cell at the time of stimulation and the maximal rate of rise of the action potential.

membranoproliferative glomerulonephritis (MPGN) /mem′brənō′prōlif′ərətiv′/, a chronic form of glomerulonephritis characterized by mesangial cell proliferation, irregular thickening of glomerular capillary walls, thickening of the mesangial matrix, and low serum levels of complement. Also called **mesangiocapillary glomerulonephritis.**



Membranoproliferative glomerulonephritis
(Kumar, Abbas, and Fausto, 2005/Courtesy Dr. H. Rennke, Brigham and Women's Hospital)

membranous /mem′brənəs/ [L, *membrana*], resembling or consisting of a membrane.

membranous dysmenorrhea [L, *membrana* + Gk, *dys,* bad, *men,* month, *rhein,* to flow], a form of spasmodic pain associated with menstruation, in which a cast of the uterine cavity is passed.

membranous labyrinth [L, *membrana* + *labyrinthos,* a maze], a network of three fluid-filled membranous semicircular ducts suspended within the bony semicircular canals of the inner ear, associated with the sense of balance. The ducts, which contain endolymph, follow the contours of the bony canals and are about one fourth of the diameter of the canals.

membranous nephropathy. See **glomerulonephritis.**

membranous pharyngitis [L, *membrana* + Gk, *pharynx,* throat], a diphtheric inflammation of the pharynx with the formation of a false membrane in the throat.

membranous stomatitis. See **pseudomembranous stomatitis.**

memory[1] /mem′ərē/ [L, *memoria*], **1.** the mental faculty or power that enables one to retain and to recall, through unconscious associative processes, previously experienced sensations, impressions, ideas, concepts, and all information that has been consciously learned. **2.** the reservoir of all past experiences and knowledge that may be recollected or recalled at will. **3.** the recollection of a past event, idea, sensation, or previously learned knowledge. Kinds of memory include **affect memory, anterograde memory, kinesthetic memory, long-term memory, screen memory, short-term memory,** and **visual memory.** See also **amnesia, déjà vu.**

memory[2], a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to cognitively retrieve and report previously stored information. See also **Nursing Outcomes Classification.**

memory cells, **1.** See **lymphocyte.** **2.** T and B lymphocytes that mediate immunological memory. They are believed to retain information that permits a subsequent antigenic challenge to be followed by a more rapid efficient immunological reaction than that seen with the first exposure.

memory image, a sensation, impression, or sense perception as it is recalled in the memory.

memory training, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of memory. See also **Nursing Interventions Classification.**

mem retinoscopy, a type of dynamic retinoscopy in which the fixation target is a series of letters on the retinoscope or a card with letters at a normal reading distance. It is a common clinical test to assess lag of accommodation.

MEN, abbreviation for **multiple endocrine neoplasia.**

menadione /men′ədi·ōn/, a synthetic fat-soluble provitamin that can be chemically converted in the body to active vitamin K. It is used as a source of vitamin K in the treatment of hypoprothrombinemia associated with vitamin K deficiency, as occurs in hepatic or biliary disease or malabsorption syndromes, or after administration of salicylates, anticoagulants, or certain antibiotics. It is administered orally or intramuscularly. See also **vitamin K.** Also called **vitamin K_3.**

menarche /menär′kē/ [Gk, *men,* month, *archaios,* from the beginning], the first menstruation and the commencement of cyclic menstrual function. It usually occurs between 9 and 17 years of age. See also **pubarche.**

menarcheal age /menär′kē·əl/ [Gk, *men,* month, *archaios,* beginning; L, *aetas,* age], the age at which menstruation begins. The normal range is from 9 to 17 years of age. See also **puberty.**

Mendel-Bekhterev reflex. See **Mendel's reflex.**

mendelevium (Md) /men′dəlē′vē·əm/ [Dimitrii Ivanovich Mendeleev, Russian chemist, 1834–1907], a synthetic element in the actinide group. Its atomic number is 101. The atomic mass of its most stable isotope is 256. It is the ninth transuranic element.

mendelian. See **mendelism.**

mendelian genetics, mendelian laws. See **Mendel's laws.**

mendelism /men′dəliz′əm/ [Gregor J. Mendel, Austrian geneticist, 1822–1884], the concept of inheritance derived from the application of Mendel's laws. Also called *mendelianism*. **—mendelian,** *adj*.

Mendel's dorsal reflex of foot. See **Mendel's reflex.**

Mendel's laws [Gregor J. Mendel], the basic principles of inheritance based on breeding experiments on garden peas by the nineteenth-century Austrian monk Gregor Mendel. These principles are usually stated as the **law of segregation** and the **law of independent assortment.** According to the law of segregation, each trait of a species is represented in the somatic cells by a pair of units, now known as genes, which are segregated during meiosis so that each gamete receives only one gene for each trait. In any monohybrid crossing, the possible ratio for the phenotypic expression of a particular dominant trait is 3:1, whereas the genotypic ratio of pure dominants to hybrids to pure recessives is 1:2:1. According to the law of independent assortment, the members of a gene pair on different chromosomes segregate independently from other pairs during meiosis so that the gametes show all possible combinations of genes. Genes on the same chromosome are affected by linkage and segregate in blocks according to the amount of crossing over that occurs, a discovery made after Mendel's work. Also called **mendelian genetics, mendelian laws.** See also **chromosome, crossing over, dominant allele, linkage, meiosis, recessive allele.**

Mendelson's syndrome [Curtis L. Mendelson, American obstetrician, b. 1913], a respiratory condition caused by the aspiration of acidic gastric contents into the lungs. It usually occurs when a person vomits while inebriated, stuporous from anesthesia, or unconscious, as during a seizure. It is marked by bronchoconstriction and destruction of the tracheal mucosa, progressing to a syndrome resembling acute respiratory distress syndrome. Also called **pulmonary acid aspiration syndrome.**

Mendel's reflex /men′dəlz/ [Kurt Mendel, German neurologist, 1874–1946], percussion of the top of the foot normally causing dorsal flexion of the second to fifth toes but in certain organic nervous conditions causing plantar flexion of the toes. Also called **Bekhterev-Mendel reflex, cuboidodigital reflex, dorsocuboidal reflex, Mendel-Bekhterev reflex, Mendel's dorsal reflex of foot, tarsophalangeal reflex.**

Ménétrier's disease. See **giant hypertrophic gastritis.**

-menia, suffix meaning "(condition of) menstrual activity": *catamenia, ischomenia, pausimenia*.

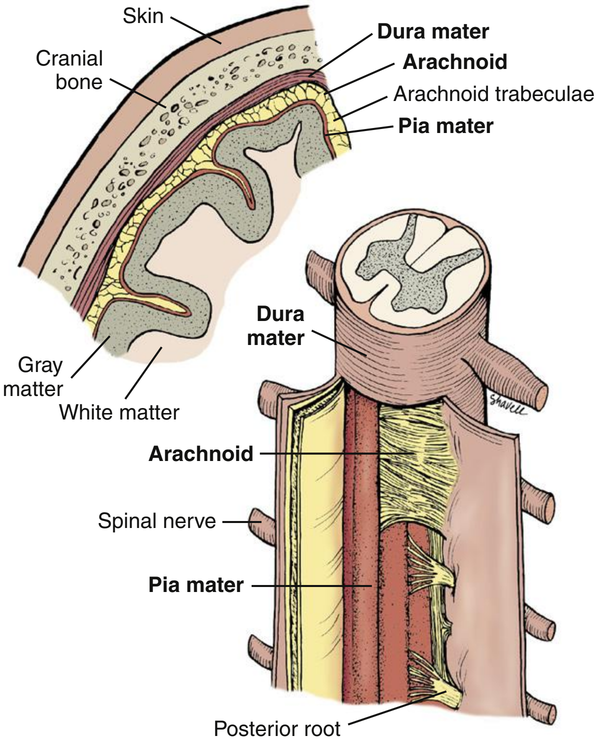
Ménière's disease /mānē·erz′/ [Prosper Ménière, French physician, 1799–1862], a chronic disease of the inner ear characterized by recurrent episodes of vertigo; progressive sensorineural hearing loss, which may be bilateral; and tinnitus.

meningeal /mənin′jē·əl/ [Gk, *meninx*, membrane], pertaining to the meninges, the three layers of membranes covering the brain and spinal cord.

meningeal artery, one of the arteries that supply the dura mater. All are small except the middle meningeal artery, which supplies the greatest part of the dura.

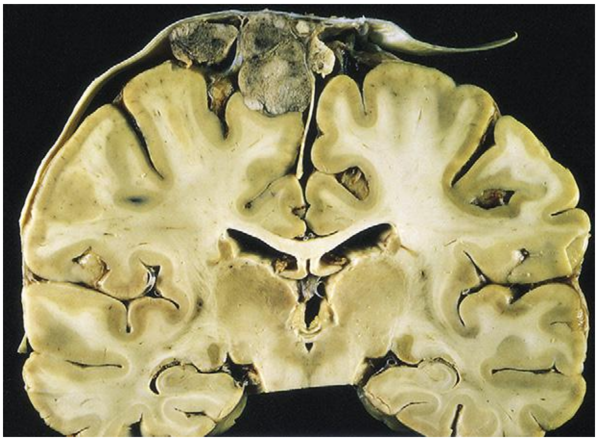
meningeal hydrops. See **pseudotumor cerebri.**

meninges /minin′jēz/ *sing.* **meninx** [Gk, *meninx*, membrane], the three membranes enclosing the brain and the spinal cord, comprising the dura mater, the pia mater, and the arachnoid membrane. The pia mater and the arachnoid can become inflamed by bacterial meningitis, causing serious complications that may be life-threatening. **—meningeal,** *adj*.



Meningeal layers of the brain *(Monahan et al, 1998)*

meningioma /minin′jē·ō′mə/ *pl.* **meningiomas, meningiomata** [Gk, *meninx*, membrane, *oma*, tumor], a mesenchymal fibroblastic tumor of the membranes enveloping the brain and spinal cord. Meningiomas grow slowly, are usually vascular, and occur most commonly near the superior longitudinal transverse and cavernous sinuses of the dura mater of the brain. The tumors may be nodular, plaquelike, or diffuse lesions that invade the skull, causing bone erosion and compression of brain tissue. Meningiomas usually occur in adults.



Meningioma *(Kumar et al, 2010)*

meningism /minin′jizəm/ [Gk, *meninx* + *ismos*, process], an abnormal condition characterized by irritation of the brain and spinal cord and by symptoms that mimic those of meningitis. In meningism, however, there is no actual inflammation of the meninges.

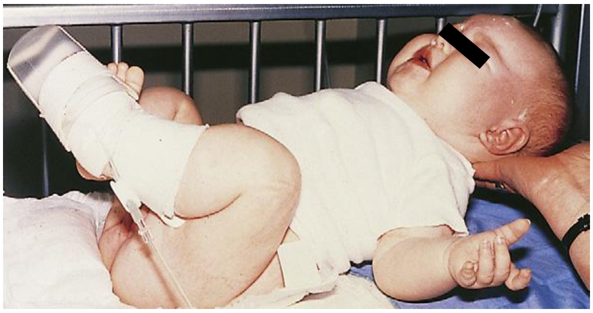
meningismus /men′injis′məs/ [Gk, *meninx*, membrane], a condition in which the patient shows signs of meningitis but examination reveals no pathological changes in the meninges. The condition is associated with cases of pneumonia in small children. See also **meningism.**

meningitis /min′injī′tis/ *pl.* **meningitides** [Gk, *meninx* + *itis*, inflammation], any infection or inflammation of the membranes covering the brain and spinal cord. It is usually purulent and involves the fluid in the subarachnoid space. The most common causes in adults are bacterial infection with *Streptococcus pneumoniae, Neisseria meningitidis,* or *Haemophilus influenzae*. **Aseptic meningitis** may be caused by nonbacterial agents such as a high dose of intravenous immunoglobulin, chemicals, neoplasms, or viruses. Many of these diseases are benign and self-limited, such as meningitis caused by strains of coxsackievirus or echovirus. Others are more severe, such as those involving arboviruses, herpesviruses, or poliomyelitis viruses. Yeasts such as *Candida* and *Cryptococcus* may cause a severe, often fatal meningitis. A kind of meningitis is **tuberculous meningitis.** Compare **encephalitis.** Also called **cerebromeningitis.**

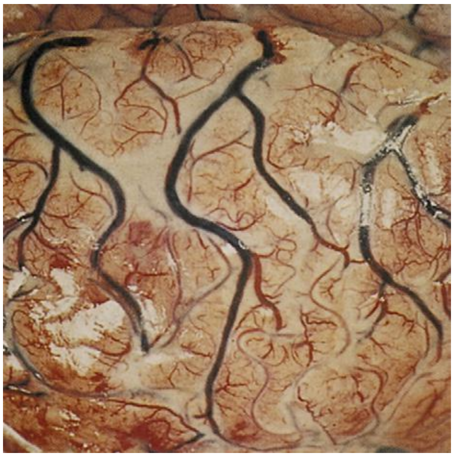
■ OBSERVATIONS: The onset of meningitis is usually sudden and characterized by severe headache, stiffness of the neck, irritability, malaise, and restlessness. Nausea, vomiting, delirium, and complete disorientation may develop quickly. Temperature, pulse rate, and respirations are increased. Residual damage may include deafness, blindness, paralysis, and mental retardation. Hydrocephalus also may develop.

■ INTERVENTIONS: Bacterial meningitis is treated promptly with antibiotics specific for the causative organism. They are administered intravenously or intrathecally. Antifungal medications, such as amphotericin B, given intravenously or intrathecally for several weeks, may prevent death from fungal meningitis, but serious neurological sequelae may occur.

■ NURSING CONSIDERATIONS: Constant skilled nursing attention is necessary to ensure early recognition of rising intracranial pressure, to prevent aspiration in the event of convulsive seizures, and to prevent airway obstruction. Except for the first day or two of meningococcal disease, strict isolation procedures are unnecessary. IV fluids and nasogastric tube feeding may be necessary for a prolonged period. Sedatives and narcotic analgesics should not be used because they may obscure important neurological signs in addition to depressing vital functions.



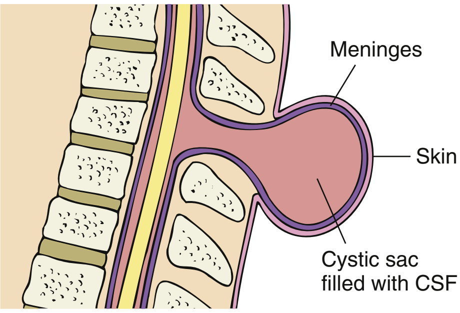
Stiffness of the neck commonly seen in meningitis *(Zitelli and Davis, 2007)*



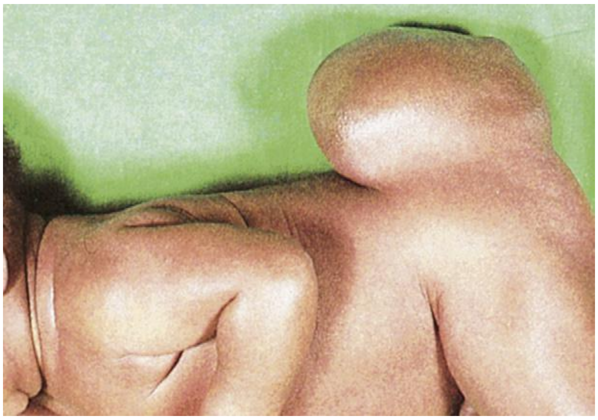
Bacterial meningitis: purulent exudate on surface of cerebral hemisphere *(Perkin et al, 2011)*

meningo-, prefix meaning "membranes covering the brain or spinal cord or other membranes": *meningocele, meningococcus, meningopathy.*

meningocele /mining′gōsēl′/ [Gk, *meninx* + *kele*, hernia], a saclike protrusion of either the cerebral or spinal meninges through a congenital defect in the skull or the vertebral column. It forms a hernial cyst that is filled with cerebrospinal fluid but does not contain neural tissue. The anomaly is designated a cranial meningocele or spinal meningocele, depending on the site of the defect. It can be easily repaired by surgery. See also **myelomeningocele, neural tube defect.**



Meningocele: protrusion of meninges through the skin *(Huether and McCance, 2008)*



Meningocele: clinical presentation *(Zitelli and Davis, 2002)*

meningococcal. See **meningococcus.**

meningococcal meningitis /mining′gōkok′əl/, bacterial meningitis caused by infection with *Neisseria meningitidis,* an acute infectious disease with seropurulent meningeal inflammation. It usually appears in epidemics, and symptoms are those of acute cerebral and spinal meningitis, usually with an eruption of cutaneous erythematous, herpetic, or hemorrhagic spots. The fulminating or malignant form accompanied with hemorrhagic apoplexy of adrenal glands is known as **Waterhouse-Friderichsen syndrome.** Also called **cerebrospinal fever, epidemic cerebrospinal meningitis.**

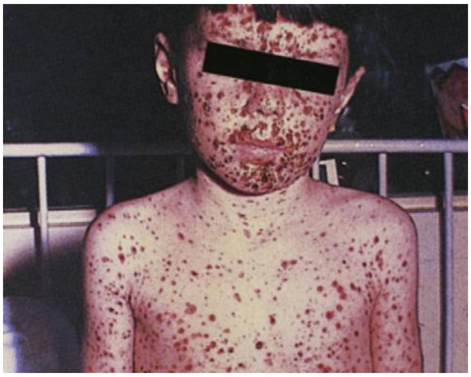
meningococcal polysaccharide vaccine /-kok′əl/, one of four active immunizing agents against group A, group C, group Y, or group W-135 meningococcal organisms.

■ INDICATION: It is prescribed for immunization against meningococcal meningitis, with the serogroup matched according to the local outbreak.

■ CONTRAINDICATIONS: Immunosuppression or acute infection prohibits its use.

■ ADVERSE EFFECT: The most serious adverse effect is anaphylaxis.

meningococcemia /mining′gōkoksē′mē·ə/ [Gk, *meninx* + *kokkos,* berry, *haima,* blood], a disease caused by *Neisseria meningitidis* in the bloodstream, subsequently causing vasculitis. Onset is sudden, with chills, pain in the muscles and joints, headache, petechiae, sore throat, and severe prostration. Tachycardia is present, respirations and pulse rate are increased, and fever is intermittent. Treatment of choice is penicillin G. Peripheral circulatory collapse or Waterhouse-Friderichsen syndrome, which is fatal if not aggressively treated, may occur.



Meningococcemia *(Zitelli and Davis, 2002)*

meningococcus /mining′gōkok′əs/ *pl.* **meningococci** /-kok'sī/ [Gk, *meninx* + *kokkos,* berry], a bacterium of the genus *Neisseria meningitidis,* a nonmotile gram-negative diplococcus, frequently found in the nasopharynx of asymptomatic carriers, that may cause septicemia or epidemic cerebrospinal meningitis. Meningococcal infections are not highly communicable. However, crowded conditions, such as may be found in army camps and college dormitories, concentrate the number of carriers and reduce individual resistance to the organism. Hemorrhagic skin lesions are significant clues to the diagnosis. Stained smears of these lesions or of cerebrospinal fluid must be examined quickly because meningococci are fragile and lyse readily. Early treatment with an appropriate antibiotic such as penicillin G is essential for cure. Contacts may receive prophylaxis with rifampin. Several meningococcal vaccines are available. See also **meningitis. —meningococcal,** *adj.*

meningoencephalitis /-ensef′əlī′tis/ [Gk, *meninx,* membrane, *enkephalos,* brain, *itis,* inflammation], an inflammation of both the brain and the meninges, usually caused by a bacterial infection.

meningoencephalocele /mining′gō·ensef′əlōsēl′/ [Gk, *meninx* + *enkephalos,* brain, *kele,* hernia], a saclike cyst containing brain tissue, cerebrospinal fluid, and meninges that protrudes through a congenital defect in the skull. It may or may not contain parts of the ventricular system and is commonly associated with brain defects. Also called **encephalomeningocele.** See also **neural tube defect.**

meningoencephalomyelitis /mining′gō·ensef′əlōmī′əlī′tis/, a combined inflammation of the brain, spinal cord, and meninges.

meningoencephalopathy /mining′gō·ensef′əlop′əthē/, a noninflammatory disease of the brain and its membranes.

meningomyelitis /-mī′əlī′tis/ [Gk, *meninx,* membrane, *myelos,* marrow, *itis,* inflammation], an inflammation of the spinal cord and its surrounding membranes.

meningomyelocele. See **myelomeningocele.**

meningovascular neurosyphilis /-vas′kyələr/ [Gk, *meninx,* membrane; L, *vasculum,* little vessel; Gk, *neuron,* nerve, *syn,* together, *philein,* to love], a neurosyphilis inflammation of the supporting and nutrient tissues of the central nervous system.

meninx. See **meninges.**

meniscectomy /men′isek′təmē/ [Gk, *meniskos,* crescent, *ektomē,* excision], surgical excision of one of the crescent-shaped cartilages of the knee joint. It is performed when a torn cartilage results in chronic pain and in instability or locking of the joint. After surgery the leg is kept elevated to reduce swelling, and exercises are performed to maintain muscle strength. See also **arthroscopy.**

menisci. See **meniscus.**

meniscocyte. See **erythrocyte.**

meniscocytosis. See **sickle cell anemia.**

meniscus /minis′kəs/ *pl.* **menisci** [Gk, *meniskos,* crescent], **1.** the interface between a liquid and air. **2.** a lens with both convex and concave aspects. **3.** a curved, fibrous cartilage in the knees and other joints. See also **meniscectomy.**

Menkes' kinky hair syndrome /men′kēz/ [John H. Menkes, American neurologist, 1928–2008; D, *kinke,* tight twist; AS, *haer*], a familial disorder affecting the normal absorption of copper from the intestine, characterized by the growth of sparse, kinky hair. Infants with the syndrome suffer cerebral degeneration, retarded growth, and early death. Early diagnosis and IV administration of copper may prevent irreversible damage.

meno-, prefix meaning "the menses": *menolipsis, menopause, menorrhea.*

menometrorrhagia /men′ōmet′rōrā′jē·ə/ [L, *men,* month; Gk, *metra,* womb, *rhegnyai,* to burst forth], excessive menstrual and uterine bleeding other than that caused by menstruation. It is a combination of metrorrhagia and menorrhagia and may be a sign of a urogenital malignancy.

menopause /men′əpôz/ [L, *men,* month; Gk, *pausis,* to cease], strictly, the cessation of menses, but commonly referring to the period of the female **climacteric.** Menses stop naturally with the decline of cyclic hormonal production and function, usually between 45 and 55 years of age, but may stop earlier in life as a result of illness or surgery or for unknown reasons. As the production of ovarian estrogen and pituitary gonadotropins decreases, ovulation and menstruation become less frequent and eventually stop. Fluctuations in the circulating levels of these hormones occur as the levels decline. Hot flashes are a common symptom of menopause.

They often can be controlled with estrogen but may not be so severe as to require therapy and cease in time without hormonal treatment. See also **artificial menopause.** Compare **andropause.**

menorrhagia /men′ərā′jē·ə/ [L, *men* + *rhegnyai,* to burst forth,], abnormally heavy or long menstrual periods. Menorrhagia occurs occasionally during the reproductive years of most women's lives. If the condition becomes chronic, anemia from recurrent excessive blood loss may result. Abnormal bleeding after menopause always warrants investigation to rule out malignancy. Menorrhagia is a relatively common complication of benign uterine fibromyomata; it may be so severe or intractable as to require hysterectomy. Also called **hypermenorrhea.** Compare **metrorrhagia, oligomenorrhea.** See also **dysmenorrhea. —menorrhagic,** *adj.*

menorrhea /men′ôrē′ə/ [L, *men* + Gk, *rhoia,* flow], the normal discharge of blood and tissue from the uterus. See also **menorrhagia, menstruation.**

menostasis /minos′təsis/ [L, *men* + Gk, *stasis,* stand still], an abnormal condition in which the products of menstruation cannot escape the uterus or vagina because of stenosis, an occlusion of the cervix or the introitus of the vagina. An imperforate hymen is a rare cause of menostasis. **—menostatic,** *adj.*

menotropins /men′ōtrop′inz/ [L, *men* + Gk, *trepein,* to turn], a preparation of gonadotropic hormones from the urine of postmenopausal women.

■ INDICATIONS: It is prescribed with chorionic gonadotropin to induce ovulation or development of multiple ovarian follicles for in vitro fertilization and to stimulate spermatogenesis in males.

■ CONTRAINDICATIONS: Elevated gonadotropin levels in the urine, thyroid or adrenal dysfunction, pituitary tumor, abnormal bleeding, ovarian cyst, pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are ovarian hyperstimulation syndrome, hemoperitoneum, arterial thromboembolism, multiple gestation, and possible birth defects.

menoxenia /men′oksē′nē·ə/ [L, *men* + Gk, *xenos,* strange], any abnormality relating to menstruation.

menses /men′sēz/ [L, *men,* month], the normal flow of blood and decidua that occurs during menstruation. The first day of the flow of the menses is the first day of the menstrual cycle. Also called **catamenia, menstrual period, period.**

menstrual /men′stro͞o·əl/ [L, *menstrualis,* monthly], pertaining to menstruation.

menstrual age [L, *menstrualis,* monthly, *aetas,* lifetime], the age of an embryo or fetus as calculated from the first day of the last menstrual period.

menstrual colic [L, *menstrualis,* monthly; Gk, *kolikos,* colon pain], a form of dysmenorrhea characterized by abdominal pain during or immediately before menstruation.

menstrual cramps, low abdominal pain that may range from a colicky feeling to a constant dull ache. The pain may radiate to the lower back and legs. Menstrual cramps are often associated with the beginning of menses, reaching a peak in 24 hours and subsiding after 2 days. Treatment may include administration of ibuprofen or other drugs immediately before and after the start of menses. See also **dysmenorrhea.**

menstrual cycle, the recurring cycle of change in the endometrium during which the decidual layer of the endometrium is shed, then regrows, proliferates, is maintained for several days, and is shed again at menstruation. The average length of the cycle, from the first day of bleeding of one cycle to the first of another, is 28 days. The duration and character vary greatly among women. Menstrual cycles begin at menarche and end with menopause. The uterine phases of the cycle are the **menstrual phase, proliferative phase,** and **secretory phase.** See also **oogenesis.**

menstrual period. See **menses.**

menstrual phase, the fourth phase of the human menstrual cycle, following the luteal phase and occurring only if fertilization has not taken place. The corpus luteum regresses and is shed through menstruation, and growth begins for the ovarian follicle, leading to the follicular phase of the next menstrual cycle.

menstrual sponge, a small natural sponge or a piece of a synthetic sponge to which a loop of string may be attached. It is inserted into the vagina to absorb the menstrual flow. Once removed, it may be washed, squeezed dry, and reused as necessary throughout menstruation. Menstrual sponges are not commonly used.

menstruation /men′stro͞o·ā′shən/ [L, *menstruare,* to menstruate], the periodic discharge through the vagina of a bloody secretion containing tissue debris from the shedding of the endometrium from the nonpregnant uterus. The average duration of menstruation is 4 to 5 days, and it recurs at approximately 28-day intervals throughout the reproductive life of nonpregnant women. Kinds of menstruation are **anovular menstruation, retrograde menstruation,** and **vicarious menstruation.** See also **menstrual cycle. —menstruate,** *v.*

ment-, prefix meaning "mind": *mental, menticide, mentimeter.*

mental^1 /men′təl/ [L, *mens,* mind], **1.** of, relating to, or characteristic of the mind or psyche. **2.** existing in the mind; performed or accomplished by the mind. **3.** of, relating to, or characterized by a disorder of the mind. **4.** slang term used to describe clients believed to have a mental health disorder.

mental^2 [L, *mentum,* chin], pertaining to the chin.

mental age (MA), the age level at which one functions intellectually, as determined by standardized psychological and intelligence tests and expressed as the age at which that level is average. Compare **achievement age.** See also **developmental age.**

mental deficiency. See **mental retardation.**

mental disorder, any disturbance of emotional equilibrium, as manifested in maladaptive behavior and impaired functioning, caused by genetic, physical, chemical, biological, psychological, or social and cultural factors. Also called **emotional illness, mental illness, psychiatric disorder.**

mental foramen [L, *mentum,* chin], an opening on the lateral part of the body of the mandible, inferior to the second premolar, through which the mental nerve and blood vessels pass.

mental handicap, any mental defect or characteristic resulting from a congenital abnormality, traumatic injury, or disease that impairs normal intellectual functioning and prevents a person from participating normally in activities appropriate for a particular age group. See also **mental retardation.**

mental health (MH), a relative state of mind in which a person is able to cope with and adjust to the recurrent stresses of everyday living in an acceptable way.

Mental Health Association, a voluntary nonprofessional agency dedicated to the improvement of mental health facilities and services in community clinics and hospitals, the recruitment and training of volunteers, and the promotion of mental health legislation. Formerly called the **National Association for Mental Health.**

mental health consultation, any interaction between two or more health care professionals related to a specific issue of mental health.

mental health nursing. See **psychiatric nursing.**

mental health service, any one of a group of government, professional, or lay organizations operating at a community, state, national, or international level to aid in the prevention and treatment of mental disorders. See also **community mental health center.**

mental hygiene, the study of the development of healthy mental and emotional habits, attitudes, and behavior and the prevention of mental illness. Also called **psychophylaxis.**

mental illness. See **mental disorder.**

mental image, any concept or sensation produced in the mind through memory or imagination.

mentalis, a muscle that arises from the mandible just inferior to the incisor teeth and helps position the lip during pouting or drinking from a cup. It raises and protrudes the lower lip as it wrinkles the skin on the chin.

mentality /mental′itē/ [L, *mens,* mind], **1.** the functional power and capacity of the mind. **2.** intellectual character.

mental protuberance, a midline swelling on the base of the mandible on its anterior surface where the two sides of the mandible come together. Just lateral to the mental protuberance, on either side, are the slightly more pronounced mental tubercles.

mental retardation, a disorder characterized by subaverage general intellectual function with deficits or impairments in the ability to learn and to adapt socially. The cause may be genetic, biological, psychosocial, or traumatic.

mental ridge [L, *mentum,* chin; AS, *hyrcg*], a dense elevation that extends from the symphysis menti (the center front of the mandible) to the premolar area on the anterolateral aspect of the body of the mandible.

mental status, the degree of competence shown by a person in intellectual, emotional, psychological, and personality functioning as measured by psychological testing with reference to a statistical norm. See also **mental status examination.**

mental status examination, a diagnostic procedure for determining the mental status of a person. The trained interviewer poses certain questions in a carefully standardized manner and evaluates the verbal responses and behavioral reactions.

mental tubercle [L, *mentum,* chin], one of a bilateral pair of prominences on the lower border of the body of the mandible.

mentation /mentā′shən/ [L, *mens,* mind, *atus,* process], any mental activity, including conscious and unconscious processes.

menthol /men′thol/ [L, *menta,* mint], a topical antipruritic with a cooling effect that relieves itching. It is an ingredient in many topical creams and ointments.

mentholated camphor /men′thəlā′tid/, a mixture of equal parts of camphor and menthol, used as a local counterirritant.

-mentia, suffix meaning "(condition of the) mind": *dementia, moramentia, pseudodementia.*

menton /men′ton/ [L, *mentum,* chin], the most inferior point on the chin in the lateral view of a cephalogram. It is a cephalometric landmark used in orthodontic treatment.

mentor /men′tər/ [Gk, *Mentor,* mythic educator], **1.** a more experienced, trusted adviser or counselor who offers helpful guidance to less experienced colleagues. **2.** a person who enters into a relationship with a new nurse to provide him or her with a source of support and information as he or she learns new roles.

mentum /men′təm/ [L, chin], **1.** the chin, especially of the fetus. **2.** a fetal reference point in designating the position of the fetus with respect to the maternal pelvis. For example, left mentum anterior indicates that the fetal chin is presenting in the left anterior quadrant of the pelvis.

menu /men′yo͞o/ [Fr, small], a list of choices displayed on a computer screen from which a user selects the next action to be taken by signaling through the keyboard or another device, such as a mouse.

MEP, **1.** abbreviation for **maximal expiratory pressure.** **2.** abbreviation for *mean effective pressure.*

mepenzolate bromide /mepen′zəlāt/, an anticholinergic/antispasmodic agent.

■ INDICATIONS: It is prescribed as an adjunct in treating peptic ulcers and preoperatively to reduce respiratory secretions.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, obstruction of the genitourinary or GI tract, severe ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, or hypersensitivity reactions may occur.

Mepergan, a trademark for a fixed-combination central nervous system drug containing an opioid analgesic **(meperidine hydrochloride)** and an antihistamine **(promethazine hydrochloride).**

meperidine hydrochloride /meper′idēn/, an opioid analgesic.

■ INDICATIONS: It is used to treat moderate to severe pain and to relieve pain and anxiety before or after surgery.

■ CONTRAINDICATIONS: It is used with caution in many conditions, including head injuries, asthma, seizures, impaired renal or hepatic function, or unstable cardiovascular status. Concomitant use of a monoamine oxidase inhibitor or known hypersensitivity to this drug prohibits its use. It is not used if the patient has convulsive disorders.

■ ADVERSE EFFECTS: Among the most serious adverse effects are drowsiness, dizziness, nausea, seizures, constipation, sweating, respiratory and circulatory depression, and drug addiction.

mephobarbital /mef′ōbär′bitol/, an anticonvulsant and sedative.

■ INDICATIONS: It is prescribed in the treatment of anxiety, nervous tension, insomnia, and epilepsy.

■ CONTRAINDICATIONS: Porphyria or known hypersensitivity to this drug or to barbiturates prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are drug dependence, a hangover effect, deficiency in vitamin D, paradoxical excitement, and GI disturbance.

Mephyton, a trademark for a vitamin K product **(phytonadione).**

mepivacaine, carbocaine, a local anesthetic of the amide type with a rapid onset and intermediate duration.

meprobamate /miprō′bəmāt/, an antianxiety agent.

■ INDICATIONS: It is prescribed in treatment of anxiety and tension.

■ CONTRAINDICATIONS: Intermittent porphyria, CNS depression, narrow-angle glaucoma, pregnancy, or known hypersensitivity to this drug or to the chemically related drug carisoprodol prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are exacerbation of intermittent porphyria, augmentation of effects of other central nervous system depressants, and various allergic reactions. Drowsiness and ataxia commonly occur.

mEq, abbreviation for **milliequivalent.**

mEq/L, abbreviation for **milliequivalent per liter.**

-mer, -mere, mero-, **1.** combining form meaning “part, portion”: *isomer, monomer, merocyte, meropia*. **2.** combining form meaning “polymer.”

meradimate /mer-ad′imāt/, an absorber of ultraviolet A radiation, used topically as a sunscreen.

meralgia /miral′jə/ [Gk, *meros,* thigh, *algos,* pain], the presence of pain in the thigh.

meralgia paresthetica /per′esthet′ikə/, a condition characterized by pain, paresthesia, and numbness on the lateral surface of the thigh in the region supplied by the lateral femoral cutaneous nerve. The cause of the condition is ischemia of the nerve caused by its entrapped position in the inguinal ligament.

mercaptopurine /mərkap′təpyo͞o′rēn/, an antineoplastic and immunosuppressive; a purine antimetabolite. Also called *6-mercaptopurine (6-MP).*

■ INDICATIONS: It is prescribed in the treatment of malignant neoplastic diseases, especially as maintenance therapy for acute lymphocytic leukemia.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more severe adverse effects are bone marrow depression and acute GI disturbances, including nausea, vomiting, diarrhea, and stomatitis.

Mercer, Ramona T., a nursing theorist who developed the Maternal Role Attainment model presented in her book *First-Time Motherhood: Experiences from Teens to Forties* (1986). Maternal role attainment is an interactional and developmental process. It occurs over a period during which the mother becomes attached to her infant, acquires competence in the care-giving tasks, and expresses pleasure and gratification in her role. The focus of Mercer’s work went beyond the concept of the “traditional” mother to encompass a variety of mothering roles, maternal age, health status, family functioning, mother-father relationship, and infant characteristics. Mercer considers a mate’s love, support, and nurturance to be important factors in enabling a woman to mother her child.

mercurial /mərkyo͞or′ē·əl/, **1.** pertaining to mercury, particularly a medicine containing the element mercury. **2.** pertaining to an adverse effect associated with the administration of a mercurial medication, such as a mercurial tremor caused by mercury poisoning.

mercurial diuretic, any one of several diuretic agents that contain mercury in an organic chemical form. The principal use for the drugs is in treating edema of cardiac origin, ascites associated with cirrhosis, or oliguria in the nephrotic stage of glomerulonephritis. Immediate fatal reactions have occurred, usually as a result of ventricular failure after intravascular injection and transient high concentration of mercury in the blood. Flushing, urticaria, fever, and nausea and vomiting are common side effects. Thrombocytopenia, neutropenia, agranulocytosis, systemic mercury poisoning, and severe hypersensitivity reactions are among the more serious adverse effects of the mercurial diuretics. The drugs are contraindicated for use in the presence of renal insufficiency or acute nephritis. Because of the toxicity of these drugs, current practice usually recommends their replacement with more convenient and less toxic diuretics.

mercurialism. See **mercury poisoning.**

-mercuric, suffix meaning “molecules of bivalent mercury or its compounds”: *phenylmercuric, potassiomercuric, trimercuric*.

mercury (Hg) /mur′kyərē/ [L, *Mercurius,* mythic messenger of the gods], a metallic element. Its atomic number is 80; its atomic mass is 200.59. It is the only common metal that is liquid at room temperature, and it occurs in nature almost entirely in the form of its sulfide, cinnabar. Mercury is produced commercially and is used in dental amalgams, thermometers, barometers, and other measuring instruments. It forms many poisonous compounds. The air, soil, and water in many areas of the world have become contaminated by mercury because of the burning of fossil fuels that contain the element and because of the greater use of mercury in industry and agriculture. The major toxic forms of this metal are mercury vapor, mercuric salts, and organic mercurials. Elemental mercury is only mildly toxic when ingested because it is poorly absorbed. The vapor of elemental mercury, however, is readily absorbed through the lungs and enters the brain before it is oxidized. The kidneys retain mercury longer than any of the other body tissues.

mercury bichloride, an extremely poisonous compound formerly used in treatment of syphilis but now used only as a disinfectant.

mercury dilators, an esophageal dilator system consisting of a series of mercury-filled tubes of graded diameter for dilating the cardioesophageal sphincter. Also called *mercury bougies*.

mercury nephropathy, acute tubular necrosis caused by mercury poisoning after ingestion of inorganic mercury salts.

mercury poisoning, a toxic condition caused by the ingestion or inhalation of mercury or a mercury compound. The chronic form, resulting from inhalation of the vapors or dust of mercurial compounds or from repeated ingestion of very small amounts, is characterized by irritability, thirst, excessive saliva, loosened teeth, gum disorders, slurred speech, tremors, and staggering. Symptoms of acute mercury poisoning appear in a few minutes to a half hour and include a metallic taste in the mouth, thirst, nausea, vomiting, severe abdominal pain, bloody diarrhea, and renal failure that may result in death. The presence of mercury in the body is determined by a urine test. Free mercury, such as in thermometers, is not absorbed in the GI tract, but because it is very volatile, hazardous vapors may penetrate ordinary toxic dust respirators, causing poisoning by inhalation. Mercury compounds are found in agricultural fungicides and in certain antiseptics and pigments. They are used extensively in industry. Industrial wastes containing mercury have been identified in some areas, and seafood from contaminated waters has caused serious public health problems. Also called **hydrargyrism, mercurialism.** See also **Minamata disease.**

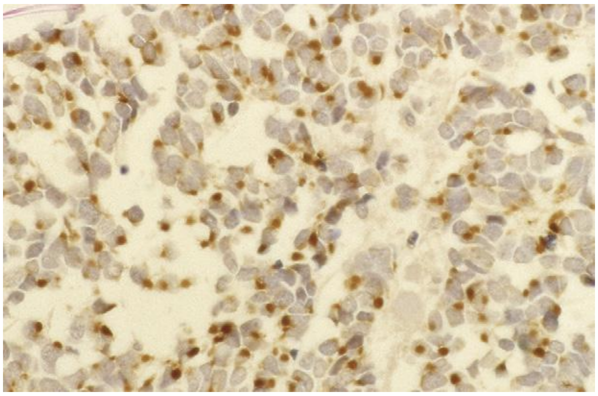
mercury thermometer [L, *Mercurius,* mythic messenger of the gods; Gk, *thermē,* heat, *metron,* measure], a thermometer in which the expandable indicator is mercury. Mercury thermometers are not commonly used in current clinical practice and have been largely replaced by digital, chemical dot, and infrared thermometers.

mercy killing. See **euthanasia,** def 1.

-meria, suffix meaning “related to parts”: *platymeria, polymeria*.

merisis. See **hyperplasia.**

Merkel cell carcinoma /mer′kəl, mur′kəl/ [Friedrich S. Merkel, German anatomist and physiologist, 1845–1919], a rapidly growing malignant skin tumor that tends to occur on sun-exposed surfaces of older Caucasian individuals. It is composed of small cells in a trabecular pattern that contain dense core granules.

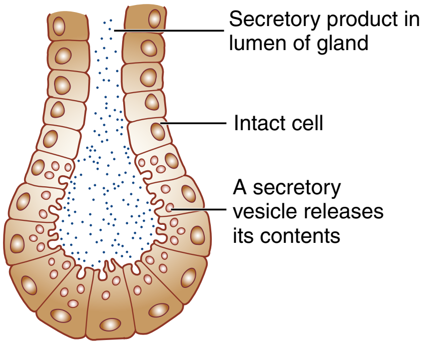


Merkel cell carcinoma *(Skarin, 2003)*

meroanencephaly /mer′ō·an′ənsef′əlē/ [Gk, *meros,* part + *a, enkephalos,* not brain], congenital absence of part of the brain, usually the forebrain and midbrain. Compare **anencephaly.**

meroblastic /mer′əblas′tik/ [Gk, *meros* + *blastos,* germ], pertaining to or characterizing an ovum that contains a large amount of yolk and in which cleavage is restricted to the yolk-free part of the cytoplasm. Compare **holoblastic.**

merocrine gland /mer′əkrin/ [Gk, *meros,* part, *krinein,* to separate; L, *secernere,* to separate], a gland in which the secreting cell remains intact while producing and releasing the secretory product. Compare **apocrine gland, holocrine gland.**



Secretory product in lumen of gland
Intact cell
A secretory vesicle releases its contents

Merocrine gland *(Applegate, 2011)*

meromelia /mer′əmē′lyə/ [Gk, *meros* + *melos,* limb], **1.** an abnormality of development in which the upper part of the arm or leg is missing so that hands or feet are attached to the body like stumps, generally resulting from the use of thalidomide during pregnancy. **2.** a general designation for the congenital absence of any part of a limb. It is used in reference to such conditions as adactyly, hemimelia, or phocomelia. Compare **amelia.**

meropenem, a miscellaneous antiinfective.

■ INDICATIONS: It is used to treat serious infections caused by ***Streptococcus pneumoniae,*** group A beta-hemolytic streptococci, enterococcus, ***Klebsiella, Proteus, Escherichia coli, Pseudomonas aeruginosa,*** *Bacteroides fragilis,* and *B. thetaiotaomicron*. It is also used to treat appendicitis and peritonitis caused by the *viridans* group of streptococci, as well as bacterial meningitis.

■ CONTRAINDICATIONS: Known hypersensitivity to meropenem or imipenem prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are seizures, pseudomembranous colitis, hepatitis, eosinophilia, neutropenia, and anaphylaxis. Other adverse effects include fever, somnolence, dizziness, weakness, myoclonia, diarrhea, nausea, vomiting, glossitis, hypotension, palpitations, decreased hemoglobin and hematocrit, urticaria, pain at the injection site, phlebitis, erythema at the injection site, chest discomfort, dyspnea, and hyperventilation. Common side effects are headache, rash, and pruritus.

merozoite /mer′əzō′īt/ [Gk, *meros* + *zoon,* animal], an organism produced from segmentation of a schizont during the asexual reproductive phase of the life cycle of a sporozoon, specifically the malarial parasite *Plasmodium*. Merozoites can either continue the asexual phase of the life cycle by developing into trophozoites and repeating the process of schizogony or differentiate into male and female gametes and enter the sexual stage. See also *Plasmodium*.

merozygote /mer′əzī′gōt/, an incomplete zygote that contains only part of the genetic material of one of the parents. It occurs during conjugation in bacteria, as part of the donor chromosome is excluded by the transfer mechanism.

MERRF syndrome, abbreviation for *myoclonus with epilepsy and with ragged red fibers,* a familial syndrome of maternal (mitochondrial) inheritance. Also called **Fukuhara 's syndrome.**

Merrifield's knife, a surgical knife with a long, narrow, triangular blade set into a shank, used for gingivectomy incisions.

Meruvax II, a trademark for an active immunizing agent (live rubella virus vaccine).

Merzbacher-Pelizaeus disease. See **Pelizaeus-Merzbacher disease.**

mes-, mesio-, meso-, prefix meaning "middle or median": *mesoderm, mesencephalon, mesiodens*.

mesalamine, an active metabolite of sulfasalazine, used in the prophylaxis and treatment of inflammatory bowel disease and ulcerative proctitis; administered orally or rectally. Also called **5-aminosalicylic acid.**

mesangial /mesan′jē·əl/, pertaining to the mesangium.

mesangial IgA nephropathy. See **Berger's disease.**

mesangiocapillary glomerulonephritis. See **membranoproliferative glomerulonephritis.**

mesangium /mesan′jē·əm/, a cellular network in the renal glomerulus that helps support the capillary loops. The mesangial cells are phagocytic and frequently contain macromolecules or inflammatory agents that may aid in diagnosis of a kidney disorder when examined in a laboratory.

mescaline /mes′kəlēn, -lin/ [Mex, *mezcal*], a psychoactive agent with effects similar to LSD, this poisonous alkaloid is derived from a colorless alkaline oil in the flowering heads of the cactus *Lophophora williamsii*. Closely related chemically to epinephrine, mescaline causes heart palpitations, diaphoresis, pupillary dilation, and anxiety. It is a Schedule I substance. The drug, taken in capsules or dissolved in a drink, produces visual hallucinations, such as color patterns and spatial distortions, but it does not ordinarily induce disorientation. Mescaline is used in some religious ceremonies to produce euphoria and a feeling of ecstasy. Also called **peyote.**

mescalism /mes′kəliz′əm/ [Mex, *mezcal*], a type of chemical dependence on the effects of mescal, an intoxicant spirit obtained from a species of cactus (agave).

mesencephalon /mes′ensef′əlon/ [Gk, *mesos,* middle, *enkephalos,* brain], one of the three parts of the brainstem, lying just below the cerebrum and just above the pons. It consists primarily of white substance with some gray substance around the cerebral aqueduct. Deep within the mesencephalon are nuclei of the third and the fourth cranial nerves and the anterior part of the fifth cranial nerve. The mesencephalon also contains nuclei for certain auditory and visual reflexes. Also called **midbrain.** **—mesencephalic** /mes′ensifal′ik/, *adj*.

mesenchymal chondrosarcoma /meseng′kəməl/ [Gk, *mesos*, middle, *enchyma*, infusion, *chondros*, cartilage, *sarx*, flesh, *oma*, tumor], a rare malignant tumor of soft tissue that develops in many sites. The tumors are highly vascular.

mesenchyme /mes′engkīm/ [Gk, *mesos* + *enchyma*, infusion], a diffuse network of tissue derived from the embryonic mesoderm. It consists of stellate cells embedded in gelatinous ground substance with reticular fibers. **—mesenchymal,** *adj*.

mesenchymoma /mes′engkimō′mə/ [Gk, *mesos* + *enchyma*, infusion, *oma*, tumor], a mixed mesenchymal neoplasm composed of two or more cellular elements that are not usually associated and fibrous tissue. See also **benign mesenchymoma, malignant mesenchymoma.**

mesenteric /mes′enter′ik/ [Gk, *mesos*, middle, *enteron*, intestine], pertaining to the mesentery, the double layer of peritoneum suspending the intestine from the posterior abdominal wall.

mesenteric adenitis. See **adenitis.**

mesenteric angina, severe pain and discomfort after a heavy meal resulting from diminished blood supply and concomitant lack of oxygen caused by the narrowing of the celiac and mesenteric artery openings.

mesenteric axis, a line passing transversely between a portion of the GI tract and its adjacent mesentery.

mesenteric ischemia, ischemia in an area of the intestine supplied by a mesenteric artery. Two types are distinguished, *occlusive* and *nonocclusive mesenteric ischemia*. It may progress to a mesenteric infarction.

mesenteric node [Gk, *mesos* + *enteron*, intestine; L, *nodus*, knot], a node in one of three groups of superior mesenteric lymph glands serving parts of the intestine. An average of 125 mesenteric nodes in three different groups lie between the layers of the mesentery. The mesenteric nodes receive afferent vessels from the jejunum, ileum, cecum, vermiform appendix, ascending colon, and transverse colon. Compare **ileocolic node, mesocolic node.**

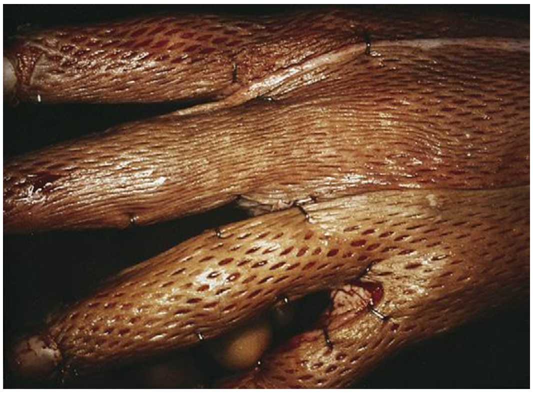
mesenteric panniculitis, inflammation with variable fibrosis of mesenteric fat, usually of the small intestine, causing a solid mass that may displace or obstruct the intestine. Some authorities consider this an inflammatory variant of retractile mesenteritis. Also called *mesenteric lipodystrophy*.

mesenteroaxial volvulus, the less common of the two types of gastric volvulus, in which the stomach twists transversely around its mesenteric axis. This type is more common in children.

mesentery proper /mez′ənter′ē/ [Gk, *mesos* + *enteron*, intestine; L, *propius*, more suitable], a broad fan-shaped fold of peritoneum suspending the jejunum and the ileum from the dorsal wall of the abdomen. The root of the mesentery proper is about 15 cm long and is connected to certain structures ventral to the vertebral column. The intestinal border of the mesentery proper is about 6 m long and separates to enclose the intestine. The cranial part of the mesentery is narrow but widens to about 20 cm and suspends the small intestine and various nerves and arteries. Compare **sigmoid mesocolon, transverse mesocolon.**

MESH /mesh/, an abbreviation derived from *Medical Subject Headings*, the list of medical terms used by the National Library of Medicine (NLM) for its computerized system of storage and retrieval of published medical reports. The system is also used for indexing medical references published in the monthly and annual volumes of ***Index Medicus,*** published by the NLM.

mesh graft, a partial or split-thickness skin graft that has had multiple slits cut into it. The slits allow the graft to be stretched to several times its original size for coverage of a larger area on the recipient. They also facilitate acceptance of the graft by permitting fluids to escape from beneath the graft.



Mesh graft covering burn to the hand
(Hockenberry and Wilson, 2011)

MeSH terms, subject headings.

mesial. See **medial.**

mesiobuccoocclusal /mē′zē·ōbuk′ō·oklo͞o′zəl/ [Gk, *mesos*, middle; L, *bucca*, cheek; L, *occludere*, to close up], pertaining to the point angle formed by the mesial, buccal, and occlusal surfaces of a tooth. Compare **mesiolinguoocclusal.**

mesiocclusion /mē′zē·oklo͞o′zhən/ [Gk, *mesos* + L, *occludere*, to close up], an occlusal relationship in which the lower teeth are positioned mesially to the upper teeth.

mesiodens /mē′zē·ədenz/ [Gk, *mesos* + L, *dens*, tooth], a supernumerary erupted or unerupted tooth that develops between two maxillary central incisors. Compare **peridens.**

mesiolinguoocclusal, pertaining to the angle formed by the mesial, lingual, and occlusal surfaces of a tooth. Compare **mesiobuccoocclusal.**

mesioversion /mē′zē·ōvur′zhən/ [Gk, *mesos* + L, *vertere*, to turn], **1.** a condition in which one or more teeth are closer than normal to the midline. **2.** a condition in which the maxilla or mandible is positioned more anteriorly than normal.

mesmerism /mez′məriz′əm/ [Franz A. Mesmer, Austrian physician, 1734–1815], a practice of hypnotism introduced by Mesmer, who believed human health was affected by “celestial magnetic forces.” Some patients were reported cured or experienced diminished symptoms by undergoing a “grand crisis,” or seizure, while under hypnosis. Mesmer was regarded as a fraud by the medical profession, but his work led to serious studies of the health effects of the power of suggestion.

meso. See **mes-.**

mesoappendix. See **vermiform appendix.**

mesoblastic nephroma, a renal tumor similar to Wilms’ tumor but appearing earlier in infancy and with more infiltration of surrounding tissue.

mesocolic node /mes′ōkol′ik/ [Gk, *mesos* + *kolon*, colon; L, *nodus*, knot], a node in one of three groups of superior mesenteric lymph glands, proliferating between the layers of the transverse mesocolon close to the transverse colon. They are best developed near the right and left colic flexures and receive afferents from the jejunum, ileum, cecum, vermiform appendix, ascending colon, and transverse colon. Their efferent vessels pass to the preaortic nodes. Compare **mesenteric node.**

mesocolopexy /mes′ōkō′ləpek′sē/ [Gk, *mesos* + *kolon*, colon, *pexis*, fixation], suspension or fixation of the mesocolon.

mesoderm /mes′ōdurm/ [Gk, *mesos* + *derma*, skin], (in embryology) the middle of the three cell layers of the developing embryo. It lies between the ectoderm and the endoderm. Bone, connective tissue, muscle, blood, vascular and lymphatic tissue, and the pleurae of the pericardium and peritoneum are all derived from the mesoderm.

mesoduodenum /-do͞o′ədē′nəm/ [Gk, *mesos*, middle; L, *duodeni*, 12 fingers long], a fold of tissue that joins the duodenum to the wall of the abdomen of the fetus. The membrane sometimes persists in later life as the **duodenal mesentery.**

mesoepididymis /mez′ō·ep′i·did′i·mis/ [Gk, *mesos*, middle + *epi*, above + *didymos*, pair], a fold of tunica vaginalis that sometimes connects the epididymis with the testicle.

mesogastric /-gas′trik/ [Gk, *mesos*, middle, *gaster*, belly], pertaining to the *mesogastrium*, a mesentery of the embryonic stomach.

mesoglia. See **microglia.**

mesogluteus /mez′ō·glo͞o′tē·əs/ [Gk, *mesos*, middle + *gloutos*, buttocks], the middle gluteal muscle, which abducts and rotates the thigh medially.

mesojejunum /mez′ō·jə·jo͞o′nəm/ [Gk, *mesos*, middle; L, *jejunus*, empty], the mesentery of the jejunum.

mesomere /mez′əmir/ [Gk, *mesos*, middle, *meros*, part], a row of bastomere between the macromere and micromere of the embryo. It develops into the renal tubules.

mesomerism /mĕsom′erizəm/, the existence of organic chemical structures that cannot be accurately represented by a single structural formula, the actual formula lying intermediate between several possible representations that differ only in the position of electrons.

mesometritis. See **myometritis.**

mesomorph /mes′əmôrf′/ [Gk, *mesos* + *morphe*, form], a person whose physique is characterized by a predominance of muscle, bone, and connective tissue, structures that develop from the mesodermal layer of the embryo. Compare **ectomorph, endomorph.** See also **athletic habitus.**

mesonephra, mesonephric. See **mesonephros.**

mesonephric duct /-nef′rik/ [Gk, *mesos* + *nephros*, kidney; L, *ducere*, to lead], (in embryology) a duct that in the male gives rise to the ducts of the reproductive system (ductus epididymidis, ductus deferens, seminal vesicle, ejaculatory duct). In the female it persists vestigially as **Gartner's duct.** Also called **wolffian duct.**

mesonephric tubule, any of the embryonic renal tubules composing the mesonephros. They function as excretory structures during the early embryonic development of humans and other mammals but are later incorporated into the reproductive system. In males the tubules give rise to the efferent and aberrant ductules of the testes, the appendix epididymis, and the paradidymis; in females, to the epoöphoron, paroöphoron, and vesicular appendices. All of the structures are vestigial except the efferent ductules of the testes.

mesonephros /-nef′rəs/ *pl.* **mesonephra, mesonephroi** [Gk, *mesos* + *nephros*, kidney], the second type of excretory organ to develop in the vertebrate embryo. It consists of a series of twisting tubules that arise from the nephrogenic cord caudal to the pronephros and that at one end form the glomerulus and at the other connect with the excretory mesonephric duct. The organ is the permanent kidney in lower animals, but in humans and various other mammals it is functional only during early embryonic development and is later replaced by the metanephros, although the duct system is retained and incorporated into the male reproductive system. Also called *mesonephron,* **middle kidney, wolffian body.** See also **metanephros, pronephros. —mesonephric, mesonephroid,** *adj*.

mesoridazine /mez′ərid′əzēn/, a phenothiazine antipsychotic.

■ INDICATION: It is prescribed in the treatment of schizophrenia.

■ CONTRAINDICATIONS: Parkinson's disease, concurrent administration of central nervous system depressants, liver or renal dysfunction, severe hypotension, or known hypersensitivity to this drug or to other phenothiazine medications prohibits its use.

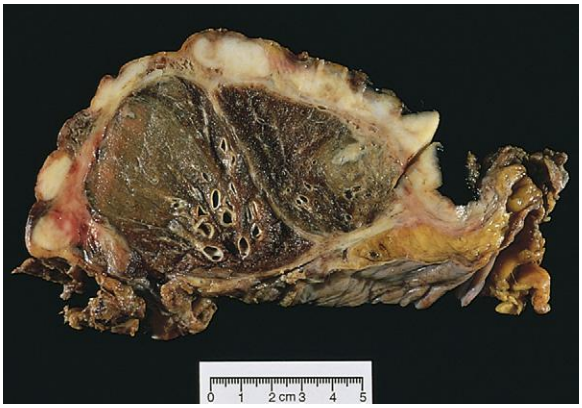
■ ADVERSE EFFECTS: Among the more serious adverse effects are prolongation of the QT interval (increases risk of torsades de pointes arrhythmia), hypotension, liver toxicity, a variety of extrapyramidal reactions, persistent tardive dyskinesia, blood dyscrasias, and hypersensitivity reactions.

mesosalpinx /mes′ōsal′pingks/ [Gk, *mesos* + *salpinx*, tube], the superior, free border of the broad ligament in which the uterine tubes lie.

mesotaurodontism /mez′ōtô′rōdon′tizəm/ [Gk, *mesos*, middle; L, *taurus*, bull; Gk, *odous*, tooth], taurodontism in which the tooth roots branch only in the middle. See also **hypertaurodontism, taurodontism.**

mesothelial /mez′ōthē′lē·əl/, pertaining to the mesothelium cell layer.

mesothelioma /mes′ōthē′lē·ō′mə/ *pl.* **mesotheliomas, mesotheliomata** [Gk, *mesos* + *epi*, above, *thele*, nipple, *oma*, tumor], a rare malignant tumor of the mesothelium of the pleura or peritoneum, associated with exposure to asbestos. The lesion, composed of spindle cells or fibrous tissue, may form thick sheets covering the viscera. The prognosis is poor. Also called **celothelioma.**



Malignant mesothelioma *(Kumar et al, 2007)*

mesothelium /mes′ōthē′lē·əm/ [Gk, *mesos* + *epi*, above, *thele*, nipple], a layer of cells that line the body cavities of the embryo and continue as a layer of squamous epithelial cells covering the serous membranes of the adult.

messenger RNA (mRNA) /mes′ənjər/ [ME, *messangere*, message bearer; *RNA*, ribonucleic acid], (in molecular genetics) an RNA fraction that carries information from deoxyribonucleic acid to the protein-synthesizing ribosomes of cells. mRNA contains codons that are eventually encoded into amino acids via the translation process.

Mestinon, a trademark for a neuromuscular blocking agent **(pyridostigmine bromide).**

mestranol /mes′trənōl/, an estrogen prescribed in fixed-combination drugs with a progestin as an oral contraceptive.

Met, abbreviation for the amino acid **methionine.**

MET, abbreviation for **metabolic equivalent of task.**

meta-, **1.** prefix meaning “change or exchange”: *metabasis, metallaxis, metamorphosis*. **2.** prefix meaning “after or next”: *metachemical, metapneumonic, metapsychics*. **3.** prefix meaning “the 1, 3 position in derivative of benzine”: *metacetone, metachloridine, metacresol*.

meta-analysis, a systematic method of evaluating statistical data based on results of several independent studies of the same problem.

metabiosis /met′əbī·ō′sis/, **1.** a condition in which the growth and metabolism of one organism alter the environment to allow the growth of another organism. **2.** the parasitic dependence of the existence of one organism on that of another.

metabolic /met′əbol′ik/ [Gk, *metabole,* change], pertaining to **metabolism.**

metabolic acidosis, acidosis in which excess acid is added to the body fluids or bicarbonate is lost from them. Acidosis is indicated by a pH of blood below 7.4. In starvation and in uncontrolled diabetes mellitus, glucose is not present or is not available for oxidation for cellular nutrition. This glucose lack causes breakdown of fats for energy, resulting in acidic ketone bodies. The body uses plasma bicarbonate to neutralize these acids. Metabolic acidosis also occurs when oxidation takes place without adequate oxygen, as in heart failure or shock. Severe diarrhea, renal failure, ingestion of toxic substances (e.g., antifreeze and large doses of aspirin) and lactic acidosis also may result in metabolic acidosis. Hyperkalemia may accompany the condition. See also **diabetic ketoacidosis.**

metabolic alkalosis, an abnormal condition characterized by the significant loss of acid in the body or by increased levels of base bicarbonate. Loss of acid may be caused by excessive vomiting, insufficient replacement of electrolytes, hyperadrenocorticism, or Cushing’s disease. Increased levels of base bicarbonate may have various causes, such as the ingestion of excessive amounts of bicarbonate of soda or other antacids during the treatment of peptic ulcers or the administration of excessive volumes of IV fluids containing high concentrations of bicarbonate. Severe, untreated metabolic alkalosis can lead to coma and death. Compare **respiratory alkalosis.** See also **metabolic acidosis, respiratory acidosis.**

■ OBSERVATIONS: Signs and symptoms of metabolic alkalosis may include apnea, headache, lethargy, muscle cramps, hyperactive reflexes, tetany, shallow and slow respirations, irritability, nausea, vomiting, and atrial tachycardia. Confirmation of the diagnosis is commonly based on laboratory findings that show a blood pH greater than 7.45, a carbonic acid concentration greater than 29 mEq/L, and alkaline urine. The electrocardiogram of a patient with this condition may show atrial tachycardia with a low T wave merging with a P wave.

■ INTERVENTIONS: Treatment seeks to eliminate the underlying cause of alkalosis. Ammonium chloride may be given intravenously to release hydrogen chloride and restore chloride levels, except in patients with liver or kidney disease. Potassium chloride and normal saline solutions usually replace fluid losses from gastric drainage but are contraindicated in patients with associated congestive heart failure.

■ NURSING CONSIDERATIONS: Nurses closely monitor the status of the patient and cautiously administer any prescribed IV solutions. Too-rapid infusion of ammonium chloride may hemolyze red blood cells, and an excessive dosage may overcorrect alkalosis and cause acidosis. The fluid intake and output of the patient are carefully noted, and the respiration rate is regularly checked. Decreased respiratory rate indicates an effort to compensate for alkalosis and may cause respiratory acidosis.

metabolic balance [Gk, *metabole,* change; L, *bilanx,* having two scale trays], an equilibrium between the intake of nutrients and their eventual loss through absorption or excretion. In a positive balance the intake of a nutrient exceeds its loss; in a negative balance a nutrient is used or excreted faster than it is consumed in the diet.

metabolic body size, an estimate of the active tissue mass of a person, calculated by the body weight in kilograms to the 0.75 power.

metabolic cirrhosis, cirrhosis of the liver associated with a metabolic disorder such as Wilson’s disease.

metabolic component, the bicarbonate component of plasma.

metabolic disorder, any pathophysiological dysfunction that results in a loss of metabolic control of homeostasis in the body.

metabolic equivalent of task (MET), a unit of measurement of heat production by the body. One MET is equal to 50 kcal per hour per square meter of body surface of a resting individual.

metabolic failure, the severe and usually rapid failure of mental and physical functions, resulting in death.

metabolic myopathy, myopathy as a result of disordered metabolism, usually caused by genetic defects or hormonal dysfunction.

metabolic pathway, a series of consecutive biochemical reactions or steps through which digested food is transformed into basic nutrients such as amino acids, free fatty acids, and simple carbohydrates.

metabolic rate, the amount of energy liberated or expended in a given unit of time. Energy is stored in the body in energy-rich phosphate compounds (adenosine triphosphate, adenosine monophosphate, and adenosine diphosphate) and in proteins, fats, and complex carbohydrates. See also **basal metabolic rate.**

metabolic respiratory quotient. See **respiratory quotient.**

metabolic syndrome, a combination including at least three of the following: abdominal obesity, hypertriglyceridemia, low level of high-density lipoproteins, hypertension, and high fasting plasma glucose level. It is associated with an increased risk for development of diabetes mellitus and cardiovascular disease.

metabolic tolerance. See **drug tolerance.**

metabolic waste products [Gk, *metabole,* change; L, *vastare,* to destroy, *producere,* to produce], the products of metabolic activity after oxygen and nutrients have been supplied to a cell. These mainly include water and carbon dioxide, along with sodium chloride and soluble nitrogenous salts, which are excreted in urine, feces, and exhaled air.

metabolism /mətab′əliz′əm/ [Gk, *metabole,* change, *ismos,* process], the aggregate of all chemical processes that take place in living organisms, resulting in growth, generation of energy, elimination of wastes, and other body functions as they relate to the distribution of nutrients in the blood after digestion. Metabolism takes place in two steps: anabolism, the constructive phase, in which smaller molecules (such as amino acids) are converted to larger molecules (such as proteins); and catabolism, the destructive phase, in which larger molecules (such as glycogen) are converted to smaller molecules (such as glucose). Exercise, elevated body temperature, hormonal activity, and digestion can increase the metabolic rate, which is the rate determined when a person is at complete rest, physically and mentally. The metabolic rate is customarily expressed (in calories) as the heat liberated in the course of metabolism. See also **acid-base metabolism, anabolism, basal metabolism, catabolism.**

metabolite /mitab′əlīt/ [Gk, *metabole,* change], a substance produced by metabolic action or necessary for a metabolic process. An essential metabolite is one required for a vital metabolic process.

metabolize /mətab′əlīz/ [Gk, *metabole,* change], to undergo metabolism, the breaking down of carbohydrates, proteins, and fats into smaller units; reorganizing of those units as tissue building blocks or as energy sources; and eliminating waste products of the processes.

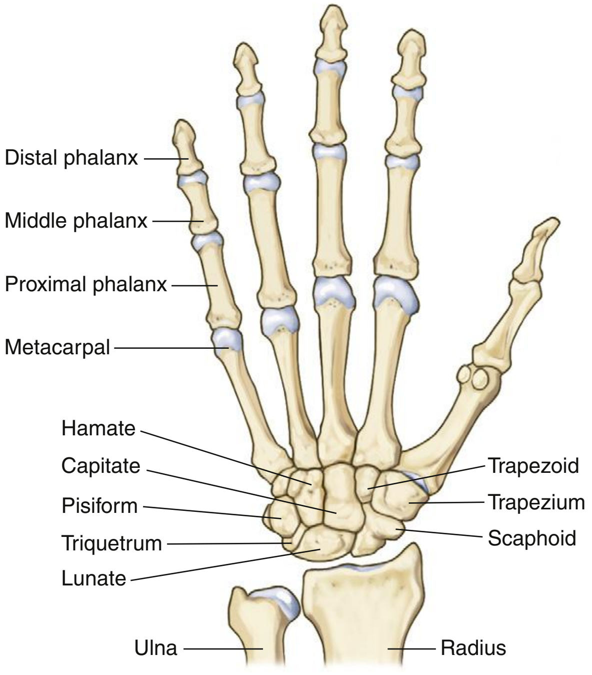
metacarpal. See **metacarpus.**

metacarpal phalanx /-kär′pəl/ [Gk, *meta* + *karpos,* wrist, *phalanx,* line of soldiers], the hands and fingers, particularly phalanges that articulate with carpal bones.

metacarpophalangeal (MCP) /-kar′pōfəlan′jē·əl/ [Gk, *meta,* beyond, *karpos,* wrist, *phalanx,* line of soldiers], pertaining to the metacarpal bones of the hand and the phalanges of fingers, as in metacarpophalangeal joints.

metacarpophalangeal (MCP) joint dislocation [Gk, *meta* + *karpos* + *phalanx* + L, *jungere,* to join, *dis* + *locare,* to place], the dislocation of a finger at the junction with the metacarpal bone, usually with damage to tendons and other structures.

metacarpus /met′əkär′pəs/ [Gk, *meta,* beyond, *karpos,* wrist], the middle part of the hand, consisting of five slender bones, metacarpals I through V, numbered from the thumb side. Each metacarpal consists of a body and two extremities. **—metacarpal,** *adj., n.*



Metacarpal bones *(Patton and Thibodeau, 2010)*

metacentric /met′əsen′trik/ [Gk, *meta* + *kentron,* center], pertaining to a chromosome in which the centromere is located near the center so that the arms of the chromosome are of approximately equal length. Compare **acrocentric, submetacentric, telocentric.**

metachromasia /-krōmā′zhē·ə/ [Gk, *meta,* beyond, *chroma,* color], a tissue-staining phenomenon in which cells being examined acquire a color other than that of the dye used. Cartilage cells, for example, may appear red after being stained with a blue dye. The cause is an interaction between the dye molecules and the acidic radicals of the tissue cells. Also called **metachromism.**

metachromatic leukodystrophy. See **sulfatide lipidosis.**

metachromatic lipids /-krōmat′ik/ [Gk, *meta,* beyond, *chroma,* color, *lipos,* fat], lipid molecules that accumulate in the central nervous system, peripheral nerves, and internal organs of infants who inherit a lipidosis disorder. See also **cerebroside sulfatase.**

metachromatic stain [Gk, *meta* + *chroma,* color; OFr, *desteindre,* to dye], a basic dye, such as toluidine, that can stain substances a different color than that of the stain.

metachromism. See **metachromasia.**

-metacin, suffix for indomethacin-type antiinflammatory substances.

metacommunication /-kəmyo͞o′nikā′shən/ [Gk, *meta* + L, *communicare,* to inform], communication that indicates how verbal information should be interpreted; stimuli surrounding the verbal communication that also have meaning, which may or may not be congruent with that of or support the verbal talk. It may support or contradict verbal communication.

metagenesis /met′əjen′əsis/ [Gk, *meta* + *genein,* to produce], the regular alternation of sexual with asexual methods of reproduction within the same species. **—metagenetic, metagenic,** *adj.*

metal [Gk, *metallon,* a mine], an element that conducts heat and electricity, is malleable and ductile, and forms positively charged ions (cations). About 80% of the known elements are metals.

metal fume fever, an occupational disorder caused by the inhalation of fumes of metallic oxides and characterized by symptoms similar to those of influenza. The condition occurs among workers engaged in welding, metal fabrication, casting, and other occupations dealing with the manipulation of metals. Access to fresh air and treatment of the symptoms usually alleviate the condition. Also called **brass founder's ague, zinc chill.** Compare **siderosis.**

metallesthesia /met′əlesthē′zhə/ [Gk, *metallon,* a mine, *aisthesia,* perception], an ability to identify a metal through the sense of touch.

metalloid /met′əloid/, **1.** any element with both metallic and nonmetallic properties, such as silicon, boron, or arsenic. **2.** resembling a metal.

metalloprotein /mətal′ōprō′tēn/, a protein that contains one or more metal atoms.

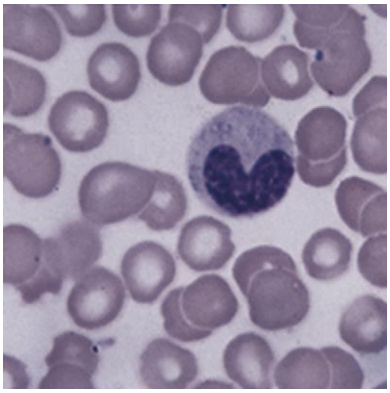
metallurgy /met′əlur′jē/ [Gk, *metallon,* a mine, *ergein,* to work], the theoretic and applied sciences of the nature and uses of metals.

metals, agents that consist of metallic poisons, such as arsenic, mercury, and thallium. Exposure to metallic poisons can be by inhalation or ingestion. Heavy metals can affect many systems, and large doses or prolonged exposure can lead to death.

metamorphopsia /met′əmôrfop′sē·ə/ [Gk, *meta* + *morphe,* form, *opsis,* sight], a defect in vision in which objects are seen as distorted in shape, which results from disease of the retina or imperfection of the media.

metamorphosis /met′əmôr′fəsis/ [Gk, *meta* + *morphe,* form], a change in shape or structure, especially a change from one stage of development to another, such as the transition from the larval to the adult stage.

metamyelocyte /met′əmī′əlōsīt′/ [Gk, *meta* + *myelos,* marrow, *kytos,* cell], a stage in the development of the granulocyte series of leukocytes, between the myelocyte stage and the neutrophilic band. See also **leukocyte, myeloblast, myelocyte.**



Metamyelocyte *(Carr and Rodak, 2008)*

metanephra. See **metanephros.**

metanephric blastema, a mass of intermediate mesodermal cells around the distal end of the ureteric bud that gives rise to nephrons in the permanent kidney. Also called *metanephric cap, metanephric mass.*

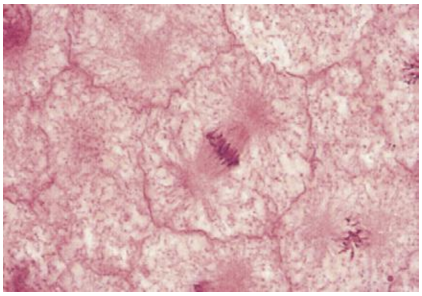
metanephrine /met′ənef′rin/, one of the two principal urinary metabolites of epinephrine and norepinephrine in the urine, the other being vanillylmandelic acid. The 24-hour normal adult value for total metanephrine is 1.3 mg.

metanephrogenic /met′ənef′rəjen′ik/ [Gk, *meta* + *nephros,* kidney, *genein,* to produce], capable of forming the metanephros, or fetal kidney.

metanephros /-nef′rəs/ *pl.* **metanephra, metanephroi** [Gk, *meta* + *nephros,* kidney], the third, and permanent, excretory organ to develop in the vertebrate embryo. It consists of a complex structure of secretory and collecting tubules that develop into the kidney. In most mammals there is limited functional use of the metanephric kidney during fetal life because waste materials are transferred across the placenta to the mother for elimination. Also called **hind kidney.** See also **kidney, mesonephros, pronephros.**

metaphase /met′əfāz/ [Gk, *meta* + *phasis,* appearance], the second of the four stages of nuclear division in mitosis and in each of the two divisions of meiosis, during which the chromosomes become arranged in the equatorial plane of the spindle to form the equatorial plate, with the centromeres attached to the spindle fibers in preparation for separation. See also **anaphase, interphase, meiosis, mitosis, prophase, telophase.**

metaphyseal dysostosis /mətaf′izē′əl disostō′sis, met′əfiz′ē·əl disostō′sis/ [Gk, *meta* + *phyein,* to grow, *dys,* bad, *osteon,* bone], a condition characterized by abnormal mineralization of the metaphyseal area of the bones, resulting in dwarfism. Metaphyseal dysostosis is classified as the Gansen, Schmidt, or Spahar-Hartmann type or as cartilage-hair hypoplasia. The Gansen type is characterized by metaphyseal alterations similar to those of achondroplasia but not involving the skull or the epiphyses of the long bones. The Schmidt type is characterized by developmental changes from the weight-bearing age to approximately 5 years of age. The metaphyseal alterations associated with this type are similar to those of achondroplasia, resulting in moderate dwarfism. The Spahar-Hartmann type is characterized by skeletal changes and severe bowleg. Cartilage-hair hypoplasia is characterized by severe dwarfism and hair that is sparse, short, and brittle. Mental retardation is not usually associated with metaphyseal dysostosis. Radiographic examination of all types of the disease reveals characteristic widening of the metaphyses of the tubular bones, with normal diaphyseal and epiphyseal ossification centers. Treatment is supportive and symptomatic. No specific modality is used.



Metaphase *(© Ed Reschke; used with permission)*

metaphyseal dysplasia, a condition characterized by disordered modeling of the long bones, in which the metaphyseal circumference is enlarged and the medullary area is reduced. Metaphyseal dysplasia most often affects the distal femur or the proximal tibia.

metaphysis /mətaf′əsis/ [Gk, *meta* + *phyein,* to grow], a region of a growing long bone in which diaphysis and epiphysis converge. **—metaphyseal,** *adj.*

metaplasia /met′əplā′zhə/, the reversible conversion of normal tissue cells into another, less differentiated cell type in response to chronic stress or injury. With prolonged exposure to the inducing stimulus, cancerous transformation can occur.

metaplasm. See **cell inclusion.**

metaprotein. See **acidalbumin.**

metaproterenol sulfate /met′əprōter′inôl/, a beta$_2$ receptor agonist bronchodilator.

■ INDICATIONS: It is prescribed in the treatment of bronchial asthma and chronic obstructive pulmonary disease when a delayed onset but prolonged effect is desired.

■ CONTRAINDICATIONS: Arrhythmias associated with tachycardia or known hypersensitivity to this drug prohibits its use. It should be used with caution in patients with hypertension, hyperthyroidism, congestive heart failure, coronary artery disease, or diabetes.

■ ADVERSE EFFECTS: Among the more serious adverse effects are tachycardia, hypertension, and cardiac arrest.

metaraminol bitartrate /met′äram′inol/, an adrenergic vasopressor.

■ INDICATIONS: It is prescribed in the treatment of hypotension and shock.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not used with the MAO inhibitors cyclopropane or halothane anesthesia or as the sole drug for hypovolemic hypotension.

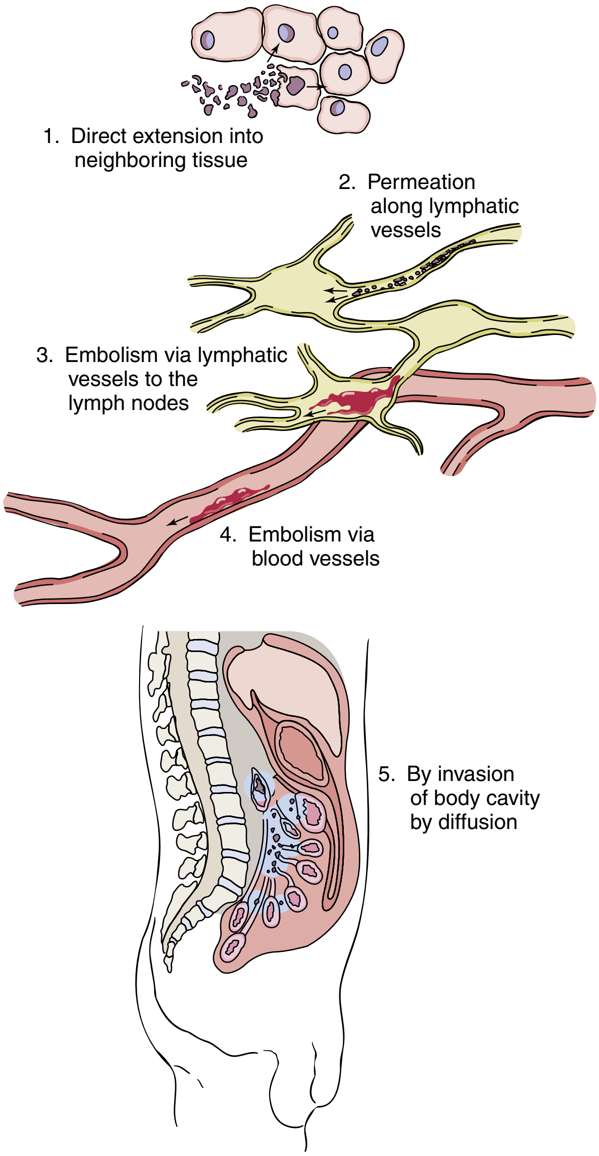
■ ADVERSE EFFECTS: Among the more serious adverse effects are cardiac arrhythmia, tissue necrosis at the site of injection, hypertension, tremors, and nausea.

metarubricyte /-ro͞o′brisīt/ [Gk, *meta* + L, *ruber,* red, *kytos,* cell], a red blood cell precursor, the last nucleated stage of red blood cell production. Metarubricytes are usually confined to the bone marrow but may appear in the peripheral blood in newborns and in uncompensated hemolytic anemia.

metastable solution. See **supersaturate.**

metastable state, a transient energy state of an atom with a half-life longer than 10^{-12} seconds (e.g., technetium^{99m}).

metastasis /mətas′təsis/ *pl.* **metastases** [Gk, *meta* + *stasis,* standing], **1.** an active process by which tumor cells move from the primary location of a cancer by severing connections from the original cell group and establishing remote colonies. Because malignant tumors have no enclosing capsule, cells may escape, become emboli, and be transported by the lymphatic circulation or the bloodstream to implant in lymph nodes and other organs far from the primary tumor. **2.** a tumor that develops away from the site of origin. Compare **anaplasia.** **—metastasize,** *v.,* **metastatic,** *adj.*



1. Direct extension into neighboring tissue
2. Permeation along lymphatic vessels
3. Embolism via lymphatic vessels to the lymph nodes
4. Embolism via blood vessels
5. By invasion of body cavity by diffusion

Modes of metastasis of cancer *(Monahan et al, 2007)*

metastasizing mole. See **chorioadenoma destruens.**

metastatic. See **metastasis.**

metastatic abscess /-stat′ik/ [Gk, *meta,* beyond, *stasis,* standing; L, *abscedere,* to go away], any secondary abscess that develops at a point distant from an original infection, resulting from transportation of infectious particles to other locations via the bloodstream.

metastatic calcification [Gk, *meta* + *stasis,* standing; L, *calx,* lime, *facere,* to make], the pathological process whereby calcium salts accumulate in previously healthy tissues, caused by excessive levels of blood calcium, such as in hyperparathyroidism.

metastatic endometriosis [Gk, *meta,* beyond, *stasis,* standing, *endon,* within, *metra,* womb, *osis,* condition], extraperitoneal lesions that resemble metastases from a carcinoma.

metastatic ophthalmia. See **sympathetic ophthalmia.**

metastatic survey [Gk, *meta,* beyond, *stasis,* standing; OFr, *surveoir,* to examine], a method of monitoring the spread of a cancer by taking a series of periodic x-ray films.

metatarsal /met′ətär′səl/ [Gk, *meta* + *tarsos,* flat surface], **1.** *adj,* pertaining to the metatarsus of the foot. **2.** *n,* any one of the five bones making up the metatarsus.

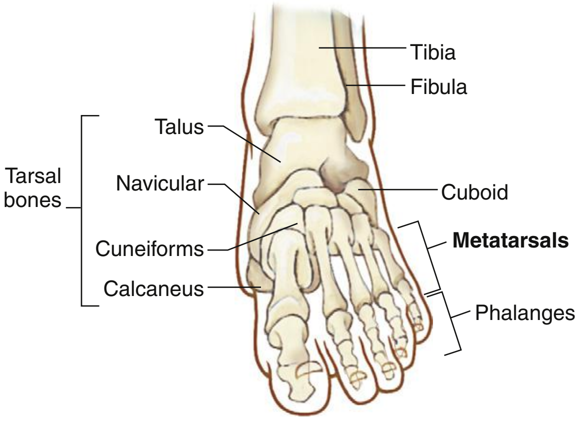
metatarsal artery. See **arcuate artery of the foot.**

metatarsalgia /met′ətärsal′jə/ [Gk, *meta* + *tarsos* + *algos,* pain], a painful condition around the metatarsal bones caused by an abnormality of the foot or by recalcification of degenerated heads of metatarsal bones.

metatarsal phalanx /-tär′səl/ [Gk, *meta* + *tarsos,* flat surface, *phalanx,* line of soldiers], the bones of the foot and toes.

metatarsal stress fracture, a break or rupture of a metatarsal bone caused by prolonged running or walking. The condition is often difficult to diagnose with x-ray films. Also called **march fracture.**

metatarsus /-tär′səs/ [Gk, *meta* + *tarsos,* flat surface], a part of the foot, consisting of five bones, numbered I to V from the medial side. Each bone has a long, slender body; a wedge-shaped proximal end; a convex distal end; and flattened, grooved sides for the attachment of ligaments. The metatarsal bones articulate with the tarsus proximally and the first row of phalanges distally. Deformities of the metatarsus include **metatarsus valgus** and **metatarsus varus.** **—metatarsal,** *adj.*

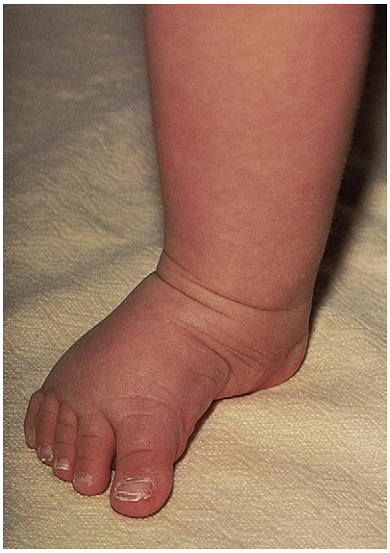


Metatarsal bones *(Patton and Thibodeau, 2010/Yvonne Wylie Walston, used with permission)*

metatarsus adductus. See **metatarsus varus.**

metatarsus valgus, a congenital deformity of the foot in which the forepart rotates outward away from the midline of the body and the heel remains straight. Also called **duck walk, toeing out.**

metatarsus varus, a congenital deformity of the foot in which the forepart rotates inward toward the midline of the body and the heel remains straight. Also called **intoe, metatarsus adductus, pigeon-toed, toeing in.**



Metatarsus varus *(Chaudhry and Harvey, 2001)*

metathalamus /met′əthal′əməs/ [Gk, *meta* + *thalamos,* chamber], one of five parts of the diencephalon, composed of a medial geniculate body and a lateral geniculate body on each side. The medial geniculate body acts as a relay station for nerve impulses between the inferior brachium and the auditory cortex. The lateral geniculate body is a superficial oval bulge at the posterior end of the thalamus, which accommodates the terminal ends of the fibers of the optic tract. Relay cells project to the visual cortex. Compare **epithalamus, hypothalamus, subthalamus. —metathalamic,** *adj.*

metaxalone /metak′səlōn/, a skeletal muscle relaxant.

■ INDICATION: It is prescribed as an adjunct in the treatment of acute skeletal muscle spasm.

■ CONTRAINDICATIONS: Significantly impaired renal or hepatic function, susceptibility to drug-induced hemolytic anemia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hemolytic anemia, leukopenia, and liver dysfunction. GI disturbances, dizziness, and nervousness may occur.

metazoa /-zō′ə/ [Gk, *meta* + *zoon,* animal], a classification that includes animals that have tissues and organs. All animals except sponges are metazoa.

Metchnikoff's theory /mech′nikofs/ [Elie Metchnikoff, Russian-French biologist, 1845–1916; Gk, *theoria,* speculation], the theory that living cells ingest microorganisms. The theory proved correct, as seen in the process of phagocytosis and the ingestion of injurious microbes by leukocytes.

meteorism [Gk, *meteorizein,* to hold up], accumulation of gas in the abdomen or the intestine, usually with distension.

meteorotropism /mē′tē·ərətrō′pizəm/ [Gk, *meteoros,* high in the air, *trope,* turning], a reaction to meteorological influences shown by various biological occurrences, such as sudden death, attacks of arthritis, and angina. **—meteorotropic,** *adj.*

meter (m) /mē′tər/ [Gk, *metron,* measure], a metric unit of length equal to 39.37 inches.

-meter, -metre, **1.** suffix meaning a "measuring instrument": *anesthesimeter, ionometer, scopometer.* **2.** suffix meaning "length or measure": *centimeter, kilometer, millimeter.*

metered dose inhaler (MDI) /mē′tərd/, a device designed to deliver a measured dose of an inhaled drug. It usually consists of a canister of aerosol spray, mist, or fine powder that releases a specific dose each time it is pushed against a dispensing valve. The device is intended to reduce the risk of overmedication by the patient.

Metered dose inhaler *(Perry, Potter, and Elkin, 2012)*

metformin /met-for′min/, a hypoglycemic agent that potentiates the action of insulin, used in treatment of type 2 diabetes mellitus.

metformin hydrochloride, an oral antidiabetic agent.

■ INDICATION: It is prescribed in the treatment of type 2 (non-insulin dependent) diabetes mellitus.

■ CONTRAINDICATIONS: The drug should not be given to patients with allergy to metformin, diabetes associated with high ketone levels, metabolic acidosis, or kidney disease, and should be discontinued 48 hours before radiology studies using radiopaque materials.

■ ADVERSE EFFECTS: The side effects most often reported include general body discomfort, muscle pain, breathing difficulty, drowsiness, diarrhea, and an unpleasant metallic taste.

methacholine /meth′äkō′lēn/, a cholinergic agonist, having a longer duration of action than acetylcholine and predominantly muscarinic effects. It has vasodilator and cardiac vagomimetic effects but has largely been replaced by other drugs. It is also used in bronchial challenge tests.

methacholine challenge /meth′əkō′lēn/, a method of measuring airway activity by an inhalation challenge test. The patient inhales a saline aerosol as a control, followed by increasing concentrations of methacholine chloride, a cholinergic drug. The test is used to confirm the diagnosis of asthma when symptoms are not present. This is a potentially dangerous test and should be performed only by qualified personnel, with resuscitation equipment readily available.

methacrylic acid (MAA) /meth′əkril′ik/, an organic acid obtained from Roman chamomile oil that polymerizes into a ceramic-like mass. The methyl ester of methacrylic acid is used in medical and dental products such as enamel sealants. A copolymer is used in tablet coatings.

methadone hydrochloride, an opioid analgesic used for anesthesia or as a substitute for heroin, permitting withdrawal without development of acute abstinence syndrome. Methadone does not produce marked euphoria, sedation, or narcosis. It is not given to pregnant women or to patients with liver disease.

methaemoglobin. See **methemoglobin.**

methaemoglobinuria. See **methemoglobinuria.**

methamphetamine hydrochloride /meth′amfet′əmēn/, a central nervous system stimulant that is easily synthesized and is a major drug of abuse.

■ INDICATIONS: It is prescribed in the treatment of attention deficit/hyperactivity disorder, and short-term for the reduction of the appetite in exogenous obesity. An unlabeled use is for the treatment of narcolepsy.

■ CONTRAINDICATIONS: Glaucoma, arteriosclerosis, cardiovascular disease, hypertension, hyperthyroidism, history of drug abuse, concomitant use of a monoamine oxidase inhibitor, or known hypersensitivity to this drug or to other sympathomimetic drugs prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are various manifestations of central nervous system excitation, increase in blood pressure, arrhythmia and other cardiovascular effects, nausea, and drug dependence.

methandriol /methan′drē·ol/, an anabolic hormone used as adjunctive therapy in senile and postmenopausal osteoporosis.

methane (CH_4) /meth′ān/, a simple hydrocarbon in the form of colorless gas, produced by the anaerobic decomposition of organic matter. It occurs naturally in the gas from oil wells and coal mines.

methanol (CH_3OH) /meth′ənol/, a clear, colorless, toxic liquid distillate of wood miscible with water, other alcohols, and ether. Methanol is produced industrially from carbon monoxide and hydrogen. It is widely used as a solvent and in the production of formaldehyde. Also called **methyl alcohol, wood alcohol.**

methanol poisoning, a toxic effect of ingestion, inhalation, or absorption through the skin of methanol (methyl alcohol, wood alcohol) that may impair the central nervous system; cause severe acidosis, blindness, and shock; and result in death. Methanol is found in antifreeze, varnish, and deicing agents. Also called **methyl alcohol poisoning.**

methazolamide /meth′əzō′ləmīd/, a carbonic anhydrase inhibitor.

■ INDICATION: It is prescribed in the treatment of glaucoma.

■ CONTRAINDICATIONS: Severe kidney or liver dysfunction, hyponatremia, hypokalemia, Addison's disease, severe pulmonary obstruction, adrenocortical insufficiency, marked kidney or liver dysfunction, or known hypersensitivity to this drug or many other sulfonamides prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are malaise, aplastic anemia, drowsiness, paresthesia, hypersensitivity reactions, and acidosis.

methemoglobin /met′hēməglō′bin, met·he′məglō′bin/, a form of hemoglobin in which the iron component has been oxidized from the ferrous to the ferric state. Methemoglobin cannot carry oxygen. It is a product of various oxidative reactions that constitute normal metabolic activity and is normally present in only trace amounts (about 1%) in the blood, but may increase in chronic inflammation. Maintenance of levels occurs by an active enzymatic reducing capability, the nicotinamide-adenine dinucleotide-methemoglobin reductase system present in normal red blood cells. Also spelled **methaemoglobin.** See also **hemoglobin.**

methemoglobinemia /-ē′mē·ə/, the presence of methemoglobin in the blood.

methemoglobin test, a blood test to detect methemoglobinemia.

methemoglobinuria /-o͝or′ē·ə/ [Gk, *meta,* beyond, *haima,* blood; L, *globus,* ball; Gk, *ouron,* urine], the presence of methemoglobin in the urine. Also spelled **methaemoglobinuria.**

methenamine. /methē´nəmēn / , a urinary antibacterial.

■ INDICATION: It is prescribed in the treatment of urinary tract infections.

■ CONTRAINDICATIONS: Liver or kidney dysfunction or known hypersensitivity to this drug or to mandelic acid prohibits its use. It should not be used by patients receiving sulfonamides.

■ ADVERSE EFFECTS: Among the most serious adverse effects are severe GI disturbances and rashes.

methenamine silver stain, a specialized stain consisting of methenamine and silver nitrate used in histological examinations for the detection of fungi. This stain is the best for detecting fungi in specimens but is very time consuming and mainly used in histology labs.

Methergine, a trademark for an oxytocic **(methylergonovine maleate).**

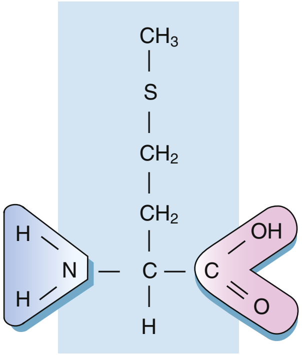
methimazole /məthim′əzōl/, an orally administered antithyroid drug.

■ INDICATION: It is prescribed in the treatment of hyperthyroidism.

■ CONTRAINDICATIONS: Use in nursing mothers, because it is excreted in milk, and known hypersensitivity to the drug prohibit its use.

■ ADVERSE EFFECTS: Agranulocytosis, leukopenia, thrombocytopenia, and aplastic anemia may occur.

methionine (Met) /methī′ənēn/, an essential amino acid needed for proper growth in infants and for maintenance of nitrogen balance in adults. It is a source for methyl groups and sulfur in the body. It is also administered as adjunctive treatment in liver diseases. See also **amino acid, protein.**



Chemical structure of methionine

methisoprinol. See **inosiplex.**

methocarbamol /meth′əkär′bəmol/, a skeletal muscle relaxant.

■ INDICATION: It is prescribed in the relief of skeletal muscle spasm.

■ CONTRAINDICATIONS: Renal dysfunction, central nervous system depression, or known hypersensitivity to this drug prohibits its use. Propylthiouracil is a better choice than methimazole for thyrotoxic crisis.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension and tachycardia. Drowsiness, dizziness, vertigo, and nausea may occur.

method /meth′əd/ [Gk, *meta,* beyond, *hodos,* way], a technique or procedure for producing a desired effect, such as a surgical procedure, a laboratory test, or a diagnostic technique.

methodology /meth′ədol′əjē/ [Gk, *meta* + *hodos* + *logos,* science], **1.** a system of principles or methods of procedure in any discipline, such as education, research, diagnosis, or treatment. **2.** the section of a research proposal in which the methods to be used are described. The research design, the population to be studied, and the research instruments, or tools, to be used are discussed in the methodology. **—methodological,** *adj.*

methohexital sodium /meth′ōhek′sitôl/, an IV barbiturate of short duration.

■ INDICATION: It is used for the induction of anesthesia in short surgical procedures like cardioversion.

■ CONTRAINDICATIONS: Porphyria, status asthmaticus, or known hypersensitivity to this drug or to any barbiturate prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are respiratory depression, skin rash, muscle tremors, hiccoughs, and cardiovascular dysfunction.

methotrexate /meth′ōtrek′sāt/, an antineoplastic antimetabolite. Also called **amethopterin.**

■ INDICATIONS: It is prescribed in the treatment of a variety of malignant neoplastic diseases of the blood and organs and in the treatment of psoriasis, and it is widely used as an immunosuppressive agent for the treatment of autoimmune diseases such as rheumatoid arthritis.

■ CONTRAINDICATIONS: Blood dyscrasias, severe renal or hepatic impairment, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are diarrhea, ulcerative stomatitis, bone marrow depression, hepatotoxicity, and skin rash.

methoxsalen /methok′sələn/, a pigmentation agent. Also called **8-MOP.**

■ INDICATIONS: It is used topically for unresponsive psoriasis and enhancement of pigmentation or for repigmentation in vitiligo and is administered orally before longwave ultraviolet irradiation of severe recalcitrant psoriasis.

■ CONTRAINDICATIONS: Liver impairment, cataracts, age <12 yrs, any disease or concomitant use of a drug that may cause photosensitization, squamous cell carcinoma, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse reactions are central nervous system effects and burns. Gastrointestinal discomfort and allergic reactions also may occur.

methoxyflurane. See **halogenated hydrocarbon.**

3-methoxy-4-hydroxymandelic acid. See **vanillylmandelic acid.**

methscopolamine bromide /meth′skōpō′ləmēn/, an anticholinergic/antispasmodic.

■ INDICATIONS: It is prescribed in the treatment of hypermotility of the GI tract and as an adjunct in treatment of peptic ulcer.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, obstruction of the genitourinary or GI tract, severe ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, or hypersensitivity reactions may occur.

methsuximide /methsuk′simīd/, an anticonvulsant.

■ INDICATION: It is prescribed in the treatment of refractory absence seizures.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any succinimide prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blood dyscrasias, liver and kidney damage, and systemic lupus erythematosus.

methyclothiazide /məthī′klōthī′əzīd, meth′əklōthī′əzīd/, a diuretic.

■ INDICATIONS: It is prescribed in the treatment of mild to moderate hypertension and edema.

■ CONTRAINDICATIONS: Anemia, renal or urinary disorders, or known hypersensitivity to this drug, to other thiazide medications, or to sulfonamide derivatives prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypokalemia, hyperglycemia, hyperuricemia, hypotension, and hypersensitivity reactions.

methyl (Me) /meth′il/, the chemical radical CH_3.

methyl alcohol. See **methanol.**

methyl alcohol poisoning. See **methanol poisoning.**

methylate /meth′ilāt/ [Gk, *methy,* wine, *hyle,* matter], **1.** *n,* an organic compound in which the hydrogen atom of methanol is replaced by a metal. **2.** *v,* to add a methyl group, CH_3, to a chemical compound.

methylation /-lā′shən/ [Gk, *methy,* wine, *hyle,* matter], **1.** the introduction of a methyl group, CH_3, to a chemical compound. **2.** the addition of methyl alcohol and naphtha to ethanol to produce denatured alcohol.

methyl blue, a blue dye of the triarylmethane class, $C_{37}H_{27}N_3O_9S_3Na_2$, used alone or in combination with water blue as a biological stain.

methyldopa /-dō′pə/, an alpha$_2$ receptor agonist that acts in the central nervous system to decrease sympathetic nervous system outflow.

■ INDICATIONS: It is prescribed for the reduction of hypertension in moderate to severe cases.

■ CONTRAINDICATIONS: Use of monoamine oxidase inhibitors, liver dysfunction, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are liver toxicity and blood dyscrasias. Sedation, dry mouth, nasal stuffiness, and postural hypotension may occur.

methylene blue /meth′əlēn/, a bluish-green crystalline substance used as a histological stain and a laboratory indicator. It is also used in the treatment of cyanide poisoning and methemoglobinemia.

methylergonovine maleate /-ərgon′əvēn/, a synthetic ergot alkaloid.

■ INDICATIONS: It is prescribed as an oxytocic to prevent or to treat postpartum uterine atony, hemorrhage, or subinvolution.

■ CONTRAINDICATIONS: It is not prescribed during pregnancy or given intravenously, except in life-threatening situations. Hypertension, toxemia, or known hypersensitivity to ergot alkaloids prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are convulsions and death. Hypertension, nausea, blurred vision, and headaches also may occur. Adverse effects are more common after IV administration.

3-methylfentanyl, a potent heroin substitute and so-called designer drug. It is an analog of fentanyl and reportedly 3000 times as potent as morphine. One ounce represents 25 million doses of a drug with effects equivalent to that of high-grade heroin. A related designer drug is *p*-fluoro fentanyl. See also **designer drugs.**

methylmalonicacidemia /meth′əl·mə·lon′ik·as′i·dē′mē·ə/, **1.** an autosomal-recessive aminoacidopathy characterized by an excess of the carboxylic acid methylmalonic acid in the blood and urine, with metabolic ketoacidosis, hyperammonemia, and excess glycine in the blood and urine, presenting in infancy as failure to thrive, persistent vomiting and dehydration, respiratory distress, and hypotonia. It results from any of several defects that cause deficiency of an enzyme involved in the use of isoleucine, threonine, valine, propionate, and other odd-number chain-length fatty acids for fuel. Treatment consists of dietary supplementation with cobalamin, and carnitine and protein restriction; a diet restricting isoleucine threonine, methionine, and valine may be useful. Also called *methylmalonicaciduria*. **2.** an excess of methylmalonic acid in the blood.

methylphenidate hydrochloride /-fen′idāt/, a central nervous system stimulant.

■ INDICATIONS: It is prescribed in the treatment of attention deficit/hyperactivity disorder in children and, more recently, adults and for narcolepsy in adults.

■ CONTRAINDICATIONS: Glaucoma, severe anxiety, tension, mental depression, or known hypersensitivity to this drug prohibits its use. It is not given to children less than 6 years of age.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nervousness, insomnia, and anorexia. Hypersensitivity reactions and tachycardia may occur.

methylPREDNISolone /-prednis′əlōn/, a glucocorticoid.

■ INDICATIONS: It is prescribed as an antiinflammatory drug and as an immunosuppressant to treat autoimmune disease, cancer, and other disease involving cells of the immune system. It is also administered to suppress graft-versus-host disease after bone marrow transplantation.

■ CONTRAINDICATIONS: Fungal infections or known hypersensitivity to this drug prohibits its systemic use. Viral or fungal infections of the skin, impaired circulation, or known hypersensitivity to this drug prohibits its topical use.

■ ADVERSE EFFECTS: Among the more serious adverse effects of the systemic administration of the drug are upper GI bleeding and endocrine, neurological, fluid, and electrolyte disturbances. Skin reactions may result from topical administration of this drug.

methylrosaniline chloride. See **gentian violet.**

methyl salicylate. See **wintergreen oil.**

methylTESTOSTERone /meth′iltəstos′tərōn/, an androgen.

■ INDICATIONS: It is prescribed in the treatment of testosterone deficiency and in the palliation of female breast cancer.

■ CONTRAINDICATIONS: Cancer of the male breast or prostate; cardiac, renal, or hepatic disease; hypercalcemia; known or suspected pregnancy; lactation; or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypercalcemia, edema, irreversible masculinization of female patients, and jaundice.

methysergide maleate /meth′isur′jīd/, a vasoconstrictor.

■ INDICATION: It is prescribed for relief of migraine headache.

■ CONTRAINDICATIONS: Pregnancy, severe infection, liver or kidney dysfunction, cardiovascular or lung disease, or known hypersensitivity to this drug prohibits its use. It is not recommended for use in children.

■ ADVERSE EFFECTS: Among the more serious adverse effects are retroperitoneal fibrosis; hallucinations; abnormally low white cell count; pulmonary and cardiac complications; hemolytic anemia; leg cramps; and pain in the chest, abdomen, back, hands, or feet.

Meticorten, a trademark for a glucocorticoid **(predniSONE).**

metipranolol /met′ipran′älol/, a beta-adrenergic blocking agent, applied topically to the conjunctiva as the hydrochloride salt in the treatment of glaucoma and ocular hypertension.

metoclopramide hydrochloride /met′əklō′prəmīd/, a GI motility agent.

■ INDICATIONS: It is prescribed to stimulate motility of and increase the tone of gastric contractions of the upper GI tract and to prevent emesis.

■ CONTRAINDICATIONS: A history of seizures; concomitant use of drugs that cause extrapyramidal reactions; pheochromocytoma; GI hemorrhage, obstruction, or perforation; or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are extrapyramidal reactions, usually in children, and GI disturbances. Drowsiness and allergic reactions and rash also may occur.

metolazone /mətō′ləzōn/, a diuretic.

■ INDICATIONS: It is prescribed for the treatment of edema and mild to moderate high blood pressure.

■ CONTRAINDICATIONS: Anuria or known hypersensitivity to this drug, to thiazides, or to sulfonamides prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypokalemia, hyperglycemia, hyperuricemia, and allergic reactions.

"me-too" drug *(informal)* a drug product that is similar, identical, or closely related to a drug for which a manufacturer has obtained a new drug application. The drug is placed on the market by a company or companies other than the holder of the new drug application. On the assumption that the new drug has been recognized as safe and effective, clinical trials required of the original manufacturer are not required of the new supplier, but information regarding the manufacture, bioavailability, and labeling of the product is required to complete the abbreviated procedure for approval by the U.S. Food and Drug Administration.

metopic /mətō′pik/, pertaining to the forehead.

metopo-, prefix meaning "forehead": *metopodynia, metopopagus, metopoplasty.*

metoprolol tartrate /metop′rəlol/, an antiadrenergic; a beta$_1$-receptor antagonist.

■ INDICATIONS: It is prescribed to treat hypertension and angina pectoris and to prevent myocardial infarction and atrial flutter or fibrillation. It also has proven benefits for patients with congestive heart failure when used in combination with other drugs. Unlabeled uses include migraine prophylaxis and treatment of essential tremor and ventricular arrhythmias.

■ CONTRAINDICATIONS: Bradycardia, cardiogenic shock, overt cardiac failure, bronchospastic disease, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are fatigue, bradycardia, bronchospasms, decreased sexual ability, and GI upset.

metr-, prefix meaning "measure": *metrechoscopy, metric, metrology.*

metra-. See **metro-.**

metralgia /mətral′jə/ [Gk, *metra,* womb, *algos,* pain], tenderness or pain in the uterus. Also called **hysteralgia, hysterodynia, metrodynia, uteralgia.**

metre. See **meter.**

-metria, **1.** suffix meaning "(condition of the) ability to measure muscular acts": *dysmetria, hypermetria, hypometria.* **2.** suffix meaning "(condition of the) uterus": *ametria, atretometria, dimetria.*

metric /met′rik/, pertaining to a system of measurement that uses the meter as a basis. See also **metric system.**

metric equivalent [Gk, *metron,* measure; L, *aequus,* equal, *valare,* to be strong], any value in metric units of measurement that equals the same value in English units, for example, 2.54 cm equals 1 inch, and 1 L equals 1.0567 quarts.

metric system, a decimal system of measurement based on the meter (39.37 inches) as the unit of length, on the gram (15.432 grains) as the unit of weight or mass, and, as a derived unit, on the liter (0.908 U.S. dry quart or 1.0567 U.S. liquid quart) as the unit of volume.

metritis /mətrī′tis/ [Gk, *metra,* womb, *itis,* inflammation], inflammation of the walls of the uterus. Kinds of metritis are **endometritis** and **parametritis.** Also called **uteritis.** See also **puerperal fever.**

metro-, metra-, prefix meaning "uterus": *metrocele, metrofibroma, metromalacoma.*

metrocarcinoma /met′rōkär′sinō′mə/ [Gk, *metra,* womb, *karkinos,* crab, *oma,* tumor], a cancer of the uterus.

metrodynia. See **metralgia.**

metromalacia, abnormal softening of the uterus.

metronidazole /met′rənī′dəzōl/, an antimicrobial with activity against anaerobic bacteria and protozoa.

■ INDICATIONS: It is prescribed in the treatment of a variety of infections, including amebiasis, trichomoniasis, anaerobic infections, antibiotic-induced infections, pseudomembranous colitis, and bacterial vaginosis.

■ CONTRAINDICATIONS: First trimester of pregnancy, blood dyscrasias, organic disease, central nervous system disorders, or known hypersensitivity to this drug prohibits its use. It is contraindicated in nursing mothers.

■ ADVERSE EFFECTS: Among the more serious adverse effects are severe GI distress, dizziness, neutropenia, and neurological disturbances. A metallic taste in the mouth is commonly noted.

metronoscope /mətron′əskōp/, **1.** a tachistoscope, a device that exposes a small amount of reading matter to the eyes for brief preset periods. It is used in testing and in aiding individuals to increase reading speed. **2.** an apparatus that exercises the eyes rhythmically to improve binocular coordination.

-metropia, -metropy, suffix meaning "(condition of the) refraction of the eye": *allometropia, antimetropia, isometropia.*

metroplasty /mē′trəplas′tē/ [Gk, *metra,* womb], reconstructive surgery on the uterus. Also called **uteroplasty.**

metrorrhagia /met′rōrā′jē·ə/ [Gk, *metra,* womb, *rhegnynai,* to burst forth], uterine bleeding other than that caused by menstruation. It may be caused by uterine lesions and may be a sign of a urogenital malignancy, especially cervical cancer.

-metry, -metria, suffix meaning the "process of measuring something specified": *oncometry, pelvimetry, symmetry.*

metyrapone /metir′əpōn/, a diagnostic test drug.

■ INDICATIONS: It is used to test hypothalamic and pituitary function.

■ CONTRAINDICATIONS: Adrenocortical insufficiency or hypersensitivity prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are nausea, dizziness, and allergic rash.

metyrosine /mətir′əsēn/, an inhibitor of tyrosine hydroxylase, the rate-limiting enzyme for catecholamine synthesis.

■ INDICATIONS: It is prescribed in the treatment of pheochromocytoma before surgery and may be used for long-term therapy if surgery is contraindicated.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are extrapyramidal reactions, including tremor and drooling. Sedation is common, and diarrhea and anxiety may occur.

Metzenbaum scissors. See **scissors.**

Meuse fever. See **trench fever.**

mev, MeV, abbreviation for *million electron volts,* the equivalent of 3.82 × 10^{-14} small calories, or 1.6 × 10^{-6} ergs.

mevalonate kinase /məval′ənāt/, an enzyme in the liver and in yeast. It catalyzes the transfer of a phosphate group from adenosine triphosphate to produce adenosine diphosphate and 5-phosphomevalonate.

Mexican bindweed. See **Rivea corymbosa.**

Mexican spotted fever. See **Rocky Mountain spotted fever.**

Mexican typhus [Gk, *typhos,* fever], a form of epidemic typhus carried by lice in Mexico. Also called **tabardillo.**

mexiletine hydrochloride /mek′silē′tin/, an oral antiarrhythmic drug.

■ INDICATIONS: It is prescribed for the treatment of symptomatic ventricular arrhythmias and suppression of premature ventricular contractions.

■ CONTRAINDICATIONS: It is contraindicated in patients with cardiogenic shock or preexisting second- or third-degree atrioventricular block in the absence of a pacemaker.

■ ADVERSE EFFECTS: Among adverse effects reported are upper GI distress, lightheadedness, tremor, loss of coordination, diarrhea, sleep disorders, headache, visual disturbances, and palpitations.

Mexitil, a trademark for an oral antiarrhythmic drug **(mexiletine hydrochloride).**

Meyenburg complexes, groups of hamartomas in the bile ducts.

Meyer, Adolf /mī′er/ [1866–1950], Swiss-born psychiatrist in the United States who directed the development of the Henry Phipps Psychiatric Clinic at Johns Hopkins University. His major contributions include propounding the theory of psychobiology, standardizing case histories, and reforming mental health institutions (which were called "insane asylums" at that time).

Meynet's node /mānāz′/, any of the numerous nodules that may develop within the capsules surrounding joints and in tendons affected by rheumatic diseases, especially in children.

Mezlin, a trademark for a semisynthetic penicillin antibiotic **(mezlocillin sodium).**

mezlocillin sodium /mezlos′ilin/, a semisynthetic penicillin antibiotic.

■ INDICATIONS: It is prescribed for the treatment of lower respiratory tract, intraabdominal, urinary tract, gynecological, and skin infections and bacterial septicemia caused by susceptible strains of multiple microorganisms.

■ CONTRAINDICATIONS: Hypersensitivity to any of the penicillins prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effects are anaphylaxis, convulsive seizures, epigastric pain, reduction in blood elements, and elevation in hepatic and renal parameters.

mF, abbreviation for *millifarad.* See **farad.**

MFCC, abbreviation for *Marriage, Family, and Child Counselor.*

MFD, abbreviation for *minimum fatal dose.* See **minimum lethal dose.**

mg, abbreviation for **milligram.**

Mg, **1.** symbol for the element **magnesium.** **2.** abbreviation for *megagram.*

MH, **1.** abbreviation for **malignant hyperthermia.** **2.** abbreviation for **mental health.**

MHA, abbreviation for **Mental Health Association.**

MHC, abbreviation for **major histocompatibility complex.** See **HLA complex.**

MHD, abbreviation for **minimum hemolytic dose.**

mho. See **siemens.**

MHz, abbreviation for **megahertz.**

MI, abbreviation for **myocardial infarction.**

miasma /mī·az′mə/ [Gk, e*iainein*, defilement], an unwholesome, polluted atmosphere or environment, such as a marsh or swamp containing rotting organic matter. Also called *miasm* /mī′əzəm/.

MIC, abbreviation for **minimal inhibitory concentration.**

mica /mī′kə/, an aluminum silicate mineral that occurs in thin laminated scales. Mica is used in paints, plastics, fire protection boards, pigments, and other industrial materials. It is used also as an electric insulator and lubricant.

micafungin, a systemic antifungal.

■ INDICATIONS: This drug is used in the treatment of esophageal candidiasis and susceptible candida species *(Candida albicans, C. glabrata, C. krusei, C. parapsilosis,* and *C. tropicalis)* and in prophylaxis of candida infections in patients undergoing hepatopoietic stem cell transplantation.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to other ecinocandins prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, flushing, hypertension, phlebitis, abdominal pain, hypokalemia, hypocalcemia, and hypomagnesemia. Life-threatening side effects include seizures, neutropenia, thrombocytopenia, leukopenia, coagulopathy, anemia, and hemolytic anemia. Common side effects include headache; somnolence; nausea; anorexia; vomiting; diarrhea; increased aspartate aminotransferase, alanine aminotransferase, alkaline phosphate, and blood dehydrogenase; hyperbilirubinemia; rash; pruritus; injection site pain; and rigors.

micatosis /mī′kətō′sis/, a form of pneumoconiosis caused by inhalation of mica particles.

micellar chromatography /mīsel′ər/, a method of monitoring minute quantities of drugs in whole body fluids by using micellar or colloidal compounds to keep proteins in solution. The technique eliminates the need to remove proteins that usually interfere with chromatographic analysis of blood serum, urine, or saliva. Micellar chromatography is used to monitor levels of prescribed drugs, as well as illicit drugs.

Michaelis-Menten kinetics [Leonor Michaelis, American biochemist, 1875–1949; Maud L. Menten, Canadian physician in U.S. practice, 1879–1960], a method of transforming drug plasma levels into a linear relationship by using the parameters of drug concentration and a constant, K_m, which is a measure of enzyme-substrate affinity. This is necessary when drug elimination mechanisms are saturable rather than proceeding by first-order kinetics.

-micin, suffix for antibiotics produced by *Micromonospora* strains.

miconazole nitrate /mīkon′əzōl/, an antifungal.

■ INDICATIONS: It is used topically to treat certain fungal infections of the skin and vagina.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects to topical or vaginal application are irritation, burning, and maceration of the skin.

micr. See **micro-.**

micrencephalia. See **microcephaly.**

micrencephalon /mī′krənsef′əlon/, an abnormally small brain. See also **microcephaly.** **—micrencephalic,** *adj., n.*

micrencephaly. See **microcephaly.**

micro-, micr-, mikro-, **1.** prefix meaning “small”: *microanalysis, microglossia.* **2.** prefix meaning one “millionth”: *micrometer.*

microabrasion /mi′kro·äbra′zhun/, removal of minute amounts of dental enamel by using an abrasive compound delivered under pressure in order to correct enamel defects or remove diseased tooth structure (caries).

microabscess /mīkrō·ab′ses/ [Gk, *mikros,* small; L, *abscedere,* to go away], a very small abscess.

microadenoma /mī′krō·ad′ənō′mə/, a pituitary adenoma less than 10 mm in diameter.

microaerophile /mī′krō·er′ōfil/ [Gk, *mikros,* small, *aer,* air, *philein,* to love], a microorganism that requires free oxygen for growth but at a lower concentration than that contained in the atmosphere. Compare **aerobe, anaerobe.** **—microaerophilic,** *adj.*

microaerotonometer /mī′krō·er′ətonom′ətər/ [Gk, *mikros* + *aer,* air, *tonos,* tension, *metron,* measure], instrument for measuring the volume of gases in blood or other fluids.

microaggregate recipient set /mi′krō·ag′rəgāt/ [Gk, *mikros* + L, *ad,* to, *gregare,* to collect, *recipere,* to receive; AS, *settan*], a device composed of plastic components for the IV delivery of large volumes of stored whole blood or of packed blood cells. The components of the set include the plastic tubing, roller clamp, and special filter that prevents the microaggregates or deteriorated red blood cells from entering the circulatory system of the patient. The plastic tubing of this device has a larger lumen than tubing of most other IV sets, which allows the blood to be delivered more rapidly. Compare **component drip set, component syringe set, straight line blood set.**

microalbumin test, a urine test to detect a greater than normal albumin concentration in the blood, an early indication of renal disease. Microalbuminuria is indicative of diabetes mellitus, hypertension, cardiovascular disease, nephropathy, urinary bleeding, hemoglobinuria, or myoglobinuria.

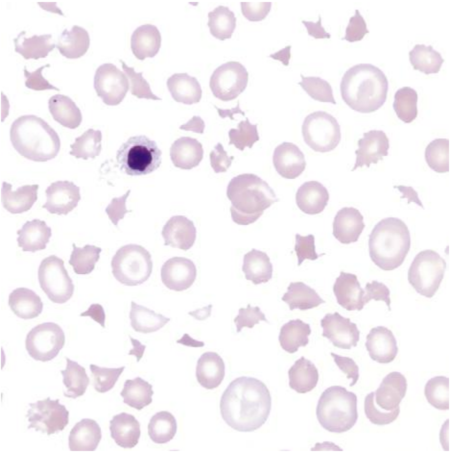
microalbuminuria /mī′krō·al′bo͞ominŏo͝r′ē·ə/, the urinary excretion of small amounts of albumin, below the detection level of routine dipstick analysis. The condition is an early indicator of altered glomerular permeability in diabetes.

microampere /mī′krō·am′pir/, one millionth of an ampere.

microanalysis /mī′krō·anal′isis/, **1.** analysis of minute quantities of material. **2.** identification of substances by examination under a microscope.

microaneurysm /mi′krō·an′yəriz′əm/ [Gk, *mikros* + *aneurysma,* a widening], a microscopic aneurysm characteristic of thrombotic purpura.

microangiopathic hemolytic anemia (MAHA) /mī′krō·an jē·əpath′ik/, a condition in which narrowing or obstruction of small blood vessels results in distortion and fragmentation of erythrocytes, hemolysis, and anemia.



Microangiopathic hemolytic anemia

(Carr and Rodak, 2008)

microangiopathy /mī′krō·an′jē·op′əthē/ [Gk, *mikros* + *angeion,* vessel, *pathos,* disease], a disease of the small blood vessels. Examples are diabetic microangiopathy, in which the basement membrane of capillaries thickens, and thrombotic microangiopathy, in which thrombi form in the arterioles and capillaries.

microbe /mī′krōb/, a microorganism. **—microbial,** *adj.*

-microbe, suffix meaning a "small living organism": *aeromicrobe, inframicrobe, ultramicrobe.*

microbial ecology /mīkrō′bē·əl/, the branch of biology that deals with the interaction of microorganisms with their environment.

microbial pesticides, pathogenic microorganisms that are toxic to a particular bacterium, insect, or other pest.

-microbic, suffix meaning "referring to or consisting of microbes": *amicrobic, monomicrobic, polymicrobic.*

microbicide /mīkrō′bisīd/ [Gk, *mikros,* small, *bios,* life; L, *cadere,* to kill], any drug, chemical, or other agent that can kill microorganisms.

microbiological assay /-bī·əloj′ik/, **1.** the use of microorganisms for measuring the activity of organic compounds. **2.** the calculation of the purity of nutritional factors such as vitamins by measuring the growth of certain bacteria.

microbiology /mī′krōbī·ol′əjē/ [Gk, *mikros* + *bios,* life, *logos,* science], the branch of biology that is concerned with the study of microorganisms, including bacteria, archaea, viruses, algae, protozoa, and fungi, and their effect on humans. **—microbiologic, microbiological,** *adj.*

microbiology technologist, a medical technologist who specializes in the identification of bacteria and other microorganisms found in patient tissues and other specimens.

microblast /mī′krōblast′/ [Gk, *mikros,* small, *blastos,* germ], a very small immature red blood cell. This term is not in common usage.

microbody /mī′krōbod′ē/, any of the round membrane-bound granular cytoplasmic particles containing enzymes and other substances, originating in the endoplasmic reticulum of vertebrate liver and kidney cells and other cells and in protozoa, yeast, and many cell types of higher plants. An important type in vertebrates is the peroxisome.

microbrachia /mī′krōbrā′kē·ə/ [Gk, *mikros* + *brachion,* arm], a developmental defect characterized by abnormal smallness of the arms. **—microbrachius,** *n.*

microcarrier /-ker′ē·ər/, microscopic bead or sphere that increases the surface area in a tissue culture for the attachment and yield of anchorage-dependent cells.

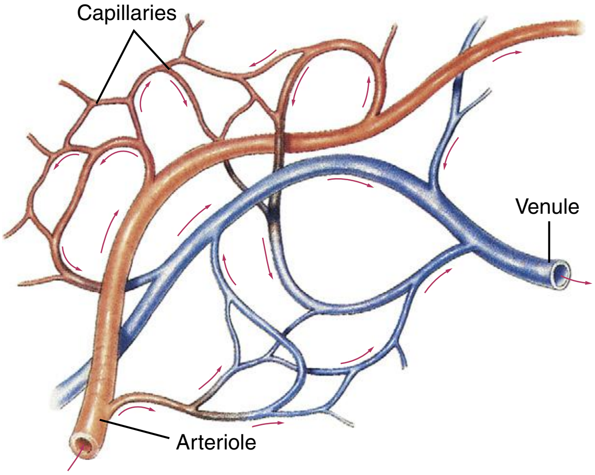
microcentrum. See **centrosome.**

microcephaly /mī′krōsef′əlē/ [Gk, *mikros* + *kephale,* head], a congenital anomaly characterized by abnormal smallness of the head in relation to the rest of the body and by underdevelopment of the brain, resulting in some degree of mental retardation. The head is more than two standard deviations below the average circumference size for age, sex, race, and period of gestation. It has a narrow, receding forehead; a flattened occiput; and a pointed vertex. The facial features are generally normal. The condition may be caused by an autosomal-recessive disorder, a chromosomal abnormality, a toxic stimulus such as irradiation or chemical agents, maternal infection during prenatal development, or any trauma, especially during the third trimester of pregnancy or early infancy. There is no treatment, and nursing care is primarily supportive and educational, helping parents learn to care for a brain-damaged child. Also called *microcephalia, microcephalism.* Compare **macrocephaly.** **—microcephalic, microcephalous,** *adj.,* **microcephalic, microcephalus,** *n.*

microcheiria /mī′krōkī′rē·ə/ [Gk, *mikros* + *cheir,* hand], a developmental defect characterized by abnormal smallness of the hands. The condition is usually associated with other congenital malformations or with bone and muscle disorders. Also spelled *microchiria.*

microcide /mī′krəsīd/, an antimicrobial flavoprotein enzyme. It has antibacterial activity only in the presence of glucose and oxygen as it reduces the oxygen to hydrogen peroxide. The enzyme is derived from *Penicillium notatum* and other fungi.

microcirculation /-sur′kyəlē′shən/, the flow of blood throughout the system of smaller vessels of the body, particularly the capillaries.



Microcirculation *(Thibodeau and Patton, 2003)*

microcomputer /-kəmpyo͞o′tər/, a complete multiuse electronic digital computer system consisting of a central processing unit, storage facilities, input/output ports, and a chip or chips containing megabytes of high-speed internal storage. It is commonly designed for use by one person at a time, and it is the primary computing device for consumers. Also called **personal computer** *and hand-held computer* Compare **mainframe computer, minicomputer.**

microcurie (µCi) /mī′krōkyo͝or′ē/ [Gk, *mikros* + *curie,* Marie Curie], a unit of radioactivity equal to one millionth of a curie, or 3.70 × 10^4 disintegrations per second. See also **curie.**

microcystic adnexal carcinoma (MAC), a form of adnexal tumor that often appears on the face as a yellow, indurated plaque with ill-defined margins. The patient experiences fullness, pain, burning, anesthesia, or paresthesia in the area of the lesion.

microcyte /mī′krəsīt/ [Gk, *mikros* + *kytos,* cell], an abnormally small erythrocyte with a mean cell volume of less than 80 fL, often occurring in iron deficiency anemia and thalassemia.

microcythosis [Gk, *mikros,* small, *kytos,* cell], an excessive number of microcytes in the blood.

microcytic /mī′krōsit′ik/ [Gk, *mikros* + *kytos,* cell], (of a cell) pertaining to a smaller-than-normal cell.

microcytic anemia, a hematologic disorder characterized by abnormally small erythrocytes, usually associated with iron deficiency anemia, thalassemia, or anemia of chronic inflammation. Compare **macrocytic anemia.**

microcytosis /mī′krōsītō′sis/ [Gk, *mikros* + *kytos* + *osis,* condition], a hematologic condition characterized by erythrocytes that are smaller than normal. Microcytosis is found in iron deficiency anemia. Compare **poikilocytosis.** See also **anisocytosis.** **—microcytic,** *adj.*

microdactyly /mī′krōdak′təlē/ [Gk, *mikros* + *dactylos*, finger], a developmental defect characterized by abnormal smallness of the fingers and toes. The condition is usually associated with bone and muscle disorders, such as progressive myositis ossificans.

microdermabrasion, a cosmetic procedure in which all or part of the stratum corneum is removed by light abrasion, used to improve the appearance of sun-damaged skin, treat hyperpigmentation, and reduce or remove scars. It is more superficial than ordinary dermabrasion, does not require anesthesia, and can be performed in less than an hour. The person may resume ordinary daily activities immediately afterward. Microdermabrasion works best for superficial lesions such as fine lines and age spots; deeper lesions require other treatments.

microdontia, a physically small tooth; an anomaly that may occur in a single tooth; a few teeth, e.g., maxillary peg-shaped lateral incisors; or all teeth.

microdrepanocytic /mī′krōdrep′ənōsit′ik/ [Gk, *mikros* + *drepane*, sickle, *kytos*, cell], pertaining to a blood disorder marked by the presence of both microcytes and drepanocytes, such as occurs in sickle cell thalassemia. This term is not in common usage.

microdrip /mī′krōdrip′/, (in IV therapy) an apparatus for delivering relatively small measured amounts of IV solutions at specific flow rates over time, as when it is necessary to keep a vein open. The size of the drops is controlled by the fixed diameter of the plastic delivery tube. With a microdrip, 60 drops delivers 1 mL of solution.

microelectrode /mī′krō·ilek′trōd/, an electrode with a very small tip for use in brain studies. The device can be inserted without membrane damage into nervous tissue to record the bioelectrical activity of a simple neuron.

microelement. See **micronutrient.**

microencapsulation /mī′krō·enkap′syəlā′shən/ [Gk, *mikros* + *en*, in; L, *capsula*, little box], a laboratory technique used in the bioassay of hormones in which certain antibodies are encapsulated with a perforated membrane. The antibodies cannot escape through the tiny perforations, but hormones that bind with the antibodies may enter the structure to bind with them. Technicians then can measure the amount of hormone present in the specimen. The technique is used for the encapsulation of unstable enzymes and in the preparation of some drugs in slow- or time-release forms.

microencephaly /mī′krō·ensef′əlē/ [Gk, *mikros*, small, *egkephalos*, brain], the condition of being born with an abnormally small brain.

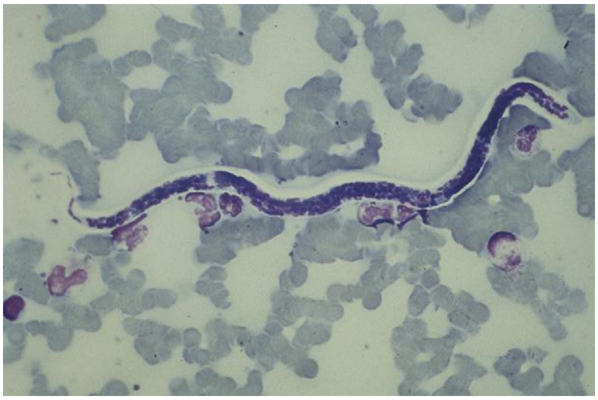
microequivalent /mī′krō·ikwiv′ələnt/, one millionth of an equivalent, the amount of a substance that corresponds to its equivalent mass in micrograms.

microfarad (μF) /mī′krōfer′əd/ [Gk, *mikros* + *farad*, Michael Faraday], a unit of capacitance that equals one millionth of a farad. See also **farad.**

microfiche /mī′krōfēsh′/ [Gk, *mikros* + Fr, *fiche*, peg], a sheet of microfilm that contains several separate photographic reproductions. The sheet is a convenient size for filing and enables large amounts of data to be stored in a relatively small space. See also **microfilm.**

microfilament /-fil′əmənt/, any of the finest of the fibrous cellular filaments, such as the tonofibrils, found in the cytoplasm of most cells, that function primarily as a supportive system. Compare **microtubule.**

microfilaria /mī′krōfiler′ē·ə/ *pl.* **microfilariae** [Gk, *mikros* + L, *filum*, thread], the prelarval form of any filarial worm. Certain blood-sucking insects ingest these forms from an infected host, and the microfilariae then develop in the body of the insect and become infective larvae. See also **filariasis, loiasis, onchocerciasis, *Wuchereria.***



Microfilaria *(Conlon and Snydman, 2000)*

microfilm /mī′krəfilm/, a strip of 16-mm or 35-mm film that contains photographic reproductions of pages of books, documents, or other library or medical records in greatly reduced size. The film is viewed through a machine that enlarges the photographic images to normal reading size.

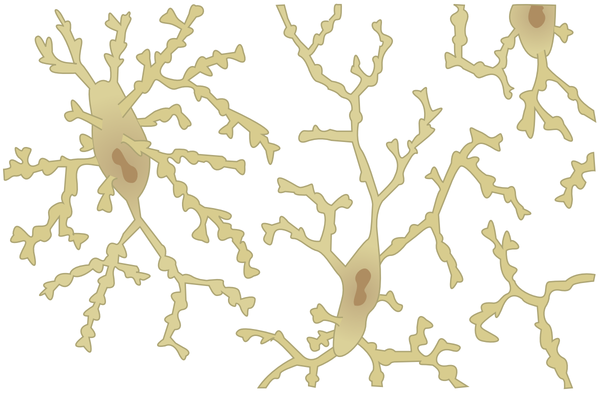
microfluorometry. See **cytophotometry.**

microgamete /-gam′ēt/, the small, motile male gamete of certain thallophytes and sporozoa, specifically the malarial parasite ***Plasmodium.*** It corresponds to the sperm of the higher animals and unites in conjugation with the larger, nonmotile female gamete. Compare **macrogamete.**

microgametocyte /-gamē′təsīt/ [Gk, *mikros* + *gamete*, spouse, *kytos*, cell], an enlarged merozoite that undergoes meiosis to form the mature male gamete during the sexual phase of the life cycle of certain thallophytes and sporozoa, specifically the malarial parasite ***Plasmodium.*** Microgametocytes are found in the red blood cells of a person infected with the malarial parasite, but they must be ingested by a female ***Anopheles*** mosquito to complete the maturation process and develop into microgametes.

microgenitalia /-jen′itā′lē·ə/, a condition characterized by abnormally small external genitalia.

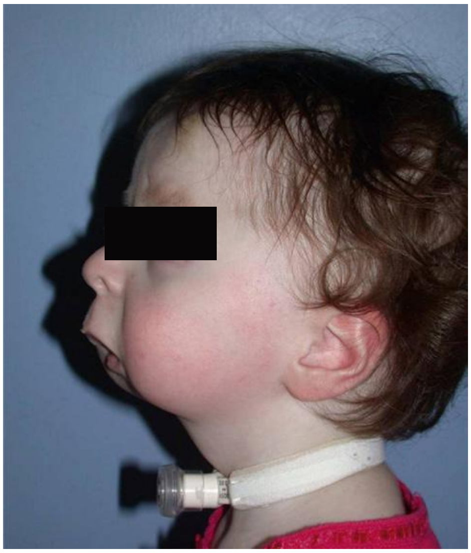
microglia /mīkrog′lē·ə/ [Gk, *mikros* + *glia*, glue], small, migratory interstitial cells that form part of the central nervous system. They have various forms and slender, branched processes. Microglia serve as phagocytes that collect waste products of the nerve tissue of the body. Also called **Hortega cells, mesoglia.**



Microglia *(Black and Hawks, 2009)*

microglossia /mī′krō·glos′ē·ə/ [Gk, *mikros,* small + *glōssa,* tongue], undersized tongue.

micrognathia /mī′krōnā′thē·ə/ [Gk, *mikros* + *gnathos,* jaw], underdevelopment of the jaw, especially the mandible. Compare **macrognathia.** Formerly called **brachygnathia.** **—micrognathic,** *adj.*



Micrognathia *(Kaban et al, 2009)*

microgram (µg, mcg) /mī′krəgram/, a unit of measurement of mass equal to one millionth (10^{-6}) of a gram. See also **gram.**

microgyri. See **microgyrus.**

microgyria /mī′krōjī′rē·ə/ [Gk, *mikros* + *gyros,* turn], a developmental defect of the brain in which the convolutions are abnormally small, resulting in structural malformation of the cortex. The condition is usually associated with mental retardation and physical defects. Also called **polymicrogyria.**

microgyrus /mī′krōjī′rəs/, *pl.* **microgyri,** an underdeveloped, malformed convolution of the brain.

microhematocrit, a hematocrit determination performed using less than a milliliter of whole blood in a capillary tube spun by a high-speed centrifuge.

microhm /mī′krōm/ [Gk, *mikros* + *ohm,* George Ohm], a unit of electrical resistance equal to one millionth (10^{-6}) of an ohm. See also **ohm.**

microinjection /mī′krō·injek′shən/, the injection of tiny amounts of a substance into a cell by using micromanipulation instruments.

microinjector /mī′krō·injek′tər/, an instrument that delivers tiny amounts of a substance into a cell.

microinvasive carcinoma /mī′krō·invā′siv/ [Gk, *mikros* + L, *in,* within, *vadere,* to go], a squamous epithelial neoplasm that has penetrated the basement membrane, the first stage in invasive cancer. See also **carcinoma in situ.**

microkeratome /mī′krō·kər′ə·tōm/ [Gk, *mikros* + *keratome*], an instrument for removing a thin slice, or creating a thin hinged flap, on the surface of the cornea.

microleakage /mī′krō·lē′kij/ [Gk, *mikros* + ONorse *leka,* to drip], leakage of minute amounts of salivary fluids, debris, and microorganisms through the microscopic space between a dental restoration or its cement and the adjacent surface of the cavity preparation. It may form a carious lesion, progress through the dentin into the pulp, resulting ultimately in the failure of the restoration and the loss of the tooth.

microlevel interventions /-lev′əl/, health-generating changes performed at the individual level, such as in conditioning or stimulus control therapies.

microliter (µL) /mī′krəlē′tər/, a unit of liquid volume equal to one millionth of a liter, or 1 mm^3.

microlith /mī′krəlith/ [Gk, *mikros* + *lithos,* stone], a small rounded mass of mineral matter or calcified stone.

micromanipulation /-mənip′yəlā′shən/, surgical displacement or dissection of very small tissues by using either miniature instruments or mechanical devices that translate large motions into smaller movements.

micromanipulator /-mənip′yəlā′tər/, a guidance accessory to a microscope that performs displacement or dissection of very small tissues.

micromelic dwarf /-mē′lik/ [Gk, *mikros* + *melos,* limb], a dwarf whose limbs are abnormally short.

micrometer (µm) /mīkrom′ətər/, **1.** an instrument used for measuring small angles or distances on objects being observed through a microscope or telescope. **2.** /mī′krōmē′tər/, a unit of measurement, commonly referred to as a **micron,** that equals one millionth (10^{-6}) of a meter.

micromicro-, prefix meaning "10^{-12}" (µµ): *micromicron.*

micromillimeter. See **nanometer.**

micromyeloblastic leukemia /mī′krōmī′əlōblas′tik/ [Gk, *mikros* + *myelos,* marrow, *blastos,* germ], a malignant neoplasm of blood-forming tissues, characterized by the proliferation of small myeloblasts distinguishable from lymphocytes only by special staining techniques and microscopic examination.

micron (µ, mu) /mī′kron/ [Gk, *mikros,* small], **1.** See **micrometer,** def. 2. **2.** (in physical chemistry) a colloidal particle with a diameter between 0.2 and 10 µm.

Micronase, a trademark for an oral antidiabetic drug **(glyburide).**

microneurography /-nyo͞orog′rəfē/, the recording of impulse conduction in individual nerve fibers by means of a microelectrode. The technique is used in studies of the relationship between body mass and the sympathetic nervous system.

micronodular /-nod′yələr/, characterized by the presence of very small nodules.

micronodular adrenal disease, a rare form of Cushing's syndrome caused by multiple bilateral small, pigmented autonomous adrenocorticotropic hormone–independent cortisol-secreting adenomas. Also called **primary bilateral micronodular hyperplasia.**

Micronor, a trademark for an oral contraceptive containing a progestin **(norethindrone).**

micronucleus /-no͞o′klē·əs/, **1.** a small nucleus. **2.** the smaller of two nuclei in some protozoa. It functions in sexual reproduction. Compare **macronucleus.**

micronutrient /-no͞o′trē·ənt/, any dietary element essential only in minute amounts for the normal physiological processes of the body, including vitamins and minerals or chemical elements such as zinc or iodine. Also called **microelement,** **trace element.**

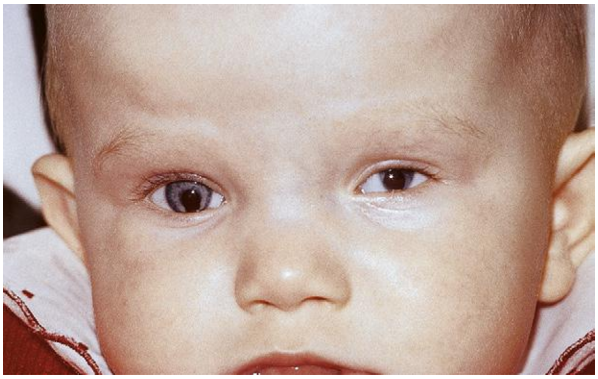
microorganism /-ôr′gəniz′əm/ [Gk, *mikros* + *organon,* instrument], any tiny, usually microscopic entity capable of carrying on living processes. It may be pathogenic. Kinds of microorganisms include **bacteria, fungi, protozoan,** and **viruses.**

micropenis. See **microphallus.**

microphage /mī′krəfāj/ [Gk, *mikros* + *phagein,* to eat], a neutrophil capable of ingesting small things, such as bacteria. Compare **macrophage.** **—microphagic,** *adj.*

microphallus /-fal′əs/ [Gk, *mikros* + *phallos,* penis], an abnormally small penis. When it is observed in the newborn, the nurse examines the child for other signs of ambiguous genitalia. Also called **micropenis.** See also **ambiguous genitalia.**

microphthalmos /mī′krəfthal′məs/ [Gk, *mikros* + *ophthalmos,* eye], a developmental anomaly characterized by abnormal smallness of one or both eyes. When the condition occurs in the absence of other ocular defects, it is called pure microphthalmos or nanophthalmos. Also spelled *microphthalmus.* Also called *microphthalmia.* **—microphthalmic,** *adj.*



Left microphthalmos and bilateral iris colobomas
(Kanski and Bowling, 2011)

microplasia. See **dwarfism.**

micropodia /-pō′dē·ə/ [Gk, *mikros* + *pous,* foot], a developmental anomaly characterized by abnormal smallness of the feet. The condition is often associated with other congenital malformations or with bone and skeletal disorders.

microprolactinoma /-prōlak′tinō′mə/, a prolactin-secreting pituitary tumor less than 10 mm in diameter. Microprolactinomas seldom enlarge, and some resolve spontaneously. Most patients experience a return to ovulatory menstrual cycles and fertility with treatment.

microprosopus /mī′krōprō′səpəs, -prəsō′pəs/ [Gk, *mikros* + *prosopon,* face], a fetus having an abnormally small or underdeveloped face.

micropsia /mīkrop′sē·ə/ [Gk, *mikros* + *opsis,* sight], a condition of vision in which a person perceives objects as smaller than they really are. It may occur during seizure activity. See also **hallucination. —microptic,** *adj.*

micropuncture /mī′krōpunk′cher/, **1.** the creation of minute openings by piercing. **2.** in renal physiology, the process by which nephron segments are pierced.

microreentry /-rē·en′trē/ [Gk, *mikros* + L, *re,* again; Fr, *entree,* entry], the reactivation of myocardial tissue by an impulse transmitted along a very small circuit within the conductive tissue of the heart.

microscope /mī′krəskōp′/ [Gk, *mikros,* small, *skopein,* to view], an instrument with lenses for viewing very small objects. Types of microscopes include the **acoustic microscope** and the **electron microscope.**

microscopic /mī′krəskop′ik/ [Gk, *mikros* + *skopein,* to look], **1.** pertaining to a microscope. **2.** very small; visible only when magnified and illuminated by a microscope. Compare **gross.**

microscopic anatomy, the study of the microscopic structure of the tissues and cells. Kinds of microscopic anatomy are **cytology** and **histology.**

microscopy /mīkros′kəpē/ [Gk, *mikros* + *skopein,* to look], a technique for observing minute materials with a microscope. Kinds of microscopy include **darkfield microscopy, electron microscopy,** and **fluorescent microscopy.**

microshock /mī′krəshok/, **1.** shock from an electric current of less than 1 milliampere. It may not be felt. **2.** the passage of current directly into the cardiac tissue.

microsomal enzymes /-sō′məl/, a group of enzymes associated with a certain particulate fraction of liver homogenate that plays a role in the metabolism of many drugs.

microsome /mī′krəsōm/, a fragment of endoplasmic reticulum associated with ribosomes, found in cells that have been homogenized and ultracentrifuged.

microsomia /-sō′mē·ə/ [Gk, *mikros* + *soma,* body], the condition of having an abnormally small and underdeveloped yet otherwise perfectly formed body with normal proportionate relationships of the various parts. See also **primordial dwarf.**

microsphere /mī′krəsfir′/, **1.** a centrosome. **2.** a microscopic globule of radiolabeled material.

microspherocytosis /-sfir′əsītō′sis/, anemia characterized by the presence of microcytes and spherocytes in a peripheral blood film. Spherocytes are red blood cells that are spherical in suspension that lack a central zone of pallor, and whose diameter is reduced on a peripheral blood film. See also **spherocyte.**

Microsporida /mī′krō·spor′i·də/ [Gk, *mikros* + *sporos,* seed], an order of parasitic protozoa found in invertebrates, especially arthropods; in lower vertebrates; and, rarely, in higher vertebrates.

microsporidiosis /mī′krō·spôrid′ē·ō′sis/, infection with protozoa of the order Microsporida, usually seen in immunocompromised patients, usually characterized by diarrhea and wasting.

Microsporum /-spôr′əm/ [Gk, *mikros* + *sporos,* seed], a genus of dermatophytes of the family Moniliaceae. The spores are multiseptate and variable in shape and have thin or thick walls. One species is *M. audouinii,* which causes epidemic tinea capitis in children. Others are *M. canis* and *M. gypseum.* Formerly called *Microsporon.*

microstomia /-stō′mē·ə/ [Gk, *mikros,* small, *stoma,* mouth], the condition of having an abnormally small mouth.

microsurgery /-sur′jərē/ [Gk, *mikros,* small, *cheirourgos,* surgery], surgery that involves dissection and manipulation of minute tissue structures under a microscope.

microsurgical epididymal sperm aspiration (MESA), retrieval of sperm from the epididymis by using microsurgical techniques, done in men with obstructive azoospermia.

microtear /mī′krəter′/, minor damage to soft tissue.

microthermy /-thur′mē/ [Gk, *mikros* + *therme,* heat], the use of heat generated by radio wave conversion in physical therapy.

microthrombus /mī′krōthrom′bəs/ *pl.* **microthrombi** [Gk, *mikros,* small + *thrombos,* lump], a small thrombus located in a capillary or other small blood vessel.

microtia /mīkrō′shī·ə/, underdevelopment or complete absence of the auricle of the ear, with a blind or absent external canal. Compare **anotia.**

microtome /mī′krətōm/ [Gk, *mikros* + *temnein,* to cut], a device that cuts specimens of tissue prepared in paraffin blocks into extremely thin slices for microscopic study.

microtrauma /-trô′mə/, a very slight injury or lesion.

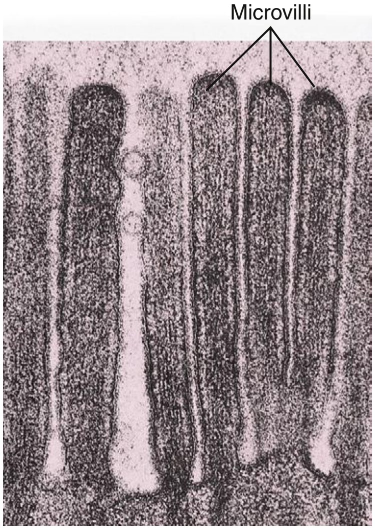
microtuboplasty, the surgical repair of an occluded fallopian tube, performed with micro instruments and a microscope.

microtubule, a hollow cylindrical structure (200 to 300 angstroms in diameter and of variable length) that occurs widely within plant and animal cells. Microtubules increase in number during cell division and are associated with the movement of deoxyribonucleic acid material. Compare **microfilament.**

microtubule organizing center (MTOC), region of eukaryotic cells such as a centrosome or basal body from which microtubules grow.

microvascular /-vas′kyələr/, pertaining to the portion of the circulatory system that is composed of the capillary network.

microvilli /-vil′ī/ [Gk, *mikros,* small; L, *villus,* shaggy hair], tiny hairlike folds in the plasma membrane that extend from the surface of many absorptive or secretory cells. They are most clearly visible with an electron microscope but may be seen as a "brush border" with a light microscope.



Microvilli *(Patton and Thibodeau, 2007/Courtesy Susumu Ito, Harvard Medical School)*

microwave [Gk, *mikros* + AS, *wafian,* wave], electromagnetic radiation with a wavelength of 1 mm to 30 cm.

microwave interstitial system /mī′krəwāv/, a microwave-generated hyperthermia system that uses up to eight 50-watt applicators to create a heat field in certain accessible tumors no more than 2 inches (5.08 cm) beneath the skin. The microwaves produce a temperature of about 109° F (42.7° C) to destroy the tumor cells. The treatment can be monitored on a video terminal that shows location of the tumor and heat applicators.

microwave thermography, measurement of temperature through the detection of microwave radiation emitted from heated tissue.

Micruroides /mi′krooroi′dēz/, a genus of venomous coral snakes found in Mexico and the southwestern United States. See also **snakebite**.

Micrurus /mikroo′rus/, a genus of venomous coral snakes, including a species found in the southeastern United States and south into Central America. See also **snakebite**.

micturition. See **urination.**

micturition reflex /mik′chərish′ən/ [L, *micturire,* to urinate, *reflectere,* to bend back], a normal reaction to a rise in pressure within the bladder, resulting in contraction of the bladder wall and relaxation of the urethral sphincter, allowing urination. Voluntary inhibition normally prevents incontinence; urination follows withdrawal of the inhibition.

micturition syncope [L, *micturire,* to urinate; Gk, *syn,* together, *koptein,* to cut], a temporary loss of consciousness that tends to affect some adult males after arising from a reclining posture to urinate in an upright posture. The effect is caused by a brief interruption of blood flow to the brain and is often associated with the use of alcohol, which contributes to vasodilation. See also **hypotension, orthostatic hypotension.**

MICU, abbreviation for *medical intensive care unit.*

MID, abbreviation for **minimal infecting dose.**

mid-, prefix meaning "the middle": *midsagittal.*

Midamor, a trademark for a diuretic **(amiloride hydrochloride).**

midarm muscle circumference, a calculation made by subtracting the triceps skin fold from the midupper arm circumference measurement. A less than expected circumference may indicate muscle wasting in the upper arm.

midaxillary line /midak′siler′ē/, an imaginary vertical line that passes midway between the anterior and posterior axillary folds.

midazolam hydrochloride /midaz′əlam/, a short-acting central nervous system depressant; a benzodiazepine anxiolytic.

■ INDICATIONS: It is prescribed for preoperative sedation and impairment of memory of preoperative events (retrograde amnesia) and for moderate sedation before short diagnostic endoscopic or dental procedures.

■ CONTRAINDICATIONS: It is contraindicated for patients with acute narrow-angle glaucoma. It should be used with caution in those with open-angle glaucoma.

■ ADVERSE EFFECTS: Possible adverse effects include decreased tidal volume, decreased respiratory rate, apnea, hypotension, hiccups, nausea, vomiting, oversedation, and tenderness at the site of injection.

midbody, **1.** the middle of the body, or the midregion of the trunk. **2.** a mass of granules that appears in the middle of the spindle during mitotic anaphase in a dividing cell.

midbrain. See **mesencephalon.**

midcarpal. See **mediocarpal.**

midclavicular line /mid′kləvik′yŏŏlər/ [AS, *midd* + L, *clavicula,* little key, *linea,* line], (in anatomy) an imaginary line that extends downward over the trunk from the midpoint of the clavicle, dividing each side of the anterior chest into two parts. The left midclavicular line is an important marker in describing the location of various cardiac phenomena, including the point of maximum impulse.

middle adult [AS, *middel* + L, *adultus,* grown up], an individual in the transitional age span between young adult and elderly, approximately 45 to 65 years of age, whose psychological task, according to Erikson, is generativity versus stagnation.

middle cardiac vein, one of the five tributaries of the coronary sinus that drain blood from the capillary bed of the myocardium. It starts at the apex of the heart, rises in the posterior interventricular sulcus, receives tributaries from both ventricles, and ends in the right extremity of the coronary sinus. Compare **great cardiac vein, small cardiac vein.**

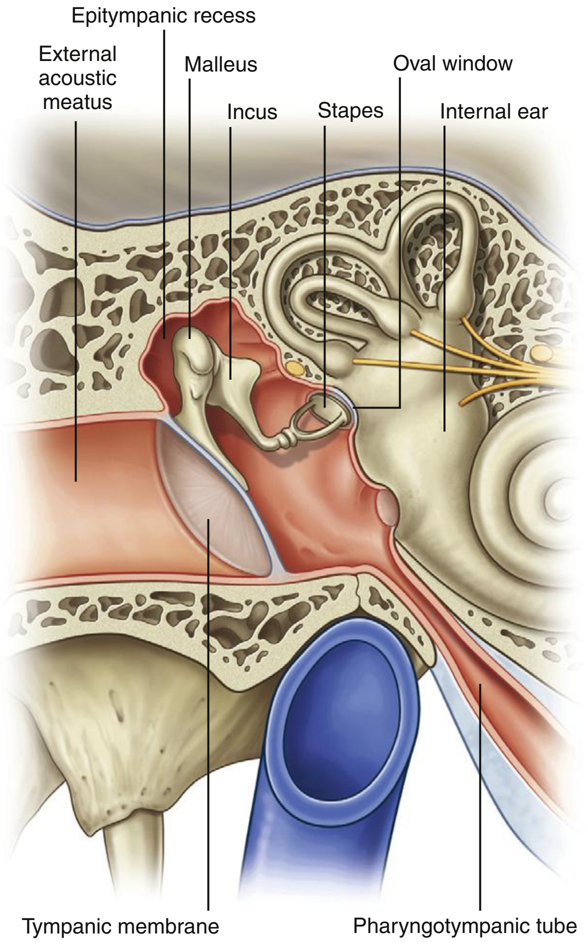
middle cerebral artery, the largest of the cerebral arteries and the vessel most commonly affected by cerebrovascular accident.

middle cervical ganglion, a ganglion at the level of the sixth cervical vertebra. Branches from this ganglion pass to spinal nerves C7 to T1, the vertebral artery, and the heart as the middle cardiac nerve.

middle costotransverse ligament. See **ligament of the neck of the rib.**

middle cuneiform bone. See **intermediate cuneiform bone.**

middle ear, the tympanic cavity with the auditory ossicles contained in an irregular space in the temporal bone. It is separated from the external ear by the tympanic membrane and from the inner ear by the oval window. The auditory (eustachian) tube carries air from the posterior nasopharynx into the middle ear. Also called **tympanic cavity.** Compare **external ear, internal ear.**



Middle ear *(Drake, Vogl, and Mitchell, 2010)*

middle kidney. See **mesonephros.**

middle lobe syndrome, localized atelectasis of the middle lobe of the right lung, characterized by chronic infection, cough, dyspnea, wheezing, and obstructive pneumonitis. Asymptomatic obstruction of the bronchus may occur. The condition arises when the cuff of lymphatic glands that surrounds the middle lobe bronchus becomes enlarged as a result of nonspecific or tuberculous inflammation during childhood. The bronchus is thus compressed, and bronchiectasis develops in the obstructed part of the lung. Treatment includes antituberculosis chemotherapy, administration of corticosteroids, and surgical excision. See also **atelectasis, bronchiectasis.**

middle mediastinum, the widest part of the mediastinum, containing the heart, ascending aorta, lower half of the superior vena cava, pulmonary trunk, and phrenic nerves. It is one of three caudal portions of the mediastinum. Compare **anterior mediastinum, posterior mediastinum, superior mediastinum.**

middle molecule, any molecule with an atomic mass between 350 and 2000 daltons. These molecules accumulate in the body fluids of patients with uremia.

middle-old, persons from 75 to 84 years of age.

middle plate. See **nephrotome.**

middle sacral artery, a small visceral branch of the abdominal aorta, descending to the fourth and fifth lumbar vertebrae, the sacrum, and the coccyx. Minute branches are said to supply the posterior surface of the rectum.

middle suprarenal artery, one of a pair of small visceral branches of the abdominal aorta, arising opposite the superior mesenteric artery and supplying the suprarenal gland.

middle temporal artery, one of the branches of the superficial temporal artery on each side of the head. It arises just above the zygomatic arch, pierces the temporal fascia, branches to the temporalis, and anastomoses with the deep temporal branches of the maxillary artery. Compare **deep temporal artery, superficial temporal artery.**

middle temporal gyrus [AS, *middel* + L, *tempus,* time; Gk, *gyros,* turn], the middle of three gyri of the temporal area of the surface of the brain. It runs horizontally between the inferior and superior temporal sulci of the temporal lobe.

middle umbilical fold, the fold of peritoneum over the urachal remnant within the abdomen. Approximately 3 cm lateral to the middle umbilical fold is the lateral umbilical fold. Between the lateral and the middle folds is the medial umbilical fold. Also called **plica umbilicalis mediana.**

midface /mid′fās/, the middle of the face, including the nose, nasion, and glabella.

mid forceps [AS, *midd* + L, *forceps,* pair of tongs], an obstetric operation in which forceps are applied to the baby's head when it has reached the midplane of the mother's pelvis. An episiotomy is usually performed, and local, regional, or inhalation anesthesia is provided. In some cases, such as severe fetal distress, mid forceps may be the most rapid and the safest means of delivery, but astute selection of cases, skill, and experience are essential. Difficult mid forceps delivery is likely to be more traumatic to the baby and the mother than cesarean section. Compare **high forceps, low forceps.** See also **failed forceps, forceps delivery, obstetric forceps, trial forceps.**

midgut [AS, *midd* + *guttas*], the central portion of the embryonic alimentary canal, between the foregut and the hindgut. It consists of endodermal tissue, is connected to the yolk sac during early prenatal development, and eventually gives rise to some of the small intestine and part of the large intestine. Compare **foregut, hindgut.**

midgut loop, a U-shaped loop of intestine that temporarily forms during the period of rapid elongation and rotation of the midgut in embryonic development. It projects into the proximal part of the umbilical cord, to which it is attached via the yolk stalk. With further development, it retracts into the abdomen, rotating further.

midgut volvulus, volvulus neonatorum involving the entire part of the intestines derived from the midgut.

midlife transition, a period between early adulthood and middle adulthood that occurs between 40 and 45 years of age. See also **age 30 transition.**

midline /mid′līn/ [AS, *midd* + L, *linea,* line], an imaginary line that divides the body into right and left halves.

midline episiotomy. See **episiotomy.**

midoccipital /mid′oksip′itəl/, pertaining to the center of the occiput.

midodrine, a vasopressor.

■ INDICATION: It is used to treat orthostatic hypotension.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to midodrine, severe organic heart disease, acute renal disease, urinary retention, pheochromocytoma, thyrotoxicosis, and persistent or excessive supine hypertension.

■ ADVERSE EFFECTS: Adverse effects include drowsiness, restlessness, headache, chills, nausea, anorexia, dry mouth, blurred vision, pruritus, piloerection, rash, urinary urgency, and supine hypertension. Common side effects are paresthesia and pain.

midparental height /-pəren′təl/, the average height of both parents at 25 to 45 years of age.

midpelvic contraction. See **contraction.**

midposition /mid′pəzish′ən/, the end-expiratory or end-tidal level or position of the lung-chest system under any given condition. It determines the functional residual capacity.

Midrin, a trademark for a fixed-combination central nervous system drug containing an adrenergic **(isometheptene mucate),** a hypnotic (dichloralphenazone), and an analgesic (acetaminophen), used in the treatment of tension and vascular headaches.

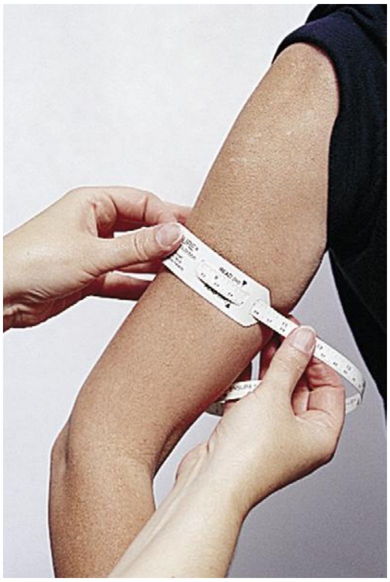
midsagittal plane. See **median plane.**

midstance /mid′stanz/ [AS, *midd* + L, *stare,* to stand], one of the five stages in the stance phase of walking, or gait, directly associated with the period of single-leg support of body weight or the period during which the body advances over the stationary foot. During midstance the tibialis posterior and the flexor hallucis longus display their greatest activity. The midstance phase is considered in the diagnosis of many abnormal orthopedic conditions and in the analysis of the associated weaknesses of certain muscles and muscle groups. Compare **initial contact stance stage, loading response stance stage, preswing stance stage, terminal stance.** See also **swing phase of gait.**

midsternum /midstur′nəm/ [AS, *midd* + Gk, *sternon,* chest], the body of the breast bone (sternum).

midstream catch urine specimen [AS, *midd* + *stream* + L, *captere,* to capture], a urine specimen collected during the middle of a flow of urine, after the urinary opening has been carefully cleaned. Also called **clean-catch specimen.**

midupper arm circumference (MAC), a measurement of the circumference of the arm at a midpoint between the tip of the acromial process of the scapula and the olecranon process of the ulna. It is an indication of upper arm muscle wasting.



Measurement of midupper arm circumference

(Seidel et al, 2011)

midwife [AS, *midd* + *wif*], **1.** also called **obstetrix.** (in traditional use) a (female) person who assists women in childbirth. **2.** (according to the International Confederation of Midwives, World Health Organization, and Federation of International Gynecologists and Obstetricians) "a person who, having been regularly admitted to a midwifery educational program fully recognized in the country in which it is located, has successfully completed the prescribed course of studies in midwifery and has acquired the requisite qualifications to be registered and/or legally licensed to practice midwifery." Among the responsibilities of the midwife are supervision of pregnancy, labor, delivery, and puerperium. The midwife conducts the delivery independently, cares for the newborn, procures medical assistance when necessary, executes emergency measures as required, and may practice in a hospital, clinic, maternity home, or private home. The midwife, whose practice may also include well-child care, family planning, and some aspects of gynecology, is often an important source of health counseling in the community. **3.** a nurse midwife or Certified Nurse Midwife.

midwifery /mid′wīf(ə)rē/ [AS, *midd* + *wif*], the employment of a person who is qualified by special training and experience to assist a woman in childbirth. See also **midwife.**

MIF, abbreviation for *macrophage inhibition factor.* See **macrophage migration inhibiting factor.**

mifepristone /mif′əpris′tōn/, an antiprogestin used with misoprostol or other prostaglandins that induces abortion if taken within the first 7 weeks of pregnancy. Two days after taking the drug to end the pregnancy, the woman must take a second drug to cause strong uterine contractions that expel the fetus. Mifepristone is reportedly effective 95.5% of the time, and serious complications are rare. However, the procedure may be somewhat painful, and a small percentage of patients have required blood transfusions. If the drug regimen fails to terminate the pregnancy, the woman must arrange for a surgical abortion to complete the process. Also called **abortion pill, RU-486.**

MIF test, abbreviation for *migration inhibitory factor test.*

miglitol, an oral hypoglycemic.

■ INDICATION: It is used to treat type 2 diabetes mellitus.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to miglitol, diabetic ketoacidosis, cirrhosis, inflammatory bowel disease, colonic ulceration, partial intestinal obstruction, and chronic intestinal disease.

■ ADVERSE EFFECTS: Hepatotoxicity is a life-threatening side effect. Other adverse effects are low iron and rash. Common side effects are abdominal pain, diarrhea, and flatulence.

miglustat, a rarely used miscellaneous agent.

■ INDICATIONS: This drug is used to treat adults with mild to moderate type 1 Gaucher disease.

■ CONTRAINDICATIONS: Pregnancy and known hypersensitivity to this drug prohibit its use.

migraine /mī′grān/ [Gk, *hemi,* half, *kranion,* skull], a recurring headache characterized by unilateral onset, severe throbbing pain, photophobia, phonophobia, and autonomic disturbances during the acute phase, which may last for hours or days. The disorder occurs more frequently in women than in men, and a predisposition to migraine may be inherited.

The exact mechanism responsible for the disorder is not known, but the head pain may be related to dilation of extracranial blood vessels, which may be the result of chemical changes that cause spasms of intracranial vessels. Allergic reactions, excess carbohydrates, iodine-rich foods, alcohol, bright lights, or loud noises may trigger attacks, which often occur during a period of relaxation after physical or psychic stress. See also **headache.**

■ OBSERVATIONS: An impending attack may be heralded by visual disturbances, such as aura, flashing lights or wavy lines, or by a strange taste or odor, numbness, tingling, vertigo, tinnitus, or a feeling that part of the body is distorted in size or shape. The acute phase may be accompanied by nausea, vomiting, chills, polyuria, sweating, facial edema, irritability, and extreme fatigue. After an attack the individual often has dull head and neck pains and a great need for sleep.

■ INTERVENTIONS: Ergotamine tartrate preparations that constrict cranial arteries can usually prevent the headache from developing if administered early in the onset via injection, suppository, tablet, or nasal spray. Ergotamine tartrate is also available in combination with other drugs, such as caffeine, phenobarbital, and belladonna. Migraine patients unable to tolerate ergot preparations may use other analgesics, including acetaminophen, NSAIDs, triptan, and propoxyphene. If headaches happen frequently, a prophylactic medication may be taken daily.

migrainous cranial neuralgia /mī′grānəs, mīgrā′nəs/ [Gk, *hemi,* half, *kranion,* skull; L, *osus,* having], a variant of migraine, most common in middle-aged men, characterized by closely spaced episodes of excruciating throbbing unilateral headaches often accompanied by dilation of temporal blood vessels, flushing, sweating, lacrimation, nasal congestion or rhinorrhea, ptosis, and facial edema. Repeated episodes usually occur in clusters within a few days or weeks and may be followed by a relatively long remission period. A typical attack begins abruptly, without prodromal signs, as a burning sensation in an orbit or temple, and the resulting radiating intense pain may last 1 or 2 hours. Histamine diphosphate injected subcutaneously in people subject to these headaches produces symptoms identical to those occurring in a spontaneous attack. The pain may be relieved by antihistamines, and ergotamine tartrate preparations may be helpful if administered at the onset of an attack. Oxygen administration and endometracin for prophylaxis may also be used. Also called **cluster headache, histamine headache, Horton's headache.** See also **migraine.**

migrating phlebitis /mī′grāting/ [L, *migrare,* to wander; Gk, *phleps,* vein, *itis,* inflammation], a form of phlebitis characterized by inflammation in one part of a vein and, after remission, in another part of the vein.

migration /mīgrā′shən/ [L, *migrare,* to wander], the passage of the ovum from the ovary into a fallopian tube and then into the uterus.

migratory gonorrheal polyarthritis. See **migratory polyarthritis.**

migratory ophthalmia. See **sympathetic ophthalmia.**

migratory polyarthritis /mī′grətôr′ē/, arthritis that progressively affects a number of joints and finally settles in one or more. It occurs in persons with gonorrhea and develops a few days to a few weeks after the onset of gonorrheal urethritis. The patient usually has a moderate fever and 1 to 5 days of migratory polyarthralgia with variable signs of inflammation. In more prolonged episodes initial arthritic sites may clear as new areas are affected, but persistently involved joints are usually severely inflamed and swollen. After the swelling subsides, the overlying skin may peel. Large joints are most affected. Treatment with penicillin or tetracycline generally provides some relief in 24 to 72 hours. Also called **migratory gonorrheal polyarthritis.**

migratory thrombophlebitis, an abnormal condition in which multiple thromboses appear in both superficial and deep veins. It may be associated with malignancy, especially carcinoma of the pancreas, often preceding other evidence of cancer by several months. Pulmonary embolism is uncommon with this condition. Also called **thrombophlebitis migrans.** See also **thrombophlebitis.**

mikro. See **micro-.**

Mikulicz's aphthae. See **Sutton's disease.**

Mikulicz's syndrome /mik′yo͞olich′ēz/ [Johann von Mikulicz-Radecki, Polish surgeon, 1850–1905], an abnormal bilateral enlargement of the salivary and lacrimal glands. It is found in a variety of diseases, including leukemia, tuberculosis, and sarcoidosis. Also called *Mikulicz's disease.* Compare (clinical variant) **Sjögren's syndrome.**

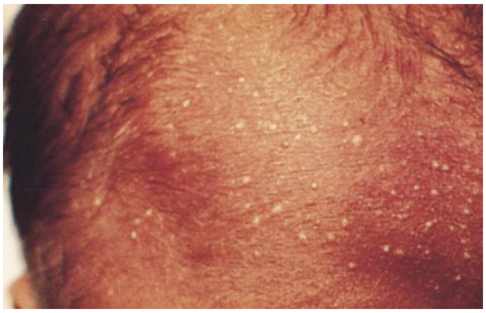
mild [AS, *milde,* soft], gentle, subtle, or of low intensity, such as a mild infection.

mildew /mil′dyo͞o/, a visible growth of any of numerous species of saprophytic fungi. Mildew causes discoloration and weakening of fabrics and fibers.

mild fever. See **field fever.**

milia. See **milium.**

milia neonatorum [L, *milium,* millet; Gk, *neo,* new; L, *natus,* born], a nonpathological dermatological condition characterized by minute epidermal cysts consisting of keratinous debris that occur on the face and occasionally on the trunk of the newborn. They are eliminated by normal desquamation of the skin within a few weeks after birth and leave no scars.



Milia neonatorum *(Weston, Lane, and Morelli, 2007)*

miliaria /mil′ē·er′ē·ə/ [L, *milium,* millet], minute vesicles and papules, often with surrounding erythema, caused by occlusion of sweat ducts during times of exposure to heat and high humidity. Backup pressure may cause sweat to escape into adjacent tissue, producing itching and prickling. Prevention and treatment include cool environment, ventilation, colloidal baths, and dusting powders. Also called **prickly heat.** See also **heat rash.**

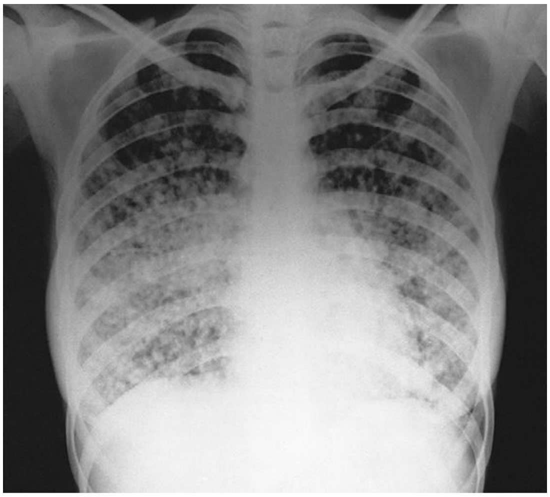
miliaria profunda, the deepest type of miliaria, with occlusion of the ducts at the dermoepidermal junction. It occurs following severe, recurrent miliaria rubra and is seen primarily in hot, humid climates. Because large numbers of sweat glands are inactivated, it can lead to heat intolerance or heat stress, as in tropical anhidrotic asthenia.

miliary /mil′ē·er′ē/ [L, *milium,* millet], describing a condition marked by the appearance of very small lesions the size of millet seeds, such as miliary tuberculosis, which is characterized by tiny tubercles throughout the body.

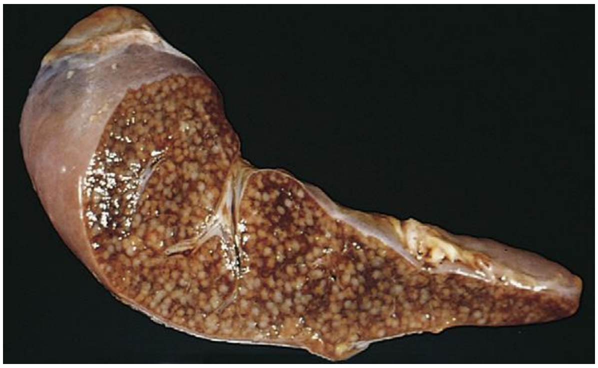
miliary carcinosis, a condition characterized by numerous cancerous nodules resembling miliary tubercles.

miliary fever [L, *milium,* millet; L, *febris*], an inflammatory skin eruption caused by sweat retention. Sweat trapped in the dermis or epidermis causes irritation. Also called **prickly heat.**

miliary tuberculosis, extensive dissemination by the bloodstream of tubercle bacilli. In children it is associated with high fever, night sweats, and often meningitis, pleural effusions, or peritonitis. A similar illness may occur in adults but with a less abrupt onset and occasionally with weeks or months of nonspecific symptoms, such as weight loss, weakness, and low-grade fever. Multiple small opacities resembling millet seeds may be evident on chest x-ray films. The liver, spleen, bone marrow, and meninges are often affected. The tuberculin test result may be negative, and diagnosis is made by biopsy of the infected tissue or organ. Combined drug therapy with isoniazid, rifampin, and pyrazinamide is usually successful if the diagnosis is not delayed. Concurrent tuberculous meningitis makes the prognosis less favorable. See also ***Mycobacterium,*** **tuberculosis.**



Miliary tuberculosis *(Kowalczyk and Mace, 2009/Courtesy American College of Radiology)*



Miliary tuberculosis of the spleen *(Kumar et al, 2007)*

milieu /milyœ′, milyo͞o′/ *pl.* **milieus, milieux** [Fr, middle], the environment, surroundings, or setting. Kinds of milieus are **milieu extérieur** and **milieu intérieur.**

milieu extérieur /eksterē·œr′/, the external or physical surroundings of an organism, including the social environment, especially the home, school, and recreational facilities, which play a dominant role in personality development.

milieu intérieur /aNterē·œr′/, the basic concept in physiology, originated by Claude Bernard, that multicellular organisms exist in an aqueous internal environment composed of the blood, lymph, and interstitial fluid that bathes all cells and provides a medium for the elementary exchange of nutrients and waste material. All fundamental processes necessary for the maintenance and life of the tissue elements depend on the stability and balance of this environment.

milieus. See **milieu.**

milieu therapy^1, a type of psychotherapy model in which the total environment is used in treating mental and behavioral disorders. Therapy is primarily conducted in a hospital or other institutional setting, where the entire facility acts as a therapeutic community. The emphasis is on providing pleasant physical surroundings, structured activities, and a stable social environment where behavior modification and personal growth are promoted through patient-group interaction; staff support and understanding; and a total, humanistic approach. Individual daily routines and treatment modalities, such as drug therapy, occupational therapy, and sensitivity training, are determined by the patient's emotional and interpersonal needs. See also **situational therapy.**

milieu therapy^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of people, resources, and events in the patient's immediate environment to promote optimal psychosocial functioning. See also **Nursing Interventions Classification.**

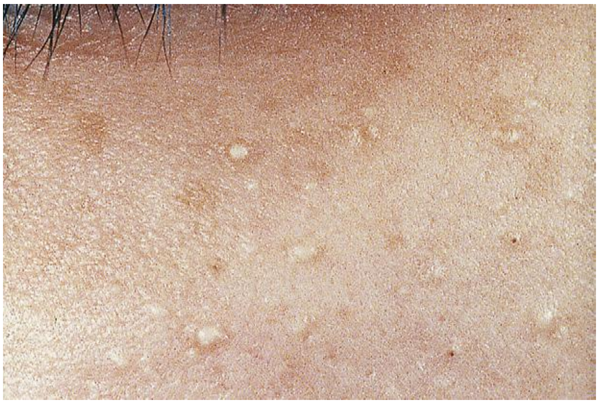
milieux. See **milieu.**

military antishock trousers (MAST) [L, *ante,* opposed; Fr, *choc* + Gael, *triubhas,* trews], a garment designed to produce pressure on the lower part of the body, thereby preventing the pooling of blood in the legs and abdomen. The trousers are used to combat shock and stabilize fractures, promote hemostasis, increase peripheral vascular resistance, and permit autotransfusion of small amounts of blood. They are now rarely used. Also called **medical antishock trousers, pneumatic antishock garment.** See **shock trousers.**

military attitude, (in obstetrics) a newborn position in which the head is not flexed and the cervical spine is in extension.

military time. See **24-hour clock system.**

milium /mil′ē·əm/ *pl.* **milia** [L, millet], a minute white cyst of the epidermis caused by obstruction of hair follicles and eccrine sweat glands. One variety is seen in newborns and disappears within a few weeks. Another type is found primarily on the faces of middle-aged women. Milia may be treated with topical or oral retinoids or by extraction. Compare **comedo.**

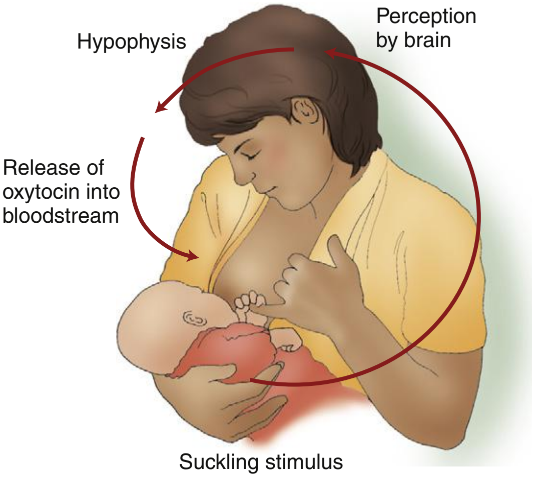


Milia *(du Vivier, 2002)*

milk [AS, *meoluc*], a liquid secreted by the mammary glands or udders of mammalian animals that suckle their young. After weaning, people consume the milk of the cow, as well as that of many other animals, including the goat, camel, mare, reindeer, llama, and yak. Milk is a basic food containing carbohydrate (in the form of lactose); protein (mainly casein, with small amounts of lactalbumin and lactoglobulin); suspended fat; the minerals calcium and phosphorus; and the vitamins A, riboflavin, niacin, thiamine, and, when the milk is fortified, D. Some individuals show a sensitivity reaction to milk caused by a deficiency of the enzyme lactase. See also **breast milk.**

milk-alkali syndrome, a condition of alkalosis caused by the excessive ingestion of milk, antacid medications containing calcium, or other sources of absorbable alkaline substances. The condition results in hypercalcemia, hypocalciuria, and calcium deposits in the kidneys and other tissues. The patient may experience symptoms of nausea, headache, weakness, and kidney damage. This condition occurs most frequently in older adults with peptic ulcers. Also called **Burnett's syndrome.**

milk ejection reflex, a normal reflex in a lactating woman elicited by tactile stimulation of the nipple, resulting in release of milk from the glands of the breast. This reflex requires intact nerve connections from nipple to hypothalamus and release of the hormone **oxytocin** from the posterior pituitary into the bloodstream. Also called **let-down reflex.**

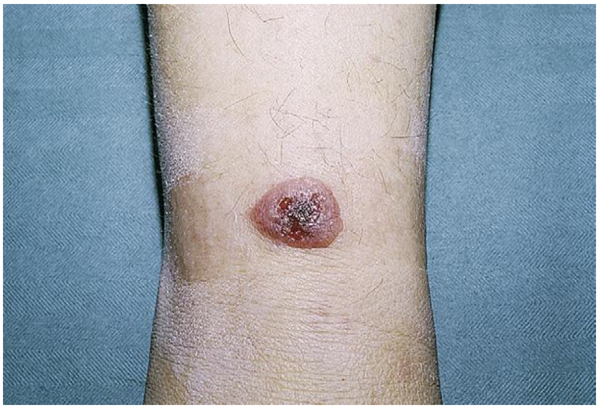


Milk ejection reflex *(Leonard, 2009)*

milker's nodule, a smooth brownish-red papilloma of the fingers or palm that begins as a macule and progresses through a vesicular stage to become a nodule. The disease is acquired from pustular lesions on the udder of a cow infected with poxvirus. No treatment is necessary because immunity is produced after primary infection.

milk fever, *nontechnical,* postpartum fever that begins with the onset of lactation and lasts only a few hours. It was formerly considered a normal reaction to lactation. Maternal oral temperature during the puerperium does not normally exceed 100.4° F; continued high readings may indicate infection.

milk globule, a spherical droplet of fat in milk that tends to separate out as cream.



Milker's nodule *(Callen et al, 2000)*

milking, a procedure used to express the contents of a duct or tube, to test for tenderness, or to obtain a specimen for study. The examiner compresses the structure with a finger and moves the finger firmly along the duct or tube to its opening. Also called **stripping.**

milk intolerance. See **lactose intolerance.**

milk leg. See **phlegmasia alba dolens.**

Milkman's syndrome [Louis A. Milkman, American radiologist, 1895–1951], a form of osteomalacia characterized by the appearance on x-ray film of multiple bilateral, symmetric stripes in hypocalcified long bones and in the pelvis and scapula. The stripes indicate pseudofractures.

milk of magnesia, a laxative and antacid containing magnesium hydroxide.

■ INDICATIONS: It is prescribed to relieve constipation and, less commonly, acid indigestion.

■ CONTRAINDICATIONS: Renal impairment, symptoms of appendicitis, or known hypersensitivity to the drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are diarrhea and hypermagnesemia, which usually occur in patients who have impaired renal function.

milk patch. See **macula albida.**

milkpox. See **alastrim.**

milk sugar. See **lactose.**

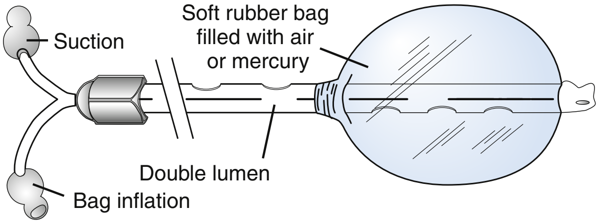
milk thistle, an herb that is native to Kashmir but is also found in North America from Canada to Mexico.

■ USES: It is used as protection against alcoholic cirrhosis and hepatitis and as an antiinflammatory. Standardized extracts have shown some efficacy for preventing cirrhosis in clinical trails.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, or in people with hypersensitivity to this herb or other plants in the Asteraceae family.

milky ascites. See **chylous ascites.**

Miller-Abbott tube [Thomas G. Miller, American physician, 1886–1981; William O. Abbott, American physician, 1902–1943], a long, small-caliber double-lumen catheter once widely used in intestinal intubation for decompression and originally containing mercury. One lumen ends in a perforated metal tip and the other in a collapsible balloon. These tubes are radiopaque and can therefore be seen on a radiogram. Similar tubes, such as the Maglinte or MDEC tube have largely replaced the Miller-Abbott tube. Compare **Harris tube.** See also **gastric intubation.**



Miller-Abbott tube
(Lewis, Heitkemper, and Dirksen, 2004)

Miller's syndrome /mil′ər/ [Marvin Miller, American pediatrician, 20th century], a syndrome of extensive facial and limb defects, characterized by malar hypoplasia, downslanting palpebral fissures, micrognathia, cleft lip and palate, cup-shaped ears, lower lid ectropion, postaxial limb deficiencies, and syndactyly. Less frequently present are heart defects and hearing loss. The syndrome is probably an autosomal-recessive trait. Also called **postaxial acrofacial dysostosis.**

milli-, prefix meaning "1/1000 part": *milliampere, millibar, milliliter.*

milliampere (mA) /mil′ēam′pir/ [L, *mille,* thousand; Andre Ampere], a unit of electric current that is one thousandth of an ampere. See also **ampere.**

milliampere-second (mAs), a measure of electric charge obtained by multiplying the electric current in milliamperes by the time in seconds. It is used to describe the exposure setting of a radiography machine and determines the density of the radiographic image.

millicoulomb (mC) /-kyo͞o′lōm/ [L, *mille,* thousand; Charles A. de Coulomb], a unit of electric charge that is one thousandth of a coulomb. See also **coulomb.**

millicurie (mCi) /-ko͝or′ē/ [L, *mille,* thousand; Marie Curie], a unit of radioactivity equal to one thousandth of a curie, or 3.70×10^7 disintegrations per second. See also **curie.**

milliequivalent (mEq) /-ikwiv′ələnt/ [L, *mille* + *aequus,* equal, *valere,* to be strong], **1.** the number of grams of solute dissolved in 1 mL of a normal (1 N) solution. **2.** one thousandth (10^{-3}) of a gram equivalent.

milliequivalent per liter (mEq/L), one thousandth (10^{-3}) of 1 equivalent of a specific substance dissolved in 1 L of solution or plasma.

milligram (mg) /-gram/ [L, *mille* + Fr, *gramme,* small weight], a metric unit of mass equal to one thousandth (10^{-3}) of a gram.

milliliter (mL) /-lē′tər/ [L, *mille* + Fr, *litre,* a measure], a metric unit of volume that is one thousandth (10^{-3}) of a liter, or 1 cm^3.

millimeter (mm) /-mē′tər/, a metric unit of length equal to one thousandth (10^{-3}) of a meter.

millimole (mmol, mM) /-mōl/ [L, *mille* + *moles,* mass], a unit of metric measurement that is equal to one thousandth (10^{-3}) of a mole. It is the amount of a substance that corresponds to its formula mass in milligrams.

Millin operation, a formerly common method of radical retropubic prostatectomy.

milliosmol /mil′ē·oz′mōl/, one thousandth of an osmole. See also **osmole, osmolality, osmolarity. —milliosmolar,** *adj.*

millipede /mil′ipēd′/ [L, *mille* + *pes,* foot], a many-legged wormlike arthropod. Certain species squirt irritating fluids that may cause dermatitis.

millirad (mrad) /-rad/, a unit of absorbed dose of ionizing radiation equal to one thousandth (10^{-3}) of a rad. See also **rad.**

millirem (mrem), a unit of ionizing radiation dose equal to one thousandth (10^{-3}) of a rem. See also **rem.**

milliroentgen (mr, mR) /mil′irent′gən, -jən/ [L, *mille,* thousand; Wilhelm K. Roentgen], a unit of radiation equal to one thousandth (10^{-3}) of a roentgen. See also **roentgen.**

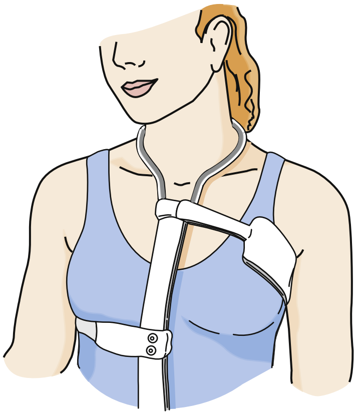
millisecond (msec) /-sek′ənd/ [L, *mille,* thousand; ME, *seconde,* small part], one thousandth (10^{-3}) of a second.

millivolt (mV, mv) /-vōlt/ [L, *mille,* thousand; Alessandro Volta], a unit of electromotive force equal to one thousandth (10^{-3}) of a volt. See also **volt.**

Milroy's disease /mil′roiz/ [William Forsyth Milroy, American physician, 1855–1942], congenital hereditary lymphedema of the legs caused by chronic lymphatic obstruction, sometimes involving additional areas, including the arms, trunk, and face. Also called **congenital lymphedema, Meige's disease,** *Milroy's edema,* **Nonne-Milroy-Meige syndrome.**

Miltown, a trademark for a sedative **(meprobamate).**

Milwaukee brace /milwô′kē/ [Milwaukee, Wisconsin; OFr, *bracier,* to embrace], an orthotic device that helps immobilize the torso and neck of a patient in the treatment of scoliosis, lordosis, or kyphosis. It is usually constructed of strong but light metal and fiberglass bars lined with rubber to protect against abrasion. The bars, which commonly connect cervical supports, rib supports, and hip supports, hold the trunk and neck erect while controlling cervical flexion and hip movements. Milwaukee braces may be used in the treatment of both orthopedic bed and ambulatory patients.



Milwaukee brace *(Monahan et al, 2007)*

-mimesis, suffix meaning "simulation, imitation": *necromimesis, neuromimesis, pathomimesis.*

-mimetic, suffix meaning "simulation of (specified) effects": *andromimetic, neuromimetic, vagomimetic.*

-mimia, suffix meaning "(condition of) ability to express thought through gestures": *macromimia, paramimia.*

mimicry /mim′ikrē/ [Gk, *mimetikos,* imitation], **1.** the effort of one species or organism to resemble another to obtain an offensive or defensive advantage. **2.** an autonomic nervous system phenomenon in which facial expressions may be the unwilled and largely unconscious expression of feelings and ideas. See also **molecular mimicry.**

mimic spasm /mim′ik/ [Gk, *mimetikos,* imitative, *spasmos,* spasm], involuntary stereotyped movements of a small group of muscles such as of the face. The spasm is usually psychogenic and may be aggravated by stress or anxiety but is generally controllable momentarily. Multiple grimacing and blinking mimic spasms occur in Gilles de la Tourette's syndrome. Also called **tic.**

min, **1.** abbreviation for **minim.** **2.** abbreviation for *minute.*

Minamata disease /min′əmä′tə/, a severe degenerative neurological disorder caused by the ingestion of seed grain heated with alkyl compounds of mercury or of seafood taken from waters polluted with industrial wastes contaminated by soluble mercuric salts. The term is derived from a tragedy involving Japanese who ate seafood from Minamata Bay. Mercury passes the placental barrier, causing the congenital form of the disease. Symptoms may not appear for several weeks or months; they include paresthesia of the mouth and extremities; tunnel vision; difficulties in speech, hearing, muscular coordination, and concentration; weakness; emotional instability; and stupor. Continued ingestion causes serious damage to the renal tubules and corrosion of the GI tract. Acute cases may result in coma and death. See also **mercury poisoning.**

mind [AS, *gemynd*], **1.** the part of the brain that is the seat of mental activity and that enables one to know, reason, understand, remember, think, feel, react to, and adapt to external and internal stimuli. **2.** the totality of all conscious and unconscious processes of the individual that influence and direct mental and physical behavior. **3.** the faculty of the intellect or understanding, in contrast to emotion and will. See also **brain, intellect, psyche.**

mind-body medicine, a holistic approach to medicine that takes into account the effect of the mind on physical processes, including the effects of psychosocial stressors and conditioning, particularly as they affect the immune system. Many of the therapeutic techniques used have as their purpose increasing the body's natural resistance to disease by managing the stressors.

mindfulness meditation, a technique of meditation in which distracting thoughts and feelings are not ignored but are rather acknowledged and observed nonjudgmentally as they arise to create a detachment from them and gain insight and awareness.

mine damp. See **damp.**

mineral /min′ərəl/ [L, *minera,* mine], **1.** an inorganic substance occurring naturally in the earth's crust, having a characteristic chemical composition and (usually) crystalline structure. **2.** (in nutrition) a compound containing a metal, nonmetal, radical, or phosphate that is needed for proper body function and maintenance of health. The needed substance is usually ingested as a part of such a compound, such as table salt (sodium chloride), instead of as a free element, and the compound is usually referred to by the name of the needed substance.

mineral deficiency. See specific minerals.

mineralization /-īzā′shən/ [L, *minera* + Gk, *izein,* to cause], the addition of any mineral to the body.

mineral jelly. See **petroleum jelly.**

mineralocorticoid /min′əral′ōkôr′tikoid/ [L, *minera* + *cortex,* bark; Gk, *eidos,* form], a hormone, secreted by the adrenal cortex, that maintains normal blood volume, promotes sodium and water retention, and increases urinary excretion of potassium and hydrogen ions. Aldosterone, the most potent mineralocorticoid with regard to electrolyte balance, acts on the distal tubules of the kidneys to enhance the reabsorption of sodium into the plasma. Trauma and stress increase mineralocorticoid secretion. The synthetic mineralocorticoid fludrocortisone, which has mineralocorticoid and glucocorticoid activity, is used to treat the salt-losing adrenogenital syndrome and the severe corticoid deficiency characteristic of Addison's disease. See also **glucocorticoid.**

mineral oil, a laxative, stool softener, emollient, and pharmaceutic aid used as a solvent.

■ INDICATIONS: It is prescribed to prevent constipation, to treat mild constipation, to prepare the bowel for surgery or examination, and to act as a solvent for various preparations.

■ CONTRAINDICATIONS: Appendicitis, fecal impaction, obstruction or perforation of the intestinal tract, pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are laxative dependence, lipid pneumonitis, fat-soluble vitamin deficiency, and abdominal cramps.

mineral soap. See **bentonite.**

miner's cramp. See **heat cramp.**

miner's elbow [L, *minera* + AS, *elboga*], an inflammation of the olecranon bursa, caused by resting the weight of the body on the elbow, as in some coal mining activities. The condition is sometimes seen in schoolchildren who lean on their elbows. Compare **lateral humeral epicondylitis.** See also **bursitis.**

miner's pneumoconiosis. See **anthracosis.**

Minerva cast /minur′və/ [L, *Minerva,* Roman goddess of wisdom; ONorse, *kasta*], an orthopedic cast applied to the trunk and head, with spaces cut out for the face and ears. The section encasing the trunk extends to the sternum and the distal rib border anteriorly and across the distal rib border posteriorly. The cast is used to immobilize the head and part of the trunk in the treatment of torticollis, cervical and thoracic injuries, and cervical spinal infections. It is not used as frequently as it once was because of advances in the field of orthotics. Also called **Minerva jacket.**

Minerva jacket. See **Minerva cast.**

minicomputer /min′ikəmpyo͞o′tər/ [L, *minimum,* smallest, *computare,* to calculate], a medium-sized computer, intermediate in size and processing capacity between a microcomputer and a mainframe computer. Compare **mainframe computer, microcomputer.**

minim (m, min) /min′im/ [L, *minimus,* smallest], a measurement of volume in the apothecaries' system, originally one drop (of water). It is now standardized to 0.06 mL; 60 minims equals 1 fluid dram.

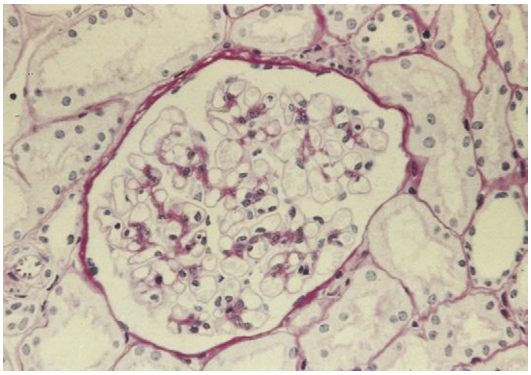
minimal access surgery. See **minimally invasive surgery.**

minimal bactericidal concentration, the lowest concentration of drug that results in a 99.9% reduction in the initial bacterial density. Compare **minimal inhibitory concentration.**

minimal brain dysfunction. See **attention deficit disorder.**

minimal care unit /min′iməl/ [L, *minimus,* smallest], a unit for the treatment of inpatients who are ambulatory and able to meet many of their own daily living needs but require minimal nursing care.

minimal change disease, a kidney disorder characterized by subtle changes in renal function, including albuminuria and presence of lipid droplets in the proximal tubules. It mainly affects small children but also occurs in adults with idiopathic nephrotic syndrome. It may or may not progress to glomerulonephritis. Also called **lipoid nephrosis, nil disease.** See also **idiopathic nephrotic syndrome.**



Minimal change disease *(Kumar et al, 2010)*

minimal dose. See **minimum dose.**

minimal erythema dose. See **threshold dose.**

minimal infecting dose (MID), the smallest amount of infective material that usually produces infection.

minimal inhibitory concentration (MIC), the lowest concentration of an antibiotic medication in the blood that is effective against a bacterial infection, determined by inoculating the bacteria into a culture medium containing various concentrations of a proposed antibiotic. The lowest antibiotic concentration that stops microbial growth may be used in further treatment of the patient. Also called **minimum inhibitory concentration.** Compare **minimal bactericidal concentration.**

minimally invasive surgery, surgery done with only a small incision or no incision at all, such as through a cannula with a laparoscope or endoscope.

minimal occlusive volume (MOV), the volume to which an endotracheal or tracheostomy tube cuff must be inflated to obliterate an air leak during the inspiratory phase of ventilation. Also called *minimal occlusive pressure*.

minimal residue diet. See **low residue diet.**

Mini-Mental State Examination (MMSE), a brief psychological test designed to differentiate among dementia, psychosis, and affective disorders. It may include ability to count backward by 7s from 100, to identify common objects such as a pencil and a watch, to write a sentence, to spell simple words backward, and to demonstrate orientation by identifying the day, month, and year, as well as town and country.

minimization /min′imīzā′shən/ [L, *minimum,* smallest; Gk, *izein,* to cause], (in psychology) cognitive distortion in which the effects of one's behavior are underestimated. See also **magnification.**

minimum alveolar concentration (MAC) /min′iməm/, the smallest concentration of a gas that is measured in the alveoli of the lungs, which can provide a state of general anesthesia.

minimum daily requirement (MDR) [L, *minimum* + OE, *daeglie* + L, *requirere,* to seek], the daily human requirement of nutrients for health and for prevention of a deficiency disease. The figures, established by the U.S. Food and Drug Administration, are generally extrapolated from experimental animal studies and include an added margin for safety. See also **Estimated Safe and Adequate Daily Dietary Intake.**

minimum dose [L, *minimum,* smallest; Gk, *dosis,* giving], the smallest amount of a drug or other substance needed to produce a desired or specified effect. Because of individual variations in drug response, the minimal dose for one person may be either excessive or insufficient for another patient. Also called **minimal dose.**

minimum hemagglutinating dose, the smallest amount of hemagglutinating agent that causes a complete hemagglutinating reaction in a standard volume of red blood cells.

minimum hemolytic dose (MHD), the smallest amount of a reagent that produces complete lysis of a specified amount of red blood cells. Not in common usage.

minimum inhibitory concentration. See **minimal inhibitory concentration.**

minimum lethal dose (MLD) [L, *minimum,* smallest, *lethum,* death; Gk, *dosis,* giving], the smallest dose of a drug, relative to body weight, that will kill an experimental animal. The MLD may vary with the species of animal tested. Also called *minimum fatal dose (MFD).* See also **median lethal dose.**

Minipress, a trademark for an antihypertensive **(prazosin hydrochloride),** an alpha$_1$ receptor blocking agent.

miniprotein /min′iprō′tēn/, a protein that has been reduced in size and complexity without loss of its ability to function.

Ministry of Indian Affairs. See **Indian Health Service.**

Minnesota Multiphasic Personality Inventory (MMPI), a commonly used psychological test that includes over 500 statements for interpretation by the subject, used clinically for evaluating personality and detecting various disorders in adults. The current version is the MMPI-2. The adolescent version is the MMPI-A.

Minocin, a trademark for an antibacterial **(minocycline hydrochloride).**

minocycline hydrochloride /min′əsī′klēn/, a tetracycline antibiotic.

■ INDICATIONS: It is prescribed for infections caused by gram-positive and gram-negative bacteria, rickettsia, anthrax, and other microorganisms.

■ CONTRAINDICATIONS: It must be used with caution in cases of renal or hepatic dysfunction. Known hypersensitivity to this or other tetracyclines prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, phototoxicity, vestibular toxicity, potentially serious superinfections, and various allergic reactions. Use during pregnancy or in children younger than 8 years of age may result in discoloration of teeth.

minor /mī′nər/ [L, smaller], (in law) a person not of legal age. A person beneath the age of majority. Minors usually cannot consent to their own medical treatment unless they are substantially independent of their parents, are married, support themselves, or satisfy other requirements specified by statute. See also **emancipated minor.**

minor arterial circle of iris, the small artery encircling the outer circumference of the iris.

minor connector, a device that links the major connector or base of a removable partial denture to other denture units, such as rests and direct and indirect retainers.

minor duodenal papilla, the entrance into the duodenum for the accessory pancreatic duct and the junction of the foregut and midgut. It is just below the major duodenal papilla.

minor epilepsy. See **absence seizure.**

minor hysteria [Gk, *hystera,* womb], a mild disorder that may be expressed in emotional outbursts, repressed anxieties, or conversion of unconscious conflicts into physical symptoms.

minor renal calyx. See **renal calyx.**

minor surgery, surgical procedure for problems or injuries that are not considered life-threatening or hazardous. Compare **major surgery.**

minoxidil /mīnok′sidil/, a vasodilator.

■ INDICATIONS: It is prescribed in the treatment of severe refractory hypertension and as a topical solution for the treatment of androgenic alopecia in both males and females.

■ CONTRAINDICATIONS: Pheochromocytoma, acute myocardial infarctions, dissecting aortic aneurysm, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are tachycardia, pericardial effusion, cardiac tamponade, salt and water retention, and excessive hair growth. GI disturbances also may occur.

mint, an herb that is native to Europe and is now grown widely throughout the United States and Canada.

■ USES: It is used as a flavoring and medicinally for GI disorders. Peppermint oil may exert beneficial effects in irritable bowel syndrome.

■ CONTRAINDICATIONS: Mint should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to this herb or gastroesophageal reflux disease.

Mintezol, a trademark for an anthelmintic **(thiabendazole).**

minute ventilation /min′it/ [L, *minus,* very small], the total lung ventilation per minute, the product of tidal volume and respiration rate. It is measured by expired gas collection for a period of 1 to 3 minutes. The normal rate is 5 to 10 liters per minute.

mio-, meio-, prefix meaning "less": *miolecithal, mioplasmia, miosphygmia*.

miosis /mī·ō′sis/ [Gk, *meiosis,* becoming less], **1.** contraction of the sphincter muscle of the iris, causing the pupil to become smaller. Certain drugs and stimulation of the pupillary light reflex result in miosis. **2.** an abnormal condition characterized by excessive constriction of the sphincter muscle of the iris, resulting in pinpoint pupils. Compare **mydriasis.**

miotic /mē·ot′ik/, **1.** *adj,* pertaining to miosis. **2.** *adj,* causing constriction of the pupil of the eye. **3.** *n,* any substance or pharmaceutic, such as pilocarpine, that causes constriction of the pupil of the eye. Such agents are used in the treatment of glaucoma.

MIP, **1.** abbreviation for **maximum inspiratory pressure.** **2.** abbreviation for **maximum intensity projection.**

miracidium /mir′əsid′ē·əm/ *pl.* **miracidia** [Gk, *meirakidion,* youthfulness], the ciliated larva of a parasitic trematode that hatches from an egg and can survive only by penetrating and further developing within a host snail into a maternal sporocyte that produces more larvae.

mirage /miräzh′/ [L, *mirari,* to look at], an optical illusion caused by the refraction of light through air layers of different temperatures, such as the illusionary sheets of water that appear to shimmer over stretches of hot sand and pavement. This phenomenon is caused by bending of horizontal light waves upward from the layer of heated air directly over the hot surface. Wind rippling the air layers may produce surprising changes in the shapes and sizes of such mirages. Individuals under severe stress are especially susceptible to interpreting these optic phenomena in bizarre, unrealistic ways.

MIRL, abbreviation for *membrane inhibitor of reactive lysis*. See **protectin.**

mirror image /mir′ər/ [L, *mirare,* to look at, *imago*], **1.** an image formed by a reflection. **2.** a kind of reversed asymmetry of characteristics often found in sets of monozygotic twins. **3.** chemical molecules with the same composition but with asymmetric arrangement of the atoms.

mirror speech [L, *mirari,* to look at; AS, *spaec,* speech], an abnormal manner of speaking characterized by the reversal of the order of syllables in a word.

mirtazapine, an antidepressant.

■ INDICATIONS: It is used to treat depression, dysthymic disorder, and bipolar disorder with either depression or agitation.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to tricyclic antidepressants, convulsive disorders, and prostatic hypertrophy. Its use is also contraindicated in patients who are in the recovery phase of a myocardial infarction.

■ ADVERSE EFFECTS: Life-threatening effects are agranulocytosis, thrombocytopenia, eosinophilia, leukopenia, seizures, paralytic ileus, jaundice, hepatitis, acute renal failure, and hypertension. Other adverse effects include confusion, headache, anxiety, tremors, stimulation, nightmares, extrapyramidal symptoms (in the elderly), increased psychiatric symptoms, nausea, vomiting, cramps, epigastric distress, stomatitis, rash, photosensitivity, palpitations, tinnitus, and mydriasis. Common side effects are dizziness, drowsiness, diarrhea, dry mouth, urinary retention, orthostatic hypotension, electrocardiogram changes, tachycardia, and blurred vision.

mis-, prefix meaning "wrong or badly": *misdiagnosis*.

miscarriage. See **spontaneous abortion.**

miscible /mis′ibəl/ [L, *miscere,* to mix], able to be mixed or blended with another substance. Compare **immiscible.**

misdemeanor /mis′dəmē′nər/ [AS, *missan,* to miss; ME, *demenen,* conduct], (in criminal law) an offense that is considered less serious than a felony and carries a lesser penalty, usually a fine or imprisonment for less than 1 year. Conviction for a misdemeanor does not prohibit the person from holding public office or practicing a licensed occupation.

misfeasance /misfē′zəns/ [AS, *missan,* to miss; L, *facere,* to make], an improper performance of a lawful act, especially in a way that may cause damage or injury. Compare **malfeasance, nonfeasance.**

Mishel, Merle H., a nursing theorist who developed the Uncertainty in Illness Theory, which asserts that uncertainty is initially a neutral cognitive state representing the inability of the patient with chronic or life-threatening conditions to interpret the outcome of events related to the illness and that nursing interventions must help patients adapt and cope productively with this uncertainty, integrating it into their lives and improving quality of life.

miso-, prefix meaning "hatred of": *misocainia, misogyny, misopedia*.

misogamy /misog′əmē/ [Gk, *misein,* to hate, *gamos,* marriage], an aversion to marriage. **—misogamic, misogamous,** *adj.,* **misogamist,** *n.*

misogyny /misoj′inē/ [Gk, *misein,* to hate, *gyne,* women], an aversion to women. **—misogynist,** *n.,* **misogynistic,** *adj.*

misopedia /mis′ōpē′dē·ə/ [Gk, *misein* + *pais,* children], an aversion to children. **—misopedic,** *adj.,* **misopedist,** *n.*

misophobia, misophobic. See **mysophobia.**

missed abortion [OE, *missan,* to be lacking; L, *ab,* away from, *oriri,* to be born], a condition in which a dead immature embryo or fetus is not expelled from the uterus for 2 months or more. The uterus diminishes in size, and symptoms of pregnancy abate; maternal infection and blood clotting disorders may follow. The fetus and placenta may become necrotic; less commonly the fetus becomes calcified, and the rest of the products of conception are resorbed.

missed period [OE, *missan,* to be lacking; Gk, *peri* + *hodos,* way], an unexplained interruption in the menstrual cycle.

missile fracture [L, *mittere,* to throw], a penetration fracture caused by a projectile, such as a bullet or a piece of shrapnel.

mistura /mistyo͞o′rə/ [L, mixture], any of a number of mixtures of drugs, usually containing suspensions of insoluble substances intended for internal use. Examples include *mistura kaolini et morphinae,* a mixture of kaolin and morphine, and *mistura cretae pro infantibus,* a mixture of chalk, tragacanth, chloroform water, and other ingredients formulated for the treatment of GI disorders in infants.

mite /mīt/ [AS], a minute arachnid with a flat, almost transparent body and four pairs of legs. Many species of these relatives of ticks and spiders are parasitic, including the chigger and *Sarcoptes scabiei,* which cause localized pruritus and inflammation. Some female mites burrow into the skin and lay eggs that hatch into larvae. The movements of the larvae cause intense itching. See also **chigger, scabies.**

mite typhus. See **scrub typhus.**

Mithracin, a trademark for an antineoplastic (**plicamycin**).

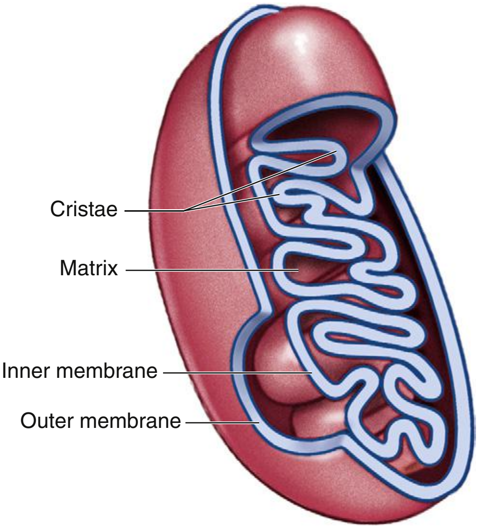
mithramycin. See **plicamycin.**

mithridatism. See **tachyphylaxis.**

mitleiden /mit′līdən/ [Ger, *mit,* with, *leiden,* to suffer], psychosomatic symptoms sometimes experienced by expectant fathers.

mito-, prefix meaning “threadlike”: *mitochondria, mitokinetic, mitoplasm.*

mitochondrion /mī′tōkon′drē·on/ *pl.* **mitochondria** [Gk, *mitos,* thread, *chondros,* cartilage], a rodlike, threadlike, or granular organelle that functions in aerobic respiration and occurs in varying numbers in all eukaryotic cells except mature erythrocytes. It is bounded by two sets of membranes, a smooth outer one and an inner one that is arranged in folds, or cristae, that extend into the interior of the mitochondrion, called the matrix. Mitochondria provide the principal source of cellular energy through oxidative phosphorylation and adenosine triphosphate (ATP) synthesis. They also contain the enzymes involved with electron transport and the citric acid and fatty acid cycles. Mitochondria are self-replicating and contain their own DNA, RNA polymerase, transfer RNA, and ribosomes. Also called **chondriosome. —mitochondrial,** *adj.*



Mitochondrion *(Patton and Thibodeau, 2010)*

mitogen /mī′təjən, mit′-/ [Gk, *mitos* + *genein,* to produce], an agent that triggers mitosis. **—mitogenic,** *adj.*

mitogenesia /mī′tōjənē′zhə/ [Gk, *mitos* + *genein,* to produce], production resulting from mitosis.

mitogenesis /mī′tōjen′əsis/, the induction of mitosis in a cell. **—mitogenetic,** *adj.*

mitogenetic radiation /-jənet′ik/, the force or specific energy that is supposedly given off by cells undergoing division. It may in turn stimulate the process of mitosis in other cells. Also called **Gurvich radiation, mitogenic radiation.**

mitogenic factor /-jen′ik/, a lymphokine that is released from activated T lymphocytes and that stimulates the production of normal unsensitized lymphocytes.

mitogenic radiation. See **mitogenetic radiation.**

mitome /mī′tōm/, the reticular network sometimes observed within the cytoplasm and nucleoplasm of fixed cells. See also **cytomitome, karyomitome.**

mitomycin /mītəmī′sin/, an antineoplastic antibiotic.

■ INDICATIONS: It is prescribed in the treatment of malignant neoplastic diseases, including disseminated adenocarcinoma of the stomach and pancreas, bladder cancer, and colon cancer.

■ CONTRAINDICATIONS: Clotting deficiency, thrombocytopenia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effect is bone marrow depression. GI disturbances, alopecia, and skin reactions commonly occur.

mitosis /mītō′sis, mit-/ [Gk, *mitos,* thread], a type of cell division that occurs in somatic cells and results in the formation of two genetically identical daughter cells containing the diploid number of chromosomes characteristic of the species. It consists of the division of the nucleus followed by the division of the cytoplasm. The former has four stages (**prophase, metaphase, anaphase,** and **telophase**), during which the two chromatids of each chromosome separate and migrate to opposite ends of the cell. Mitosis is the process by which the body produces new cells for both growth and repair of injured tissue. Kinds of mitosis are **heterotypic mitosis, homeotypic mitosis, multipolar mitosis,** and **pathological mitosis.** Also called **indirect division.** Compare **meiosis.** See also **interphase. —mitotic,** *adj.*

mitotane /mī′tətān/, an antineoplastic that destroys normal and neoplastic adrenal cortical cells.

■ INDICATIONS: It is prescribed in the treatment of carcinoma of the adrenal cortex and has an unlabeled use for treating Cushing’s syndrome.

■ CONTRAINDICATION: Known hypersensitivity to this drug is the only contraindication.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI symptoms, lethargy, and adrenal insufficiency.

mitotic /mītot′ik/ [Gk, *mitos,* thread], pertaining to or characterized by mitosis, the process of cell division in the formation of identical daughter cells.

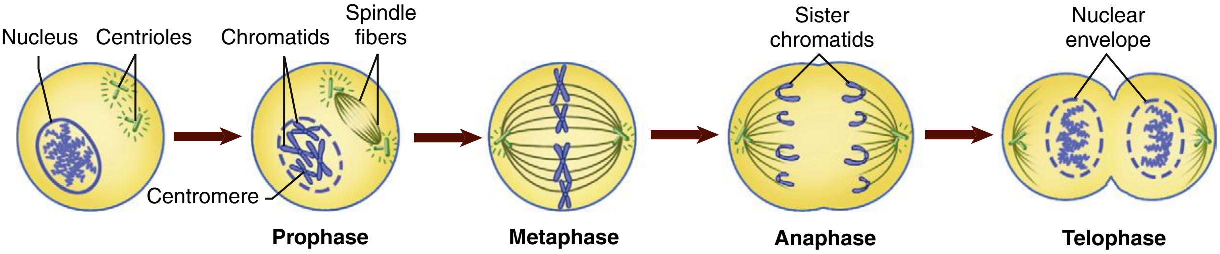
mitotic figure [Gk, *mitos* + L, *figura,* form], any chromosome or chromosome aggregation during any of the stages of mitosis.

mitotic index, the number of cells per unit (usually 1000 cells) undergoing mitosis during a given time. The ratio is used primarily as an estimation of the rate of tissue growth.

mitotic spindle. See **spindle.**

mitoxantrone, a synthetic antineoplastic antibiotic.

■ INDICATIONS: It is prescribed in combination with other approved drugs in the initial treatment of acute nonlymphocytic leukemia in adults and has activity against other leukemias, lymphoma, and breast cancer.



Mitosis *(Patton and Thibodeau, 2010)*

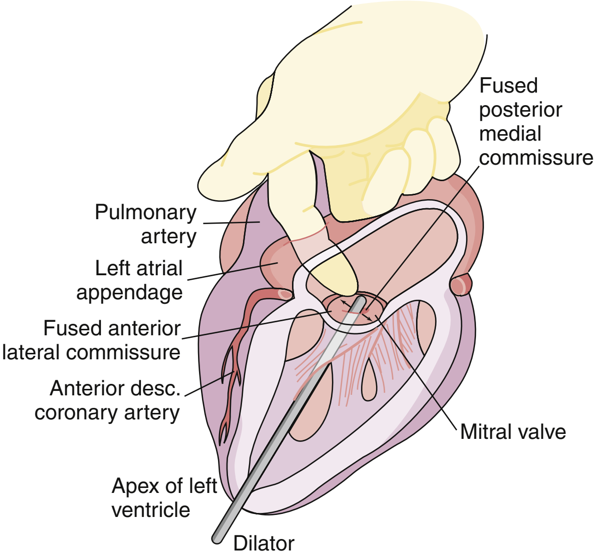
■ CONTRAINDICATIONS: It should not be given to patients who are pregnant, have a clinically significant low left ventricular ejection fraction, or have evidence of prior hypersensitivity to this drug. Its use should be accompanied by close and frequent monitoring of hematologic and chemical laboratory parameters, as well as frequent patient observation.

■ ADVERSE EFFECTS: The side effects most often reported include hypotension, urticaria, dyspnea, rashes, phlebitis, myelosuppression, nausea, and vomiting.

mitral /mī′trəl/ [L, *mitra,* turban], **1.** pertaining to the mitral valve of the heart. **2.** shaped like a miter.

mitral atresia, a congenital absence of the mitral valve associated with transposition of the great vessels or hypoplastic left heart syndrome. See also **valvular heart disease.**

mitral commissurotomy [L, *mitra,* turban, *commissura,* joining together; Gk, *temnein,* to cut], a closed-heart surgical procedure in which the mitral valve is divided at the junction of its cusps for the treatment of mitral valve stenosis.



Fused posterior medial commissure
Pulmonary artery
Left atrial appendage
Fused anterior lateral commissure
Anterior desc. coronary artery
Mitral valve
Apex of left ventricle
Dilator

Mitral commissurotomy *(Monahan, 1998)*

mitral gradient, the difference in pressure in the left atrium and left ventricle during diastole.

mitral insufficiency. See **mitral regurgitation.**

mitral murmur [L, *mitra,* turban, *murmur,* humming], a heart murmur caused by a defective mitral valve.

mitral regurgitation, a backflow of blood from the left ventricle into the left atrium in systole across a diseased mitral valve. The condition may result from congenital valve abnormalities, rheumatic fever, mitral valve prolapse, endocardial fibroelastosis, myocarditis, myocardiopathy, or dilation of the left ventricle as a result of severe anemia. Symptoms include dyspnea, fatigue, intolerance of exercise, systolic murmur, and heart palpitations. Congestive heart failure may ultimately occur. Treatment depends on the severity of the condition. Surgery may be necessary in cases of refractory congestive heart failure, progressive cardiomegaly, and pulmonary hypertension. Also called **mitral insufficiency.** See also **valvular heart disease.**

mitral stenosis. See **mitral valve stenosis.**

mitral valve, a bicuspid valve situated between the left atrium and the left ventricle; the only valve with two, rather than three, cusps. The mitral valve allows blood to flow from the left atrium into the left ventricle but prevents blood from flowing back into the atrium. Ventricular contraction in systole forces the blood against the valve, closing the two cusps and assuring the flow of blood from the ventricle into the aorta. The ventral cusp of the mitral valve is longer than the dorsal cusp. Also called **bicuspid valve, left atrioventricular valve.** Compare **aortic valve, pulmonary valve, semilunar valve, tricuspid valve.**

mitral valve prolapse (MVP) syndrome, protrusion of one or both cusps of the mitral valve back into the left atrium during ventricular systole. See also **Barlow's syndrome, valvular heart disease.**

mitral valve stenosis, an obstructive lesion in the mitral valve caused by adhesions on the leaflets of the valve, usually the result of recurrent episodes of rheumatic endocarditis or age-related calcification of the valve leaflets. Hypertrophy of the left atrium develops and may be followed by right-sided heart failure and pulmonary edema. Reduced cardiac output characteristically produces fatigue, dyspnea, orthopnea, and cyanosis. Surgical correction of the defective valve may be necessary. The valve may be freed of the adhesions in a mitral commissurotomy, or it may be replaced by a prosthetic valve. See also **atrioventricular valve, valvular heart disease, valvular stenosis.**

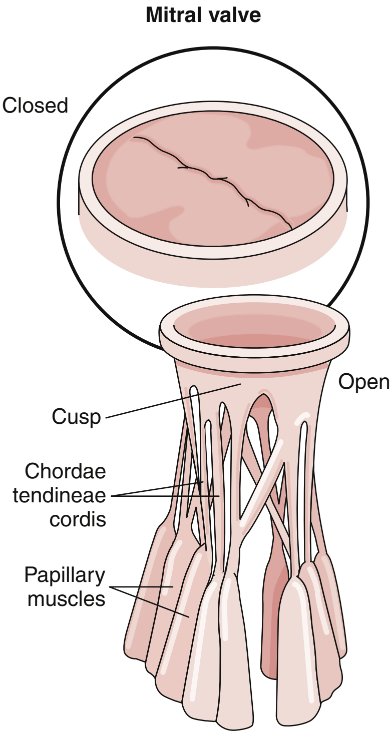
mittelschmerz /mit′əlshmerts/ [Ger, *MITTE,* middle, *Schmerz,* pain], abdominal pain in the region of an ovary during ovulation, usually occurring midway through the menstrual cycle. Present in many women, mittelschmerz is useful for identifying ovulation, thus pinpointing the fertile period of the cycle. Also called **intermenstrual pain.**

Mittendorf's dot, an eye anomaly characterized by the presence of a small dense floating opacity behind the posterior lens capsule. It is a remnant of the hyaloid artery that was present in the eye during embryonic development. The object usually does not affect vision.

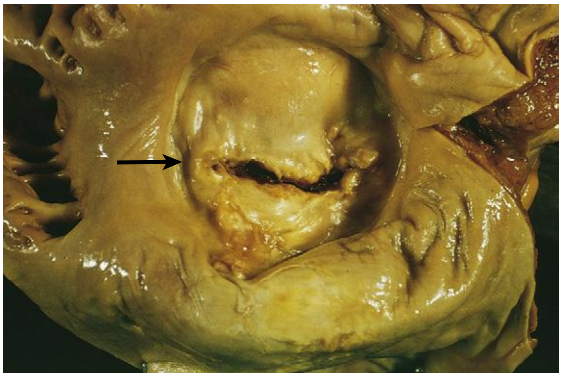
mivacurium, a nondepolarizing neuromuscular blocker.

■ INDICATIONS: This drug is used to facilitate endotracheal intubation and skeletal muscle relaxation during mechanical ventilation, surgery, or general anesthesia.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.



Mitral valve *(Monahan et al, 2007)*



Mitral valve stenosis *(Kumar et al, 2007)*

■ ADVERSE EFFECTS: Adverse effects of this drug include decreased blood pressure, bradycardia, tachycardia, diplopia, rash, urticaria, weakness, and prolonged skeletal muscle relaxation. Life-threatening side effects include paralysis, prolonged apnea, bronchospasm, wheezing, and respiratory depression.

mixed anesthesia. See **balanced anesthesia.**

mixed aneurysm. See **compound aneurysm.**

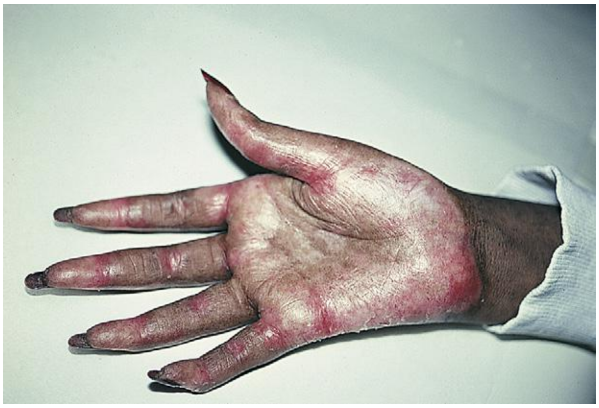
mixed anxiety-depressive disorder, a mental disorder characterized by symptoms of depression and of anxiety, but not meeting the full criteria for either a depressive disorder or an anxiety disorder.

mixed aphasia. See **global aphasia.**

mixed cell malignant lymphoma [L, *miscere,* to mix], a lymphoid neoplasm containing lymphocytes and histiocytes (macrophages).

mixed cell sarcoma, a tumor consisting of two or more cellular elements, excluding fibrous tissue. Also called **malignant mesenchymoma.**

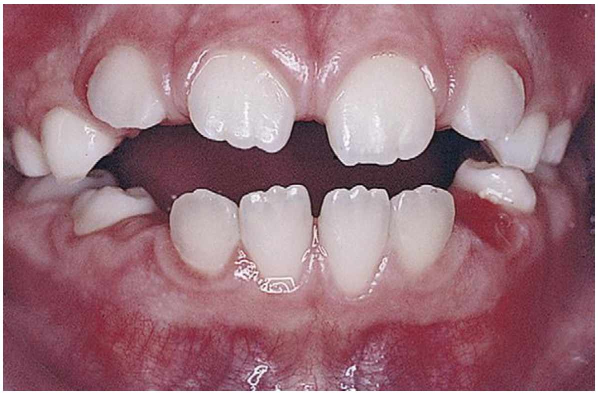
mixed connective tissue disease (MCTD), a systemic disease characterized by the combined symptoms of various collagen diseases, such as synovitis, polymyositis, scleroderma, and systemic lupus erythematosus, with a high concentration of antibodies of ribonucleoprotein. Other symptoms may include arthralgia, muscle inflammation, nondeforming arthritis, swollen hands, esophageal hypomotility, and reduced diffusing capacity of the lungs. Treatment often includes the administration of corticosteroids. Recurrence is common when the steroid medication is discontinued.



Mixed connective tissue disease *(Callen et al, 2000)*

mixed culture [L, *miscere,* to mix, *colere,* to cultivate], a laboratory culture that contains two or more different strains of organisms.

mixed dentition, dentition containing both primary and adult secondary teeth. It usually occurs between 6 and 13 years of age. Also called **transitional dentition.**



Mixed dentition *(Daniel, Harfst, and Wilder, 2008)*

mixed dust pneumoconiosis, pneumoconiosis that is caused by more than one type of dust.

mixed glioma, a tumor, composed of glial cells, that contains more than one kind of cell, the most common being nonneural cells of ectodermal origin.

mixed hearing loss, deafness that is both conductive and sensorineural in nature.

mixed hyperlipemia, mixed hypertriglyceridemia. See **hyperlipidemia type V.**

mixed infection, an infection by several microorganisms, as in some abscesses, pneumonia, and infections of wounds. Numerous combinations of bacteria, viruses, and fungi may be involved. Compare **endogenous infection, germinal infection, retrograde infection, secondary infection.**

mixed leukemia, a malignancy of blood-forming tissues characterized by the proliferation of more than one predominant cell line.

mixed lymphocyte culture (MLC) reaction, an assay of the function of T cells. It is used primarily for histocompatibility testing before grafting.

mixed neoplasm [L, *miscere,* to mix; Gk, *neos,* new + *plasma,* something formed], a tumor or growth involving two germinal layers of tissue.

mixed nerve [L, *miscere,* to mix, *nervus*], a nerve that contains both sensory and motor fibers.

mixed porphyria. See **variegate porphyria.**

mixed receptive-expressive language disorder, a communication disorder involving both the expression and the comprehension of language, either spoken or signed. Patients have difficulties with language production, such as in selection of words and creation of appropriate sentences, and also have trouble understanding words, sentences, or specific types of words.

mixed sleep apnea, a condition marked by signs and symptoms of both central sleep apnea and obstructive sleep apnea. It often begins as central sleep apnea and develops into the obstructive form. Mixed sleep apnea may also result from obstructive sleep apnea as hypoxia and hypercapnia induce signs and symptoms of the central form. See also **central sleep apnea, obstructive sleep apnea.**

mixed triglyceride breath test, a breath test for pancreatic function, in which a mixture of synthetic triglycerides labeled with carbon 13 is administered to the fasting patient and levels of labeled carbon dioxide in the breath are subsequently measured at regular time intervals. Excessively low carbon dioxide indicates inadequate pancreatic lipase in the intestine.

mixed tumor, a growth composed of more than one kind of neoplastic tissue.

mixed vaccine, an immunizing preparation that protects against more than one kind of pathogen, such as the diphtheria, tetanus, and pertussis vaccine or the measles, mumps, and rubella vaccine.

mixed venous blood, blood that is composed of the venous blood from the heart and all systemic tissues in proportion to their venous returns. In the absence of abnormalities, mixed venous blood is present in the main pulmonary artery.

-mixis, -mixia, -mixie, -mixy, mixo-, combining form meaning "related to intercourse": *amphimixis, mixoscopia.*

mixture /miks′chər/ [L, *miscere,* to mix], **1.** a substance composed of ingredients that are not chemically combined and do not necessarily occur in a fixed proportion. **2.** (in pharmacology) a liquid containing one or more medications in suspension. The proportions of the ingredients are specific to each mixture. Compare **compound, solution.** See also **mistura.**

-mixy. See **-mixis.**

mL, abbreviation for **milliliter.**

MLC, abbreviation for *mixed lymphocyte culture.* See **mixed lymphocyte culture reaction.**

MLD, abbreviation for **minimum lethal dose.**

MLT, abbreviation for **medical laboratory technician.**

MLVA, abbreviation for **multiple-locus variable number of tandem repeat analysis.**

mm, abbreviation for **millimeter.**

mM, abbreviation for **millimole.**

mm^3, abbreviation for **cubic millimeter.**

MMFR, abbreviation for **maximal midexpiratory flow rate.**

MMIH syndrome, abbreviation for *megacystis-microcolon-intestinal hypoperistalsis syndrome.*

M-mode, motion modulation in diagnostic ultrasonography. It is a variation of B-mode ultrasound used in echocardiography. See also **B-mode.**

mmol, abbreviation for **millimole.**

MMPI, abbreviation for **Minnesota Multiphasic Personality Inventory.**

MMR, abbreviation for **measles, mumps, and rubella virus vaccine live.**

MMWR, abbreviation for ***Morbidity and Mortality Weekly Report.***

Mn, symbol for the element **manganese.**

mne-, prefix meaning "memory": *mnemic, mnemism, mnemonic.*

mnemonics [Gk, *mnemonikos*], a system of memory training that links a new concept or image with one already established in the memory, such as associating the numbers of a combination lock with a birthday or telephone number.

-mnesia, suffix meaning "(condition or type of) memory": *amnesia, ecmnesia, logamnesia.*

-mnestic, -mnesic, suffix meaning "memory": *amnestic, anamnestic, catamnestic.*

MNL, abbreviation for **mononuclear leukocyte.**

Mo, symbol for the element **molybdenum.**

Moban, a trademark for an antipsychotic agent **(molindone hydrochloride).**

mobile arm support (MAS) /mō′bəl, mōbēl′/, a forearm support device that enables people with upper extremity disabilities to fulfill some activities of daily living, by helping to move the hand into position for self-feeding. It may also be used as a training device and may be mounted on a wheelchair. Also called **balanced forearm orthosis, ball-bearing feeder.**

mobile unit, an easily transportable radiography unit designed for use outside a radiology department.

mobility^1 /mōbil′itē/ [L, *mobilis,* movable], the velocity a particle or ion attains for a given applied voltage; a relative measure of how quickly an ion may move in an electric field.

mobility^2, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to move purposefully in one's own environment independently with or without an assistive device. See also **Nursing Outcomes Classification.**

-mobility. See **-motility.**

Mobitz I heart block /mō′bits/ [Woldemar Mobitz, German physician, 1889–1951; AS, *hoerte,* heart; Fr, *bloc,* block], second-degree or partial atrioventricular (AV) block in which the P-R interval increases progressively until the propagation of an atrial impulse to the ventricles does not occur. Mobitz I heart block is caused by abnormal conduction of the cardiac impulse in the AV node and may be precipitated by increased vagal tone, AV nodal ischemia, or digitalis therapy. It may be a complication of inferior myocardial infarction. Also called **type I AV block, Wenckebach heart block.**

Mobitz II heart block, second-degree or partial atrioventricular block characterized by the sudden nonconduction of an atrial impulse and a periodic dropped beat without prior or subsequent lengthening of the P-R interval. This kind of block usually results from bilateral impaired conduction in the bundle branches. It may be caused by anterior myocardial infarction, myocarditis, drug toxicity, electrolyte disturbances, rheumatoid nodules, and various degenerative diseases. Syncopal attacks, which occur without warning when the patient is upright or recumbent, are common in Mobitz II heart block, which may be transient or suddenly progress to complete block. Long-term therapy may require implantation of a pacemaker. Also called **type II AV block.**

Möbius' syndrome /mē′bē·əs/ [Paul J. Möbius, German neurologist, 1853–1902], a rare developmental disorder characterized by congenital bilateral facial palsy, usually associated with oculomotor or other neurological dysfunctions, speech disorders, and various anomalies of the extremities. It is caused by a developmental defect involving the motor nuclei of the cranial nerves. Also called **congenital facial diplegia, congenital oculofacial paralysis, nuclear agenesis.**

moccasin /mok′äsin/, any of several species of snakes of the genus *Agkistrodon*.

Cottonmouth water moccasin
(Auerbach, 2012/Courtesy Dr. Sherman Minton)

Moctanin, a trademark for a gallstone dissolving agent **(monooctanoin).**

modafinil, a cerebral stimulant.

■ INDICATION: It is used to treat narcolepsy.

■ CONTRAINDICATIONS: Factors that prohibit its use include hyperthyroidism, hypertension, glaucoma, severe arteriosclerosis, drug abuse, cardiovascular disease, anxiety, and known hypersensitivity to this drug.

■ ADVERSE EFFECTS: Arrhythmias are a life-threatening effect of this drug. Other adverse effects are hyperglycemia, albuminuria, rhinitis, pharyngitis, lung disorder, dyspnea, asthma, epistaxis, abnormal vision, amblyopia, dizziness, headache, chills, stimulation, anorexia, dry mouth, diarrhea, nausea, vomiting, mouth ulcer, gingivitis, thirst, urinary retention, abnormal ejaculation, hypertension, herpes simplex, and dry skin. Common side effects include hyperactivity, insomnia, restlessness, palpitations, and tachycardia.

modality /mōdal′itē/, **1.** the method of application of a therapeutic agent or regimen. **2.** a sensory entity, such as the sense of vision or taste.

mode /mōd/ [L, *modus,* measure], a value or term in a set or series of data that occurs more frequently than other values or terms.

model /mod′əl/ [L, *modulus,* small measure], (in nursing research) a symbolic representation of the interrelations exhibited by a phenomenon within a system or a process. The model is presented as a conceptual framework or a theory that explains a phenomenon and allows predictions to be made about a patient or a process. A model is analogous to an equation in mathematics. Nursing models usually describe person, environment, health, and nursing.

Model HMO Act, a comprehensive health maintenance organization (HMO) statute adopted by several states. It requires that enrollees be entitled to receive copies of individual and group contracts and documented evidence of coverage describing the essential services and features of the HMO. It also requires filing of a premium rate schedule or method used to determine rates and establishment of a grievance procedure to resolve enrollee complaints.

modeling /mod′əling/, a technique used in behavior therapy in which a person learns a desired response by observing and imitating the behavior.

Modeling and Role Modeling, a theory developed by the nursing theorists *Helen C. Erickson, Evelyn M. Tomlin,* and *Mary Ann P. Swain*. Their book, *Modeling and Role Modeling: A Theory and Paradigm for Nursing,* was published in 1983. From a synthesis of multiple concepts related to basic needs, developmental tasks, object attachment, and adaptive coping potential, they developed their highly abstract role-modeling theory. The term *modeling* refers to the development of an understanding of the client's world. Role modeling is the nursing intervention, or nurturance, that requires unconditional acceptance. Erickson, Tomlin, and Swain believe that, although people are alike because of their holism (multiple interacting subsystems), lifetime growth, and development, they are also different because of inherent endowment, adaptation, and self-care knowledge. Role modeling provides a framework for understanding the way clients structure their world. Erickson, Tomlin, and Swain view nursing as a self-care model based on the client's perception of the world and adaptations to stressors.

Model of Human Occupation, a model of practice used in occupational therapy designed to understand human occupation. MOHO includes volition, habituation, performance capacity, and environment. This model was the life work of Dr. Gary Kielhofner. It is used throughout the world.

modem /mō′dəm/, abbreviation for *modulate/demodulate*. It is a device for transforming serial binary numbers into an audible tone, and vice versa, for transmission over a telephone line to another computer.

moderate sedation, the administration of central nervous system depressant drugs and/or analgesics to provide analgesia, relieve anxiety, and/or provide amnesia during surgical, diagnostic, or interventional procedures. Consciousness is depressed, and the patient may fall asleep but is not unresponsive. Oversedation or an adverse patient response to sedation may result in life-threatening complications such as hypotension, loss of airway reflexes, inability to maintain a patent airway, hypoventilation, apnea, or agitation and movement at a critical point in the procedure. Anesthetic monitoring during conscious sedation includes at a minimum monitoring of blood pressure, electrocardiography, and pulse oximetry. See also **anesthesia, awake anesthesia.**

moderator band /mod′ərā′tər/ [L, *moderari,* to restrain; AS, *bindan,* to bind], a thick bundle of muscle in the central part of the right ventricle of the heart. Missing in some individuals and varying in size in others, it usually contains part of the atrioventricular conduction bundle. Also called **trabecula septomarginalis.**

modesty, propriety of dress, speech, and conduct in relations between patients and health care personnel, including draping and covering of the patient to the greatest extent possible, depending on the type of care or examination.

Modicon, a trademark for an oral contraceptive containing an estrogen **(ethinyl estradiol)** and a progestin **(norethindrone).**

modification /mod′ifikā′shən/, **1.** a process whereby a substance is changed from one form to another. **2.** a change in an organism that is acquired or learned and does not involve inheritance.

modification allele. See **modifying gene.**

modified barium swallow, radiological examination performed while the person swallows barium-coated substances, done to assess quality of the swallowing mechanisms of the mouth, pharynx, and esophagus.

modified jaw thrust /mod′ifīd/, an upper airway control maneuver to maintain an open airway of an unconscious person in cases of potential spinal injury. In such persons in-line stabilization of the head and neck can be obtained primarily by forward jaw thrust with minimum head extension.

modified milk [L, *modus,* measure, *facere,* to make], cow's milk in which the protein content has been reduced and the fat content increased to correspond to the composition of breast milk. See also **formula, infant.**

modified plantigrade position, a position used in physical therapy to prepare the patient for independent standing and walking. The person stands with feet flat on the ground and the upper limbs leaning on a table or similar structure to support a large part of the weight.

modified radical mastectomy, a surgical procedure in which a breast is completely removed with the underlying pectoralis minor and some of the adjacent lymph nodes. The pectoralis major is not excised. The operation is performed to treat early and well-localized malignant neoplasms of the breast, for which it appears to be as curative as the more extensive radical mastectomy. Care of the woman before and after a modified radical mastectomy is similar to that for a radical mastectomy. Compare **radical mastectomy, simple mastectomy.** See also **lumpectomy, mastectomy, Reach to Recovery.**

modifying gene /mod′ifī′ing/ [L, *modus,* measure; Gk, *genein,* to produce], a gene that alters or influences the expression function of another gene, including the suppression or reduction of the usual function of the modified gene. Also called **modification allele.**

modiolus, a central column of bone around which the cochlea twists. Also called **lamina of modiolus, spiral lamina.**

modulation /mod′yəlā′shən/, an alteration in the magnitude or any variation in the duration of an electrical current. Modulation, which affects physiological responses to various waveforms, may be continuous, interrupted, pulsed, or surging.

modulation transfer function (MTF) [L, *modulus,* small measure; L, *transferre,* to carry, *functio,* performance], a quantitative measure of the ability of an imaging system to reproduce patterns that vary in spatial frequency. The MTF is useful in predicting image degradation in a series of radiographic components.

modulator /mod′ula′ter/, a specific inductor or agent that brings out characteristics peculiar to a definite region.

MODY, abbreviation for *maturity-onset diabetes of youth.*

Moeller's glossitis /mel′ərz/ [Julius O.L. Moeller, German surgeon, 1819–1887], a form of chronic glossitis characterized by burning or pain in the tongue and increased sensitivity to hot or spicy foods. Also called **glossodynia exfoliativa.** See also **glossitis.**

moexipril, an angiotensin-converting enzyme inhibitor.

■ INDICATIONS: It is prescribed in the treatment of high blood pressure alone or in combination with diuretics and in the treatment of left ventricular dysfunction after myocardial infarction.

■ CONTRAINDICATIONS: It should not be given to patients with hypersensitivity reactions to angiotensin-converting enzyme inhibitors or those who are pregnant (especially during 2nd and 3rd trimesters). It should be used with caution in people with renal insufficiency, hypovolemia, or collagen vascular diseases.

■ ADVERSE EFFECTS: The side effects most often reported include digestive tract disorders, depression, headache, dizziness, vertigo, sleeping difficulties, chest pains, and palpitations. There can be pronounced first dose hypotension. Anaphylatic reactions can occur, and angiodema can occur at any time during therapy (but usually with first dose).

mogi-, prefix meaning "difficult, or with difficulty": *mogiarthria, mogigraphia, mogilalia.*

mohel /mō′əl, môhāl′/, in Judaism, ordained to circumcise.

Mohr's syndrome /mor/ [Otto Lous Mohr, Norwegian geneticist, 1886–1967], an autosomal recessive disorder characterized by brachydactyly, clinodactyly, polydactyly, syndactyly, and bilateral polysyndactyly of the big toe; by cranial, facial, lingual, palatal, and mandibular anomalies; and by episodic neuromuscular disturbances. Also called **orodigitofacial dysostosis,** *oral-facial-digital syndrome, type II.*

moiety /moi′itē/ [L, *medietas,* middle], a part of a molecule that exhibits a particular set of chemical and pharmacological characteristics.

moist cough. See **productive cough.**

moist crackle [OFr, *moiste,* fresh; ME, *krakelen*], an adventitious breathing sound heard on auscultation when air bubbles through fluid or secretions in the bronchi or trachea.

moist gangrene. See **gangrene.**

moist heat [OFr, *moiste* + AS, *haetu*], the use of hot water, towels soaked in hot water, aquathermia pads, hot water bottles, or hot water vapors to reduce inflammation and pain, stimulate circulation, and/or relieve symptoms as directed by a physician. Hot towels should be wrung out to remove surplus moisture and should not be too hot to be held in the hands of the person applying moist heat.

moist rale, a rale heard over fluid in the bronchial tubes.

mol. See **mole^2.**

molality /mōlal′itē/ [L, *moles,* mass], the number of moles of solute per kilogram of water or other solvent. It refers to the solution concentration.

molal volume. See **mole volume.**

molar (M) /mō′lər/ [L, *moles,* mass], **1.** any of the 12 teeth, 6 in each dental arch, located posterior to the premolars. The crown of each molar is nearly cubical, convex on its buccal and lingual surfaces, and flattened on its surfaces of contact. Each of the upper molars can have three roots. The roots of each third upper molar are often fused. The lower molars are larger than the upper, and each has two roots. The roots of each third lower molar tend to fuse. Molars are used to crush and grind food. **2.** (**M**) pertaining to the concentration of a solution, expressed as the number of moles of solute per liter of solution. See also **mole^2.**

molarity /mōler′itē/ [L, *moles,* mass], the number of moles of solute per liter of solution. It refers to the concentration of the solution.

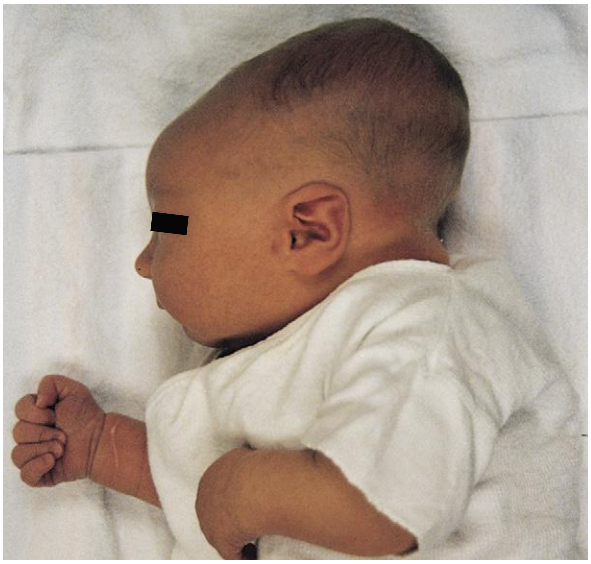
molar pregnancy, pregnancy in which a hydatid mole develops from the trophoblastic tissue of the early embryonic stage of development. The signs of pregnancy are all exaggerated: the uterus grows more rapidly than is normal, morning sickness is often severe and constant, blood pressure is likely to be elevated, and blood levels of chorionic gonadotropins are extremely high. The uterus must be evacuated because the mole may develop into a malignant trophoblastic disease, choriocarcinoma. See also **hydatid mole.**

molar solution, a solution that contains 1 mole of solute per liter of solution.

molar volume. See **mole volume.**

mold, **1.** a hollow form for casting or shaping an object, as a prosthesis. **2.** fungi that grow on moist organic matter, breaking it down.

molding /mōl′ding/ [ME, *moulde,* shaping], the natural process by which a baby's head is shaped during labor as it is squeezed into and through the birth passage by the forces of labor. The head often becomes quite elongated, and the bones of the skull may be caused to overlap slightly at the suture lines. The biparietal diameter of the head may be compressed as much as 0.5 cm without intracranial damage. Most of the changes caused by molding resolve themselves during the first few days of life. Compare **caput succedaneum.** See also **cephalhematoma.**



Molding *(Lowdermilk et al, 2012/Courtesy Kim Molloy, Knoxville, Louisiana)*

mole[1] [L, mass], *informal.* **1.** a pigmented nevus. **2.** (in obstetrics) a hydatid mole.

mole[2] [L, *molecula,* small mass], the standard unit used to measure the amount of a substance. A mole of a substance is the amount containing the same number of elementary particles as there are atoms in 12 g of carbon 12, typically 6.02×10^{23} particles. This number is called **Avogadro's number.** Also spelled **mol. —molar,** *adj.*

molecular biology /məlek′yələr/ [L, *molecula,* small mass; Gk, *bios,* life, *logos,* science], the branch of biology that deals with the physical and chemical interactions of molecules involved in life functions.

molecular genetics [L, *molecula,* small mass; Gk, *genesis,* origin], the branch of genetics that focuses on the chemical structure and the functions, replication, and mutations of the molecules involved in the transmission of genetic information, namely DNA and RNA. Molecular genetics is concerned with the arrangement of genes on DNA, the replication of DNA, the transcription of DNA into RNA, and the translation of RNA into proteins. Also called **biochemical genetics.** See also **recombinant DNA.**

molecular hybridization, in molecular biology, formation of a partially or wholly complementary nucleic acid duplex by association of single strands, usually between DNA and RNA strands or previously unassociated DNA strands, but also between RNA strands, used to detect and isolate specific sequences, measure homology, or define other characteristics of one or both strands.

molecular lesion. See **point lesion.**

molecular mass, the mass of a molecule of a substance as compared with the mass of an atom of carbon-12. It is equal to the sum of the masses of its constituent atoms and is measured in daltons. Formerly called **molecular weight.** See also **atom, atomic mass, molecule.**

molecular mimicry, an antigenic similarity between unrelated macromolecules, believed to play a role in the pathogenesis of rheumatic fever and other diseases. See also **mimicry.**

molecular pathology [L, *molecula,* small mass; Gk, *pathos,* disease, *logos,* science], the branch of the science of disease that is concerned with the health effects of specific molecules.

molecular sieve, **1.** a crystalline chemical separation device with molecular size pores that adsorbs small but not large molecules. **2.** a cross-linked polymer that forms a porous sieve used as a supporting medium for chromatographic separation of mixtures of solutes.

molecular stutter, a gene defect in which the three-nucleotide code for an amino acid is repeated, missing, or jumbled, causing the gene either to fail to make a specific protein or to make a protein that does not function properly. In Huntington's disease, for example, the code for glutamine may be repeated 40 or 50 times in a row in the defective gene. The symptoms of Huntington's disease develop in patients with more than 30 glutamine repeats, and the longer the string of repeats, the earlier the symptoms develop.

molecular taxonomy, the classification of organisms on the basis of the distribution and composition of chemical substances in them.

molecular weight (mol wt). See **molecular mass.**

molecule /mol′əkyo͞ol/ [L, *molecula,* small mass], the smallest unit that exhibits the properties of an element or compound. A molecule is composed of two or more atoms that are covalently bonded. See also **atom, compound.**

mole percent, a percentage calculation expressed in terms of moles of a substance in a mixture or solution rather than in terms of molecular mass.

mole volume, the volume occupied by one mole of a substance, which may be a solid, liquid, or gas. It is numerically equal to the molecular mass divided by the density. For a gas it is 22.4 L at standard temperature and pressure. Also called **molal volume, molar volume.**

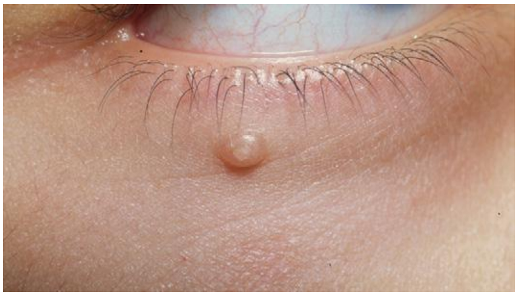
molindone hydrochloride /mol′indōn/, an antipsychotic agent.

■ INDICATION: It is prescribed in the treatment of schizophrenia.

■ CONTRAINDICATIONS: Severe central nervous system depression or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are extrapyramidal reactions, hypotension, sedation, and other reactions characteristic of the phenothiazine antipsychotics.

molluscum contagiosum /məlus′kəm/ [L, *molluscus,* soft], a disease of the skin and mucous membranes caused by a poxvirus, which occurs all over the world. It is characterized by scattered flesh-toned or white papules. Palms of the hands and soles of the feet are not affected. The disease most frequently occurs in children and in adults with an impaired immune response. It is transmitted from person to person by direct or indirect contact and lasts up to 3 years, although individual lesions persist for only 6 to 8 weeks. Diagnosis is easily made by electron microscopy. Curettage or electrical or chemical desiccation helps to clear the lesions, but untreated lesions eventually resolve spontaneously without scarring. Also called **molluscum.**



Molluscum contagiosum *(Marks and Miller, 2006)*

Moloney test [Paul J. Moloney, Canadian physician, 1870–1939], a skin test for sensitivity to diphtheria toxoid.

mol wt, abbreviation for **molecular weight.**

molybdenum (Mo) /məlib′dənəm/ [Gk, *molybdos,* lead], a grayish metallic element. Its atomic number is 42; its atomic mass is 95.94. Molybdenum is poisonous if ingested in large quantities. Molybdenum is used as an additive in certain steels.

molybdenum 99, the radionuclide that is the parent of technetium 99 and as such is present as a generator in most nuclear medicine departments.

-monab, suffix for monoclonal antibodies.

monad /mon′ad, mō′nəd/, **1.** a unicellular, free-living organism. **2.** a monovalent element or ion. **3.** a haploid set of chromosomes in a spermatid or ootid.

-monam, suffix for monobactam (monocyclic beta-lactam) antibiotics.

monamine. See **monoamine.**

monarthritis /mon′ärthrī′tis/ [Gk, *monos,* single, *arthron,* joint, *itis,* inflammation], arthritis affecting only one joint.

monarticular /mon′ärtik′yələr/ [Gk, *monos,* single; L, *articulus,* joint], pertaining to only one joint.

monascus, a natural product derived from red yeast grown on rice, traditionally used in Chinese medicine and now in more common use as both a medicine and a foodstuff. Commerically prepared supplements are grown under conditions that maximize the production of mevinic acids (statins), primarily lovastatin, agents manufactured and sold by pharmaceutical companies that inhibit cholesterol synthesis. Also called **red yeast**.

■ USE: It is used to help maintain acceptable cholesterol levels.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to monascus or with hepatic disease such as cirrhosis or fatty liver.

monaural /monôr′əl/ [Gk, *monos,* single; L, *auris,* ear], pertaining to one ear.

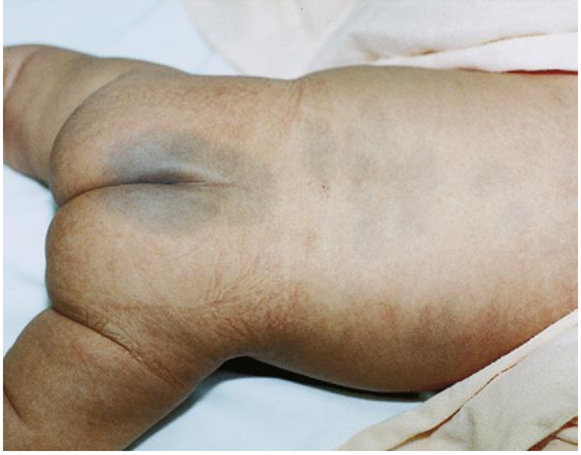
Mönckeberg's arteriosclerosis /meng′kəbərgz/ [Johann G. Mönckeberg, German pathologist, 1877–1925], a form of arteriosclerosis in which extensive calcium deposits are found in the tunica media of the artery with little obstruction of the lumen. Also called **medial arteriosclerosis.**

Monday morning fever. See **byssinosis.**

Monera. See **Procaryotae.**

Monge's disease. See **altitude sickness.**

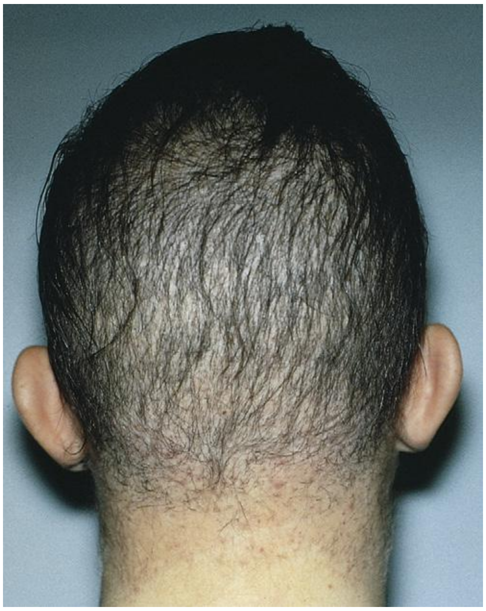
Mongolian spot /mong·gō′lē·ən/ [*Mongol,* Asian ethnic group; ME, *spotte,* stain], a benign bluish-black macule, between 2 and 8 cm, occurring over the sacrum and on the buttocks of some newborns. It is especially common in African-Americans, Native Americans, southern Europeans, and Asian-Americans and usually disappears during early childhood.



Mongolian spot *(Lowdermilk et al, 2012)*

mongolism. See **Down syndrome.**

monilethrix /mōnil′əthriks/ [L. *monile* necklace; Gk, *thrix,* hair], an autosomal-dominant condition in which the hairs exhibit multiple constrictions, with a beading effect, and are brittle, rarely reaching an inch in length before breaking.



Monilethrix *(Hordinsky, Sawaya, and Scher, 2000)*

Monilia. See ***Candida albicans.***

monilial vulvovaginitis, moniliasis. See **candidiasis.**

moniliform /mōnil′ifôrm/, resembling a string of beads.

Monistat, a trademark for an antifungal **(miconazole nitrate).**

monitor /mon′ətər/ [L, *monere,* to warn], **1.** *v,* to observe and evaluate a function of the body closely and constantly. **2.** *n,* a mechanical device that provides a visual or audible signal or a graphic record of a particular function, such as a cardiac monitor or a fetal monitor.

monitrice /mon′itris/ [Fr, female instructor], a labor coach, usually a registered nurse, who provides emotional support and leads the mother through labor and delivery.

monkey disease. See **Kyasanur Forest disease.**

monkeypox, an epidemic human disease, caused by exposure to a monkeypox virus, with symptoms resembling those of smallpox. The virus is related antigenically to smallpox and vaccinia organisms.

mono, abbreviation for **mononucleosis.**

mono-, prefix meaning “one”: *monobacillary, monodal, mononeuritis.*

monoamine /mon′ō·am′in/, an amine containing one amine group.

monoamine oxidase (MAO), an enzyme that catalyzes the oxidation of amines. See also **monoamine oxidase inhibitor.**

monoamine oxidase inhibitor (MAOI, MAO inhibitor), any of a chemically heterogeneous group of drugs used primarily in the treatment of depression. These drugs also exert an antianxiety effect, especially anxiety associated with phobia. The effects of the drugs vary greatly from patient to patient, and their specific actions leading to clinical benefits are poorly understood. Among the most common adverse effects are drowsiness, dry mouth, orthostatic hypotension, and constipation. Overdosage may cause tremor, euphoria, or manic behavior. MAO inhibitors interact with many drugs and with foods containing large amounts of the amino acid tyramine. Ingestion of these foods by a person taking an MAO inhibitor is likely to cause a severe hypertensive episode associated with headache, palpitations, and nausea. Among these foods are cheeses, red wine, smoked or pickled herring, beer, and yogurt. Among the drugs that interact with MAO inhibitors are DOPamine, meperidine, and the indirect acting sympathomimetics, one of which, pseudoephedrine, is an ingredient in many common cold remedies. MAO inhibitors are also sometimes used in the treatment of migraine headache and hypertension. See also **amine pump.**

monobasic acid /mon′ōbā′sik/, an acid with only one replaceable hydrogen atom, such as hydrochloric acid.

monobasic potassium phosphate, the monopotassium salt KH_2PO_4, used as a buffering agent in pharmaceutic preparations and, alone or in combination with other phosphate compounds, as an electrolyte replenisher and urinary acidifier and for prevention of kidney stones.

monobasic sodium phosphate, a monosodium salt of phosphoric acid, used in buffer solutions. Used alone or in combination with other phosphate compounds, it is given intravenously as an electrolyte replenisher, orally or rectally as a laxative, and orally as a urinary acidifier and for prevention of kidney stones.

monobenzone /-ben′zōn/, a depigmenting agent.

■ INDICATION: It is prescribed in final depigmentation in extensive vitiligo.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effect is excessive and irreversible hypopigmentation. Common effects are irritation and allergic reactions of the skin.

monoblast /mon′əblast/ [Gk, *monos,* single, *blastos,* germ], earliest identifiable immature monocyte. Increased production of monoblasts in the marrow and the presence of these forms in the peripheral circulation occur in acute monoblastic leukemias and tuberculosis. Compare **myeloblast.** See also **bone marrow, leukocyte. —monoblastic,** *adj.*

monoblastic leukemia /-blas′tik/, a malignancy of blood-forming organs, characterized by the proliferation of monoblasts and monocytes. The disease develops late in the course of a small but significant number of cases of plasma cell myeloma. Also called **monocytic leukemia, Schilling’s leukemia.**

monocarboxylic acid /mon′ō·kär′bok·sil′ik/, a carboxylic acid with a single carboxyl group.

monocephalus. See **syncephalus.**

monochorial twins, monochorionic twins. See **monozygotic twins.**

monochromatic /-krōmat′ik/, **1.** pertaining to a single color or a single wavelength of light. **2.** describing a person who is totally color blind. **3.** pertaining to a substance that has only one color or stains with only one color.

monochromaticity /-krō′mətis′itē/, the specificity of light in a single defined wavelength. If the specificity is in the visible light spectrum, it is only one color.

Monocid, a trademark for a cephalosporin-type antibiotic **(cefonicid sodium).**

monoclonal /mon′əklō′nəl/ [Gk, *monos* + *klon,* twig], pertaining to or designating a group of identical cells or organisms derived from a single cell or organism. Compare **polyclonal.**

monoclonal antibody (MAB) [Gk, *monos,* single, *klon,* twig; Gk, *anti* + AS, *bodig,* body], an antibody produced in a laboratory from a single clone of B lymphocytes. All MABs produced from the same clone are identical and have the same antigenic specificity.

monoclonal gammopathy. See **gammopathy.**

monocomponent insulin /-kəmpō′nənt/ [Gk, *monos,* single; L, *componere,* to bring together, *insula,* island]. See **single component insulin.**

monocrotic pulse /-krot′ik/ [Gk, *monos,* single, *krotein,* to strike; L, *pulsare,* to beat], a pulse characterized by a single wave.

monoctanoin. See **monooctanoin.**

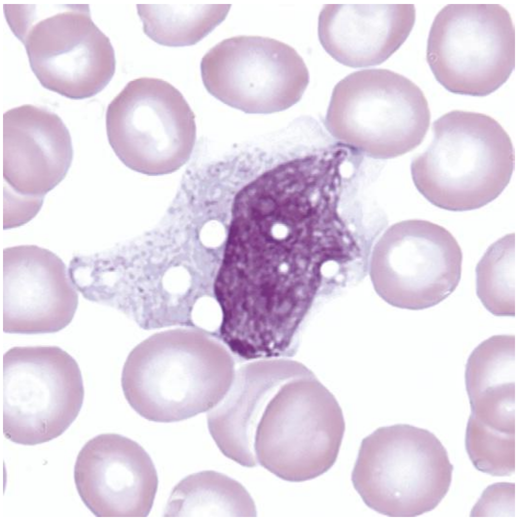
monocular diplopia /monok′yələr/ [Gk, *monos,* single, *oculus,* eye; Gk, *diploos,* double, *opsis,* vision], a condition in which a double image is perceived with one eye. The cause is a disorder in the refracting medium of the eye, such as a cataract, or partial dislocation of the lens. In rare cases more than two images may be seen with one eye. Also called **uniocular diplopia.**

monocular strabismus [Gk, *monos,* single; L, *oculus,* eye; Gk, *strabismos*], strabismus that is confined to one particular eye. Also called **uniocular squint.**

monocular vision [Gk, *monos,* single; L, *oculus,* eye, *visio,* seeing], a condition of seeing with or using only one eye at a time. Also called **uniocular vision.**

monocutaneous candidiasis, a cellular immunodeficiency disorder associated with fungal ***(Candida)*** infections of the skin, mucous membranes, nails, and hair. Patients show a lack of immune reaction after intradermal injection of *Candida,* but immunity to other infectious agents is not impaired. About half the patients also exhibit endocrine abnormalities.

monocyte /mon′əsīt/ [Gk, *monos* + *kytos,* cell], a granular peripheral blood mononuclear leukocyte, 13-25 μm in diameter with a lobulated nucleus, containing chromatin material with a lacy pattern and abundant gray-blue cytoplasm filled with fine, bluish granules. See also **monocytosis.** **—monocytic,** *adj*.



Monocyte *(Carr and Rodak, 2008)*

monocytic leukemia /mon′əsit′ik/, a malignancy of blood-forming tissues in which the predominant cells are monocytes. The disease has an erratic course characterized by malaise, fatigue, fever, anorexia, weight loss, splenomegaly, bleeding gums, dermal petechiae, anemia, and lack of responsiveness to therapy. There are two forms: **Schilling's leukemia,** in which most of the cells are monocytes that probably arise from the reticuloendothelial system, and the more common **Naegeli's leukemia,** in which a large number of the cells resemble myeloblasts. Also called **histiocytic leukemia.**

monocytopenia /-sī′təpē′nē·ə/, an abnormally low number of monocytes in the peripheral blood. Also called *monocytic leukopenia*.

monocytosis /mon′ōsītō′sis/, an increased proportion of monocytes in the circulation.

monodactylism /-dak′tiliz′əm/ [Gk, *monos*, single, *daktylos*, finger or toe], a congenital defect in which the person is born with only one finger on the hand or one toe on the foot.

monoethanolamine /mon′ō·eth′ənol′əmēn/. See **ethanolamine.**

monofactorial inheritance /-faktôr′ē·əl/ [Gk, *monos* + L, *factare*, to make], the acquisition or expression of a trait or condition that depends on the transmission of a single specific gene. Compare **multifactorial inheritance.**

monogamy /mənog′əmē/, **1.** the practice of having one long-term sexual partner. **2.** (in biology) the habit of pairing with only one mate.

monohybrid /-hī′brid/ [Gk, *monos* + L, *hybrida*, mixed offspring], pertaining to or describing an individual, organism, or strain that is heterozygous for only one specific trait or that is heterozygous for the single trait or gene locus under consideration.

monohybrid cross, the mating of two individuals, organisms, or strains that have different alleles for only one specific trait or in which only one particular characteristic or gene locus is being followed.

monohydric alcohol /-hī′drik/, an alcohol containing one hydroxyl group.

monoiodotyrosine /mon′ō·ī·ō′dōtī′rəsin/, an iodinated amino acid involved in the synthesis of thyroxine (T_4) and triiodothyronine (T_3).

monokaryotic /-ker′ē·ot′ik/, having a single nucleus.

monolayer /-lā′ər/, pertaining to or consisting of a single layer of molecules.

monomer /mon′əmər/ [Gk, *monos* + *meros*, part], **1.** a molecule that repeats itself to form a polymer, such as a molecule of fibrin monomer that polymerizes to form fibrin in the blood-clotting process. **—monomeric,** *adj*. **2.** a simple molecule of relatively low molecular weight, which is capable of reacting chemically with other molecules to form a dimer, trimer, or polymer. **3.** some basic unit of a molecule, either the molecule itself or functional subunit of it.

monomolecular elimination reaction (E_1) /-məlek′yələr/, a first-order chemical kinetic reaction in which only one molecule is involved in the slow step reaction. Also called **unimolecular reaction.**

monomphalus /mənom′fələs/ [Gk, *monos* + *omphalos*, navel], conjoined twins that are united at the umbilicus. Also called **omphalopagus.**

mononeuropathy /-no͞orop′əthē/ [Gk, *monos* + *neuron*, nerve, *pathos*, disease], any disease or disorder that affects a single nerve trunk. Some common causes of disorders involving single nerve trunks are electric shock, radiation, and fractured bones that may compress or lacerate nerve fibers. Casts and tourniquets that are too tight may also damage a nerve by compression or by ischemia. The peripheral nerve trunks are especially vulnerable to compression and entrapment.

mononeuropathy multiplex, a peripheral nerve disorder characterized by numbness, pain, and weakness in several areas of the body. The symptoms may develop suddenly in the region supplied by one peripheral nerve and days later in the region of another nerve.

mononuclear /-nyo͞o′klē·ər/ [Gk, *monos*, single; L, *nucleus*, nut kernel], pertaining to one nucleus, such as a monocyte.

mononuclear leukocyte, a white blood cell, including lymphocytes and monocytes, with a single nucleus. Also called mononuclear cell. Compare **polymorphonuclear.** See also **monocyte.**

mononucleosis (mono) /mon′ōno͞o′klē·ō′sis/ [Gk, *monos*, single; L, *nucleus*, nut kernel; Gk, *osis*, condition], an abnormal increase in the number of mononuclear leukocytes in the blood. See also **infectious mononucleosis.**

mononucleosis spot test, a rapid slide blood test performed to aid in the diagnosis of infectious mononucleosis, a disease caused by the Epstein-Barr virus (EBV). Abnormal findings may indicate chronic EBV infection, chronic fatigue syndrome, some forms of chronic hepatitis, and Burkitt's lymphoma, which is strongly associated with EBV.

monooctanoin /mon′ō·ok′tənō′in/, a gallstone-dissolving agent.

■ INDICATION: It is used to dissolve cholesterol gallstones.

■ CONTRAINDICATIONS: It is contraindicated in patients with jaundice, severe biliary tract infection, or a history of recent duodenal ulcer or jejunitis.

■ ADVERSE EFFECTS: Adverse effects may include nausea, vomiting, diarrhea, and GI pain.

monoovular twins, identical twins. Also called **monovular twins, monozygotic twins.**

monophagia /-fā′jə/, the practice of eating only one kind of food.

monophasic /-fā′sik/, having one phase, part, aspect, or stage.

monoploid, monoploidic. See **haploid.**

monopodial symmelia, a congenital anomaly characterized by the fusion of the lower extremities and the presence of one foot. Compare **dipodial symmelia, sirenomelia, tripodial symmelia.** See also **sympus monopus.**

monopolar electrocautery, an electrocautery in which current is applied through a handheld active electrode and travels back to the generator through an inactive electrode attached to the patient (the grounding pad), so that the patient is part of the electrical circuit. Also called **unipolar electrocautery.**

Monopril, a trademark for an angiotensin-converting enzyme inhibitor **(fosinopril).**

monopus /mon′əpəs/ [Gk, *monos* + *pous,* foot], a fetus or individual with the congenital absence of a foot or leg.

monorchid /monôr′kid/, a male who has monorchism.

monorchism /mon′ôrkiz′əm/ [Gk, *monos* + *orchis,* testicle, *ismos,* state], a condition in which only one testicle has descended into the scrotum. Also called *monorchidism.* See also **cryptorchidism. —monorchidic,** *adj.*

monosaccharide /-sak′ərīd/ [Gk, *monos* + *sakcharon,* sugar], a simple carbohydrate consisting of a single basic sugar unit with the general formula $C_n(H_2O)_n$, with *n* ranging from 3 to 8.

monosodium glutamate (MSG) /-sō′dē·əm/, a food flavor enhancer derived from naturally occurring salt of glutamic acid and a cause of **Chinese restaurant syndrome.** It is also used in the treatment of encephalopathies associated with liver disorders. Also called **sodium glutamate.**

monosodium urate monohydrate, the monosodium salt of uric acid, deposited as needle-shaped crystals in the joints and other sites in gout.

monosome /mon′əsōm/ [Gk, *monos* + *soma,* body], **1.** an unpaired X or Y chromosome. Also called **accessory chromosome. 2.** the single, unpaired chromosome in monosomy.

monosomy /mon′əsō′mē/ [Gk, *monos* + *soma,* body], a chromosomal aberration characterized by the absence of one chromosome from the normal diploid complement. In humans the monosomic cell contains 45 chromosomes and is designated 2*n* N 1, such as occurs in the XO condition in Turner's syndrome. Compare **trisomy.** See also **aneuploidy. —monosomic,** *adj.*

monosomy X. See **Turner's syndrome.**

monospecific /-spəsif′ik/ [Gk, *monos* + L, *species,* form, *facere,* to make], pertaining to an antibody that binds to only one type of antigen.

monosymptomatic demyelinating disease, acute occurrence of any one of a number of symptoms that suggest a diagnosis of multiple sclerosis. Persons who have such an attack may or may not develop multiple sclerosis.

monosynaptic reflex /-sinap′tik/ [Gk, *monos,* single, *synaptein,* to join; L, *reflectere,* to bend back], a reflex requiring only one afferent and one efferent neuron.

monotherapy /mon′ōther′əpē/ [Gk, *monos,* single + *therapeia,* treatment], treatment of a condition by means of a single drug.

monotropy /mənot′rəpē/ [Gk, *monos* + *trepein,* to turn], a concept, named by J. Bowlby, describing the phenomenon in which a mother appears to be able to bond with only one infant at a time. The concept is used by Marshall Klaus and John Kennell in their studies of maternal-infant bonding in mothers of twins. When one twin is taken home from the hospital earlier than the other, the mother often reports that she does not feel that the baby discharged later is hers. The second baby to reach the home is much more likely to fail to thrive or to be neglected or abused. Nurses working in intensive care nurseries and adoption homes are also known to become attached to only one child at a time. Monotropy also may explain a mother's common tendency to dress twins alike, in effect making them one. **—monotropic,** *adj.*

monounsaturated fatty acids. See **unsaturated fatty acid.**

monovalent /-vā′lənt/, **1.** also called **univalent,** describing an atom or radical having the valence or combining power of one hydrogen atom. See also **valence. 2.** describing a serum antibody capable of combining with only one antigen or complement.

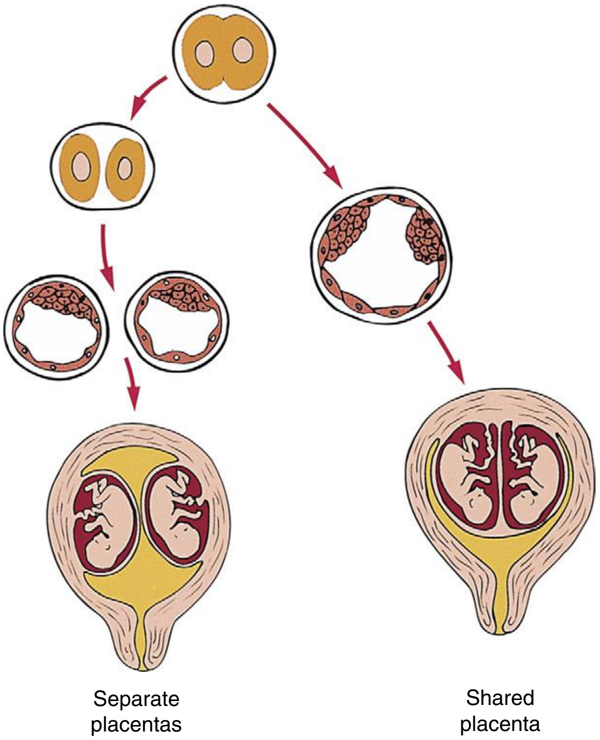
monovular. See **uniovular.**

monovular twins. See **monoovular twins.**

monovulatory /mənō′vyələtôr′ē/ [Gk, *monos* + L, *ovulum,* small egg, *orius,* characterized by], routinely releasing one ovum during each ovarian cycle. Compare **diovulatory.**

monozygotic (MZ) /-zīgō′tik/ [Gk, *monos* + *zygon,* yoke], pertaining to or developed from a single fertilized ovum, or zygote, such as occurs in identical twins. Compare **dizygotic. —monozygosity,** *n.,* **monozygous,** *adj.*

monozygotic twins, two offspring born of the same pregnancy and developed from a single fertilized ovum that splits into equal halves during an early cleavage phase in embryonic development, giving rise to separate fetuses. Such twins are always of the same sex, have the same genetic constitution, possess identical blood groups, and closely resemble each other in physical, psychological, and mental characteristics. Monozygotic twins may have single or separate placentas and membranes, depending on the time during development when division occurs. Monozygotic twinning occurs with relatively uniform frequency in all races, is unaffected by heredity, and represents approximately one third of all twin births. Also called **enzygotic twins, identical twins, true twins, uniovular twins.** Compare **dizygotic twins.** See also **Siamese twins.**



Monozygotic twins *(Carlson, 2009)*

Monro-Kellie doctrine /mənrō′ kel′ē/ [Alexander Monro, Scottish anatomist and surgeon, 1733–1817; George Kellie, Scottish anatomist, late 18th century], the doctrine that the central nervous system and its accompanying fluids are enclosed in a rigid container whose total volume tends to remain constant. An increase in volume of one component (e.g., brain, blood, or cerebrospinal fluid) will elevate pressure and decrease the volume of one of the other elements.

mons /mons/ [L, mountain], a mound or slight elevation.

Monsel's solution /monselz′/, a reddish-brown aqueous solution of basic ferric sulfate, prepared from ferrous sulfate and nitric acid and used as an astringent and hemostatic.

Monson curve [George S. Monson, American dentist, 1869–1933; L, *curvus,* a bend], the curve of occlusion in which each tooth cusp and incisal edge lie on the surface of a sphere 8 inches (20 cm) in diameter, with its center in the region of the glabella.

mons pubis. See **mons veneris.**

mons veneris /ven′əris/ [L, *mons,* mountain; *venus,* love], a pad of fatty tissue and thick skin that overlies the symphysis pubis in the woman. After puberty it is covered with pubic hair. Also called **mons pubis, mount of Venus.**

Monteggia's fracture /montej′əz/ [Giovanni B. Monteggia, Italian physician, 1762–1815], a break in the ulna, associated with radial dislocation or rupture of the annular ligament and resulting in the angulation or overriding of ulnar fragments.

montelukast, a leukotriene receptor.

■ INDICATION: It is used to treat chronic asthma.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include dizziness, fatigue, headache, abdominal pain, dyspepsia, abnormal liver function tests, rash, asthenia, influenza, cough, and nasal congestion.

Montenegro test /mon′tənā′grō/, a test used in the diagnosis of cutaneous leishmaniasis, in which killed ***Leishmania*** antigens are injected intradermally. A positive reaction is indicated by the appearance of a palpable nodule in 48 to 72 hours. Also called **leishmanin test.**

Montercaux fracture /monterkō′/, a break in the neck of the fibula associated with the dislocation of the ankle mortise joint.

Montgomery's gland. See **areolar gland.**

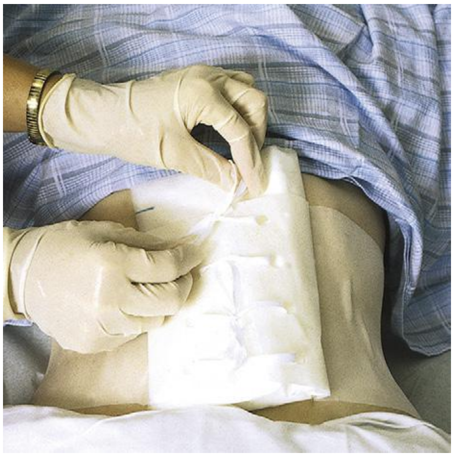
Montgomery strap /montgom′ərē/, a band of adhesive tape featuring a lace-up design, used to secure dressings that must be changed frequently. Also called **Montgomery tape.**

mood, a prolonged subjective emotional state that influences one's whole personality and perception of the world. Examples include sadness, elation, and anger. See also **affect.**

mood-congruent psychotic features /-kon′gro͞o·ənt/ [AS, *mod,* mind; L, *congruere,* to come together], the characteristics of a psychosis in which the content of hallucinations or delusions is consistent with an elevated, expansive mood or with a depression. Mood congruence is most often noted in mood disorders, whereas schizophrenia is often a mood-incongruent disorder.

mood disorder [AS, *mod,* mind; L, *dis* + *ordo,* rank], a variety of conditions characterized by a disturbance in mood as the main feature. If mild and occasional, the feelings may be normal. If more severe, they may be a sign of a major depressive disorder or dysthymic reaction or be symptomatic of a bipolar disorder. Other mood disorders may be caused by a general medical condition. *Mood disorder* is a *DSM-IV* term. Also called **affective disorder.**

mood equilibrium, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as appropriate adjustment of prevailing emotional tone in response to circumstances. See also **Nursing Outcomes Classification.**



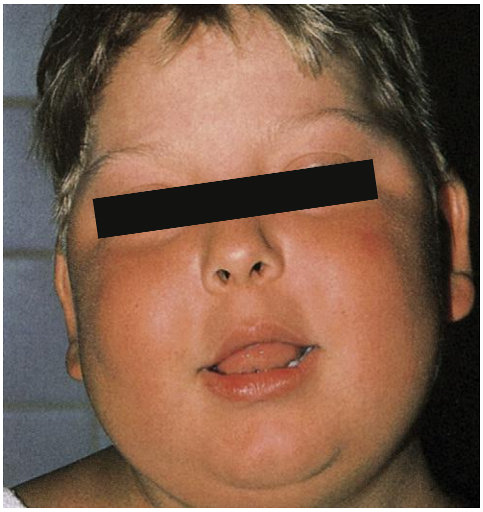
Montgomery straps *(Harkreader, Hogan, Thobaben, 2007)*

mood management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing for safety, stabilization, recovery, and maintenance of a patient who is experiencing dysfunctionally depressed or elevated mood. See also **Nursing Interventions Classification.**

mood swing, an oscillation between periods of feelings of well-being and depression. Occasional "blue" periods are not regarded as abnormal. The swings are longer and more intense in persons with manic-depression. See also **bipolar disorder.**

mood theme. See **communication theme.**

moon face [AS, *mona,* moon; L, *facies,* face], a condition characterized by a rounded, puffy face. It occurs in people treated with large doses of corticosteroids, such as those with chronic asthma, rheumatoid arthritis, or acute childhood leukemia. The features return to normal when the medication is stopped. Moon face is symptomatic of **Cushing's disease** and **Cushing's syndrome.** Also called *moon facies*.



Moon face *(Zitelli and Davis, 2007)*

Moore, Ruth Ella /mor/ [1903–1994], the first African-American woman to earn a PhD in bacteriology. Her areas of research were blood groups and the family Enterobacteriaceae.

Moore's fracture [Edward M. Moore, American surgeon, 1814–1902], a break in the distal radius with associated dislocation of the ulnar head, which causes the styloid process to be secured under the annular ligaments of the wrist.

Moore, Shirley M., a nursing theorist who, with Cornelia M. Ruland, developed the Peaceful End of Life Theory, which asserts that nurses are integral to the creation of peaceful end-of-life care, which includes freedom from suffering, emotional support, closeness to and participation by significant others, and treatment with empathy and respect. The theory was developed from a standard of care created by expert nurses to manage the care of patients with terminal illness.

8-MOP. See **methoxsalen.**

MOPP /mop/, abbreviation for a combination drug regimen used in the treatment of cancer, containing three antineoplastics, *M*ustargen (mechlorethamine hydrochloride), *O*ncovin (vinCRIStine sulfate), Matulane (*p*rocarbazine hydrochloride), and *p*redniSONE (a glucocorticoid). MOPP is prescribed in the treatment of Hodgkin's disease.

Moraxella, a genus of the Neisseriaceae family of gram-negative nonmotile cocci. They are found as pathogens and parasites on the mucous membranes of warm-blooded animals.

Moraxella catarrhalis, a species of aerobic nonmotile bacteria found in both the normal and the diseased nasopharynx. It is a cause of otitis media and respiratory diseases. It is a significant pathogen in children and patients with underlying conditions. Formerly called ***Neisseria catarrhalis.***

Moraxella lacunata, a species of nonmotile cocci that causes corneal infections and subacute conjunctivitis or angular conjunctivitis in humans.

morbid [L, *morbidus,* diseased], **1.** pertaining to a pathological or diseased condition, either physical or mental. **2.** preoccupied with unwholesome ideas.

morbid anatomy. See **pathological anatomy.**

morbidity /môrbid′itē/ [L, *morbidus,* diseased], **1.** an illness or an abnormal condition or quality. **2.** (in statistics) the rate at which an illness or abnormality occurs, calculated by dividing the number of people who are affected within a group by the entire number of people in that group. **3.** the rate at which an illness occurs in a particular area or population.

***Morbidity and Mortality Weekly Report* (MMWR),** a weekly epidemiological report on the incidence of communicable diseases and deaths in 120 urban areas of the United States. It is published by the Centers for Disease Control and Prevention in Atlanta, Georgia. The publication also includes information on accident rates and important international health data.

morbidity rate [L, *morbidus,* diseased, *ratum,* calculation], the number of cases of a particular disease occurring in a single year per a specified population unit, as *x* cases per 1000. It also may be calculated on the basis of age groups, sex, occupation, or other population unit.

morbidity statistics [L, *morbidus,* diseased, *status,* condition], a branch of statistics that is concerned with the disease rate of a population or geographic region.

morbid obesity [L, *morbidus,* diseased, *obesitas,* fatness], an excess of body fat, or weight of 100 pounds over ideal body weight, that increases the risk of developing cardiac and endocrine disturbances, including coronary artery disease and diabetes mellitus, as well as some kinds of cancer.

morbid physiology. See **pathological physiology.**

morbilli. See **measles.**

morbilliform /môrbil′ifôrm/ [L, *morbilli,* little disease, *forma,* form], describing a skin condition that resembles the erythematous maculopapular rash of measles, for example, a drug rash.

mordant /môr′dənt/, a substance capable of deepening the reaction of a biological specimen to a stain. The chief mordants are alum, aniline, oil, and phenol.

Morel's syndrome. See **hyperostosis frontalis interna.**

Morgagni's globule /môrgan′yēz/ [Giovanni B. Morgagni, Italian anatomist, 1682–1771], a minute opaque sphere that may form from fluid coagulation between the eye lens and its capsule, especially in cataract. See also **globule.**

Morgagni's tubercle [Giovanni B. Morgagni], one of several small soft nodules on the surface of each of the areolas in women. The tubercles are produced by large sebaceous glands just below the surface of the areolae. They secrete a bacteriostatic lubricating substance during pregnancy and lactation.

morgan /môr′gən/ [Thomas H. Morgan, American biologist, 1866–1945], a unit of measure used in mapping the relative distances between genes on a chromosome. The measurement uses the total crossover value as the basic unit so that 1 morgan equals 100% crossing over or 1 centimorgan equals 1% recombination. One centimorgan is also equal to one map unit. See also **map unit.**

Morganella morganii, urease-producing bacteria found in urinary tract infections and enteric bacteriosis.

morgue /môrg/ [Fr, mortuary], a unit of a hospital with facilities for the storage and autopsy of the dead.

moribund /môr′ibund/ [L, *moribundus,* dying], near death or in the act of dying.

moricizine /morĭ′sĭzēn/, a phenothiazine derivative used as the hydrochloride salt in treatment of ventricular arrhythmias.

morinda, an evergreen shrub that is native to Asia, Australia, and Polynesia.

■ USES: This herb is used for headache; arthritis; and digestive, heart, and liver conditions, but there are no reliable data regarding efficacy.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to this herb or hyperkalemia.

Morita therapy /môrē′tä/ [Shomei Morita, Japanese physician, 1874–1938], an alternative therapy founded between 1910 and 1920 that has as its focus the symptoms of the patient. Its goal is character building, which enables the patient to live responsibly and constructively, even if the symptoms persist.

morning-after pill [AS, *morgen* + *aefter* + *pilian,* to peel], *(informal)* a large dose of an estrogen, given orally, over a short period, to a woman within 24 to 72 hours after sexual intercourse to prevent conception, most commonly in an emergency such as rape or incest. The woman is warned that the medication may cause the formation of clots, severe nausea and vomiting, and teratogenic and carcinogenic effects on the fetus if pregnancy already exists or if contraception fails. The availability of mifepristone provides an alternative and ~100% effective method for preventing pregnancy with fewer side effects; a single dose prevents pregnancy by preventing implantation.

morning dip, a significant decline in maximal expiratory flow rate (MEFR) observed in some asthmatic patients during the early morning. The MEFR in an asthmatic person tends to follow a circadian rhythm with a morning dip and a high point in midafternoon.

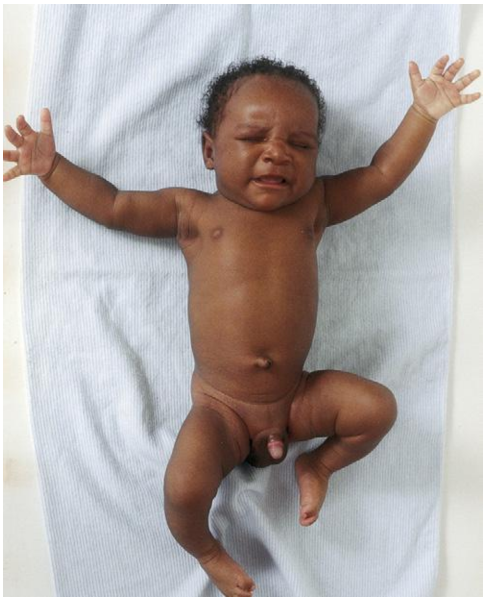
morning glory. See ***Rivea corymbosa.***

morning ptosis, a temporary paralysis of the upper eyelid on awakening from sleep. Also called **waking ptosis.**

morning sickness. See **nausea and vomiting of pregnancy.**

morning stiffness [OE, *morgen* + *stif*], a period of muscular stiffness after awakening in the morning, a common complaint of patients with arthritis or similar musculoskeletal disorders.

Moro reflex /môr′ō/ [Ernst Moro, German pediatrician, 1874–1951], a normal mass reflex in a young infant (up to 3 to 4 months of age) elicited by a sudden loud noise, such as by striking the table next to the child, or raising the head slightly and allowing it to drop. A normal response consists of flexion of the legs, an embracing posture of the arms, and usually a brief cry. Also called **startle reflex.**



Moro reflex *(Hockenberry and Wilson, 2011/Courtesy Paul Vincent Kuntz, Texas Children's Hospital)*

morph-, morpho-, -morph, combining form meaning "form or shape": *endomorph, morphallaxis, morphea, morphogenesis.*

morphea /môr′fē·ə/ [Gk, *morphe,* form], a skin disease consisting of patches of yellowish or ivory-colored hard, dry, smooth skin. It is more common in females. Also spelled **morphoea.** Also called **Addison's keloid, circumscribed scleroderma, localized scleroderma.**

-morphia, -morphy, suffix meaning a "condition of form": *pantamorphia, prosopodysmorphia, theromorphia.*

morphine /môr′fēn/ [Gk, *Morpheus,* god of sleep], a white crystalline alkaloid derived from the opium poppy, *Papaver somniferum,* the source of its principal pharmacological activity. Morphine acts on the central nervous system to produce both depression and euphoric stimulation, effects that are mediated through its stimulation of mu opioid receptors. Stimulation of mu receptors exerts effects that depress nerve impulse transmission. Even in small amounts morphine depresses the respiratory system. Mu receptors' activation in some instances inhibits the transmission of inhibitory impulses, thereby causing stimulation. Examples of this include the euphoric response and constriction of the pupils by the third cranial nerve. Morphine has a marked analgesic effect because of its stimulation of mu receptors in both the brain and spinal cord, and its principal therapeutic value is for the relief of moderate to severe pain. Morphine rarely provides total relief of pain, but in most cases it reduces the level of suffering. Patients with severe pain may become drowsy and relaxed but seldom achieve the sensation of euphoria associated with use of the drug. Morphine is often given parenterally because its rapid absorption following oral administration is followed by rapid first-pass metabolism to an inactive glucuronide (oral bioavailability ranges from 17% to 33%). Repeated use of morphine leads to tolerance, necessitating increased dosage levels to get the same degree of pain relief. See also **morphine sulfate, morphine tartrate.**

morphine poisoning, adverse effect of injection or ingestion of opioids, marked by symptoms of pinpoint pupils, drowsiness, and shallow respiration. Emergency treatment includes gastric lavage, charcoal, and respiratory support. Naloxone is administered intravenously as needed to arouse the patient, and IV fluid is given to support circulation.

morphine sulfate, an opioid analgesic.

■ INDICATIONS: It is prescribed for relief of moderate to severe pain, including that from myocardial infarction and dyspnea caused by left heart failure, and as a preanesthetic.

■ CONTRAINDICATIONS: Drug dependence or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are increased intracranial pressure, cardiovascular disturbances, respiratory depression, and drug dependence. Nausea, vomiting, constipation, and xerostomia are common.

morphine tartrate, a white crystalline powder used in injections of morphine. It is more soluble in water than morphine itself and is used in various parenteral preparations.

morphinism /môr′finiz′əm/, a pathological state caused by morphine addiction.

-morphism, suffix meaning the "condition of having a (specified) shape": *amorphism, isomorphism, pedomorphism.*

morpho. See **morph-.**

morphoea. See **morphea.**

morphogen /môr′fəjen/, **1.** a soluble substance that controls the embryonic differentiation of a cell or tissue. **2.** a substance secreted by one group of cells that causes a specific change in the growth and differentiation of a different group.

morphogenesis /môr′fəjen′əsis/ [Gk, *morphe* + *genein,* to produce], the development and differentiation of the structures and form of an organism, specifically the changes that occur in the cells and tissue during embryonic development. Also called **morphogeny** /môrfoj′ənē/.

morphogenetic /-jənet′ik/, (in embryology) pertaining to a substance or hormone that acts as an evocator in differentiation. Also *morphogenic.*

morphogeny. See **morphogenesis.**

morphology /môrfol′əjē/ [Gk, *morphe* + *logos,* science], the study of the physical shape and size of a specimen, plant, or animal. **—morphological** /môr′fəloj′ik/, *adj.*

morphometry /môrfom′ətrē/, the measurement of the structures and parts of organisms.

-morphosis, suffix meaning a "development or change": *chemomorphosis, epimorphosis, heteromorphosis.*

Morquio's disease /môrkē′ōz/ [Luis Morquio, Uruguayan physician, 1867–1935], a familial form of mucopolysaccharidosis that results in abnormal musculoskeletal development in childhood. Dwarfism, hunchback, enlarged sternum, and knock-knees may occur. The disease may first be evident as the child, learning to walk, displays an abnormal, waddling gait. Also called **MPS IV.** See also **mucopolysaccharidosis.**

mortal [L, *mortalis,* perishable], **1.** subject to death. **2.** causing death.

mortality [L, *mortalis,* perishable], **1.** the condition of being subject to death. **2.** the death rate, which reflects the number of deaths per unit of population in any specific region, age group, disease, or other classification, usually expressed as deaths per 1000, 10,000, or 100,000.

mortar /môr′tər/ [L, *mortarium*], a cup-shaped vessel in which materials are ground or crushed by a pestle in the preparation of drugs.

mortinatality /môr′tinātal′itē/ [L, *mors,* death, *natus,* birth], the stillbirth rate. It is calculated by multiplying the number of stillbirths by 1000 and dividing by the total number of births per year. Also called **natimortality.**

mortise joint /môr′tis/ [ME, *mortays,* fixed in, *jungere,* to join], the articulatio talocruralis joint of the ankle.

Morton's disease [Thomas G. Morton, American surgeon, 1835–1903; L, *dis* + Fr, *aise,* ease], a form of foot neuralgia caused by a falling metatarsal arch, which puts pressure on the digital branches of the lateral plantar nerve. Also called *Morton's foot,* **Morton's plantar neuralgia,** *Morton's neuroma,* **Morton's toe.**

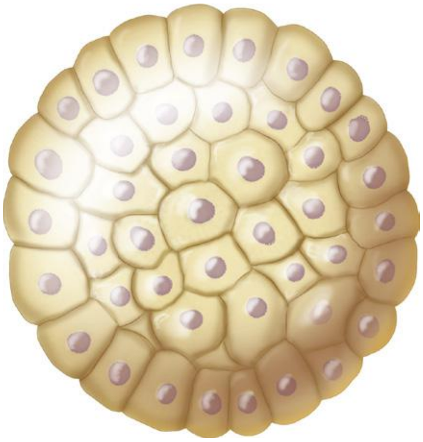
Morton's plantar neuralgia [Thomas G. Morton; L, *planta,* foot sole; Gk, *neuron,* nerve, *algos,* pain], a severe throbbing pain that affects the anastomotic nerve branch between the medial and the lateral plantar nerves.

Morton's syndrome [Dudley J. Morton, American orthopedist, 1884–1960; Gk, *syn,* together, *dromos,* course], a congenital foreshortening of the first metatarsal segment, causing pain and deformity of the front part of the foot.

Morton's toe. See **Morton's disease.**

mortuary /môr′chəwer′ē/ [L, *mortuarium,* tomb], a building where the bodies of deceased persons are held for identification, postmortem examination, and preparation for burial or cremation.

morula /môr′ələ/ *pl.* **morulas, morulae** [L, *morulus,* blackberry], a solid, spherical mass of cells resulting from the cleavage of the fertilized ovum in the early stages of embryonic development. It represents an intermediate stage between the zygote and the blastocyst and consists of blastomeres that are uniform in size, shape, and physiological capabilities. **—morular,** *adj.*



Morula *(Patton and Thibodeau, 2010)*

-morula, suffix meaning a "clump of blastomeres formed by cleavage of a fertilized ovum": *amphimorula, archimorula, pseudomorula.*

morulae, morulas. See **morula.**

Morvan's disease, a form of syringomyelia with tissue changes in the extremities, such as a paresthesia of the forearms and hands and progressive painless ulceration of the fingertips.

mosaic /mōzā′ik/ [L, *Musa,* goddess of the arts], **1.** an individual or organism that developed from a single zygote but that has two or more kinds of genetically different cell populations. Mosaicism may result from a mutation, crossing over, or, more commonly in humans, nondisjunction of chromosomes during early embryogenesis, which causes a variation in the number of chromosomes in the cells. The type of chromosomal aberration and the fraction of cells that are affected depend on the cleavage stage at which the causative event occurred. Because monosomic cells are nonviable, except in X monosomic conditions, most mosaic conditions caused by nondisjunction in humans represent a mixture of normal and trisomic cells, regardless of whether an autosome or the sex chromosomes are involved. The degree of clinical involvement depends on the type of tissue containing the abnormality and may vary from near normal to full manifestation of a syndrome, such as Down syndrome or Turner's syndrome. Compare **chimera.** See also **monosomy, sex chromosome mosaic, trisomy.** **2.** a fertilized ovum that undergoes determinate cleavage. See also **mosaic development.** **—mosaicism,** *n.*

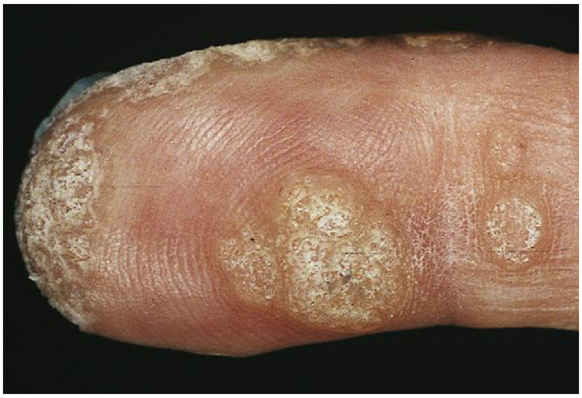
mosaic bone, bone tissue appearing to be made up of many tiny pieces cemented together, as seen on microscopic examination of an x-ray film of the affected bone. It is characteristic of Paget's disease.

mosaic cleavage. See **determinate cleavage.**

mosaic development, a kind of embryonic development occurring in the blastocyst. The fertilized ovum undergoes determinate cleavage, developing according to a precise, unalterable plan in which each blastomere has a characteristic position and limited developmental potency and is a precursor of a specific part of the embryo. Damage to or destruction of these cells results in a defective organism. Compare **regulative development.**

mosaicism /mōzā′isiz′əm/ [L, *Musa,* goddess of the arts], (in genetics) a condition in which an individual or an organism that develops from a single zygote has two or more cell populations that differ in genetic constitution. Most commonly seen in humans is a variation in the number of chromosomes in the cells, which may involve either a particular autosome, such as in Down syndrome, or the sex chromosomes, such as in Turner's syndrome and Kleinfelter's syndrome. See also **mosaic, sex chromosome mosaic.**

mosaic wart, a group of contiguous plantar warts.



Mosaic wart *(du Vivier, 2002)*

mosquito bite /məskē′tō/ [L, *musca,* a fly; AS, *bitan,* to bite], a bite of a blood-sucking arthropod of the subfamily Culicidae that may result in a systemic allergic reaction in a hypersensitive person, an infection, or, most often, a pruritic wheal. Mosquitoes, which are attracted to hosts by moisture, carbon dioxide, estrogens, sweat, or warmth, are vectors of many infectious diseases.

mosquito forceps, a small hemostatic forceps. See also **Halsted's forceps,** def. 1.

Mössbauer spectrometer /mes′bou·ər, mœs′bou·ər/ [Rudolf L. Mössbauer, German physicist, 1929–2011], an instrument that can detect small changes between an atomic nucleus and its environment, such as caused by alterations in temperature, pressure, or chemical state. The device is used in chemical and physical research with applications in medicine.

most probable number, a statistical value representing the viable bacterial population in a sample through the use of dilution and multiple tube inoculations.

mot-, prefix meaning "movement": *motoneuron, motorgraphic, motoricity.*

mother fixation [AS, *modor,* mother; L, *figere,* to fasten], an arrest in psychosexual development characterized by an abnormally persistent, close, and often paralyzing emotional attachment to one's mother. Compare **father fixation.** See also **freudian fixation.**

mother yaw. See **yaw.**

motilin /mōtil′in/, a peptide hormone secreted by enterochromaffin cells of the intestinal tract. It stimulates GI motility and pepsin secretion.

motility /mō′tilitē/ [L, *motare,* to move often], spontaneous but unconscious or involuntary movement. **—motile,** *adj.*

-motility, -mobility, suffix meaning the "condition of being capable of movement": *cardiomotility, hypermotility, supermotility.*

-motine, suffix for antiviral quinoline derivatives.

motion sickness. See **kinesia.**

motivation^1 /mō′tivā′shən/ [L, *movere,* to move], conscious or unconscious needs, interests, rewards, or other incentives that arouse, channel, or maintain a particular behavior.

motivation^2, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the inner urge that moves or prompts an individual to positive action(s). See also **Nursing Outcomes Classification.**

motivational conflict /mō′tivā′shənəl/ [L, *movere,* to move, *alis,* relating to, *confluere,* to come together], a conflict resulting from the arousal of two or more motives that direct behavior toward incompatible goals. Kinds of motivational conflict include **approach-approach conflict, approach-avoidance conflict,** and **avoidance-avoidance conflict.**

motoneuron /mō′tōnŏŏr′on/ [L, *movere,* to move; Gk, *neuron,* nerve], a motor neuron. Its function is to produce muscle contractions.

motor [L, *movere,* to move], **1.** pertaining to motion, the body apparatus involved in movement, or the brain functions that direct purposeful activities. **2.** pertaining to a muscle, nerve, or brain center that produces or subserves motion.

-motor, suffix meaning "effects of activity in a body part": *nervimotor, psychomotor, viscerimotor.*

motor aphasia, the inability to say remembered words, caused by a cerebral lesion in the inferior frontal gyrus (Broca's motor speech area) of the left hemisphere. The condition most commonly is the result of a stroke. The patient knows what to say but cannot articulate the words. Also called **ataxic aphasia, expressive aphasia, frontocortical aphasia, verbal aphasia.**

motor apraxia, the inability to carry out planned movements or to handle small objects, although cognizant of the proper use of the object. The condition results from a lesion in the premotor frontal cortex on the opposite side of the affected limb. Also called **innervation apraxia.** See also **apraxia.**

motor area, a portion of the cerebral cortex that includes the precentral gyrus and the posterior part of the frontal gyri and that causes the contraction of the voluntary muscles on stimulation with electrodes. Normal voluntary activity requires associations between the motor area and other parts of the cortex; removal of the motor area from one cerebral hemisphere causes paralysis of voluntary muscles, especially of the opposite side of the body. Various parts of the motor area are associated with different body structures, such as the lower limb, the face, the mouth, and the hand. The parts associated with more delicate, complicated movements, such as those of the hand, are larger than those associated with more general movements.

motor ataxia, an inability to perform coordinated movements. Also called **kinetic ataxia.**

motor control, the systematic transmission of nerve impulses from the motor cortex to motor units, resulting in coordinated contractions of muscles.

motor control frame of reference, a task-oriented approach that encourages the repetition of desired movements in a variety of settings and circumstances.

motor coordination, the harmonious functioning of body parts that involve movement, including gross motor movement, fine motor movement, and motor planning.

motor depressant [L, *movere,* to move, *deprimere,* to press down], a drug or agent that reduces the normal functioning level of motor neurons, mainly in voluntary muscles.

motor endplate, a large special synaptic contact between motor axons and each skeletal muscle fiber. Each muscle fiber forms one endplate. See also **end plate.**

motor fiber, one of the fibers (axons) in the cranial and spinal nerves that transmit impulses to and cause contraction of muscle fibers.

motor hallucination [L, *movere,* to move, *alucinari,* wandering mind], the subjective experience of movement when there is no movement.

motor image, a visual concept of one's bodily movements, real or imagined.

motor learning, the process of improving motor skills through practice, with long-lasting changes in the capability for responding. The cerebellum and basal nuclei play a major role in such coordination.

motor nerve, an efferent nerve that conveys impulses to motor endplates or another terminal and is mainly responsible for stimulating muscles and glands.

motor neuron, one of various efferent nerve cells that transmit nerve impulses from the brain or from the spinal cord to muscular or glandular tissue. According to location, some kinds of motor neurons are the peripheral motor neurons and the upper motor neurons. Also called **motoneuron.** Compare **sensory nerve.** See also **nervous system.**

motor neuron disease [L, *movere,* to move, *neuron,* nerve; L, *dis* + Fr, *aise,* ease], any disease of a motor neuron, with degeneration of anterior horn cells, motor cranial nerve nuclei, and pyramidal tracts. An example is **amyotrophic lateral sclerosis.**

motor neuron paralysis, an injury to the spinal cord that causes damage to the motor neurons and results in various degrees of functional impairment depending on the site of the lesion. See also **lower motor neuron paralysis, upper motor neuron paralysis.**

motor nucleus [L, *movere,* to move, *nucleus,* nut kernel], the nucleus of a motor nerve or collection of motor neurons.

motor pathway [L, *movere,* to move; AS, *paeth*], the route of motor nerve impulses, from the central neuron to a muscle or gland.

motor planning, the ability to plan and execute skilled nonhabitual tasks. Also called **motor praxis.**

motor point, **1.** a point at which a motor nerve enters a muscle. **2.** any point on the skin over a muscle at which electrical stimulation (via electrode) causes contraction of the muscle. See also **motor nerve, nervous system.**

motor praxis. See **motor planning.**

motor protein, protein that moves along a surface, propelled by the energy of adenosine triphosphate hydrolysis.

motor root [L, *movere,* to move; AS, *rot*], the proximal end of a motor nerve at its attachment to the spinal cord.

motor seizure, abnormal electrical activity that arises initially in a localized motor area of the cerebral cortex. The manifestations depend on the site of the abnormal electrical activity, such as tonic contractures of the thumb caused by excessive discharges in the motor area of the cortex controlling the first digit or chewing movements resulting from discharges in the lower part of the motor strip controlling mastication. The disturbance may spread, resulting in generalized convulsion, or it may end in a shower of clonic movements. See also **epilepsy, focal seizure.**

motor sense, the feeling or perception enabling a person to accomplish a purposeful movement, presumably achieved by evoking a sensory engram or memory of the pattern for that specific movement. Proprioceptive signals transmitted by feedback pathways through the cerebellum and sensory areas of the motor cortex are compared with the engram and modify the movement. Experiments with animals show that a movement cannot be performed if the corresponding sensory area of the brain is removed. If the motor area is removed, the movement is accomplished by using a different group of muscles.

motor speech areas [L, *movere,* to move; AS, *spaec* +L, *area,* vacant place], the regions of the cerebral hemispheres that are associated with motor control of speech. For right-handed people the sites are generally located in the left hemisphere. See also **Broca's area.**

motor tract [L, *movere,* to move, *tractus*], an efferent nerve pathway that conveys impulses controlling movement.

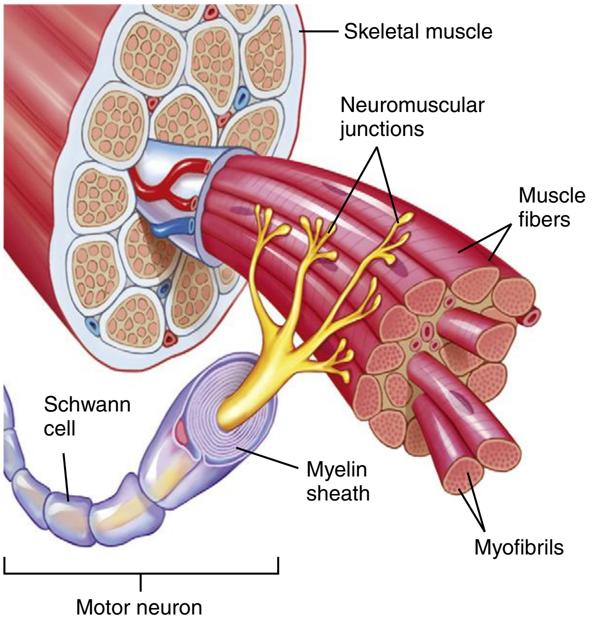
motor unit, a functional structure consisting of a motor neuron and the muscle fibers it innervates.

motor unit recruitment, the bringing into activity of additional motor neurons, which causes additional muscle fibers to contract. As more units are recruited and as the frequency of discharge increases, muscle tension increases. The pattern of motor unit recruitment varies, depending on the inherent properties of specific motor neurons.

mottle [ME, *motley,* mixed colors], an effect observed in radiographic imaging when the dose of radiation used is reduced to a level at which individual quantum effects can be seen. At very low doses, the number of photons being produced is so small that the statistical variations in x-ray production can be visualized. Also called **noise, quantum mottle.**

mountain fever. See **Colorado tick fever, Rocky Mountain spotted fever.**

mountain sickness. See **altitude sickness.**



Motor unit

mountain tick fever. See **Colorado tick fever, Rocky Mountain spotted fever.**

mounting /mount′ing/, the preparation of specimens and slides for study.

mount of Venus. See **mons veneris.**

mourning /mōr′ning/ [AS, *murnan,* to mourn], a response to the loss of a loved object. It is through mourning that grief is resolved. See also **bereavement, grief.**

mouse [L, *mus*], a hand-controlled computer input device. Moving the device on a flat surface and pushing buttons on its back cause the cursor or pointer to move to target areas or select items on a computer screen. See also **joystick.**

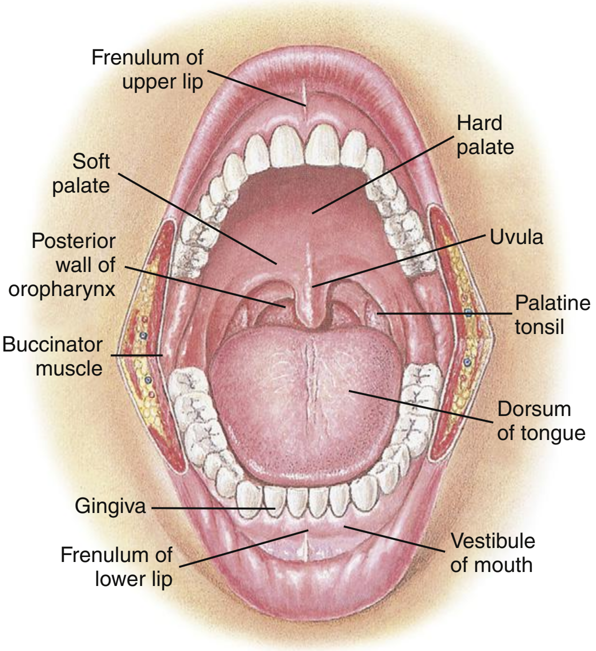
mouse-tooth forceps, a kind of dressing forceps that has one or more fine sharp points on the tip of each blade. The tips turn in, and the delicate teeth interlock.

mouth [AS, *muth*], **1.** the nearly oval oral cavity at the superior, anterior end of the digestive tube, bounded anteriorly by the lips and containing the tongue and the teeth. It consists of the vestibule and the **oral cavity proper.** The vestibule, situated in front of the teeth, is bounded externally by the lips and the cheeks, internally by the gums and the teeth. The vestibule receives the secretion from the parotid salivary glands. The oral cavity proper is bounded by the alveolar arches and the teeth, communicates with the pharynx, and is roofed by the hard and the soft palates. The tongue forms the greater part of the floor of the cavity. The rest of the floor is formed by the reflection of the mucous membrane from the sides and the bottom of the tongue to the gum lining the inner part of the mandible. The oral cavity proper receives the secretion from the submandibular and sublingual salivary glands. **2.** an orifice.

mouth breathing, breathing through the mouth instead of the nose, usually because of some obstruction of the nasal passages.

mouth guard, a soft, plastic, intraoral appliance that covers the palate and all the occlusal and incisal surfaces of the teeth. It is worn in contact sports to limit damage to tissues of the mouth, lips, and other oral surfaces. Compare **biteguard.**

mouth prop. See **gag.**



Mouth structures *(Seidel et al, 2011)*

mouth rinse /mouth′rins/, a solution for cleaning or treating the oral mucosa and controlling dental caries. A typical therapeutic mouth rinse may contain sodium fluoride, glycerine, alcohol, detergents, and other ingredients. Some mouth rinses only remove loose debris and add a fragrance to mask mouth odors.

mouthstick /mouth′stik/, a device that is gripped with the teeth and can be used to type, push buttons, turn pages, operate power wheelchairs, or modify environmental control units and other equipment. It is commonly used by individuals who have a high-level (C4 and up) tetraplegia. Also called **chinstick.**

mouth-to-mouth resuscitation, a procedure in artificial resuscitation, performed most often with cardiac massage. The victim's nose is sealed by pinching the nostrils closed, the head is extended, and air is breathed by the rescuer through the mouth into the lungs. See also **cardiopulmonary resuscitation.**

mouth-to-nose resuscitation, a procedure in artificial resuscitation in which the mouth of the victim is covered and held closed and air is breathed through the victim's nose. See also **mouth-to-mouth resuscitation.**

mouthwash /mouth′wôsh/, a medicated liquid used for cleaning the oral cavity and treating mucous membranes of the mouth. Many over-the-counter mouthwashes contain alcohol, which may contribute to surface softening and increased wear of dental resins and composite materials. See also **mouth rinse.**

MOV, abbreviation for **minimal occlusive volume.**

movement decomposition [L, *movere,* to move, *de,* away, *componere,* to assemble], a distortion in voluntary movement in which motion occurs in a distinct sequence of isolated steps rather than in a normal smooth, flowing pattern.

movement disorder, any of numerous neurological disorders characterized by disturbances of muscular movement, distinguished as either hyperkinetic (conditions such as chorea, dystonia, hemiballismus, myoclonus, stereotypy, tic, and tremor) or hypokinetic (conditions such as akinetic mutism, psychomotor retardation, and the stiff-man syndrome).

movement therapy, a movement-based therapeutic technique that aids in release of expressions or feelings and aids in promoting feeling and awareness.

moving grid, an x-ray grid that is continuously moved or oscillated throughout the exposure of a radiographic film.

moxibustion /mok′səbus′chən/ [Jpn, *moe kusa,* burning herb; L, *comburere,* to burn up], a method of producing analgesia or altering the function of a body system by igniting moxa, wormwood, or another combustible, slow-burning substance and holding it as near the point on the skin as possible without causing pain or burning. It is also sometimes used with acupuncture.

moxifloxacin, an antiinfective.

■ INDICATIONS: It is used to treat acute bacterial sinusitis caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Moraxella catarrhalis;* acute bacterial exacerbation of chronic bronchitis from *S. pneumoniae, H. influenzae, H. parainfluenzae, Klebsiella pneumoniae, Staphylococcus aureus,* and *M. catarrhalis;* and community-acquired pneumonia from *S. pneumoniae, H. influenzae, Mycoplasma pneumoniae, Chlamydia pneumoniae,* and *M. catarrhalis.*

■ CONTRAINDICATION: Known hypersensitivity to quinolones prohibits its use.

■ ADVERSE EFFECTS: Seizures are a life-threatening effect of this drug. Other adverse effects include prolonged QT interval, dizziness, fatigue, insomnia, depression, confusion, increased ALT and AST, flatulence, heartburn, oral candidiasis, dysphagia, pruritus, urticaria, photosensitivity, flushing, fever, chills, tremor, arthralgia, and tendon rupture. Common side effects include headache, restlessness, nausea, diarrhea, and rash.

moxifloxacin hydrochloride, the hydrochloride salt of moxifloxacin, administered orally in the treatment of bacterial exacerbation of chronic bronchitis, acute sinusitis, community-acquired pneumonia, and skin and skin structure infections caused by susceptible organisms.

moyamoya disease /moi′əmoi′ə/, a cerebrovascular disorder in which the main cerebral arteries at the base of the brain are replaced by a fine network of vessels. It is caused by progressive stenosis of the large-caliber vessels and development of collateral network. It tends mainly to affect Japanese children and young adults and is characterized by convulsions, hemiplegia, mental retardation, and subarachnoid hemorrhage. Patients who survive into adulthood are susceptible to massive intracerebral hemorrhage caused by rupture of the fragile network of new vessels. Few patients live beyond 30 years of age.

6-MP, abbreviation for *6-mercaptopurine.* See **mercaptopurine.**

MPD, M.P.D., abbreviation for **maximum permissible dose.**

MPGN, abbreviation for **membranoproliferative glomerulonephritis.**

M.P.H., abbreviation for *Master of Public Health.*

MPL + PRED, an anticancer drug combination of melphalan and predniSONE.

MPO, abbreviation for **myeloperoxidase.**

MPR, abbreviation for **multiplanar reformatting.**

MPS, abbreviation for **mucopolysaccharidosis.**

MPS I, abbreviation for *mucopolysaccharidosis I.* See **Hurler's syndrome.**

MPS II, abbreviation for *mucopolysaccharidosis II.* See **Hunter's syndrome.**

MPS IV, abbreviation for *mucopolysaccharidosis IV.* See **Morquio's disease.**

MPS IV & MPS VII. See **mucopolysaccharidosis.**

MQF, abbreviation for *mobile quarantine facility.*

MQSA, abbreviation for **Mammography Quality Standards Act.**

mr, mR, abbreviation for **milliroentgen.**

mrad, abbreviation for **millirad.**

mrem, abbreviation for **millirem.**

MRI, abbreviation for **magnetic resonance imaging.**

mRNA, abbreviation for **messenger RNA.**

MRSA, abbreviation for *methicillin-resistant Staphylococcus aureus.*

MS, abbreviation for **multiple sclerosis.**

M.S., **1.** abbreviation for *Master of Science.* **2.** abbreviation for *Master of Surgery.*

MSAFP, abbreviation for *maternal serum alpha-fetoprotein.* See **maternal serum alpha-fetoprotein (MSAFP) test.**

msec, abbreviation for **millisecond.**

MSG, abbreviation for **monosodium glutamate.**

MSH, abbreviation for **melanocyte-stimulating hormone.**

MSLT, abbreviation for **multiple sleep latency test.**

MS/MS, abbreviation for **tandem mass spectrometry.**

MSN, abbreviation for *Master of Science in Nursing.* See **master's degree program in nursing.**

MSO, abbreviation for **management service organization.**

M.T., abbreviation for **medical technologist.** See **clinical laboratory scientist/medical technologist.**

MTOC, abbreviation for **microtubule organizing center.**

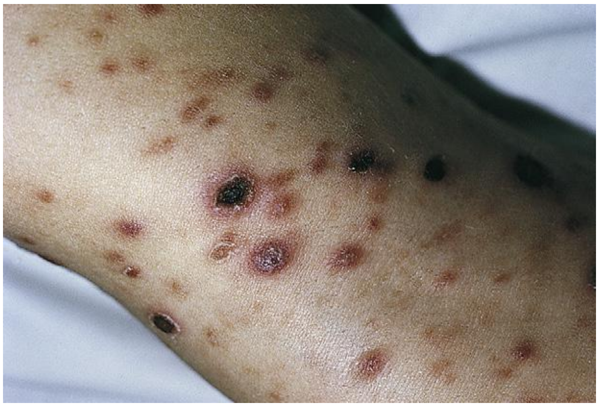
MTT, abbreviation for **maximal treadmill test.**

MTX + MP + CTX, an anticancer drug combination of methotrexate, mercaptopurine, and cyclophosphamide.

mu /myo͞o, mo͞o/, **1.** μ, M, the twelfth letter of the Greek alphabet. **2.** μ, symbol for **micron.**

muc-, muco-, prefix meaning "mucus": *mucolytic, mucosal.*

Mucha-Habermann disease /mo͞o′kä hä′bermän/ [Viktor Mucha; Austrian dermatologist, 1877–1919; Rudolf Habermann, German dermatologist, 1884–1941], an acute or subacute, sometimes relapsing, widespread macular, papular, or vesicular eruption that tends to crusting, necrosis, and hemorrhage, which heals and leaves pigmented depressed scars, followed by the development of a new crop of lesions. Occasionally, progression to a chronic form may occur. Also called **acute lichenoid pityriasis, acute parapsoriasis, Habermann's disease,** *Mucha's disease,* **parapsoriasis varioliformis acuta,** *pityriasis lichenoides et varioliformis acuta.*



Mucha-Habermann disease *(Callen et al, 2000)*

Much's granules /mo͝oks, mo͝okhs/ [Hans C. Much, German physician, 1880–1932], granules and rods, found in tuberculosis sputum, that stain with Gram's stain but not by the usual methods for acid-fast bacilli.

μCi, abbreviation for **microcurie.**

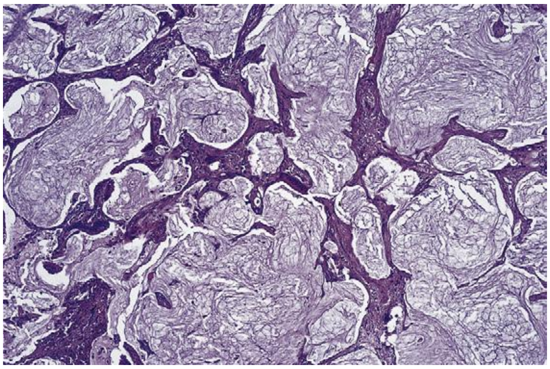
mucilage /m(y)o͞o′səlij/, **1.** a sticky mixture of carbohydrates produced by plant cell activity. **2.** a thick aqueous solution of a gum used for suspending insoluble substances and for increasing viscosity.

mucin /myo͞o′sin/ [L, *mucus,* slime], a mucopolysaccharide, the chief ingredient in mucus. Mucin is present in most glands that secrete mucus and is the lubricant protecting body surfaces from friction or erosion.

mucinase. See **mucopolysaccharidase.**

mucinoid /myo͞o′sinoid/ [L, *mucus* + Gk, *eidos,* form], **1.** resembling mucin. **2.** See **mucoid,** def. 2.

mucinous carcinoma /myo͞o′sinəs/, an epithelial neoplasm characterized by a sticky gelatinous consistency caused by copious mucin secretion. Formerly called **gelatinous carcinoma.** Also called *colloid carcinoma,* **gelatiniform carcinoma,** *mucinous adenocarcinoma.*



Mucinous carcinoma *(Fletcher, 2007)*

mucocele /myo͞o′kōsēl/ [L, *mucus,* slime; Gk, *koilia,* cavity], **1.** dilation of a cavity with accumulated mucus secretion. **2.** a dome-shaped mucosal swelling caused by a rupture of a salivary gland duct, which spills mucin into the surrounding tissues. A mucocele is usually caused by trauma. See **mucus extravasation phenomenon, mucus retention cyst.**

mucocutaneous /myo͞o′kōkyo͞otā′nē·əs/ [L, *mucus* + *cutis,* skin, *osus,* having], pertaining to the mucous membrane and the skin.

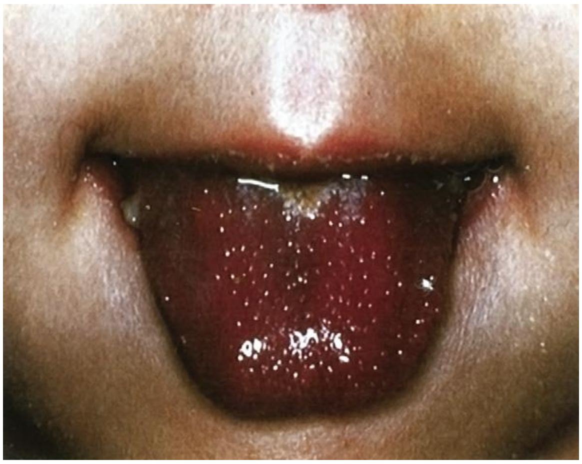
mucocutaneous leishmaniasis. See **American leishmaniasis.**

mucocutaneous lymph node syndrome (MLNS), an acute febrile illness, primarily of young children, characterized by inflamed mucous membranes of the mouth; "strawberry tongue"; cervical lymphadenopathy; polymorphous rash on the trunk; and edema, erythema, and desquamation of the skin on the extremities. Other commonly associated findings include arthralgia, diarrhea, otitis, pneumonia, photophobia, meningitis, and electrocardiographic changes. The cause is unknown. No clear-cut environmental, seasonal, or geographic factors have been discovered, and person-to-person transmission is unproved. A genetic predisposition has been indicated. Treatment includes IV gammaglobulin; aspirin in large doses, which may be prescribed over a long period; and supportive care. Also called **Kawasaki disease.**

■ OBSERVATIONS: The acute stage of the disease begins with a remittent fever (103° F to 105° F) accompanied by extreme irritability, lethargy, and intermittent colicky abdominal pain. The fever typically lasts 7 days to 2 weeks and is unresponsive to antibiotics. After 1 to 2 days, bilateral conjunctivitis occurs. Within 5 days, there is erythema and edema of the hands and feet, a macular rash on the trunk and perineum, strawberry tongue, fissuring of the lips, and reddened pharynx. Cervical lymphadenopathy is present. Ten to 25 days after onset, fever resolves and symptoms diminish. Irritability, anorexia, and conjunctivitis remain. There is peeling of the hands and feet, arthritis, arthralgia, and thrombocytosis. The greatest risk for coronary artery aneurysm occurs during this time. During convalescence, all clinical signs have resolved, but erythrocyte sedimentation rate is still abnormal. ESR blood values return to normal about 6 to 8 weeks after onset. Clinical exam reveals a history of fever with four of five of the following conditions: conjunctivitis, changes in mucosa of oropharynx, edema and erythema of hands and feet, nonvesicular truncal rash, and lymphadenopathy. Blood studies reveal elevated WBCs and platelets; elevated ESR; positive C-reactive protein; and elevated ALT and AST. Chest x-rays may reveal pulmonary infiltrates. An echocardiogram may show depressed left ventricular function. Echocardiograms are also useful to monitor cardiac status during the course of the disease. Complications include coronary arteritis, coronary artery aneurysms, and thrombotic occlusion of an aneurysm leading to a myocardial infarction and possible death. However, prognosis with treatment is excellent, with a mortality rate of less than 0.1%.

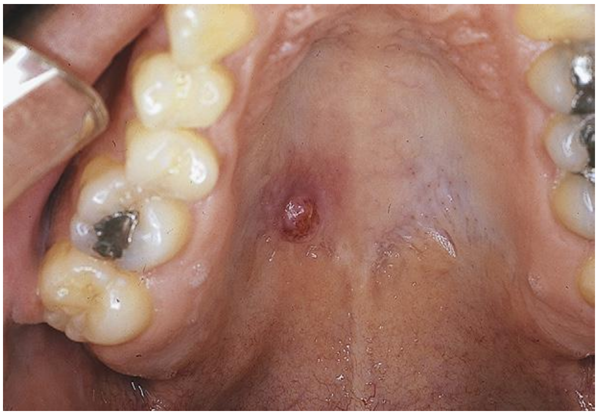
■ INTERVENTIONS: Intravenous immunoglobulin is the primary treatment to reduce inflammation in the acute stage. Aspirin therapy is used until temperatures return to normal. Corticosteroids increase possibility of aneurysm and are contraindicated in treatment of MLNS. Anticoagulant and antiplatelet therapy may be used if there is evidence of coronary thrombosis. If the child develops cardiac complications, percutaneous transluminal coronary angioplasty, coronary bypass grafting, or cardiac transplant may be required.

■ NURSING CONSIDERATIONS: Nursing care is primarily supportive and includes careful monitoring of cardiac status, careful fluid replacement, I & O, comfort measures (lubrication for lips, lotion for skin, and cool cloths), quiet soothing environment, and parental support in attempting to console an irritable child. Parental education is needed about possible cardiac complications. Caregiver instruction in CPR should be provided if cardiac complications are present.



Mucocutaneous lymph node syndrome (Kawasaki disease) *(Hurwitz, 1993/ Courtesy Tomisaku Kawasaki, MD)*

mucoepidermoid carcinoma /myo͞o′kō·ep′idur′moid/ [L, *mucus* + Gk, *epi,* above, *derma,* skin, *eidos,* form], a malignant neoplasm of glandular tissues, especially the ducts of the salivary glands. The tumor contains mucinous and epidermoid squamous cells.



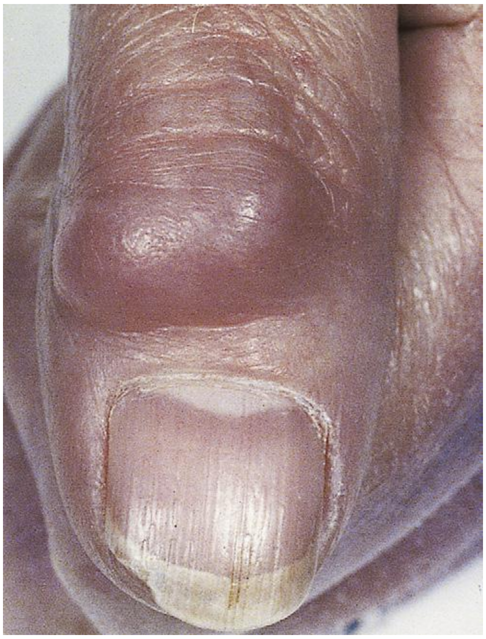
Mucoepidermoid carcinoma *(Regezi, Sciubba, and Pogrel, 2000)*

mucogingival junction /myo͞o′kōjinjī′vəl/ [L, *mucus* + *gingiva,* gum, *jungere,* to join], the scalloped linear area of the gums that separates the free gingiva from the attached gingiva, also called the alveolar mucosa. It can be seen easily by pulling the mandibular lip outward and looking at the labial mucosa of the mandible.

mucogingival line. See **free gingival groove.**

mucoid /myo͞o′koid/ [L, *mucus* + Gk, *eidos,* form], **1.** resembling mucus. **2.** also **mucinoid,** pertaining to a group of glycoproteins, including colloid and ovomucoid, similar to the mucins, primarily differing in solubility.

mucoid cyst [L, *mucus* + Gk, *eidos,* form, *kytis,* bag], a cyst formed by an overgrowth of a mucus gland or by the spread of mucus into the interstitial tissues. Also called **mucous cyst.**



Mucoid cyst *(du Vivier, 2002)*

mucoid tissue. See **embryonic tissue.**

mucolipidosis /myo͞o′kōlip′idō′sis/, any of a group of metabolic disorders characterized by an accumulation of mucopolysaccharides and lipids in the tissues, but without an excess of mucopolysaccharides in the urine. Mucolipidosis includes **I cell disease** (mucolipidosis II) and **pseudo-Hurler polydystrophy** (mucolipidosis III).

mucolipidosis II. See **I cell disease.**

mucolipidosis IV, an autosomal-recessive disorder characterized by psychomotor retardation and severe visual impairment, initially manifest in infancy or childhood as corneal clouding. Sialic acid–containing gangliosides are accumulated as a result of deficient ganglioside sialidase activity. However, the deficiency is not believed to be the primary defect.

mucolytic /myo͞o′kəlit′ik/ [L, *mucus* + Gk, *lysis,* loosening], **1.** exerting a destructive effect on mucus. **2.** any agent that dissolves or destroys mucus.

mucomembranous /myo͞o′kəmem′brənəs/ [L, *mucus* + *membrana,* thin skin, *osus,* having], pertaining to a mucous membrane, such as that of the small intestine or the bladder.

Mucomyst, a trademark for a mucolytic **(acetylcysteine);** also the antidote for acute acetaminophen poisoning.

mucopolysaccharidase /myo͞o′kōpol′ēsak′əridās′/, an enzyme that breaks down molecules of polysaccharides. Also called **mucinase.**

mucopolysaccharide /myo͞o′kōpol′ēsak′ərīd/ [L, *mucus* + Gk, *polys,* many, *sakcharon,* sugar], a polysaccharide containing hexosamine and sometimes occurring with protein, such as mucins.

mucopolysaccharidosis (MPS) /myo͞o′kōpol′ēsak′əridō′sis/ *pl.* **mucopolysaccharidoses** [L, *mucus* + Gk, *polys,* many, *sakcharon,* sugar, *osis,* condition], one of a group of genetic disorders characterized by greater than normal accumulations of mucopolysaccharides in the tissues, with other symptoms specific to each type. The disorders are numbered MPS I through MPS VII, and each type has a specific eponym. All types are characterized by pronounced skeletal deformity (especially of the face), mental and physical retardation, and decreased life expectancy. The disorders may be detected before birth by testing fetal cells present in amniotic fluid. After birth, diagnosis is established through urine testing, skeletal changes observed on radiographic films, and family history. There is no successful treatment. Kinds of mucopolysaccharidosis include **Hunter's syndrome (MPS II), Hurler's syndrome (MPS I), Morquio's disease (MPS IV), sanfilippo's syndrome (MPS III),** and **Sly syndrome (MPS VII).**

mucoprotein /myo͞o′kōprō′tēn, -tē·in/ [L, *mucus* + Gk, *proteios,* first rank], a compound, present in all connective and supporting tissue, that contains polysaccharides combined with protein. It is relatively resistant to denaturation.

mucopurulent /myo͞o′kōpyo͝or′yələnt/ [L, *mucus* + *purulentus,* pus], characteristic of a combination of mucus and pus.

Mucorales, an order of perfect fungi of the class Zygomycetes, made up of bread molds and related fungi. Genera *Absidia, Mucor,* and *Rhizopus* can cause opportunistic mucormycosis in humans.

mucormycosis. See **zygomycosis.**

mucosa /myo͞okō′sə/, *pl.* **mucosae.** See **mucous membrane.**

mucosal immune system /myo͞okō′səl/, the lymphoid tissues of the mucosal surfaces lining the GI, respiratory, and urogenital tracts.

mucosal neuroma syndrome /mo͞oko′säl no͞oro′mä/, multiple endocrine neoplasia, type III.

mucosal prolapse, prolapse of the mucosa in part of the GI tract. In the colon it sometimes occurs with congenital megacolon.

mucositis /myo͞o′kōsī′tis/, any inflammation of a mucous membrane, such as the lining of the mouth and throat.

mucosulfatidosis. See **multiple sulfatase deficiency.**

mucous. See **mucus.**

-mucous, suffix meaning "containing or composed of or secreting mucus": *fibromucous, puromucous, seromucous.*

mucous colitis. See **irritable bowel syndrome.**

mucous cyst. See **mucoid cyst.**

mucous membrane /myo͞o′kəs/ [L, *mucus* + *membrana,* thin skin], any one of four major kinds of thin sheets of tissue that cover or line various parts of the body. Mucous membrane lines cavities or canals of the body that open to the outside, such as the linings of the mouth, the digestive tube, the respiratory passages, and the genitourinary tract. It consists of a surface layer of epithelial tissue covering a deeper layer of connective tissue and protects the underlying structure, secretes mucus, and absorbs water, salts, and other solutes. Also called **mucosa.** Compare **serous membrane, skin, synovial membrane.**

mucous plug, (in obstetrics) a collection of thick mucus in the uterine cervix that is often expelled at the onset of dilation of the cervix, just before labor begins or in its early hours. The plug may be dry and firm, following the shape of the endocervical canal, but more often it is semifluid and mucoid, streaked with blood.

mucous shreds. See **shreds.**

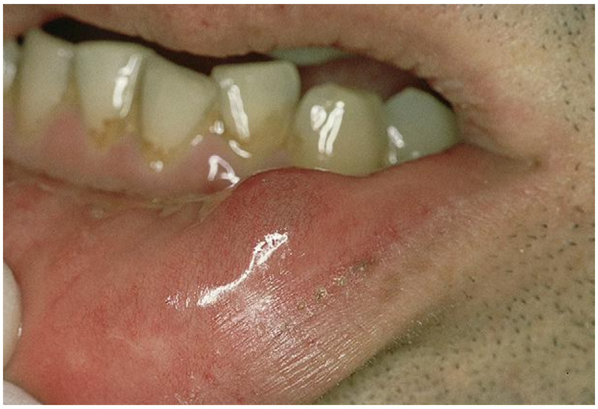
mucous tissue. See **embryonic tissue.**

mucous tumor. See **myxoma.**

mucoviscidosis. See **cystic fibrosis.**

mucus /myo͞o′kəs/ [L, slime], the viscous, slippery secretions of mucous membranes and glands, containing mucin, white blood cells, water, inorganic salts, and exfoliated cells. **—mucoid,** *adj.,* **mucous** /myo͞o'kəs/, *adj.*

mucus extravasation phenomenon, extravasation of mucus into the surrounding connective tissue from a damaged minor salivary gland excretory duct followed by an inflammatory reaction leading to the formation of a pool of macrophages and mucin surrounded by a wall of granulation tissue, visible as a small nodule or vesicle on the oral mucosa. Also called **mucocele.** Compare **mucus retention cyst.**



Mucus extravasation phenomenon

(Regezi, Sciubba, and Jordan, 2008)

mucus retention cyst, a mucus-containing epithelium-lined cavity caused by blockage of a salivary gland duct with mucus, visible as a small nodule on the oral mucosa.

Also called **mucocele.** Compare **mucus extravasation phenomenon.**

mucus trap suction apparatus, a catheter containing a trap to prevent mucus being aspirated from the nasopharynx and trachea of a newborn from entering the mouth of the person operating the device. Mucus traps are also found in adult respiratory equipment. Mucus goes into the trap rather than into the suction bottle and can then be sent for analysis.

mud bath, the application of warm mud to the body for therapeutic purposes.

mud fever, a type of leptospirosis occurring in the summer and autumn in Germany and Russia, caused by *Leptospira interrogans*. It is transmitted to humans by the field mouse *Microtus arvalis* and affects mainly workers in swamps or flooded fields. Also called **autumn fever**.

μF, abbreviation for **microfarad.**

MUGA, abbreviation for *multigated acquisition* scan.

μg, abbreviation for **microgram.**

mulberry molar, a malformed first adult or secondary molar characterized by dwarfing of the cusps and hypertrophy of the enamel surrounding the cusp with agglomeration of masses of globules, giving it the appearance of a mulberry. It is seen in congenital syphilis and certain other diseases. Also called mulberry tooth.

mulibrey nanism /mul′ibrī/, a rare genetic disorder, transmitted as an autosomal-recessive trait, characterized by dwarfism, constrictive pericarditis, muscular hypotonia, anomalies of the skull and face, and characteristic yellow dots in the ocular fundus. The name of the condition is an abbreviation composed of the first two letters of the anatomical sites of the principal defects: *mu*scle, *li*ver, *br*ain, and *ey*es.

müllerian duct /miler′ē·ən, mYl-/ [Johannes P. Müller, German physiologist, 1801–1858], one of a pair of embryonic ducts that become the fallopian tubes, uterus, and vagina in females and that atrophy in males, resulting in formation of the prostatic utricle.

Müller's law /mil′ərz, mYl-/ [Johannes P. Müller], the principle that each type of sensory nerve cell normally responds to only one specific stimulus and gives rise to one sensation. A cell may be excited artificially by other forms of stimuli, but the sensation evoked will be the same. Also called **law of specific nerve energies.**

Müller's maneuver [Johannes P. Müller], an inspiratory effort against a closed airway or glottis. The effort decreases intrapulmonary and intrathoracic pressures and expands pulmonary gas. It is used during fluoroscopic examination to help visualize esophageal varices because it also causes engorgement of intrathoracic vascular structures.

multi- /mul′ti-/, prefix meaning "many": *multicapsular, multifamilial, multipara*.

multiaxial joint. See **ball-and-socket joint.**

multibacillary /mul′tĭbas′ĭlare/, having numerous bacilli. See also **leprosy.**

multicellular /-sel′yələr/, **1.** consisting of more than one cell. **2.** containing many cavities.

multicentric mitosis. See **multipolar mitosis.**

multicomponent virus /-kəmpō′nənt/, a virus that occurs in two or more different particles. Each particle contains only one part of the viral genome.

multidisciplinary care conference, a nursing intervention from the Nursing Interventions Classification (NIC) defined as planning and evaluating patient care with health professionals from other disciplines. See also **Nursing Interventions Classification.**

multidisciplinary health care team /-dis′ipliner′ē/, a group of health care workers who are members of different disciplines, each providing specific services to the patient.

multidrug resistance, **1.** the resistance of tumor cells to more than one chemotherapeutic agent. Resistance may be aided by a P-glycoprotein transmembrane pump that lowers the concentration of drugs in the cell. **2.** the resistance of bacteria, especially *Mycobacterium tuberculosis*, against more than two of the antibiotics that were once effective.

multidrug-resistant organisms, antimicrobial resistance, such as in methicilin-resistant *Staphylococcus aureus* and vancomycin-resistant enterococcis.

multifactorial /-faktôr′ē·əl/ [L, *multus,* many, *facere,* to make], pertaining to or characteristic of any condition or disease resulting from the interaction of many factors, specifically the interaction of several genes, usually polygenes, with or without the involvement of environmental factors. Many disorders, such as spina bifida, neural tube defects, and Hirschsprung's disease, are considered to be multifactorial.

multifactorial inheritance, the tendency to develop a physical appearance, disease, or condition that is a condition of many genetic and environmental factors, such as stature and blood pressure. See also **polygene.**

multifidus, a group of transversospinales muscles that span the length of the vertebral column. They are best developed in the lumbar region.

multifocal /-fō′kəl/ [L, *multus* + *focus,* hearth], characterized by more than two ectopic foci that pace the heart. The foci may be atrial or ventricular.

multifocal atrial tachycardia, an atrial rhythm with a rate exceeding 100 beats/min caused by multifocal atrial activity and characterized by at least three different shapes of P′ waves on the electrocardiogram. The condition is often associated with chronic obstructive lung disease. Also called **chaotic atrial tachycardia.**

multifocal motor neuropathy, an acquired, autoimmune neuropathy characterized by progressive, asymmetric muscle weakness, affecting especially the arms, with little or no sensory deficit. Electrophysiologically, there is a persistent conduction block in motor nerves.

multiform /mul′tifôrm/ [L, *multus,* many, *forma*], an organ, tissue, or other object that appears in more than one shape.

multigenerational model /-jen′ərā′shənəl/, a model of family therapy that focuses on reciprocal role relationships over a period and thus takes a longitudinal approach. The family is viewed as an emotional system in which patterns of interacting and coping, as well as unresolved issues, can be passed down from one generation to the next and can cause stress to the family members onto whom they are projected.

multigenerational transmission process, the repetition of relationship patterns, including divorce, suicide, and alcoholism, associated with emotional dysfunction that can be traced through several generations of the same family.

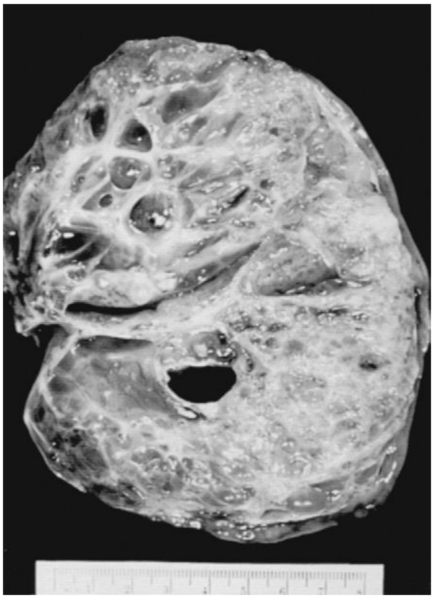
multigravida /mul′tigrav′idə/ [L, *multus* + *gravidus,* pregnancy], a woman who has been pregnant more than once. Compare **multipara, primigravida.**

multihospital system /-hos′pitəl/, a group of two or more hospitals owned, sponsored, or managed by a central organization.

multiinfarct dementia /-infärkt′/ [L, *multus* + *infarcire,* to stuff, *de,* away, *mens,* mind], a form of organic brain disease characterized by the rapid deterioration of intellectual functioning, caused by vascular disease. Symptoms include emotional lability; disturbances in memory, abstract thinking, judgment, and impulse control; and focal neurological impairment, such as gait abnormalities, pseudobulbar palsy, and paresthesia.

multilocular cyst /-lok′yələr/ [L, *multus* + *locilus,* little place; Gk, *kystis,* bag], **1.** a cyst containing several loculi or spaces. **2.** a hydatid cyst with many small irregular cavities that may contain scolices but generally little fluid.

multilocular cyst of kidney, a thick-walled cyst in the kidney, found in clusters and usually unilaterally. In children it contains blastema and may develop into a Wilms' tumor. A variety in adults has more fibrous tissue than the juvenile variety.



Multilocular cyst of kidney *(Wein et al, 2012)*

multipara /multip′ərə/ *pl.* **multiparae** [L *multus* + *parere,* to bear], a woman who has delivered more than one viable infant. Also called **pluripara.** Compare **multigravida, nullipara, primipara.**

multiparity /-per′itē/ [L, *multus,* many, *parere,* to give birth], the status of a mother of more than one child.

multiparous /multip′ərous/ [L, *multus,* many, *parere,* to give birth], having given birth to more than one child.

multipenniform /-pen′ifôrm/ [L, *multus* + *penna,* feather, *forma*], (of a body structure) having a shape resembling a pattern of many feathers, especially the pattern formed by the muscular fasciculi that converge to form several tendons. Compare **bipenniform, penniform.**

multiphase generator /-fāz′/, a generator of x-rays that operates on more than single-phase power. It usually has three phases, which greatly increases the rate at which it produces x-rays.

multiphasic screening /-fā′sik/ [L, *multus* + *phasis,* appearance; ME, *scren*], a technique of screening populations for diseases that combines a battery of screening tests. The technique serves to identify any of several diseases being screened for in a population that is apparently healthy.

multiplanar reformatting (MPR), a technique used in two-dimensional tomographic imaging (computed tomography and magnetic resonance) to generate sagittal, coronal, and oblique views from axial sections.

multiple acyl CoA dehydrogenation deficiency. See **glutaricaciduria.**

multiple autoimmune disorder (MAD) /mul′tipəl/, a condition in which a patient exhibits symptoms of at least two of a group of diseases, including Addison's disease, autoimmune thyroid disease, mucocutaneous candidiasis, hypoparathyroiditis, and insulin-dependent diabetes.

multiple benign cystic epithelioma. See **trichoepithelioma.**

multiple carboxylase deficiency, an autosomal-recessive inherited aminoacidopathy correctable by biotin therapy and caused by deficiency of either of two enzymes necessary for activity of several biotin-containing carboxylases. It is characterized by metabolic ketoacidosis, excretion of organic acids in the urine, hyperammonemia, and variable manifestation of breathing difficulties, hypotonia, seizures, ataxia, alopecia, skin rash, and developmental delay. The neonatal form, caused by deficiency of holocaroxylase synthetase, may progress rapidly to coma; the juvenile form, caused by deficiency of biotinase, is characterized additionally by sensorineural deafness and optic atrophy.

multiple cartilaginous exostoses. See **diaphyseal aclasis.**

multiple endocrine adenomatosis (MEA), a condition characterized by functioning tumors in more than one endocrine gland. The disorder is commonly associated with Zollinger-Ellison syndrome and may involve the pituitary, pancreas, and parathyroid glands. It is also seen in multiple endocrine neoplasia (MEN) type I. Also called **familial multiple endocrine.** See also **adenomatosis.**

multiple endocrine deficiency syndrome. See **polyglandular deficiency syndrome.**

multiple endocrine neoplasia (MEN), a hereditary hormonal disorder that occurs in an autosomal-dominant pattern. The endocrine neoplasms may be expressed as hyperplasia, adenoma, or carcinoma and may develop synchronously or metachronously. Some kinds are **multiple mucosal neuroma syndrome,** Sipple's syndrome, and **Werner's syndrome.** See also **multiple endocrine neoplasia, type I,** and **multiple endocrine neoplasia, type II.**

multiple endocrine neoplasia, type I, a type of multiple endocrine neoplasia that includes tumors of the pituitary, parathyroid glands, and pancreatic islet cells, often with peptic ulcers and sometimes the Zollinger-Ellison syndrome. See also **multiple endocrine neoplasia.**

multiple endocrine neoplasia, type II, a type of multiple endocrine neoplasia characterized by medullary carcinoma of the thyroid, pheochromocytoma, and hyperplasia of the parathyroid glands. See also **multiple endocrine neoplasia.**

multiple exostoses. See **diaphyseal aclasis.**

multiple factor. See **polygene.**

multiple family therapy [L, *multus* + *plica,* fold], psychotherapy in which several families meet weekly to confront and deal with problems or issues that they have in common.

multiple fission, cell division in which the nucleus first divides into several equal parts and then the cytoplasm divides into as many cells as there are nuclei. It is the common form of asexual reproduction in certain acellular organisms. Compare **binary fission.**

multiple fracture, **1.** a fracture break that extends several fracture lines in one bone. **2.** the fracture of several bones at one time or from the same injury.

multiple gene. See **polygene.**

multiple glandular deficiency syndrome. See **polyglandular deficiency syndrome.**

multiple idiopathic hemorrhagic sarcoma. See **Kaposi's sarcoma.**

multiple lentigines syndrome. See **LEOPARD syndrome.**

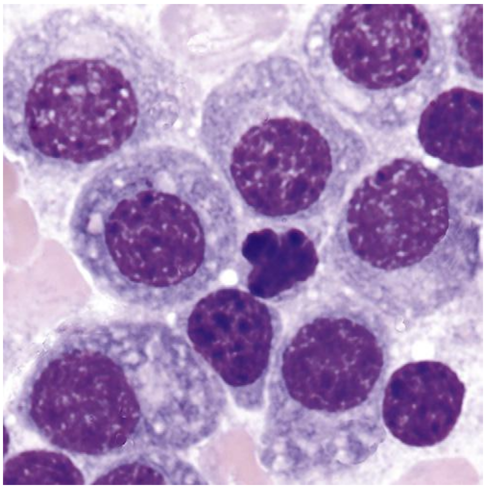
multiple lipomatosis, a rare inherited disorder characterized by discrete localized subcutaneous deposits of fat in the tissues of the body. This fat is not available for metabolic use, even in starvation.

multiple-locus variable number of tandem repeat analysis (MLVA), a laboratory tool designed to recognize tandem repeats and other qualities in the genome of an individual to provide a high resolution DNA fingerprint for the purpose of identification.

multiple mononeuropathy, an abnormal condition characterized by dysfunction of several individual nerve trunks. It may be caused by various diseases, such as necrotizing angiopathy, uremia, diabetes mellitus, and some inflammatory immunological disorders.

multiple mucosal neuroma syndrome, a condition of multiple submucosal neuromas or neurofibromas of the lips, tongue, and eyelids. The disease affects young persons and may be associated with tumors of the thyroid or adrenal medulla or with subcutaneous neurofibromatosis. See also **multiple endocrine neoplasia.**

multiple myeloma, a malignant neoplasm of the bone marrow. The tumor, composed of B lymphocyte plasma cells, disrupts normal bone marrow functions; destroys osseous tissue, especially in flat bones; and causes pain, fractures, hypercalcemia, and skeletal deformities. The onset is insidious, and most people are asymptomatic until the disease is advanced. In addition, the ability of the plasma cells to make functional antibodies decreases, leaving the person immunocompromised. Characteristically abnormal proteins in the plasma and urine, anemia, weight loss, pulmonary complications secondary to rib fractures, and kidney failure are present. The cause is unknown, but radiation and chemical exposure may increase risk. It occurs in people older than 50 years of age and is twice as common among African-Americans as Caucasians. It occurs equally in men and women. Also called **multiple plasmacytoma of bone, myelomatosis, plasma cell myeloma.**



Multiple myeloma *(Carr and Rodak, 2008)*

multiple myositis. See **polymyositis.**

multiple neuroma. See **neuromatosis.**

multiple peripheral neuritis, acute or subacute disseminated inflammation or degeneration of symmetrically distributed peripheral nerves, characterized initially by numbness, tingling in the extremities, hot and cold sensations, and slight fever, progressing to pain, weakness, diminished reflexes, and, in some cases, flaccid paralysis. The disorder may be caused by toxic substances, such as antimony, arsenic, carbon monoxide, copper, lead, mercury, nitrobenzol, organophosphates, and thallium, or by various drugs, including diphenylhydantoin, isoniazid, nitrofurantoin, thalidomide, and vinCRIStine. Multiple peripheral neuritis may occur in alcoholism, arteriosclerosis, beriberi, chronic GI disease, diabetes, leprosy, pellagra, porphyria, rheumatoid arthritis, systemic lupus erythematosus, and many infectious diseases. Therapy consists of removal of the toxic agent or treatment of the causative disease, rest, and medication for pain. See also **Guillain-Barré syndrome.**

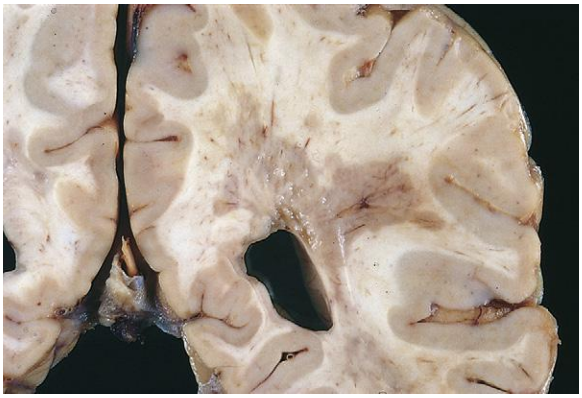
multiple personality disorder. See **dissociative identity disorder.**

multiple plasmacytoma of bone. See **multiple myeloma.**

multiple pregnancy, a pregnancy in which there is more than one fetus in the uterus at the same time.

multiple pterygium syndrome, an autosomal-recessive syndrome characterized by pterygia of the neck, axillae, and popliteal, antecubital, and intercrural areas, accompanied by hypertelorism, cleft palate, micrognathia, ptosis of eyelids, and short stature. Skeletal abnormalities include camptodactyly, syndactyly, clubfoot, and flatfoot, in which the bottom of the foot resembles a rocker, as well as vertebral fusion and rib anomalies. Cryptorchidism is present in males, and labia majora are absent in females. Also called *Escobar syndrome,* **pterygium syndrome.**

multiple sclerosis (MS) [L, *multus* + *plica,* fold; Gk, *sklerosis,* hardening], a progressive disease characterized by disseminated demyelination of nerve fibers of the brain and spinal cord. It begins slowly, usually in young adulthood, and continues throughout life with periods of exacerbation and remission. The first signs are often paresthesias, or abnormal sensations in the extremities or on one side of the face. Other early signs are muscle weakness, vertigo, and visual disturbances, such as nystagmus, diplopia (double vision), and partial blindness. Later in the course of the disease there may be extreme emotional lability, ataxia, abnormal reflexes, and difficulty in urinating. A history of exacerbation and remission of symptoms and the presence of greater than normal amounts of protein in cerebrospinal fluid are characteristic. Most of the brain and spinal cord will show characteristic lesions. As the disease progresses, the intervals between exacerbations grow shorter and disability becomes greater. Treatment involves drugs that affect the function of the immune system; acute episodes, also called exacerbations, are often treated with corticosteroids. Physical therapy may help postpone or prevent specific disabilities. The patient is encouraged to live as normal and active a life as possible. Also called *disseminated multiple sclerosis.*



Multiple sclerosis *(Kumar, Abbas, and Fausto, 2005)*

multiple sclerosis self-management, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to manage multiple sclerosis and prevent disease progression. See also **Nursing Outcomes Classification.**

multiple self-healing squamous epithelioma. See **keratoacanthoma.**

multiple sleep latency test (MSLT), a test of the propensity to fall asleep, often used to diagnose narcolepsy. The subject is given five 20-minute nap opportunities at 2-hour intervals, usually after an overnight polysomnogram. The mean latency to sleep onset and the stages of sleep that occur are determined from polygraph records. Well-rested adults have a mean MSLT of 15 minutes. A mean MSLT of less than 5 minutes indicates severe hypersomnia.

multiple sulfatase deficiency, an autosomal-recessive lysosomal storage disease in which a deficiency of at least nine lysosomal and microsomal sulfatases leads to accumulation of sulfate-containing glycolipids, mucopolysaccharides, and steroids. The disorder generally presents as **sulfatide lipidosis** and later also shows features of *mucopolysaccharidoses,* variably combining phenotypic features of the specific enzymatic defects. Neurological deterioration is rapid. Also called **mucosulfatidosis.**

multiplicative growth. See **hyperplasia.**

multipolar mitosis /-pō′lər/ [L, *multus* + *polus,* pole], cell division in which the spindle has three or more poles and results in the formation of a corresponding number of daughter cells. Also called **multicentric mitosis, pluripolar mitosis.** See also **trisomy.**

multiskilled worker, a health team member with at least the education of a nurse assistant who has been trained to perform selected nursing skills and selected skills from the allied health professions under the supervision of a registered nurse. Duties may include, but are not limited to, bedmaking, bathing, assisting with elimination needs, performing phlebotomy, and recording electrocardiograms.

multisource drug /mul′tisôrs/ [L, *multus* + OFr, *sourse,* origin], a pharmaceutic that can be purchased under any of several trademarks from different manufacturers or distributors. See also **generic equivalent, generic name.**

Multispecialty Medical Group. See **Integrated Multispecialty Group.**

multispecific /-spes′ifik/, pertaining to an antibody that binds to more than one type of antigen.

multisynaptic /-sinap′tik/ [L, *multus* + Gk, *synaptein,* to join], pertaining to a nervous process or system of nerve cells requiring a series of synapses.

multitasking, performing two or more tasks with a computer at the same time. The computer actually processes a small part of one task at a time, switching from one to another in a commutative manner, but it can handle so many pieces of data in brief time segments that the operator or operators are not aware of the computer switching. Also called **time-sharing.**

multivalent /mul′tivā′lənt/ [L, *multus* + *valere,* to be strong], **1.** See **polyvalent. 2.** (in immunology) able to act against more than one strain of organism. Compare **valence.**

multivalent vaccine [L, *multus,* many, *valere,* value, *vaccinus,* cow], a vaccine prepared from several antigenic types within a species. Also called **polyvalent vaccine.**

μm, abbreviation for **micrometer.**

mummification /mum′ifikā′shən/ [Per, *mum,* wax; L, *facere,* to make], a dried-up state, such as occurs in dry gangrene or a dead fetus in utero.

mummified fetus /mum′ifīd/, a fetus that has died in utero and has shriveled and dried.

mumps [D, *mompen,* to sulk], an acute viral disease, characterized by a swelling of the parotid glands, caused by a paramyxovirus. It is most likely to affect children between 5 and 15 years of age, but it may occur at any age. In adulthood the infection may be severe. Passive immunity from maternal antibodies usually prevents this disease in children younger than 1 year of age. The incidence of mumps is highest during the late winter and early spring. The mumps paramyxovirus is present in the saliva of the affected individual and is transmitted in droplets or by direct contact. The virus is present in the saliva from 6 days before to 9 days after the onset of the swelling of the parotid gland. The time of maximum communicability is believed to be the 48-hour period immediately before the start of parotid swelling. The prognosis in mumps is good, but the disease sometimes involves complications, such as arthritis, pancreatitis, myocarditis, oophoritis, and nephritis. About half of the men with mumps-induced orchitis suffer some atrophy of the testicles, but, because the condition is usually unilateral, sterility rarely results. Also called **epidemic parotitis, infectious parotitis.**

■ OBSERVATIONS: The common symptoms of mumps usually last for about 24 hours; they include anorexia, headache, malaise, and low-grade fever. These signs are commonly followed by earache, parotid gland swelling, and a temperature of 101° F to 104° F (38.3° C to 40° C). The patient also experiences pain when drinking acidic liquids or when chewing. The salivary glands also may become swollen. Complications, such as epididymoorchitis and mumps meningitis, may develop. In about 25% of the postpubertal men who contract mumps, epididymoorchitis with associated testicular swelling and tenderness that may persist for several weeks develops. Mumps meningitis develops in 10% of patients with mumps and occurs in three to five times as many male as female patients. Diagnosis of mumps is usually based on typical symptoms, especially parotid gland swelling. If the parotid gland is not swollen, confirming diagnosis may be based on serological antibody tests.

■ INTERVENTIONS: The treatment of mumps commonly includes the respiratory isolation of the patient and the administration of analgesics, antipyretics, and fluids adequate to prevent dehydration associated with fever and anorexia. IV fluids may be administered to the patient who cannot swallow as the result of severe parotitis.

■ NURSING CONSIDERATIONS: The patient is confined to bed and may be given antipyretics and tepid sponge baths to reduce fever. Patients with mumps are also encouraged to drink fluids and to avoid spicy or tart foods and those that require considerable chewing. During the acute phase of the disease, the nurse is especially alert to any signs of central nervous system involvement, such as nuchal rigidity and altered consciousness. All cases of mumps are routinely reported to local health authorities. Nurses aid public health education by stressing the importance of immunization with live attenuated mumps virus for children at 15 months of age and for susceptible people, especially males who are approaching puberty or who are past puberty. Immunization within 24 hours of exposure may prevent the disease or minimize its effects.

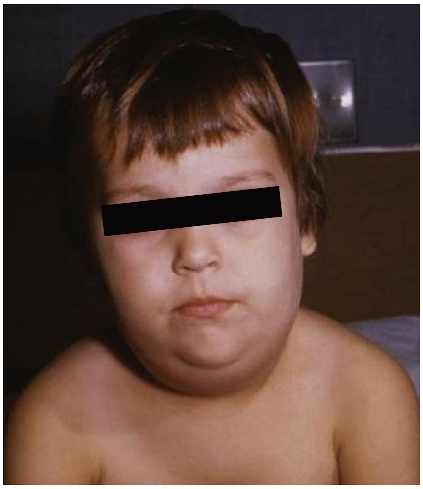
mumps orchitis, an inflammatory disorder of the testis characterized by swelling, with fever, malaise, and acute parotitis. It usually occurs in postpubertal men with a recent history of mumps and may result in testicular atrophy. Also called **orchitis parotidea.**

Mumpsvax, a trademark for an active immunizing agent (live mumps virus vaccine).

mumps virus, a paramyxovirus that causes mumps and sometimes tenderness and swelling of the testes, pancreas, ovaries, or other organs.

mumps virus vaccine live, an active immunizing agent.

■ INDICATION: It can be prescribed for immunization against mumps. People born before 1957 are considered



Mumps *(Centers for Disease Control and Prevention Public Health Image Library ID#4491)*

immune. MMR (mump/measles/rubella) is generally the preferred vaccine for children and adults.

■ CONTRAINDICATIONS: Immunosuppression, concomitant use of corticosteroids, acute infection, pregnancy, or known hypersensitivity to chicken proteins, neomycin, or this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are fevers, parotitis, and allergic reactions.

Münchausen's syndrome /mun′chousənz/ [Baron von Münchausen, German adventurer and confabulator, 1720–1797], an unusual condition characterized by habitual pleas for treatment and hospitalization for a symptomatic but imaginary acute illness. The affected person may logically and convincingly present the symptoms and history of a real disease. Symptoms resolve with treatment, but the person may seek further treatment for another imaginary disease. Also called **pathomimicry.**

Münchausen's syndrome by proxy [Baron von Münchausen], a variation of Münchausen's syndrome in which the parent persistently fabricates or induces illness in a child with the intent of keeping in contact with hospitals and physicians. The child may endure dozens of surgeries and hospitalizations for illness induced by the parent; nearly 9% of the children die as a result. The mother poses as being a good parent by "saving" the child from medical catastrophe, and the child serves as a manipulative object.

mural /myo͞o′rəl/ [L, *murus,* wall], **1.** *adj,* pertaining to something that is found on or against the wall of a cavity, such as a mural thrombus on an interior wall of the heart. **2.** *n,* a painting on a wall.

mural thrombus [L, *murus,* wall], a thrombus that originates in the wall of a cavity, particularly on a diseased patch of endocardium.

Murchison fever. See **Pel-Ebstein fever.**

muriatic acid /mo͞o′rē·at′ik/ [L, *muria,* brine, *acidus,* sour], hydrochloric acid.

murine typhus /myo͞o′rēn/ [L, *mus,* mouse; Gk, *typhos,* stupor], an acute arbovirus infection caused by *Rickettsia typhi* and transmitted by the bite of an infected flea. The disease is similar to epidemic typhus but less severe. It is characterized by headache, chills, fever, myalgia, and rash. After an 8- to 16-day incubation period, fever develops and lasts about 12 days. A dull-red maculopapular rash, mainly on the trunk, appears about the fifth day and lasts for 4 to 8 days. Recovery is usually rapid and complete, but death has occurred in elderly or debilitated people. Weil-Felix and complement fixation tests aid in the diagnosis. Chloramphenicol or tetracycline is usually prescribed in treatment. Prevention involves the elimination of the rodents that are the natural host of the organism and the use of appropriate insecticides to control fleas. Also called **endemic typhus, flea-borne typhus, New World typhus, rat typhus, urban typhus.** Compare **epidemic typhus, Rocky Mountain spotted fever.** See also **Brill-Zinsser disease.**

murmur /mur′mər/ [L, a humming], a gentle blowing, fluttering, or humming sound, such as a heart murmur, susceptible to auscultation. Types of murmurs include systolic, diastolic, and continuous murmurs.

muromonab-Cd3 /myo͞o′rəmon′ab/, a parenteral immunosuppressant drug, a monoclonal antibody that interferes with the function of the T cell antigen recognition receptors.

■ INDICATIONS: It is used to control acute renal transplant rejection, and to control liver or pancreas rejection or graft-versus-host disease when conventional methods are unsuccessful.

■ CONTRAINDICATIONS: Hypersensitivity to muromonab-CD3 or any other murine products, patients in fluid over or those with greater than 3% weight gain over the past week, uncontrolled hypertension, or uncompensated heart failure.

■ ADVERSE EFFECTS: It causes a first-dose effect within 1 to 3 hours that ranges from mild flu-like symptoms to a life-threatening anaphylaxis. Pulmonary edema, fever, chills, breathing difficulty, chest pain, vomiting, nausea, diarrhea, and tremors are among the adverse effects associated with each administration.

Murphy's sign, a test for gallbladder disease in which the patient is asked to inhale while the examiner's fingers are hooked under the liver border at the bottom of the rib cage. The inspiration causes the gallbladder to descend onto the fingers, producing pain if the gallbladder is inflamed. Deep inspiration can be very much limited.

muscarine /mus′kərēn/ [L, *musca,* fly], a choline-related alkaloid present in the poisonous mushroom *Amanita muscaria.* It is similar pharmacologically to acetylcholine, although it is not used in therapeutics.

muscarinic /mus′kərin′ik/ [L, *musca,* fly], **1.** stimulating the postganglionic parasympathetic receptor. **2.** pertaining to the poisonous activity of muscarine.

musca volitans. See **floater.**

muscle (m) /mus′əl/ [L, *musculus*], a kind of tissue composed of fibers or cells that is able to contract, causing movement of body parts and organs. Muscle fibers are richly vascular, excitable, conductive, and elastic. There are two basic kinds—striated muscle and smooth muscle. **Striated muscle,** which composes all skeletal muscles except the myocardium, is long and voluntary. It responds very quickly to stimulation and is paralyzed by interruption of its innervation. **Smooth muscle,** of which all visceral muscles are composed, is short and involuntary. It reacts slowly to all stimuli and does not entirely lose its tone if innervation is interrupted. The myocardium is sometimes classified as a third (cardiac) kind of muscle, but it is basically a striated muscle that does not contract as quickly as the striated muscles of the rest of the body. See also **cardiac muscle.**

muscle albumin, albumin present in muscle.

muscle biopsy [L, *musculus* + Gk, *bios,* life, *opsis,* view], an examination of surgically removed muscle tissue for diagnosis.

muscle bridge, a band of myocardial tissue over one or more of the large epicardial coronary vessels. It may cause constriction of the artery during systole.

muscle cell, any contractile cell peculiar to muscle. Smooth muscle cells are elongated spindle-shaped cells containing a single nucleus and longitudinally arranged myofibrils. Cardiac and skeletal muscle cells are called **muscle fibers.** Also called *myocyte*.

muscle cramp, a sudden intermittent pain in almost any part of the body. It may involve involuntary contractions of variable duration and be accompanied by spasms. Cramps may develop in striated muscle as a result of exertion, high temperature, and excessive loss of sodium, potassium, and magnesium through perspiration. Cramps can also be associated with arthritic conditions and exposure to cold. See also **heat cramp.**

muscle excitability /eksī′təbil′itē/, the ability of a muscle fiber to respond rapidly to a stimulating agent.

muscle fiber, any of the cells of skeletal or cardiac muscle tissue. Skeletal muscle fibers are cylindrical polynuclear cells containing contracting myofibrils, across which run transverse striations, enclosed in a sarcolemma. Cardiac muscle fibers contain one or sometimes two nuclei and myofibrils and are separated from one another by an intercalated disk; although striated, cardiac muscle fibers branch to form an interlacing network.

muscle guarding, a protective response in muscle that results from pain or fear of movement. The condition may be treated through induced relaxation of the muscle by using biofeedback to reduce electromyographic activity.

muscle of expression. See **facial muscle.**

muscle overuse syndrome. See **delayed-onset muscle soreness.**

muscle receptor, a sensory organ that responds to muscle stretch or tension, including muscle spindles and tendon organs. Also called **myoreceptor.**

muscle reeducation, the use of physical therapeutic exercises to restore muscle tone and strength after an injury or disease.

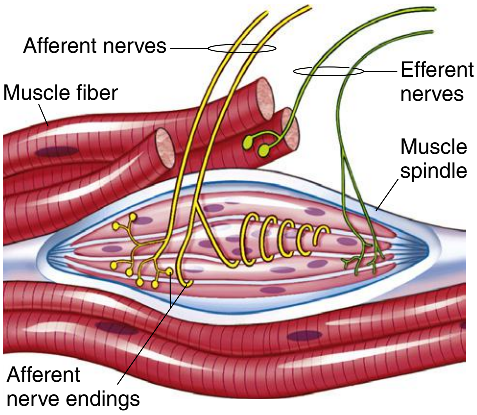
muscle relaxant, an agent that reduces the contractility of muscle fibers. Curare derivatives and succinylcholine compete with acetylcholine and block neural transmission at the myoneural junction. These drugs are used during anesthesia, in the management of patients undergoing mechanical ventilation, and in shock therapy, to reduce muscle contractions in pharmacologically or electrically induced seizures. Several drugs that relieve muscle spasms act at various levels in the central nervous system: baclofen inhibits reflexes at the spinal level; cyclobenzaprine acts primarily in the brainstem; and the benzodiazepines reduce muscle tension, chiefly by acting on mechanisms that control muscle tone. Dantrolene acts directly on muscles in reducing contraction and apparently achieves its effect by interfering with the release of calcium from the sarcoplasmic reticulum.

muscle-setting exercise, a method of maintaining muscle strength and tone by alternately contracting and relaxing a skeletal muscle or group of skeletal muscles without moving the associated body part. Such activity is useful in preventing atrophy of the muscles, especially in patients with conditions involving the joints. See also **isometric exercise.**

muscles of mastication, a group of muscles—the masseter, pterygoideus lateralis, pterygoideus medialis, and temporalis—responsible for movement of the jaws during the process of chewing. All four muscles are innervated by the mandibular division of the trigeminal nerve.

muscles of ventilation [L, *musculus* + *respirare,* to breathe], muscles that provide inspiration, partly by increasing the volume of the chest cavity so that air is drawn into the lungs, including the diaphragm and external intercostal muscles. They are aided during forced breathing by the scalenus muscles, levatores costarum, sternocleidomastoid, pectoralis major, platysma myoides, and serratus superior posterior. Muscles of forced expiration include the external and internal oblique, rectus abdominis, and transverse abdominis.

muscle spindle [L, *musculus* + AS, *spinel*], a specialized proprioceptive sensory organ composed of a bundle of fine striated intrafusal muscle fibers innervated by gamma nerve fibers. Their nuclei are gathered together near the center of each fiber to form a nuclear sac, which is surrounded in turn by sensory, annulospiral nerve endings, all enclosed in a fibrous sheath.



Muscle spindle

muscle testing, a method of evaluating the contractile unit, including the muscle, tendons, and associated tissues, of a moving part of the body by neurological or resistance testing. The tests may include shortened, middle, and lengthened range-of-motion ability; isokinetic measurement of muscle strength, power, and endurance; and functional tests, such as jogging or specific agility drills, as well as radiography, arthroscopy, electromyography, and other medical tests.

muscle tone. See **tonus.**

muscular /mus′kyələr/ [L, *musculus*], **1.** pertaining to a muscle. **2.** characteristic of well-developed musculature.

muscular artery. See **distributing artery.**

muscular atrophy, a condition of motor unit dysfunction, usually the result of a loss of efferent innervation.

muscular branch of the deep brachial artery, one of several similar branches of the deep brachial artery, supplying certain arm muscles, such as the coracobrachialis, biceps brachii, and brachialis.

muscular dystrophy (MD) [L, *musculus* + Gk, *dys,* bad, *trophe,* nourishment], a group of genetically transmitted diseases characterized by progressive atrophy of symmetric groups of skeletal muscles without evidence of involvement or degeneration of neural tissue. In all forms of muscular dystrophy an insidious loss of strength with increasing disability and deformity occurs, although each type differs in the groups of muscles affected, the age of onset, the rate of progression, and the mode of genetic inheritance. The basic cause is unknown but appears to be an inborn error of metabolism. Serum creatine phosphokinase level is increased in affected individuals and acts as a diagnostic aid, especially in asymptomatic children in families at risk. Diagnostic confirmation is made by muscle biopsy, electromyography,

Evaluation of muscle strength *(Seidel et al, 2011)*

and genetic pedigree. Treatment of the muscular dystrophies consists primarily of supportive measures, such as physical therapy and orthopedic procedures to minimize deformity. The main types of the disease are pseudohypertrophic (**Duchenne's muscular dystrophy), limb-girdle muscular dystrophy,** and **facioscapulohumeral muscular dystrophy.** Rarer forms include **Becker's muscular dystrophy, distal muscular dystrophy, ocular myopathy,** and **myotonic muscular dystrophy.** Also called **myodystrophy.** See also **myotonic myopathy.**

muscular fatigue, a condition in which a muscle loses its ability to contract as a result of overactivity. It is usually a period after stimulation during which the muscle is unresponsive to a second stimulus.

muscular incompetence [L, *musculus* + *incompetens*], a failure of a cardiac valve to close properly because of a dysfunction of the papillary muscles of the heart.

muscular sarcoidosis, the formation of epithelioid tubercles in the skeletal muscles, characterized by interstitial inflammation, fibrosis, atrophy, and damage to the muscle fibers as the tubercles form within and replace normal muscle cells. See also **sarcoidosis.**

muscular system, all of the muscles of the body, including the smooth, cardiac, and striated muscles, considered as an interrelated structural group. See also the **Color Atlas of Human Anatomy,** pp. A8–A11.

muscular tone [L, *musculus* + Gk, *tonos,* stretching], a normal degree of tension in muscles at rest.

muscular tremor [L, *musculus* + *tremor,* shaking], minute regular involuntary contraction of individual muscle fasciculi. If the tremors are mild and occasional, the cause may be physiological. Profuse, persistent, or recurrent widespread muscular twitching often indicates a motor neuron disorder.

muscular triangle. See **inferior carotid triangle.**

muscular tumor. See **myoma.**

musculature /mus′kyəlā′chər/, the arrangement and condition of the muscles.

musculi pectinati. See **pectinate muscles.**

musculo-, prefix meaning "muscle."

musculocutaneous nerve /mus′kyəlōkyo͞otā′nē·əs/ [L, *musculus* + *cutis,* skin, *osus,* having], one of the terminal branches of the brachial plexus. It is formed on each side by division of the lateral cord of the plexus into two branches. Various branches and filaments supply different structures, such as the biceps, the brachialis, the humerus, and the skin of the forearm. Compare **median nerve, radial nerve, ulnar nerve.**

musculophrenic artery, a terminal branch of the internal thoracic artery that passes along the costal margin, goes through the diaphragm, and ends near the last intercostal space. Its branches supply the superior part of the anterolateral abdominal wall.

musculoskeletal /mus′kyo͝olōskel′ətəl/ [L, *musculus* + Gk, *skeletos,* dried up], pertaining to the muscles and the skeleton.

musculoskeletal system, all of the muscles, bones, joints, and related structures, such as the tendons and connective tissue, that function in the movement of body parts and organs. See also the **Color Atlas of Human Anatomy,** pp. A8–A11.

musculoskeletal system assessment, an evaluation of the condition and functioning of the patient's muscles, joints, and bones and of factors that may contribute to abnormalities in these body structures.

■ METHOD: The patient is questioned about any pain and edema in muscles, joints, and bones; weakness in extremities; limitations in movements and activities; unsteadiness on the feet; fatigability; insomnia; anorexia; and weight loss. The individual's general appearance, age, blood pressure, pulse, respirations, body alignment, ability or inability to move in bed, gait, need for assistance in walking, handgrip, range of motion, and internal and external rotation of extremities are observed. The presence of contractures, deformities, paralysis, contusions, lacerations, wounds, footdrop, wristdrop, paralysis, crutches, brace, cast, prosthesis, cane, walker, pressure ulcers, allergies, skin rash, or tenseness is noted. It is ascertained whether the patient can perform activities of daily living and is able to sit up and turn, whether constipation is a complaint, and whether the individual is independent or dependent. Concurrent diseases or conditions investigated include injury to the spinal cord, nerve impairment, cerebrovascular accident, rheumatoid arthritis, osteoarthritis, bursitis, polyneuritis, multiple sclerosis, muscular dystrophy, myasthenia gravis, fracture, ruptured disk, Ménière's disease, and labyrinthitis. It is determined whether the patient previously had orthopedic or spinal surgery, poliomyelitis, hemiplegia, cerebral palsy, parkinsonism, a cerebrovascular accident, ataxia, syphilis, hyperparathyroidism, osteoporosis, rickets, osteomalacia, tuberculosis, alcoholism, and impaired vision or hearing. A family history of carcinoma, diabetes, or tuberculosis and the patient's involvement in a hazardous job or recreation, history of previous accidents, and use of tobacco or medications such as steroids, sedatives, tranquilizers, analgesics, antimalarials, acetylsalicylic acid, or indomethacin are determined. Laboratory studies important for the assessment are assays of serum and urine calcium and phosphorus and of alkaline phosphatase serum level. Diagnostic procedures that may be required include x-ray films of bones, arthrograms, myelograms, arteriograms, arthroscopy, biopsies of bone or muscle, incision and drainage of joints, and electromyograms of muscles.

■ INTERVENTIONS: Health care providers conduct the interview to obtain subjective data, make the necessary observations of the patient, and assemble the information on concurrent and previous disorders, the family history, the patient's social and medication background, and the results of laboratory studies and diagnostic procedures.

■ OUTCOME CRITERIA: A meticulous assessment of the patient's musculoskeletal system is a valuable aid in making the diagnosis, planning the course of therapy, predicting the prognosis, and ensuring the patient's safety.

musculospiral nerve. See **radial nerve.**

musculus trigoni vesicae urinariae superficialis, the superficial layer of the trigonal muscles, continuous proximally with the muscles of the ureteral wall.

musculus uvulae, a muscle that elevates and retracts the uvula, thickening the central part of the soft palate and helping the levator veli palatini muscles close the pharyngeal isthmus between the nasopharynx and oropharynx. It originates from the posterior nasal spine on the posterior margin of the hard palate and is innervated by the vagus nerve through the pharyngeal branch to the pharyngeal plexus.

mush bite, a procedure for making simultaneous tooth impressions used in the construction of study models or full or partial dentures. The patient draws his or her upper and lower jaws together into a block of softened wax, thus indicating the spatial relationship between the maxilla and mandible.

mushroom [ME, *mucheron*], the fruiting body of the fungus of the class Basidiomycetes, especially edible members of the order Agaricales, commonly known as field mushrooms or meadow mushrooms. Mushrooms contain some protein and minerals, but they are composed largely of water.

Edible mushroom *Agaricus bisporus* *(Auerbach, 2012)*

mushroom poisoning, a toxic condition caused by the ingestion of certain mushrooms, particularly species of the genus *Amanita*. Muscarine in *A. muscaria* produces intoxication in a few minutes to 2 hours. Symptoms include lacrimation, salivation, sweating, vomiting, labored breathing, abdominal cramps, diarrhea and in severe cases convulsions, coma, and circulatory failure. More deadly but slower-acting phalloidin in *A. phalloides* and *A. verna* causes similar symptoms, as well as liver damage, renal failure, and death. Rapid identification of mushroom poisoning and treatment is critical. According to the Center for Food Safety and Applied Nutrition of the Food and Drug Administration, persons who have ingested poisonous mushrooms and are treated immediately have a mortality rate of 10%, whereas those who are treated 60 or more hours later have a 60% to 90% mortality rate. Also called **phalloidine poisoning.**

mushroom worker's lung, a type of farmer's lung seen in those working on mushroom farms, caused by inhalation of mold spores from mushroom beds.

music therapist, a health professional trained to use music within a therapeutic relationship to address a client's needs, such as facilitating movement and physical rehabilitation, motivating the client to cope with treatment, providing emotional support, and providing an outlet for expressing feelings. A baccalaureate or master's degree and clinical internship are required, after which an individual may take an examination to earn the credential Music Therapist-Board Certified.

music therapy^1 [Gk, *mousike,* music, *therapeia,* treatment], a form of adjunctive psychotherapy in which music is used as a means of recreation and communication, especially with autistic children, and as a means to elevate the mood of depressed and psychotic patients. It is used to effect positive changes in the psychological, physical, cognitive, or social functioning of individuals with health or educational problems and used for a wide variety of indications, including mental disorders, developmental and learning disabilities, neurological disabilities, and the management of pain or stress.

music therapy^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as using music to help achieve a specific change in behavior, feeling, or physiology. See also **Nursing Interventions Classification.**

Musset's sign /mo͝osāz′, sīn/ [Alfred de Musset, French poet, 1810–1857], a rhythmic movement of the head and neck synchronous with each ventricular systole. The disorder is named for the patient in whom the condition was first recorded.

mustard gas /mus′tərd/, a poisonous gas used in chemical warfare during World War I. It causes corrosive destruction of the skin and mucous membranes, often resulting in permanent respiratory damage and death.

mustard plaster [L, *mustum* + Gk, *emplastron*], a counterirritant made from dried mustard, flour, and a small amount of water and spread onto a fabric base that is placed on the skin. It must be used with care since it can cause burns.

mustard poultice. See **poultice.**

Mustargen, a trademark for an antineoplastic (mechlorethamine hydrochloride).

-mustine, suffix for antineoplastic agents, particularly [B-chlorethyl] amine derivatives.

mutacism /myo͞o′təsiz′əm/, mimmation, or the incorrect use of the /m/ sound.

mutagen /myo͞o′təjən/ [L, *mutare,* to change, *genein,* to produce], any chemical or physical environmental agent that induces a genetic mutation or increases the mutation rate. **—mutagenic,** *adj.,* **mutagenicity,** *n.*

mutagenesis /myo͞o′təjen′əsis/, the induction or occurrence of a genetic mutation. See also **teratogenesis.**

Mutamycin, a trademark for an antineoplastic **(mitomycin).**

mutant /myo͞o′tənt/ [L, *mutare,* to change], **1.** *n,* any individual or organism with genetic material that has undergone mutation. **2.** *adj,* relating to or produced by mutation.

mutant gene, any gene that has undergone a change, such as the loss, gain, or exchange of genetic material, that affects the normal transmission and expression of a trait. Such genes can become inactive or show reduced, increased, or antagonistic activity. Kinds of mutant genes are **amorph, antimorph, hypermorph, hypomorph.**

mutase /myo͞o′tās/, any enzyme that catalyzes the shifting of a chemical group or radical from one position to another within the same molecule or occasionally from one molecule to another.

mutation /myo͞otā′shən/ [L, *mutare,* to change], an unusual change in a gene occurring spontaneously or by induction. The change affects the original expression of the gene. If a mutation occurs in the genome of a gamete, the mutation may be transmitted to later generations. **—mutate,** *v.,* **mutational,** *adj.*

mutein /myo͞o′tē·in, m(y)o͞o′tēn/, a protein molecule that results from a mutation.

mutism /myo͞o′tizəm/ [L, *mutus,* mute], the inability to speak because of a physical defect or emotional problem.

muton /myo͞o′ton/, the smallest DNA segment whose alteration can result in a mutation.

mutual goal setting, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collaborating with the patient to identify and prioritize care goals, then developing a plan for achieving those goals. See also **Nursing Interventions Classification.**

mutually exclusive categories /myo͞o′cho͞o·əlē/, categories on a research instrument that are sufficiently precise to allow each subject, factor, or variable to be classified uniquely, such as male/female.

mutual support group, a type of group in which members organize to solve their own problems. It is led by the group members themselves, who share a common goal and use their own strengths to gain control over their lives.

MV, **1.** abbreviation for *megavolt*. **2.** abbreviation for *minute volume*.

mv, mV, abbreviation for **millivolt.**

MVIC, abbreviation for **maximum voluntary isometric contraction.**

mVO_2, symbol for *myocardial oxygen consumption*.

MVP, abbreviation for *mitral valve prolapse*. See **mitral valve prolapse syndrome.**

MVV, abbreviation for **maximum voluntary ventilation.**

M.W.I.A., abbreviation for **Medical Women's International Association.**

MX gene, a human gene that helps the body resist viral infections. When exposed to interferon, the MX gene inhibits the production of viral protein and nucleic acid necessary for the proliferation of new viral particles. The presence of the MX gene helps explain why some individuals are better able to resist certain viral infections, such as influenza, than other people.

my. See **myo-.**

myalgia /mī·al′jə/ [Gk, *mys,* muscle, *algos,* pain], diffuse muscle pain, usually accompanied by malaise. Also called **myoneuralgia.**

myalgic asthenia /mī·al′jik/ [Gk, *mys* + *algos,* pain, *a* + *sthenos,* without strength], a condition characterized by a general feeling of fatigue and muscular pain, often resulting from or associated with psychological stress.

Myambutol, a trademark for an antitubercular (**ethambutol hydrochloride).**

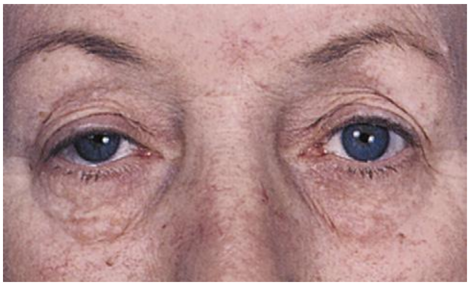
myasthenia /mī′əsthē′nē·ə/ [Gk, *mys* + *a* + *sthenos,* without strength], a condition characterized by an abnormal weakness of a muscle or a group of muscles that may be the result of a systemic myoneural disturbance, such as in myasthenia laryngis, which involves the vocal cord tensor muscles. See also **myasthenia gravis.** **—myasthenic,** *adj.*

myasthenia gravis, an abnormal condition characterized by chronic fatigability and muscle weakness, especially in the face and throat, as a result of a defect in the conduction of nerve impulses at the neuromuscular junction.

■ OBSERVATIONS: Muscular fatigability in myasthenia gravis is caused by the inability of receptors at the myoneural junction to depolarize because of a deficiency of acetylcholine; hence the diagnosis may be made by administering an anticholinesterase drug and observing improved muscle strength and stamina. The onset of symptoms is usually gradual, with ptosis of the upper eyelids, diplopia, and weakness of the facial muscles. The weakness may then extend to other muscles innervated by the cranial nerves, particularly the respiratory muscles. Muscular exertion aggravates the symptoms, which typically vary over the course of the day. The disease occurs in younger women more often than in older women and in men over 60 years of age more often than in younger men.

■ INTERVENTIONS: Anticholinesterase drugs are given. The edrophonium test is used to determine the optimal maintenance dose. Neostigmine or pyridostigmine is the drug most often used.

■ NURSING CONSIDERATIONS: Physical activity is restricted and bed rest encouraged. Anticholinesterase drugs are usually administered before meals, and the patient is monitored for toxic side effects. Myasthenic crisis may require emergency respiratory assistance. The patient's diet may have to be adjusted if the ability to chew and swallow is affected.



Myasthenia gravis: typical facial expression
(Perkin et al, 2011)

myasthenia gravis crisis, an acute exacerbation of the muscular weakness characterizing the disease, triggered by illness, infection, surgery, emotional stress, or an overdose or insufficiency of anticholinesterase medication.

■ OBSERVATIONS: Typical signs and symptoms include worsening diplopia or muscle weakness that can progress to respiratory distress accompanied by apnea, extreme fatigue, increased muscular weakness, dysphagia, dysarthria, and fever. The patient may be anxious, restless, irritable, and unable to move the jaws or to raise one or both eyelids. If the condition is caused by anticholinesterase toxicity, then anorexia, nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, sweating, lacrimation, blurred vision, vertigo, and muscle cramps and spasms, as well as general weakness, dysarthria, and respiratory distress may occur.

■ INTERVENTIONS: Initial treatment is directed to maintaining airway patency. Oxygen with assisted or controlled ventilation is administered. The patient is placed in a bed in which the head is elevated 30 degrees. The withdrawal or reduction of anticholinergic drugs may be ordered, or they may be given to differentiate the kind of crisis. If the eyelids are affected, the eyes may be covered with a patch and soothing eyedrops may be administered. To enable the patient to communicate, the call bell and a pad and pencil are placed within reach. Nourishment is offered between meals, and a daily intake of up to 2000 mL of fluids is encouraged. Walking as tolerated and other activities are planned at the time of the maximum effect of medication. Active or passive range-of-motion exercises of all extremities are performed several times a day, but rest periods are maintained to prevent fatigue and relapse.

■ NURSING CONSIDERATIONS: Before discharge the patient is instructed on the importance of taking the prescribed medication with milk, crackers, or bread at the scheduled time and of reporting toxic side effects and symptoms of recurrent or progressive disease. The nurse points out the need to maintain a regular diet, to exercise to tolerance, to rest, and to avoid infections and exposure to hot or cold weather and the use of alcohol and tobacco. The nurse's help in planning a schedule that conserves energy for essential activities can enable the patient to be relatively independent and self-sufficient.

myasthenic. See **myasthenia.**

myasthenic crisis /mī′asthen′ik/, an acute episode of muscular weakness. See also **myasthenia gravis crisis.**

myc. See **myco-.**

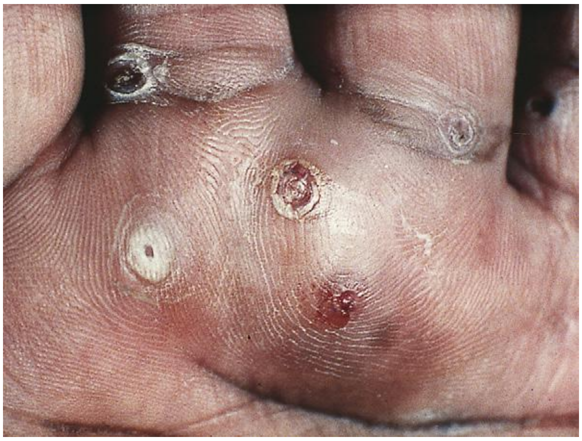
Mycamine, a trademark for **micafungin.**

mycelium /mīsē′lē·əm/. *pl.* **mycelia** [Gk, *mykes,* fungus, *helos,* nail], a mass of interwoven, branched, threadlike filaments that makes up most fungi. Also called **hypha.**

mycetismus /mī′sitiz′məs/ See **mushroom poisoning.**

myceto. See **myco-.**

mycetoma /mī′sətō′mə/ [Gk, *mykes* + *oma,* tumor], a severe fungal infection involving skin, subcutaneous tissue, fascia, and bone. One kind of mycetoma is **Madura foot.**



Mycetoma *(du Vivier, 2002/Courtesy Dr. Rod Hay)*

-mycin, suffix for antibiotics produced by *Streptomyces* strains.

Mycitracin, a trademark for a fixed-combination topical drug containing antibacterials **(polymyxin B sulfate, bacitracin,** and **neomycin sulfate).**

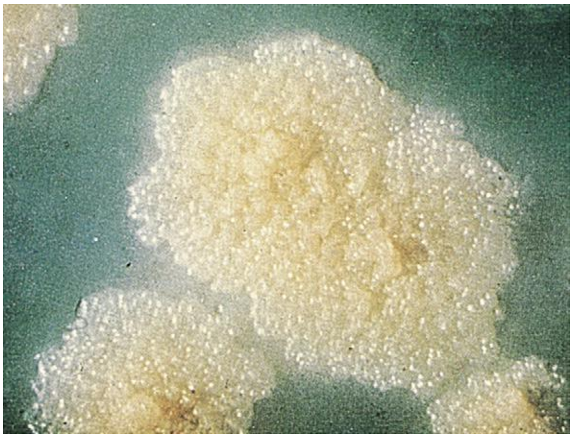
myco-, myc-, myceto-, myko-, prefix meaning "fungus": *mycobacteriosis, mycohemia, mycophage.*

mycobacteria /mī′kōbaktir′ē·ə/ [Gk, *mykes* + *bakterion,* small rod], acid-fast microorganisms belonging to the genus ***Mycobacterium.*** **—mycobacterial,** *adj.*

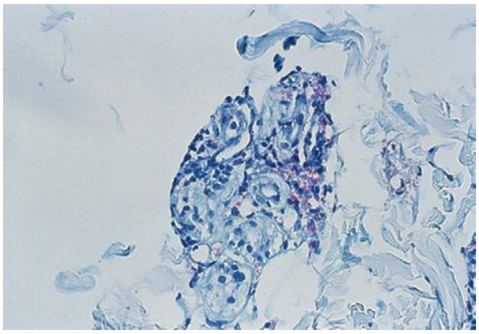
mycobacteriosis /mī′kōbak′tirē·ō′sis/ [Gk, *mykes* + *bakterion* + *osis,* condition], a tuberculosis-like disease caused by mycobacteria other than *Mycobacterium tuberculosis.*

Mycobacterium /mī′kōbaktir′ē·əm/ [Gk, *mykes* + *bakterion,* small rod], a genus of rod-shaped acid-fast bacteria having two significant pathogenic species: *Mycobacterium leprae,* which causes leprosy, and *M. tuberculosis,* which causes tuberculosis. *M. avium* complex or *M. avium-intracellulare* disseminated infection may occur in AIDS and cause cervical adenitis in children and pulmonary disease in immunodeficient patients.

Mycobacterium avium* complex (MAC) disease,** systemic disease caused by infection with organisms of the ***Mycobacterium avium-intracellulare complex in patients with human immunodeficiency virus infection. Manifestations include bacteremia, fever, chills, fatigue, night sweats, weight loss, abdominal pain, anemia, and elevated alkaline phosphatase. Also called *MAC disease.* Compare **mycobacteriosis.**



Mycobacterium tuberculosis colonies
(Forbes, Sahm, and Weissfeld, 2007)



***Mycobacterium leprae* from a skin biopsy from a patient with lepromatous leprosy**
(Mahon, Lehman, and Manuselis, 2007)

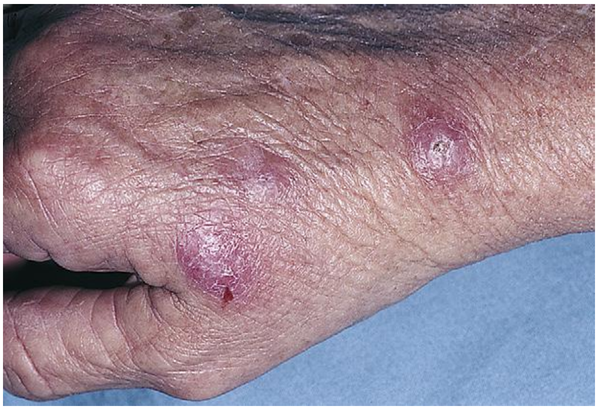
Mycobacterium avium-intracellulare, a complex of slow-growing organisms that cause tuberculosis in birds and swine and is associated with human pulmonary disease, lymphadenitis in children, and serious systemic disease in immunocompromised patients. See also **mycobacteriosis, *Mycobacterium avium* complex disease.**

Mycobacterium bovis, a species of bacteria that causes tuberculosis in cattle and other animals and is transmitted to humans by the ingestion of raw milk contaminated by the microorganism.

Mycobacterium kansasii, a species of slow-growing photochromogenic bacteria that causes tuberculosis-like pulmonary infection in humans. It affects the joints, gonads, spinal fluid, lymph nodes, and viscera. The incidence of this infection has increased with the advent of AIDS.

Mycobacterium leprae, a species of bacteria that causes leprosy. It has not yet been cultivated in vitro. Organisms are isolated from suspect lesions as acid-fast bacilli, typically in intracellular clumps or in groups of bacilli side by side.

Mycobacterium marinum, a species of bacteria that causes a form of tuberculosis in cold-blooded animals including saltwater fish. The bacterium is also found in swimming pools and aquariums and is associated with skin lesions in humans.



Mycobacterium marinum *(Callen et al, 2000)*

Mycolog, a trademark for a topical fixed-combination drug containing a glucocorticoid (triamcinolone acetonide).

mycology /mīkol′əjē/ [Gk, *mykes* + *logos,* science], the study of fungi and fungoid diseases. **—mycologic, mycological,** *adj.,* **mycologist,** *n.*

mycomyringitis. See **myringomycosis.**

mycophenolate mofetil, an immunosuppressant used to prevent rejection of allogeneic cardiac, hepatic, and renal transplants. It is administered orally or intravenously.

■ INDICATIONS: It is used to prevent rejection of organ transplants and for prophylaxis of organ rejection in allogenic cardiac transplants.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to mycophenolic acid prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects are leukopenia, thrombocytopenia, anemia, pancytopenia, renal tubular necrosis, and lymphoma. Other adverse effects are arthralgia, muscle wasting, and stomatitis. Common side effects are diarrhea, constipation, nausea, vomiting, rash, dyspnea, respiratory infection, increased cough, pharyngitis, bronchitis, pneumonia, tremor, dizziness, insomnia, headache, fever, peripheral edema, hypercholesterolemia, hypophosphatemia, edema, hyperkalemia, hypokalemia, hyperglycemia, urinary tract infection, hematuria, hypertension, chest pain, and nonmelanoma skin carcinoma.

mycophenolic acid /mī′kōfinō′lik/, a bacteriostatic and fungistatic crystalline immunosuppressant obtained from *Penicillium brevi compactum* and related species.

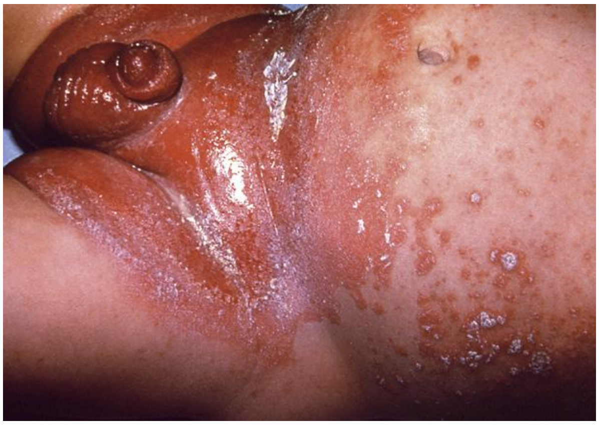
Mycoplasma /mī′kōplaz′mə/ [Gk, *mykes* + *plassein,* to mold], a genus of ultramicroscopic organisms lacking rigid cell walls and considered to be the smallest free-living organisms. Some are saprophytes, some are parasites, and many are pathogens. One species is a cause of mycoplasma pneumonia, tracheobronchitis, pharyngitis, and bullous myringitis. See also **pleuropneumonia-like organism.**

mycoplasma pneumonia, a contagious disease of children and young adults caused by *Mycoplasma pneumoniae.* It is characterized by a 9- to 12-day incubation period and followed by symptoms of an upper respiratory infection, dry cough, and fever. Also called **Eaton agent pneumonia, primary atypical pneumonia, walking pneumonia.** See also **cold agglutinin.**

■ OBSERVATIONS: Harsh or diminished breath sounds and fine inspiratory rales are frequently heard. Pulmonary infiltrates visible on chest x-ray films may resemble those of bacterial or viral pneumonia and may persist for 3 weeks in untreated cases. Rarely, complications such as sinusitis, pleurisy, polyneuritis, myocarditis, or Stevens-Johnson syndrome may follow the pneumonia. In untreated adults prolonged cough, weakness, and malaise are common. Diagnosis is suggested by physical examination and by observation of the clinical course and elevated cold agglutinin level and is confirmed by a complement fixation test. Prognosis is favorable.

■ INTERVENTIONS: Erythromycin or tetracycline, bed rest, a high-protein diet, and an adequate fluid intake are recommended. It is important that infants and people for whom a respiratory illness is particularly hazardous avoid contact with infected individuals.

mycosis /mīkō′sis/ [Gk, *mykes* + *osis,* condition], any disease caused by a fungus. Some kinds of mycoses are **candidiasis, coccidioidomycosis,** and **tinea pedis. —mycotic,** *adj.*



Candidiasis, a kind of mycosis. *(Centers for Disease Control and Prevention Public Health Image Library ID#5143, 1975)*

mycosis fungoides /fung·goi′dēz/, a rare chronic lymphomatous skin malignancy resembling eczema or a cutaneous tumor that is followed by microabscesses in the epidermis and lesions simulating those of Hodgkin's disease in lymph nodes and viscera. The condition is considered a distinctive entity by some specialists and a cutaneous manifestation of a malignant lymphoma by others.

Mycostatin, a trademark for an antifungal **(nystatin).**

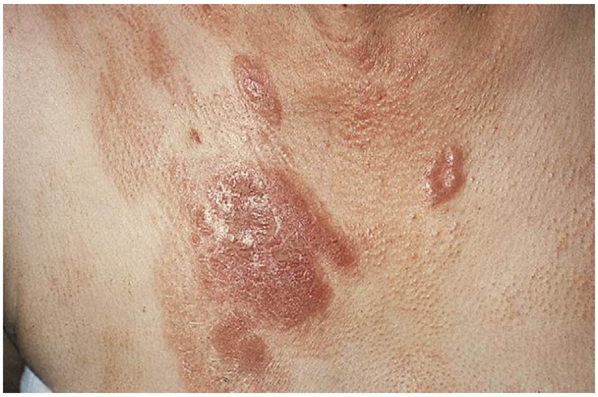
mycotic /mīkot′ik/ [Gk, *mykes,* fungus], pertaining to a disease caused by a fungus.

mycotic aneurysm, a localized dilation in the wall of a blood vessel caused by the growth of a fungus. It usually occurs as a complication of bacterial endocarditis. See also **bacterial aneurysm.**

mycotic endocarditis /mīkot′ik en′do·kär·dī′tis/ [Gk, *mykes,* fungus; Gk, *endon,* within + *kardia,* heart + *-itis,* inflammatory disease suffix], infectious endocarditis caused by infection by a fungus, most commonly ***Candida albicans*** and species of ***Aspergillus*** and *Histoplasma.* Symptoms are usually subacute.

mycotic granuloma of the larynx, a chronic throat condition characterized by white patches on an otherwise bright red mucous membrane. In the southwestern United States it is associated with histoplasmosis of the larynx. It may also be caused by candidiasis as a complication of chemotherapy or an altered immune state.

mycotoxicosis /mī′kōtok′sikō′sis/ [Gk, *mykes* + *toxikon,* poison, *osis,* condition], a systemic poisoning caused by toxins produced by fungal organisms.



Mycosis fungoides *(Callen et al, 2000)*

mycotoxin /mī′kōtok′sins/, a poison produced by fungi that are harmful to other organisms.

mydriasis /midrī′əsis/ [Gk, *mydros,* hot mass], **1.** dilation of the pupil of the eye caused by contraction of the dilator muscle of the iris, a muscular sheath that radiates outward like the spokes of a wheel from the center of the iris around the pupil. With a decrease in light or the pharmacological action of certain drugs, the dilator acts to pull the iris outward, enlarging the pupil. **2.** an abnormal condition characterized by contraction of the dilator muscle, resulting in widely dilated pupils. See also **alternating mydriasis.** Compare **miosis.** **—mydriatic,** *adj.*

mydriatic and cycloplegic agent /mid′rē·at′ik/ [Gk, *mydros* + *kyklos,* circle, *plege,* stroke], any one of several ophthalmic pharmaceutic preparations that dilate the pupil and paralyze the ocular muscles of accommodation. Mydriatics stimulate alpha adrenergic receptors or block cholinergic muscarinic receptors in the eye, temporarily paralyzing the iris sphincter muscle so that the pupil is maximally dilated. Cycloplegics block cholinergic muscarinic receptors, which temporarily paralyzes accommodation by relaxing the ciliary muscle to focus the lens for far vision. These drugs are used in diagnostic and refractive examination of the eye, before and after various procedures in eye surgery, in some tests for glaucoma, and in the treatment of anterior uveitis and certain kinds of glaucoma. Blurred vision, thirst, flushing, fever, and rash may occur. In children and elderly people ataxia, somnolence, delirium, and hallucination may occur but are rare. Among these drugs are atropine, cyclopentolate, homatropine, scopolamine, and tropicamide. They are prepared in solution for topical ophthalmic application.

myectomy, excision of part of a muscle.

myectomy/myotomy, a surgical method of treating total or near-total intestinal aganglionosis. It combines circular excision of seromuscular tissue from a short segment of bowel and a longitudinal myotomy with creation of a stoma, resulting in a short length of functional intestine that will support increasing amounts of enteral nutrition. Also called *myectomyotomy.*

myel. See **myelo-.**

myelacephalus /mī′əlāsef′ələs/ [Gk, *myelos,* marrow, *a* + *kephale,* without head], a fetus, usually a separate monozygotic twin, whose form and parts are barely recognizable; a slightly differentiated amorphous mass. **—myelacephalous,** *adj.*

myelatelia /mī′ələtē′lē·ə/ [Gk, *myelos* + *atelia,* unfinished], any developmental defect involving the spinal cord.

myelauxe /mī′əlôk′sē/ [Gk, *myelos* + *auxe,* increasing], a developmental anomaly characterized by hypertrophy of the spinal cord.

myelencephalon /mī′əlensef′əlon/, the lower part of the embryonic hindbrain, from which the medulla oblongata develops.

-myelia, suffix meaning "(condition of the) spinal cord": *atelomyelia, hydromyelia, syringomyelia.*

myelin /mī′əlin/ [Gk, *myelos,* marrow], a lipoproteinaceous substance constituting the sheaths of various nerve fibers throughout the body and enveloping the axis of myelinated nerves. It is largely composed of phospholipids and protein, which gives the fibers a white, creamy color. **—myelinic,** *adj.*

myelinated /mī′əlinā′tid/, (of a nerve) having a myelin sheath.

myelination /mī′əlinā′shən/ [Gk, *myelos* + L, *atio,* process], the process of furnishing or taking on myelin.

myelin globule, a fatlike droplet found in some sputum.

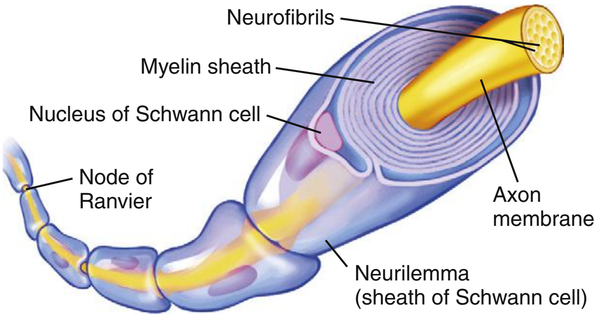
myelinic /mī′əlin′ik/ [Gk, *myelos* + L, *icus,* form of], pertaining to myelin.

myelinic neuroma, a neuroma neoplasm composed of myelinated nerve fibers.

myelinization /mī′əlin′īzā′shən/ [Gk, *myelos* + *izein,* to cause], development of the myelin sheath around a nerve fiber. Also called *myelinogenesis.*

myelinolysis /mī′əlinol′isis/ [Gk, *myelos* + *lysein,* to loosen], a pathological process that dissolves the myelin sheaths around certain nerve fibers, such as those of the pons in alcoholic and undernourished people who are afflicted with central pontine myelinolysis.

myelin sheath, a segmented fatty lamination composed of myelin that wraps the axons of many nerves in the body. The usual thickness of the myelin sheath is between 200 and 800 μm. Various diseases such as multiple sclerosis can destroy myelin wrappings.



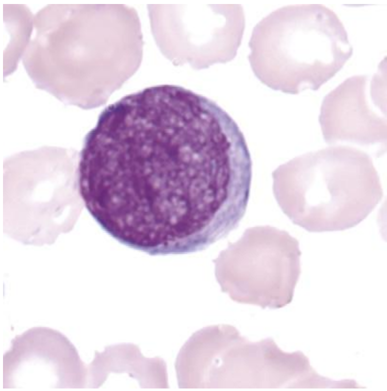
Myelin sheath

myelitis /mī′əlī′tis/, an abnormal condition characterized by inflammation of the spinal cord with associated motor or sensory dysfunction. Some kinds of myelitis are **acute transverse myelitis,** and **poliomyelitis.** **—myelitic,** *adj.*

myelo-, myel-, prefix meaning "spinal cord or bone marrow": *myeloblast, myelocyte, myelomenia.*

myeloablation /mī′əlō·ablā′shən/ [Gk, *myelos,* marrow; L, *ab, latus* carried away], severe myelosuppression. See also **bone marrow suppression.**

myeloblast /mī′əlōblast′/ [Gk, *myelos* + *blastos,* germ], earliest recognizable precursor of the granulocytic leukocytes. The cytoplasm appears light blue, scanty, and nongranular when seen in a stained blood film. The nucleus contains distinct chromatin material in strands, together with several nucleoli. In certain leukemias a marked increase in myeloblasts is observed in the marrow and in the peripheral blood. Compare **megaloblast, myelocyte, normoblast. —myeloblastic,** *adj*.



Myeloblast *(Carr and Rodak, 2008)*

myeloblastemia. See **myeloblastosis.** Not in common usage.

myeloblastic. See **myeloblast.**

myeloblastic leukemia /-blas′tik/, a malignant neoplasm of blood-forming tissues, characterized by many myeloblasts in the circulating blood and tissues. The disease may be a terminal event in the course of chronic granulocytic leukemia, sometimes referred to as "blast crisis."

myeloblastomatosis /mī′əlōblas′tōmətō′sis/ [Gk, *myelos* + *blastos* + *oma*, tumor, *osis*, condition], abnormal localized clusters of myeloblasts in the peripheral circulation.

myeloblastosis /mī′əlōblastō′sis/ [Gk, *myelos* + *blastos* + *osis*, condition], an excess of myeloblasts in the blood.

myelocele /mī′əlōsēl′/ [Gk, *myelos* + *kele*, hernia]. See **myelomeningocele.**

myeloclast /mī′əlōclast′/ [Gk, *myelos* + *klastos*, broken], a cell that breaks down the myelin sheaths of nerves.

myelocyst /mī′əlōsist′/ [Gk, *myelos* + *kystis*, cyst], any benign cyst formed from the rudimentary medullary canals that give rise to the vertebral canal during embryonic development.

myelocystocele /mī′əlōsis′təsēl′/ [Gk, *myelos* + *kystis* + *kele*, hernia]. See **myelomeningocele.**

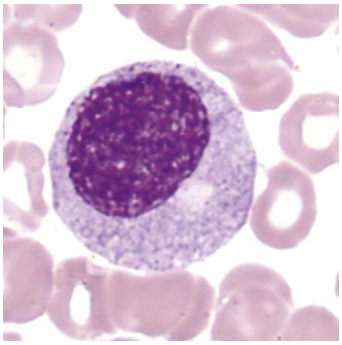
myelocystomeningocele /mī′əlōsis′tōməning′gōsēl/ [Gk, *myelos* + *kystis* + *menix*, membrane, *kele*, hernia]. See **myelomeningocele.**

myelocyte /mī′əlōsīt′/ [Gk, *myelos* + *kytos*, cell], the third of the maturation stages of the granulocytic leukocytes normally found in the bone marrow. Granules are visible in the cytoplasm. The nuclear material of the myelocyte is denser than that of the myeloblast. Myelocytes appear on peripheral blood films in chronic myelogenous leukemia or in severe infection. Compare **myeloblast. —myelocytic,** *adj*.

myelocythemia /mī′əlōsīthē′mē·ə/ [Gk, *myelos* + *kytos* + *haima*, blood], an excessive presence of myelocytes in the circulating blood, such as in myelocytic leukemia. Not in common usage.

myelocytic. See **myelocyte.**

myelocytoma /mī′əlō′sītō′mə/ [Gk, *myelos* + *kytos*, cell, *oma*, tumor], a localized cluster of myelocytes in the peripheral vasculature that may occur in myelocytic leukemia.



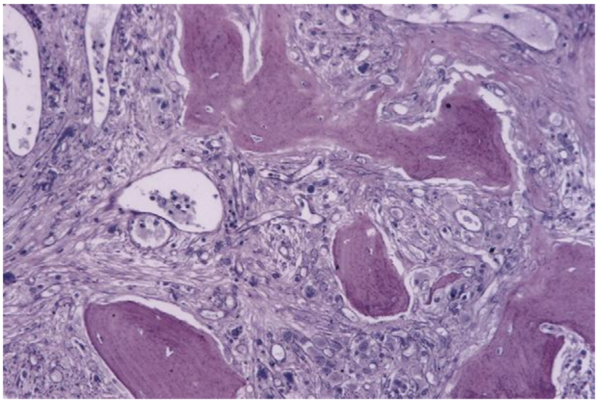
Myelocyte *(Carr and Rodak, 2008)*

myelocytosis. See **myelocythemia.**

myelodiastasis /mī′əlōdī·as′təsis/ [Gk, *myelos* + *diastasis*, separation], disintegration and necrosis of the spinal cord.

myelodysplasia /mī′əlōdisplā′zhə/ [Gk, *myelos* + *dys*, bad, *plassis*, formation], **1.** a general designation for the defective development of any part of the spinal cord. The term is used primarily to describe abnormalities without gross superficial defects, especially of the lower segment, specifically spina bifida occulta. **2.** dysplasia of the myelocytes and other elements in bone marrow.

myelofibrosis /mī′əlōfībrō′sis/, the replacement of bone marrow with fibrous tissue. The condition may be associated with anemia, thrombocytopenia, myeloid metaplasia, new bone formation, polycythemia vera, and other abnormalities. Also called **myelosclerosis.** See also **myeloid metaplasia.** See **primary myelofibrosis.**



Myelofibrosis *(Goldman et al, 2012)*

myelogenesis /-jen′əsis/ [Gk, *myelos* + *genein*, to produce], **1.** the formation and differentiation of the nervous system, in particular of the brain and spinal cord, during prenatal development. See also **neural tube formation. 2.** the development of the myelin sheath around the nerve fiber. See also **myelinization.**

myelogenous /mī′əloj′ənəs/, pertaining to the cells produced in bone marrow or the tissue from which such cells originate. Also *myelogenetic, myelogenic*.

myelogenous leukemia. See **acute myeloid leukemia.**

myelogeny /mī′əloj′ənē/ [Gk, *myelos* + *genein*, to produce], the formation and differentiation of the myelin sheaths of nerve fibers during the prenatal and postnatal development of the central nervous system.

myelogram /mī′əlōgram′/, **1.** an x-ray film taken after the injection of a radiopaque medium into the subarachnoid space to demonstrate any distortions of the spinal cord, spinal nerve roots, and subarachnoid space. **2.** a graphic representation of a count of the different kinds of cells in a stained preparation of bone marrow.

myelography /mī′əlog′rəfē/ [Gk, *myelos* + *graphein,* to record], a radiographic process by which the spinal cord and the spinal subarachnoid space are viewed and photographed after the introduction of a contrast medium. It is used to identify and study spinal lesions caused by trauma or disease. **—myelographic,** *adj.*

myeloid /mī′əloid/ [Gk, *myelos* + *eidos,* form], **1.** pertaining to the bone marrow. **2.** pertaining to the spinal cord. **3.** pertaining to myelocytic forms that do not necessarily originate in the bone marrow.

myeloid leukemia. See **acute myeloid leukemia, chronic myelocytic leukemia.**

myeloid metaplasia, a disorder in which bone marrow tissue develops in abnormal sites. Characteristics of the condition are anemia, splenomegaly, immature blood cells in the circulation, and hematopoiesis in the liver and spleen. Myeloid metaplasia may be secondary to carcinoma, leukemia, polycythemia vera, or tuberculosis. The primary form is called **agnogenic myeloid metaplasia, aleukemic myelosis.**

myeloidosis /mī′əloidō′sis/ [Gk, *myelos* + *eidos,* form, *osis,* condition], an abnormal condition characterized by general hyperplasia of the myeloid tissue. See also **Hodgkin's disease, multiple myeloma.**

myeloma /mī′əlō′mə/ [Gk, *myelos* + *oma,* tumor], an osteolytic neoplasm consisting of a profusion of cells typical of the bone marrow that may develop in many sites and cause extensive destruction of the bone. The tumor occurs most frequently in the ribs, vertebrae, pelvic bones, and flat bones of the skull. Intense pain and spontaneous fractures are common. The tumor is radiosensitive, and local lesions are curable. Kinds of myeloma are **endothelial myeloma, extramedullary myeloma, giant cell myeloma, multiple myeloma,** and **osteogenic myeloma.**

-myeloma, suffix meaning a "tumor composed of cells normally found in bone marrow": *globomyeloma, lymphomyeloma, orchiomyeloma.*

myeloma cast, a urinary cast containing Bence Jones protein and desquamated cells of the tubular epithelium, seen with multiple myeloma in the condition known as myeloma kidney disease.

myeloma kidney disease, a kidney disorder often characterized by irreversible renal failure. It may involve intratubular coalescence of light chain molecules and obstruction of nephronal flow.

myelomalacia /mī′əlōmələ′shə/ [Gk, *myelos* + *malakia,* softening], an abnormal softening of the spinal cord, caused primarily by inadequate blood supply.

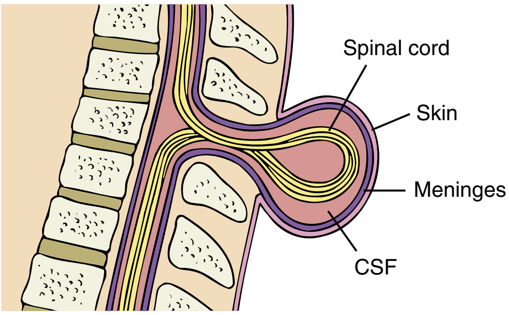
myelomatosis. See **multiple myeloma.**

myelomeningocele /mī′əlō′məning′gōsēl/ [Gk, *myelos* + *menix,* membrane, *kele,* hernia], a developmental defect of the central nervous system in which a hernial sac containing a portion of the spinal cord, its meninges, and cerebrospinal fluid protrudes through a congenital cleft in the vertebral column. The condition is caused primarily by failure of the neural tube to close during embryonic development, although in some instances it may result from the reopening of the tube as a result of an abnormal increase in cerebrospinal fluid pressure. Also called **meningomyelocele, myelocele, myelocystocele, myelocystomeningocele.** Compare **meningocele.** See also **neural tube defect, spina bifida cystica.**

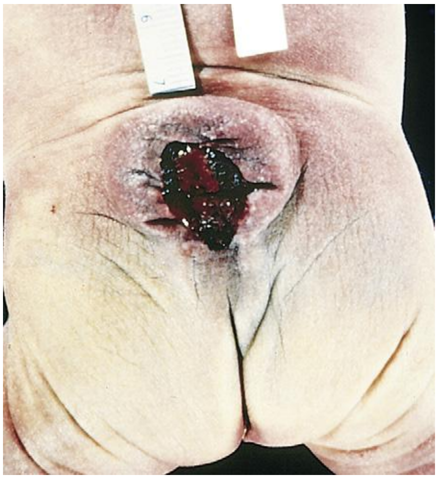
■ OBSERVATIONS: The defect, which occurs in approximately 2 in every 1000 live births, is readily apparent and easily diagnosed at birth. Although the opening may be located at any point along the spinal column, the anomaly characteristically occurs in the lumbar, low thoracic, or sacral region and extends for three to six vertebral segments. The saclike structure may be covered with a thin layer of skin or with a fine membrane that can be easily ruptured, increasing the risk of meningeal infection. The severity of neurological dysfunction is directly related to the amount of neural tissue involved, which can be roughly estimated by the degree of the transillumination of the mass. Usually the condition is accompanied by varying degrees of paralysis of the lower extremities; by musculoskeletal defects such as clubfoot, flexion and joint deformities, or hip dysplasia; and by anal and bladder sphincter dysfunction, which can lead to serious genitourinary disorders. Hydrocephalus, frequently related to the Arnold-Chiari malformation, is the most common anomaly associated with myelomeningocele and occurs in approximately 90% of the cases in which the spinal lesion is located in the lumbosacral region. In most cases, hydrocephalus is apparent at birth, although it may appear shortly afterward. Supplementary diagnostic procedures include x-ray examination of the spine, skull, and chest to determine the extent of the vertebral defect and the presence of other malformations in other organ systems; a computed tomographic scan of the brain to establish the ventricular size and the presence of any structural congenital anomalies; and laboratory examinations, especially urine analysis, culture, blood urea nitrogen evaluation, and creatinine clearance determination. Amniocentesis is recommended for all pregnant women who have had a child with a neural tube defect.

■ INTERVENTIONS: Immediate surgical repair is essential if the defect is leaking cerebrospinal fluid. However, surgical intervention may not be appropriate if neurological involvement is extreme, if the lesion is infected, or if associated problems, such as hydrocephalus, are severe. When surgical repair of the spinal defect is recommended, associated problems are managed by appropriate measures, including shunt procedures for correction of hydrocephalus; antibiotic therapy to reduce the incidence of meningitis, urinary tract infections, and pneumonia; casting, bracing, traction, and surgical techniques for correction of hip, knee, and foot deformities; and prevention and treatment of renal complications. Prognosis is determined by the severity of neurological involvement and the number of associated anomalies. With proper care and long-term maintenance most children can survive and do well. Early death is usually caused by central nervous system infection or by hydrocephalus, whereas mortality in later childhood is caused by urinary tract infection, renal failure, complications from shunt therapy, or pulmonary disease.

■ NURSING CONSIDERATIONS: Immediate care centers on the prevention of local infection and trauma by carefully handling and positioning the infant, applying sterile moist dressings to the membranous sac, avoiding fecal contamination and breakdown of sensitive skin areas, and maintaining warmth, proper nutrition, and adequate hydration and electrolyte balance. Gentle range-of-motion exercises are carried out to prevent or minimize hip and lower extremity deformity. An important function of the nurse is to involve the parents in the care of the infant as soon as possible and to teach them the essential procedures for adequate home care, including how to observe for signs of complications. The nurse also helps the parents in long-term management by planning activities appropriate to the developmental age and physical limitations of the child and by providing information for teaching all family members about the condition.



Myelomeningocele: protrusion of meninges and spinal cord through the skin *(Huether and McCance, 2008)*



Myelomeningocele: clinical presentation
(Kumar et al, 2007)

myelomere /mī′əlōmir′/ [Gk, *myelos* + *meros*, part], any of the embryonic segments of the brain or spinal cord during prenatal development.

myelomonocytic leukemia. See **monocytic leukemia.**

myelopathic anemia. See **myelophthisic anemia.**

myelopathy /mī′əlop′əthē/, **1.** any disease of the spinal cord. **2.** any disease of the myelopoietic tissues.

myeloperoxidase (MPO) /mī′əlōpərok′sidās/, a peroxidase enzyme occurring in phagocytic cells that can oxidize halide ions, producing a bactericidal effect.

myelophthisic anemia /mī′əlofthiz′ik/ [Gk, *myelos* + *phthisis*, wasting], a disorder characterized by anemia and the appearance of immature granulocytes and nucleated erythroid elements in the peripheral blood. Also called **myelopathic anemia.** Compare **hemolytic anemia, leukoerythroblastic anemia.**

myelopoiesis /mī′əlō′pō·ē′sis/ [Gk, *myelos* + *poiein*, to form], the formation and development of bone marrow or the cells that originate from it. A kind of myelopoiesis is **extramedullary myelopoiesis.** **—myelopoietic** /-pō·et′ik/, *adj*.

myeloproliferative neoplasms /mī′əlōprōlif′ərətiv′/, a family of chronic malignant bone marrow and blood diseases caused by mutations that generate clones of myelocytic or erythrocytic precursors and platelet precursors. Diseases include chronic myelogenous leukemia, polycythemia vera, essential thrombocythemia, and primary myelofibrosis.

myeloradiculodysplasia /mī′əlō′rədik′yəlō′dis′plā′zhə/ [Gk, *myelos* + L, *radiculus*, small root; Gk, *dys*, bad, *plassein*, to form], any developmental abnormality of the spinal cord and spinal nerve roots. See also **myelomeningocele, neural tube defect.**

myeloschisis /mī′əlos′kəsis/ [Gk, *myelos* + *schisis*, cleft], a developmental defect characterized by a cleft spinal cord that results from the failure of the neural plate to fuse and form a complete neural tube. See also **myelomeningocele, neural tube defect, neural tube formation, rachischisis, spina bifida.**

myelosclerosis. See **myelofibrosis.**

myelosuppression /-səpresh′ən/. See **bone marrow suppression.**

myenteric plexus /mī′enter′ik/ [Gk, *mys*, muscle, *enteron*, bowel; L, *plexus*, plaited], a group of autonomic nerve fibers and ganglion cells in the muscular coat of the intestine.

myesthesia /mī′esthē′zhə/, perception of any sensation in a muscle, such as touch, direction, proprioception, contraction, relaxation, or extension.

myiasis /mī′yəsis/ [Gk, *myia*, fly, *osis*, condition], infection or infestation of the body by the larvae of flies, usually through a wound or an ulcer, but rarely through intact skin.

myitis. See **myositis.**

myko- See **myco-.**

Myleran, a trademark for an antineoplastic **(busulfan).**

Mylicon, a trademark for an antiflatulent **(simethicone).**

mylohyoideus /mī′lōhī·oi′dē·əs/ [Gk, *myle*, mill, *hyoeides*, upsilon, U-shaped], one of a pair of flat triangular muscles that form the floor of the cavity of the mouth. It is innervated by the mylohyoid nerve and acts to raise the hyoid bone and the tongue. Also called *mylohyoid muscle*. Compare **digastricus, geniohyoideus, stylohyoideus.**

myo-, my-, prefix meaning "muscle": *myocardia, myocele, myolipoma*.

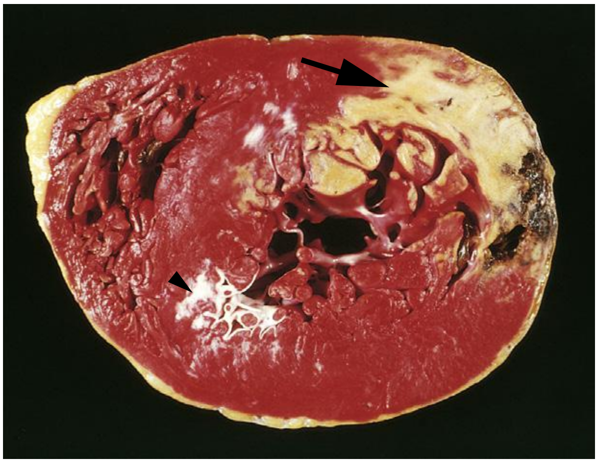
myocardial. See **myocardium.**

myocardial infarction (MI) /mī′ōkär′dē·əl/ [Gk, *mys*, muscle, *kardia*, heart; L, *infarcire*, to stuff], necrosis of a portion of cardiac muscle caused by an obstruction in a coronary artery resulting from atherosclerosis, a thrombus, or a spasm. Also called **heart attack.** See also **acute myocardial infarction.**

■ OBSERVATIONS: The onset of MI is characterized by a crushing, viselike chest pain that may radiate to the left arm, neck, jaw, or epigastrium and sometimes stimulates the sensation of acute indigestion or a gallbladder attack. The patient usually becomes ashen, clammy, short of breath, nauseated, faint, and anxious and often feels that death is imminent. Typical signs are tachycardia, a barely palpable pulse, low blood pressure, mildly elevated temperature, cardiac arrhythmia, and elevation of the S-T segment and Q wave on the electrocardiogram. Laboratory studies usually show an increased sedimentation rate, leukocytosis, and elevated serum levels of creatine kinase and its isoenzyme MB, lactic dehydrogenase and its isoenzymes, and glutamic-oxaloacetic transaminase. Potential complications in MI are pulmonary or systemic embolism, pulmonary edema, acute congestive heart failure, shock, ventricular tachycardia, ventricular fibrillation, and cardiac arrest.

■ INTERVENTIONS: Emergency treatment of MI may require cardiopulmonary resuscitation before the patient reaches the hospital emergency department. Early IV administration of thrombolytic drugs and heparin improves left ventricular function, limits damage, and increases survival rates. Primary percutaneous transvenous coronary angioplasty (PTCA) is being used with increasing frequency and can achieve prompt reperfusion and help prevent the hemorrhagic risks of thrombolysis. Primary PTCA requires a well-staffed, well-equipped cardiac catheterization laboratory that can mobilize within 1 hour and achieve reperfusion within 2 hours.

■ NURSING CONSIDERATIONS: The patient is admitted to an intensive care unit with continual electrocardiographic monitoring at the acute onset. Blood pressure, temperature, respiration, and apical pulse are checked frequently. Parenteral fluids may be administered, and the patient is usually served a low-sodium, low-cholesterol, low-fat diet. Stool softeners and laxatives may be indicated to prevent straining. The nurse's role in helping the patient and family understand the nature and treatment of the disease is extremely important. Before discharge the nurse usually discusses the need to adhere to the prescribed diet and medication, to limit activities, to rest at regular periods, and to avoid caffeine, nicotine, large meals, and emotional stress.



Acute myocardial infarction *(Kumar et al, 2007)*

myocardial insufficiency, inadequate functioning of the heart muscle. See also **heart failure.**

myocardial ischemia, a condition of insufficient blood flow to the heart muscle via the coronary arteries, often resulting in chest pain (angina pectoris). In diagnostic imaging, thallium-201 or other substances are injected into the blood to reveal areas of myocardial ischemia.

myocardial perfusion, the flow of blood to the heart muscle.

myocardiograph /mī′ōkär′dē·əgraf′/, a tracing device for recording the activity of heart muscle.

myocardiopathy /mī′ōkär′dē·op′əthē/ [Gk, *mys,* muscle, *kardia,* heart, *pathos,* disease]. See **cardiomyopathy.**

myocarditis /mī′ōkärdī′tis/ [Gk, *mys* + *kardia* + *itis,* inflammation], inflammation of the myocardium. It may be caused by viral, bacterial, or fungal infection; serum sickness; rheumatic fever; or a chemical agent; or it may be a complication of a collagen disease. Myocarditis most frequently occurs in an acute viral form and is self-limited, but it may lead to acute heart failure. Management includes treatment of the cause, analgesia, oxygen, antiinflammatory agents, constant monitoring, and rest to prevent shock or heart failure. See also **acute primary myocarditis, acute secondary myocarditis, acute septic myocarditis.**

myocardium /mī′ōkär′dē·əm/ [Gk, *mys,* muscle, *kardia,* heart], a thick contractile middle layer of uniquely constructed and arranged muscle cells that forms the bulk of the heart wall. The myocardium contains a minimum of other tissue, except blood vessels, and is covered interiorly by the endocardium. The contractile tissue of the myocardium is composed of fibers with the characteristic cross-striations of muscular tissue. The fibers are about one third as large in diameter as those of skeletal muscle and contain more sarcoplasm. They branch frequently and are interconnected to form a network that is continuous except where the bundles and the laminae are attached at their origins and insertions into the fibrous trigone of the heart. Myocardial muscle contains less connective tissue than does skeletal muscle. Specially modified fibers of myocardial muscle constitute the conduction system of the heart, including the sinoatrial node, the atrioventricular (AV) node, the AV bundle, and the Purkinje fibers. Most of the myocardial fibers function to contract the heart. The metabolic processes of the myocardium are almost exclusively aerobic. Many key enzymatic reactions of the heart, such as the citric acid cycle and oxidative phosphorylation, take place in the highly concentrated myocardial sarcosomes. The process of oxidative phosphorylation produces adenosine triphosphate (ATP), the immediate energy source for myocardial contraction. Oxygen, which significantly affects ATP production and contractibility, is a critical metabolic component of the myocardium, which consumes from

6.5 to 10 mL/100 g of tissue per minute. Without this oxygen supply, myocardial contractions decrease in a few minutes. The myocardium maintains a relatively constant level of glycogen in the form of sarcoplasmic granules. Compare **epicardium.** See also **cardiac muscle. —myocardial,** *adj*.

myoclonic encephalopathy of childhood. See **Kinsbourne's syndrome.**

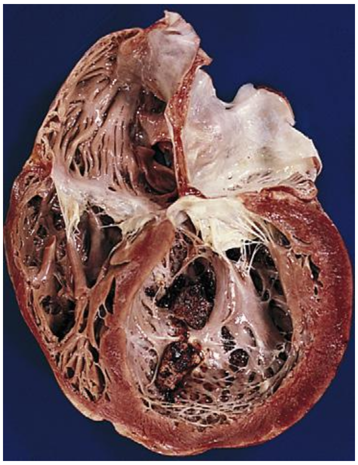
myoclonic seizure, a seizure characterized by a brief episode of myoclonus (brief lightning-like jerks), with immediate recovery and often without loss of consciousness.

myoclonus /mī′ōklō′nəs/ [Gk, *mys* muscle; + *klonos*, contraction], a spasm of a muscle or a group of muscles. **—myoclonic,** *adj*.

myocutaneous flap /mī′ōkyo͞o·tā′nē·əs/ [Gk, *mys*, muscle; L, *cutis*, skin], a compound flap of skin and muscle with adequate vascularity to permit sufficient tissue to be transferred to the recipient site.

myocyte /mī′əsīt/, a muscle cell.

myodiastasis /mī′ōdī·as′təsis/ [Gk, *mys* + *diastasis*, separation], an abnormal condition in which there is separation of muscle bundles.



Dilated myocardiopathy *(Damjanov and Linder, 2000)*

myodystrophy. See **muscular dystrophy.**

myoedema /mī′ō·idē′mə/, *pl*. **myoedemas, myoedemata,** muscle edema. Compare **myxedema.**

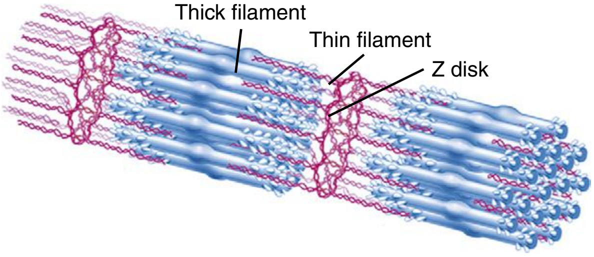
myoelectric, pertaining to the electric property of muscle.

myofascial /mī·ōfa′shē·əl/, pertaining to a muscle and its sheath of connective tissue, or fascia.

myofascial pain, jaw muscle distress associated with chewing or exercise of the masticatory muscles.

myofascial release, a set of massage techniques used to relieve muscle pain resulting from abnormally tight fascia.

myofibril /-fī′bril/ [Gk, *mys* + L, *fibrilla*, small fiber], a slender striated strand within skeletal and cardiac muscle fibers and composed of bundles of myofilaments. Myofibrils occur in groups of branching threads running parallel to the cellular long axis of the fiber.



Molecular structure of a myofibril
(Patton and Thibodeau, 2010)

myofilament /mī′ōfil′ə·mənt/ [Gk, *mys*, L, *filare*, to spin], any of the numerous ultramicroscopic threadlike structures occurring in bundles in the myofibrils of striated muscle fibers. The thick filaments of **myosin** and the thin filaments of **actin** are together responsible for the contractile properties of muscle. Also present are intermediate filaments, of uncertain function. See also **myofibril.**

myogelosis /mī′ōjəlō′sis/ [Gk, *mys* + L, *gelare*, to freeze; Gk, *osis*], a condition in which there are hardened areas or nodules within muscles, especially the gluteal muscles. There are no serious consequences of this condition, and no treatment is necessary.

myogenic /mī′ōjen′ik/ [Gk, *mys* + *genesis*, origin], generated by muscles. The term usually refers to rhythmic activity in cardiac and smooth muscles, which do not require neural input to initiate and maintain contractions.

myoglobin /mī′ōglō′bin/ [Gk, *mys* + L, *globus*, ball], a ferrous globin complex in muscle consisting of one heme molecule containing one iron molecule attached to a single globin chain. Myoglobin is responsible for the red color of muscle and for its ability to store oxygen. Normal blood levels of myoglobin are 0-85 ng/mL. Excessive myoglobin levels may result from burns, muscle-wasting diseases, acute myocardial infarction, or trauma.

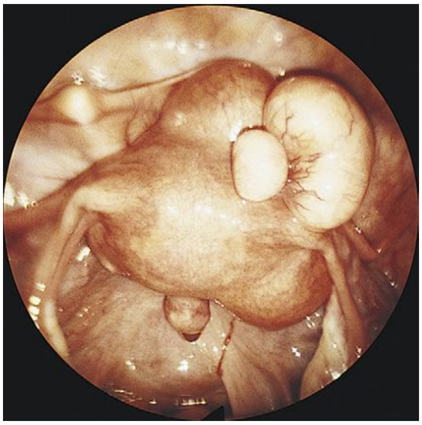
myoglobin test, a blood test that detects levels of myoglobin, an oxygen-binding protein found in cardiac and skeletal muscle. Measurement of myoglobin is an index of damage to the myocardium in myocardial infarction or reinfarction, and also an indicator of disease or trauma of the skeletal muscle.

myoglobinuria /-glō′binŏŏr′ē·ə/ [Gk, *mys* + L, *globus* + Gk, *ouron*, urine], the presence of myoglobin, an oxygen-storing pigment of muscle tissue, in the urine. The condition usually occurs after massive muscle injury, physical trauma, or electrical injury. The urine has a brown discoloration.

myoglobinuric renal failure /-glō′binŏŏr′ik/, a kidney disease in which large amounts of filtered myoglobin coalesce in the tubules, obstructing nephronal flow and producing epithelial cell injury.

myokinase. See **adenylate kinase.**

myoma /mī·ō′mə/ *pl.* **myomas, myomata** [Gk, *mys* + *oma*, tumor], a common benign fibroid tumor of the uterine muscle. The tumor develops most frequently after 30 years of age in women, especially African-American women, who have never been pregnant. Menorrhagia, backache, constipation, dysmenorrhea, dyspareunia, and other symptoms develop in proportion to the size, location, and rate of growth of the tumor.



Multiple myomas: laporascopic view *(Hunt, 1999)*

myoma previum. See leiomyoma uteri.

myomas. See **myoma.**

myoma striocellulare. See **rhabdomyoma.**

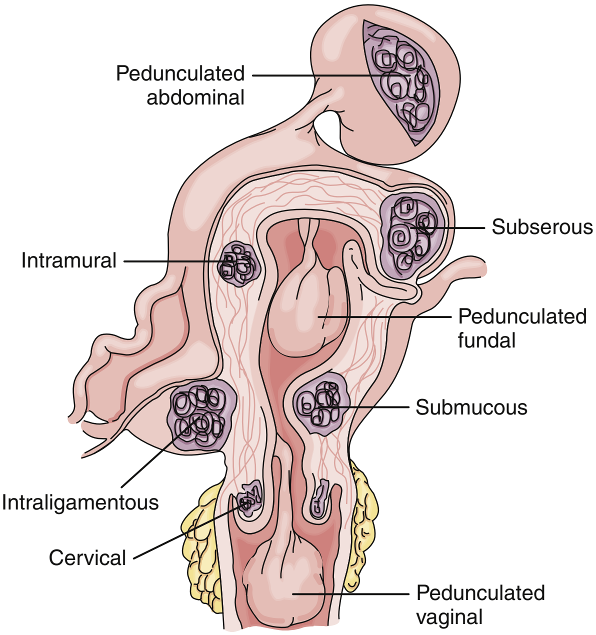
myomata. See **myoma.**

myomectomy /mī′ōmek′təmē/, the surgical removal of muscle tissue.

myomere. See **myotome.**

myometria. See **myometrium.**

myometritis /mī′ōmətrī′tis/, an inflammation or infection of the myometrium of the uterus.



Common locations for myomas of the uterus
(Monahan et al, 2007)

myometrium /mī′ōmē′trē·əm/ *pl.* **myometria** [Gk, *mys* + *metra*, womb], the muscular layer of the wall of the uterus. The smooth muscle fibers of the myometrium course around the uterus horizontally, vertically, and diagonally.

myonecrosis /mī′ōnekrō′sis/ [Gk, *mys* + *necrosis*, death], the death of muscle fibers. **Progressive,** or **clostridial, myonecrosis** is caused by the anaerobic bacteria of the genus ***Clostridium.*** Seen in deep wound infections, progressive myonecrosis is accompanied by pain, tenderness, a brown serous exudate, and a rapid accumulation of gas within the muscle tissue. The affected muscle turns a blackish green. Treatment includes thorough wound debridement, IV administration of penicillin, and hyperbaric oxygen therapy to destroy the anaerobe and to promote healing.

myoneural /mī′ōnŏŏr′əl/ [Gk, *mys* + *neuron*, nerve], pertaining to a muscle fiber and the synapse of the motor neuron, especially a nerve ending in a muscle.

myoneuralgia. See **myalgia.**

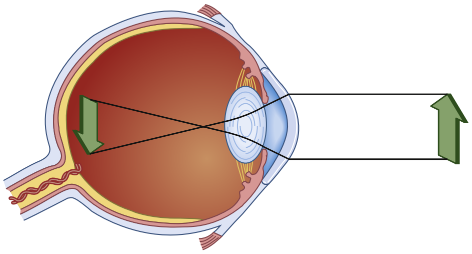
myoneural junction. See **end plate.**

myopathy /mī·op′əthē/ [Gk, *mys* + *pathos*, disease], an abnormal condition of skeletal muscle characterized by muscle weakness, wasting, and histological changes within muscle tissue, as seen in any of the muscular dystrophies. A myopathy is distinct from a muscle disorder caused by nerve dysfunction. The specific diagnosis is made by using tests of serum enzyme levels, electromyography, and muscle biopsy. See also **muscular dystrophy. —myopathic,** *adj*.

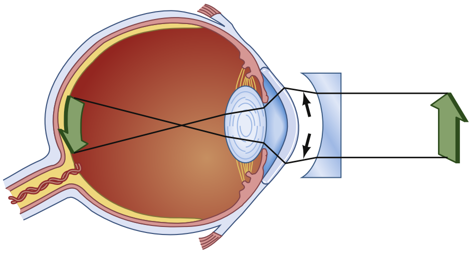
myope /mī′ōp/, an individual who is nearsighted or afflicted with myopia.

myophosphorylase deficiency glycogenosis. See **McArdle's disease.**

myopia /mī·ō′pē·ə/ [Gk, *myops*, nearsighted], a condition of nearsightedness caused by the elongation of the eyeball or by an error in refraction so that parallel rays are focused in front of the retina. Myopia can be classified as **curvature myopia, index myopia,** and **pathological myopia.** Also called **nearsightedness, short sight, shortsightedness. —myopic,** *adj.*



Uncorrected



Corrected

Myopia *(Patton and Thibodeau, 2010)*

myopic shift. See **prodromal myopia.**

myoreceptor. See **muscle receptor.**

myorrhaphy /mī·ôr′əfē/ [Gk, *mys* + *rhaphe,* suture], suturing of a wound in a muscle.

myorrhexis /mī′ərek′sis/ [Gk, *mys* + *rhexis,* rupture], the tearing of any muscle. **—myorrhectic,** *adj.*

myosarcoma /mī′ōsärkō′mə/ [Gk, *mys* + *sarx,* flesh, *oma,* tumor], a malignant tumor of muscular tissue.

myosin /mī′əsin/ [Gk, *mys* + *in,* within], a protein that makes up close to one half of the total protein in muscle tissue. The interaction between myosin and another protein, actin, is essential for muscle contraction. See also **actino-.**

myositis /mī′əsī′tis/, inflammation of muscle tissue, usually of voluntary muscle. Causes of myositis include infection, trauma, and infestation by parasites. Kinds of myositis include **epidemic myositis, myositis fibrosa, parenchymatous myositis, polymyositis,** and **traumatic myositis.** Also called **myitis** /mī·ī′tis/. Compare **fibromyalgia.**

myositis fibrosa, an uncommon inflammation of the muscles, characterized by abnormal formation of connective tissue. Also called **interstitial myositis.** See also **myositis.**

myositis ossificans /əsif′əkanz/, a rare inherited disease in which muscle tissue is replaced by bone. It begins in childhood, with stiffness in the neck and back, and progresses to rigidity of the spine, trunk, and limbs. The administration of diphosphonates may prevent the abnormal deposition of bone, but there is no cure after it has occurred. Metabolism of calcium and phosphate remains normal throughout the course of the disease. Compare **myositis.**

myositis ossificans progressiva, a progressive disease beginning in early life, in which the muscles are gradually converted into bony tissue. Also called **fibrodysplasia ossificans progressiva, progressive ossifying myositis.**

myositis purulenta, any bacterial infection of muscle tissue. This condition may result in the formation of an abscess or multiple abscesses.

myositis trichinosa /trik′ənō′sə/, inflammation of the muscles resulting from infection by the parasite *Trichinella spiralis.* See also **trichinosis.**

myostasis /mī′ōstā′sis/ [Gk, *mys* + *stasis,* standing], a condition of muscle weakness in which the resting length of the muscle is shorter than normal, which reduces the maximal tension the muscle can develop when it contracts. In a normal muscle, the force of contraction is greatest at the resting length. **—myostatic,** *adj.*

myostatic reflex. See **deep tendon reflex.**

myostroma /mī′əstrō′mə/ [Gk, *mys* + *stroma,* covering], the framework of muscle tissue.

myotenotomy /-tenot′əmē/ [Gk, *mys* + *tenon,* tendon, *temnein,* to cut], surgical division of the whole or part of a muscle by cutting through its main tendon.

myotherapy /-ther′əpē/, a technique of corrective muscle exercises involving pressure on fingers and joints to relieve pain or spasms.

myotome /mī′ətōm/ [Gk, *mys* + *temnein,* to cut], **1.** also called **myomere,** the muscle plate of an embryonic somite that develops into a voluntary muscle. **2.** a group of muscles innervated by a single spinal segment. **3.** an instrument for cutting or dissecting a muscle.

myotomic muscle /-tom′ik/, any of the numerous muscles of the trunk of the body, derived from the myotomes and divided into the deep muscles of the back and the thoracoabdominal muscles.

myotomy /mī·ot′əmē/ [Gk, *mys* + *temnein,* to cut], the dissection or cutting of a muscle, performed to gain access to underlying tissues or to relieve constriction in a sphincter, such as in severe esophagitis or pyloric stenosis. With the patient under general anesthesia, a longitudinal cut is made through the sphincter muscle but not through the mucosa lining the stomach. See also **abdominal surgery.**

Myotonachol, a trademark for a cholinergic **(bethanechol chloride).**

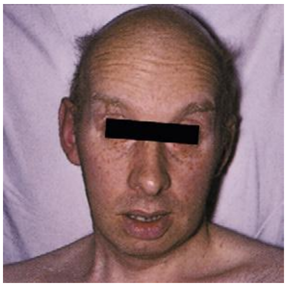
myotonia /mī′ətō′nē·ə/ [Gk, *mys* + *tonos,* tone], any condition in which a muscle or a group of muscles does not readily relax after contracting. **—myotonic,** *adj.* Compare **amyotonia.**

myotonia atrophica. See **myotonic muscular dystrophy.**

myotonia congenita /konjen′itə/, a rare mild and nonprogressive form of myotonic myopathy evident early in life. The only effects of the disorder are hypertrophy and stiffness of the muscles. Also called **Thomsen's disease.**

myotonic. See **myotonia.**

myotonic muscular dystrophy /-ton′ik/, a severe form of muscular dystrophy marked by ptosis, facial weakness, and dysarthria. Weakness of the hands and feet precedes that in the shoulders and hips. Myotonia of the hands is usually present. Electromyography is helpful in establishing the diagnosis. Although there is no specific treatment, active and



Myotonic muscular dystrophy: characteristic facial expression *(Perkin et al, 2011)* passive exercises are used to alleviate symptoms. Also called **myotonia atrophica, Steinert's disease.**

myotonic myopathy, any of a group of disorders characterized by increased skeletal muscle tone and decreased relaxation of muscle after contraction. Kinds of myotonic myopathy include **myotonia congenita, myotonic muscular dystrophy.**

myotube /mi′oto͞ob/, a developing muscle cell or fiber with a centrally-located nucleus.

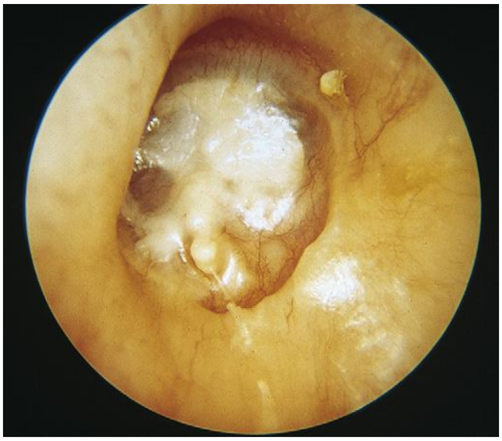
MyPlate, an icon that replaced the United States Department of Agriculture's food pyramid in 2011.

myria-, prefix meaning "a great number": *myriapod*.

myringa. See **tympanic membrane.**

myringectomy /mir′injek′təmē/ [L, *myringa*, eardrum; Gk, *ektomē*, excision], excision of the tympanic membrane.

myringitis /mir′injī′tis/ [L, *myringa* + Gk, *itis*], inflammation or infection of the tympanic membrane.



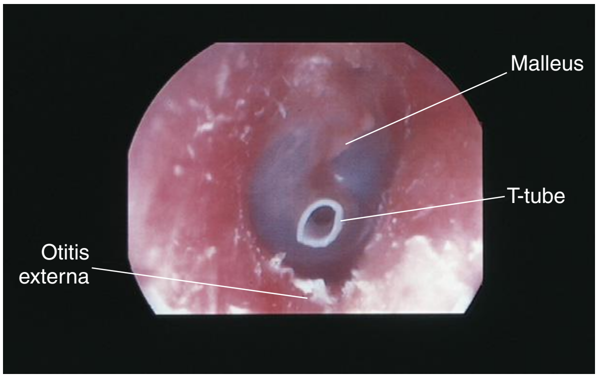
Myringitis *(Stone and Gorbach, 2000/Courtesy Dr. N. Blevins, New England Medical Center)*

myringo-, prefix meaning "related to the tympanic membrane": *myringodectomy, myringoplasty, myringoscope*.

myringomycosis /miring′gōmīkō′sis/ [L, *myringa* + Gk, *mykes*, fungus, *osis*, condition], a fungal infection of the tympanic membrane. Also called **mycomyringitis.**

myringoplasty /miring′gōplas′tē/ [L, *myringa* + Gk, *plassein*, to mold], surgical repair of perforations of the eardrum with a tissue graft, performed to correct hearing loss. The openings in the eardrum are enlarged, and the grafting material is sutured over them. Topical antibiotics are applied, then a packing of absorbable gelatin sponge to hold the graft in position. After surgery an antihistamine with an ephedrine derivative is given. The nurse keeps the outer ear clean and dry. Debris is removed by gentle suctioning about 12 days after surgery. See also **myringotomy, tympanoplasty.**

myringotomy /mir′ing·got′əmē/ [L, *myringa* + Gk, *temnein*, to cut], surgical incision of the eardrum, performed to relieve pressure and release pus or fluid from the middle ear. Antibiotics are given before surgery and continued afterward. The drum is incised, and cultures may be taken. Fluid is gently suctioned from the middle ear. Eardrops may be instilled, or tubes may be inserted to improve drainage. The nurse cautions against putting cotton in the canal because the ear must drain freely. The outer ear is kept clean and dry. If pain increases, the procedure may have to be repeated. Severe headache or disorientation must be reported. Earplugs are required for swimming and showers if tubes are used. Also called **tympanostomy, tympanotomy.** See also **myringoplasty.**



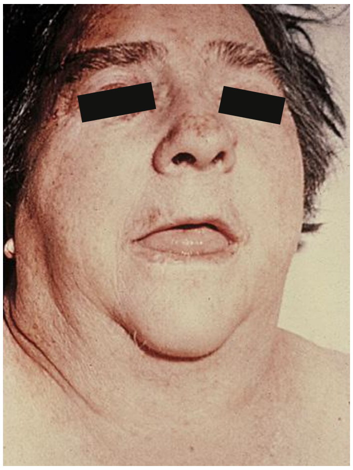
Myringotomy with tympanostomy tube *(Swartz, 2009)*

Mysoline, a trademark for an anticonvulsant **(primidone).**

mysophobia /mē′sə-/ [Gk, *mysos*, anything disgusting, *phobos*, fear], an anxiety disorder characterized by an overreaction to the slightest uncleanliness or an irrational fear of dirt, contamination, or defilement. Also spelled **misophobia. —misophobic, mysophobic,** *adj*.

myx-, myxo-, prefix meaning "relating to mucus": *myxoblastoma, myxocyte, myxoma*.

myxedema /mik′sədē′mə/ [Gk, *myxa*, mucus, *oidema*, swelling], the most severe form of hypothyroidism. It is characterized by swelling of the hands, face, feet, and periorbital tissues and may lead to coma and death. Also spelled *myxoedema*. See also **hypothyroidism.**



Myxedema facies *(Seidel et al, 2006/Courtesy Dr. Paul Ladenson, Johns Hopkins University and Hospital)*

myxofibroma /mik′sōfībrō′mə/ [Gk, *myxa* + L, *fibra*, fiber; Gk, *oma*, tumor], a fibrous tumor that contains myxomatous tissue. Also called **myxoma fibrosum.**

myxoid. See **mucoid,** def. 1.

myxoma /miksō′mə/ [Gk, *myxa* + *oma*, tumor], a neoplasm of the connective tissue, characteristically composed of stellate cells in a loose mucoid matrix crossed by delicate reticulum fibers. These tumors may grow to enormous size and may occur under the skin but are also found in bones, the genitourinary tract, and the retroperitoneal area. **—myxomatous,** *adj*.

-myxoma, suffix meaning a "soft tumor made up of primitive connective tissues": *adenomyxoma, gliomyxoma, lipomyxoma*.

myxoma fibrosum. See **myxofibroma.**

myxoma sarcomatosum. See **myxosarcoma.**

myxomatous. See **myxoma.**

myxopoiesis /mik′sōpō·ē′sis/ [Gk, *myxa* + *poiein,* to make], the production of mucus.

myxosarcoma /mik′sōsärkō′mə/ [Gk, *myxa* + *sarx,* flesh, *oma,* tumor], a sarcoma that contains some myxomatous tissue. Also called **myxoma sarcomatosum.**

myxovirus /mik′sōvī′rəs/ [Gk, *myxa* + L, *virus,* poison], any of a group of medium-size ribonucleic acid viruses that are further divided into orthomyxoviruses and paramyxoviruses. Infection with these viruses is usually caused by transmission of the respiratory secretions of an infected host. The viruses that cause influenza, mumps, and parainfluenza are myxoviruses.

MZ, abbreviation for **monozygotic.**

N

N, **1.** symbol for the element **nitrogen.** **2.** abbreviation for **normal.** **3.** abbreviation for *node* in the TNM system for staging malignant neoplastic disease. See **cancer staging.** **4.** symbol for **magnetic flux.** **5.** abbreviation for **theoretic plate number.** **6.** abbreviation for the amino acid **asparagine.**

N/1, symbol for **normal solution.**

n, 2n, 3n, 4n, symbols for the haploid, diploid, triploid, and tetraploid number of chromosomes in a cell, organism, strain, or individual.

N_A, symbol for **Avogadro's number.**

nA, abbreviation for *nanoampere,* one billionth of an ampere.

Na, chemical symbol for the element **sodium.**

-nab, combining form for cannabinol derivatives.

nabilone, an antiemetic.

■ INDICATIONS: This drug is used to prevent nausea and vomiting associated with cancer chemotherapy in those who have not responded to other treatment.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to cannabinoids prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include syncope; hallucinations; chest discomfort; orthostatic hypotension; nausea; increased appetite; allergic reactions; rash; photosensitivity; pruritus; and back, joint, muscle, and neck pain. A life-threatening side effect is tachycardia. Common side effects include headache, ataxia, drowsiness, dysphoria, euphoria, sleep disturbance, vertigo, asthenia, concentration difficulties, depression, dry mouth, and anorexia.

nabothian cyst /nabō′thē·ən/ [Martin Naboth, German physician, 1675–1721; Gk, *kystis,* bag], a cyst formed in a nabothian gland of the uterine cervix. It is a common finding on routine pelvic examination of women of reproductive age, especially in women who have borne children. The cyst, which is white to yellow with normal branching vessels, seldom results in adverse or pathological effects. Also called **cervical cyst.**

nabothian gland /nəbō′thē·ən/ [Martin Naboth; L, *glans,* acorn], one of many small, mucus-secreting glands of the uterine cervix.

NAD, abbreviation for *no appreciable disease*.

NADH, abbreviation for *nicotine adenine dinucleotide, reduced*.

nadir /nā′dər/, the lowest point, such as the blood count after it has been depressed by chemotherapy.

nadolol /nad′ənol/, a beta-adrenergic blocking agent.

■ INDICATIONS: It is prescribed for long-term management of angina pectoris, for hypertension, and for migraine prophylaxis.

■ CONTRAINDICATIONS: Bronchial asthma, sinus bradycardia, greater than first-degree conduction block, cardiogenic shock, overt cardiac failure, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are bronchospasm, bradycardia, precipitation of heart failure, cardiac arrhythmia, masking of signs of hypoglycemia in diabetics, fatigue, and lethargy. GI disturbances, rashes, and other allergic reactions may also occur.

NADPH, abbreviation for *nicotine adenine disphosphonucleotide, reduced*.

NADPH oxidase defect, a disorder in patients with chronic granulomatosis disease. It is caused by an abnormality in the enzyme (nicotinamide adenine dinucleotide phosphate oxidase) that catalyzes the conversion of oxygen to superoxide anions and hydrogen peroxide in phagocytes. Phagocytes with the abnormal enzyme are unable to destroy invading microorganisms.

Naegeli's leukemia. See **monocytic leukemia.**

Naegleria /nā·glēr′ē·ə/ [F.P.O. Nägler, Austrian bacteriologist, 20th century], a genus of free-living protozoa, found in freshwater, soil, and sewage, that have both an ameboid and a flagellate stage in their life cycle. Certain species, especially *N. fowleri,* are capable of facultative parasitism, and some strains are highly pathogenic and may cause a highly fatal primary amebic meningoencephalitis. Infection is usually acquired by swimming in water contaminated with the organisms. See also **primary amebic meningoencephalitis.**

naegleriasis /nā′glərī′əsis/, infection with ***Naegleria.***

naevus. See **nevus.**

nafcillin sodium /nafsil′in/, an antibiotic.

■ INDICATIONS: It is prescribed in the treatment of infections caused by penicillinase-producing staphylococci.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to other penicillins prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypersensitivity reactions, nausea, and vomiting.

Naffziger sign /naf′zigər/ [Howard C. Naffziger, American surgeon, 1884–1961], a diagnostic sign for sciatica or a herniated intervertebral disk. Nerve root irritation is produced by the examiner through external jugular venous compression.

Naffziger's syndrome [Howard C. Naffziger], a condition of cervical vertebral muscle spasms secondary to intervertebral disk disease, cervical rib disease, or other disorders. The spasms compress the major nerve plexus of the arm, causing the patient to experience pain in the neck, shoulder, arm, and hand. Also called **scalenus anticus syndrome.** Compare **thoracic outlet syndrome.**

Naffziger's test /naf′zig·ərz/, (for nerve root compression) manual compression of the jugular veins bilaterally. An increase or aggravation of pain or sensory disturbance over the distribution of the involved nerve root confirms the presence of an extruded intervertebral disk or other mass.

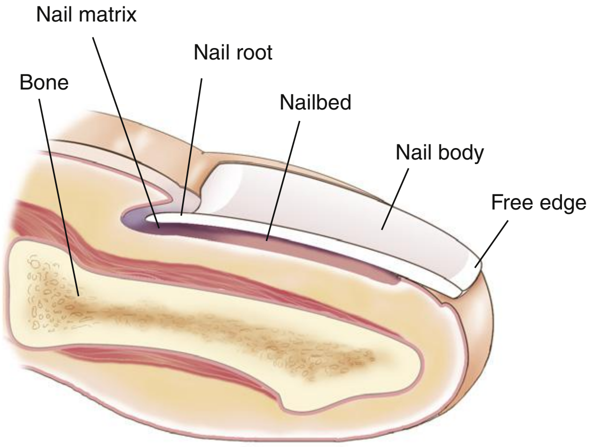
Nägele obliquity. See **asynclitism.**

Nägele's rule /nā′gələz/ [Franz K. Nägele, German obstetrician, 1778–1851; L, *regula,* model], a method for calculating the estimated date of delivery based on a mean length of gestation. Three months are subtracted from the first day of the last normal menstrual period, and 1 year plus 7 days are added to that date.

Nager's acrofacial dysostosis /nā′gərz/ [Felix R. Nager, Swiss physician, 1877–1959; Gk, *akron,* extremity; L, *facies,* face; Gk, *dys,* bad, *osteon,* bone, *osis,* condition], an abnormal congenital condition characterized by limb deformities such as radioulnar synostosis, hypoplasia, and the absence of the radius or of the thumbs. Also called **dysostosis mandibularis.** Compare **cleidocranial dysostosis, craniofacial dysostosis, mandibulofacial dysostosis.**

Naglazyme, a trademark for **galsulfase.**

nail [AS, *naegel*], **1.** also called **unguis.** A flattened elastic structure with a horny texture at the end of a finger or a toe. Each nail is composed of a root, body, and free edge at the distal extremity. The root fastens the nail to the finger or the toe by fitting into a groove in the skin and is closely molded to the surface of the dermis. The nail matrix beneath the body and the root projects longitudinal vascular ridges, which are easily visible through the translucent tissue of the body. The matrix firmly attaches the body of the nail to the underlying connective tissue. The whitish lunula near the root contains irregularly arranged papillae that are less firmly attached to the connective tissue than the rest of the matrix. The cuticle is attached to the surface of the nail just ahead of the root. **2.** any of various metallic nails used in orthopedics to fasten together bones or pieces of bone.



Nail *(Leonard, 2009)*

nailbed [AS, *naegle,* nail, *bedd,* bed], the dermis beneath the nail. It appears through the clear nail as a series of longitudinal ridges. Also called **matrix unguis.**

nail biting, the habit of excessive biting and chewing one's fingernails and periungual skin, sometimes leading to cutaneous injury. The condition is commonly associated with body manipulations of anxious children. It is also considered a form of motor discharges of inner tension. The recommended treatment includes daily bandaging of injured fingers and frequent applications of a distasteful topical preparation. Also called **onychophagia.**

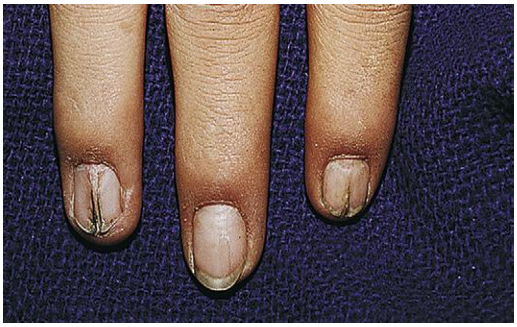
nail care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of clean, neat, attractive nails and prevention of skin lesions related to improper care of nails. See also **Nursing Interventions Classification.**

nail fold, a fold of skin supporting a nail at its base.

nail groove [AS, *naegle* + D, *groeve,* groove], a shallow depression between the nailbed and the nail wall.

nail matrix. See **nailbed.**

nail-patella syndrome, a hereditary syndrome consisting of dystrophy of the nails, absence or hypoplasia of the patella, hypoplasia of the lateral side of the elbow joint, and bilateral iliac horns. Also called **hereditary osteoonychodysplasia, onycho-osteodysplasia, osteoonychodysplasia.**



Nail-patella syndrome *(Callen et al, 2000)*

nail plate, the rigid outer part of a nail. It extends about 8 mm under the nail fold and arises from the nailbed.

nail plate avulsion, a partial or complete removal of the nail plate without disruption of the underlying matrix cells.

nal-, prefix meaning "narcotic agonists or antagonists related to normorphine."

nalbuphine, a synthetic opioid agonist and antagonist.
■ INDICATIONS: This drug is used to treat moderate to severe pain.
■ CONTRAINDICATIONS: Opiate addiction and known hypersensitivity to this drug prohibit its use.
■ ADVERSE EFFECTS: Adverse effects of this drug include dysphoria, hallucinations, dreaming, tolerance, physical dependency, psychological dependency, palpitations, bradycardia, change in blood pressure, orthostatic hypotension, tinnitus, blurred vision, miosis, diplopia, increased urinary output, dysuria, urinary retention, urinary urgency, urticaria, bruising, flushing, diaphoresis, pruritus, and pulmonary edema. Common side effects include drowsiness, dizziness, confusion, headache, sedation, euphoria, nausea, vomiting, anorexia, constipation, cramps, and rash. Respiratory depression is a life-threatening side effect.

Nalebuff arthrodesis, surgical fixation of the wrist accomplished with the use of a Steinmann pin.

Nalfon, a trademark for an antiinflammatory agent **(fenoprofen calcium).**

nalidixic acid /nal′idik′sik/, an antibacterial.
■ INDICATIONS: It is prescribed in the treatment of certain urinary tract infections.
■ CONTRAINDICATIONS: Renal or hepatic insufficiency, a history of convulsive disorders, or known hypersensitivity to this drug prohibits its use. It should not be used in children less than 3 months of age and should be used with care in prepubertal children.
■ ADVERSE EFFECTS: Quinolones have caused tendon rupture, especially in prepubertal children, and severe hypersensitivity reactions. Among the more serious effects are increased intracranial pressure, seizures, hemolytic anemia in people affected with glucose-6-phosphate dehydrogenase deficiency, and GI and neurological disturbances.

nalmefene /nal′mĕfēn′/, an opioid antagonist, used as the hydrochloride salt in the treatment of opioid overdose and postoperative opioid depression.

naloxone hydrochloride /nal′əksōn/, an opioid antagonist.
■ INDICATIONS: It is prescribed for reversal of respiratory depression and other opioid effects in patients receiving opioid analgesics and in patients who have abused heroin, morphine, or other synthetic opioids.
■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects when given to opioid-dependent patients are side effects associated with opioid withdrawal.

naltrexone hydrochloride /naltrek′sōn/, an oral opioid antagonist.

■ INDICATIONS: It is prescribed to block the effects of opioid analgesics, including heroin, morphine, and methadone, in patients recovering from addiction and to treat ethanol dependence.

■ CONTRAINDICATIONS: Acute hepatitis or liver failure prohibits its use. Periodic liver function tests are recommended for all patients. Patients must be completely free of opioids before taking naltrexone to prevent severe withdrawal symptoms. Patients must be educated that their tolerance to morphine disappears while they are on naltrexone and that they can be much more sensitive to opioids after discontinuing naltrexone; past dosages of heroin, morphine, etc., could now be fatal.

■ ADVERSE EFFECTS: The most serious adverse effects are abdominal pain, cramps, nausea, vomiting, headache, sleep disorders, and joint and muscle pain. Some adverse effects may actually be withdrawal symptoms rather than reactions to naltrexone.

Namaqualand hip dysplasia, an autosomal-dominant genetic defect found in children of African heritage. It is characterized by a growth failure in the femoral epiphysis, resulting in pain and early degenerative arthritis of the hip.

Namenda, a trademark for **memantine.**

NAMI, abbreviation for **National Alliance for the Mentally Ill.**

NANB, abbreviation for **non-A, non-B hepatitis.** See **hepatitis C.**

Nance's leeway space. See **leeway space.**

NANDA, abbreviation for **North American Nursing Diagnosis Association.**

nandrolone /nan′drəlōn/, an anabolic steroid.

■ INDICATIONS: It is prescribed to treat metastatic breast cancer in females and to increase hemoglobin and red cell mass in the management of the anemia of renal insufficiency. It increases hemoglobin and red cell mass.

■ CONTRAINDICATIONS: Cancer of the male breast or prostate, liver disease, pregnancy, nephrosis, suspected pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are various endocrine disturbances, depending on the patient's age. Hirsutism, acne, liver toxicity, masculinization, and electrolyte imbalances also occur.

nanism /nā′nizəm, nan′-/ [Gk, *nanos,* dwarf], an abnormal smallness or underdevelopment of the body; dwarfism. Kinds of nanism are **mulibrey nanism, Paltauf's nanism, pituitary nanism, renal nanism, senile nanism,** and **symptomatic nanism.** Also called **nanosomia.**

nano-, **1.** prefix meaning "small, or related to smallness or dwarfism": *nanocephalia, nanomelia.* **2.** prefix used in measurement to mean "billionth (10^{-9})": *nanocurie, nanogram, nanometer.*

nanocephalia. See **nanocephaly.**

nanocephalic dwarf. See **Seckel's syndrome.**

nanocephaly /nā′nōsef′əlē, nan′-/ [Gk, *nanos* + *kephale,* head], a developmental defect characterized by abnormal smallness of the head. Also called **nanocephalia,** *nanocephalism.* **—nanocephalous,** *adj.,* **nanocephalus,** *n.*

nanocormia /nā′nōkôr′mē·ə/ [Gk, *nanos* + *kormos,* trunk], disproportionate smallness of the trunk of the body in comparison with the head and limbs. **—nanocormus,** *n.*

nanocurie (nCi) /nan′əkyo͝or′ē/ [Gk, *nanos,* dwarf; Marie and Pierre Curie], a unit of radiation equal to one billionth of a curie. See also **curie.**

nanogram (ng) /nan′əgram/ [Gk, *nanos* + Fr, *gramme,* small weight], one billionth (10^{-9}) of a gram.

-nanoid, small. See **nanus.**

nanomelia /nā′nōmē′lyə, nan′-/ [Gk, *nanos* + *melos,* limb], a developmental defect characterized by abnormally small limbs in comparison with the size of the head and trunk. **—nanomelous,** *adj.,* **nanomelus,** *n.*

nanometer (nm) /nan′əmē′tər/ [Gk, *nanos* + *metron,* measure], a unit of length equal to one billionth of a meter.

nanophthalmos /nā′nofthal′məs, nan′-/ [Gk, *nanos* + *ophthalmos,* eye], the condition in which one or both eyes are abnormally small, although other ocular defects are not present. Also called *nanophthalmia.* See also **microphthalmos.**

nanosecond (ns) /nan′əsek′ənd/ [Gk, *nanos,* dwarf; L, *secundus,* second], one billionth (10^{-9}) of a second.

nanosomia. See **nanism.**

nanosomus /nā′nōsō′məs/ [Gk, *nanos* + *soma,* body], a person of very short stature; a dwarf.

nanotechnology /-teknol′əjē/, technology at the level of atoms, molecules, and molecular fragments, including manipulating them and creating new structures.

nanukayami /nä′no͞okäyä′mē/ [Jpn], an acute, infectious disease caused by one of the serotypes of the spirochete *Leptospira* that is indigenous to Japan. See also **leptospirosis.**

nanus /nā′nəs/, **1.** See **dwarf. 2.** an individual of abnormally small stature. **—nanoid** /nā′noid/, *adj.*

napalm /nā′päm/, abbreviation for *napthenate palmitate,* a form of jellied gasoline used in warfare.

napalm burn [AS, *baernan,* burn], a thermal burn caused by contact with flaming **napalm.**

nape [ME], the back of the neck.

naphazoline hydrochloride /nəfaz′əlēn/, an adrenergic vasoconstrictor.

■ INDICATIONS: It is prescribed in the treatment of nasal congestion and as an ophthalmic vasoconstrictor to decrease redness and itching.

■ CONTRAINDICATIONS: Glaucoma or known hypersensitivity to this drug or abnormal sensitivity to sympathomimetic drugs prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are those associated with systemic absorption, including sedation and cardiovascular effects. Irritation to mucosa and rebound congestion also may occur.

naphthalene poisoning /naf′thəlēn/ [Gk, *naptha,* flammable liquid; L, *potio,* drink], a toxic condition caused by the ingestion of naphthalene or paradichlorobenzene that may cause increased heart rate, nausea, vomiting, headache, abdominal pain, spasm, and convulsions. Naphthalene and paradichlorobenzene are common ingredients in mothballs, moth crystals, and toilet bowl deodorizers. Paradichlorobenzene is also used as an insecticide in agriculture.

naphthol poisoning. See **phenol poisoning.**

napkin ring tumor [ME, *nappekin,* tablecloth, *hring,* band; L, *tumor,* swelling], a tumor that encircles a tubular structure of the body, usually impairing its function and constricting its lumen to some degree.

NAP-NAP, abbreviation for **National Association of Pediatric Nurse Associates/Practitioners.**

NAPNES, abbreviation for **National Association for Practical Nurse Education and Services.**

napping [ME, *nappen,* to doze], periods of sleep, usually during the day, which may last from 15 to 60 minutes without attaining the level of deep sleep.

Naprosyn, a trademark for a nonsteroidal antiinflammatory, antipyretic, and analgesic agent **(naproxen).**

naproxen /naprok′sən/, a nonsteroidal antiinflammatory agent.

■ INDICATIONS: It is prescribed for the relief of fever, migraine headache, inflammatory symptoms of rheumatoid arthritis and osteoarthritis, and mild to moderate pain and for treatment of primary dysmenorrhea, ankylosing spondylitis, tendinitis, bursitis, and acute gout.

■ CONTRAINDICATIONS: Impaired renal function, GI disease, or known hypersensitivity to this drug, to aspirin, or to nonsteroidal antiinflammatory drugs prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disorders and peptic ulcers. Dizziness, rashes, and tinnitus commonly occur. This drug interacts with many other drugs.

NAPT, abbreviation for *National Association of Physical Therapists*.

Naqua, a trademark for a diuretic and antihypertensive **(trichlormethiazide).**

naratriptan, a migraine agent.

■ INDICATIONS: It is used in the acute treatment of migraine with or without aura.

■ CONTRAINDICATIONS: The following factors prohibit its use: angina pectoris, a history of myocardial infarction, documented silent ischemia, ischemic heart disease, concurrent use of ergotamine-containing preparations, uncontrolled hypertension, hypersensitivity, severe renal disease (creatinine clearance rate 15 mL/min), and severe hepatic disease in children (Pugh grade C).

■ ADVERSE EFFECTS: Adverse effects include nausea, myalgia, dizziness, sedation, and fatigue. Common side effects include weakness and neck stiffness.

narc, abbreviation for **narcotic.**

Narcan, a trademark for an opioid antagonist **(naloxone hydrochloride).**

narcissism /när′sisiz′əm/ [Gk, *Narcissus,* mythic youth in love with himself], **1.** an abnormal interest in oneself, especially in one's own body and sexual characteristics; self-love. **2.** (in psychoanalysis) sexual self-interest that is a normal characteristic of the phallic stage of psychosexual development, occurring as the infantile ego acquires a libido. Narcissism in the adult is abnormal, representing fixation at this stage of development or regression to it. Compare **egotism.** See also **narcissistic personality, narcissistic personality disorder.**

narcissistic personality, a disposition characterized by behavior and attitudes that indicate an abnormal love of the self. A person with this disposition is self-centered and self-absorbed, is extremely unrealistic concerning attributes and goals, vacillates between overidealizing and devaluing others, and, in general, assumes that he or she is entitled to more than is reasonable in relationships with others. Compare **narcissism.**

narcissistic personality disorder /när′sisis′tik/, a psychiatric diagnosis characterized by an exaggerated sense of self-importance and uniqueness, an abnormal need for attention and admiration, preoccupation with grandiose fantasies concerning the self, and disturbances in interpersonal relationships, usually involving the exploitation of others and a lack of empathy.

narco-, prefix meaning "related to stupor or a stuporous state": *narcolepsy, narcomania, narcotic*.

narcoanalysis /när′kōənal′isis/, an interview conducted while the patient is deeply sedated with medication so that inhibitions are reduced and responses will be more truthful.

narcohypnosis /-hipnō′sis/ [Gk, *narke,* stupor, *hypnos,* sleep], hypnosis induced with the aid of a narcotic drug such as sodium amobarbital or sodium pentothal.

narcolepsy /när′kəlep′sē/ [Gk, *narke,* stupor, *lambanein,* to seize], a syndrome characterized by sudden sleep attacks, cataplexy, sleep paralysis, and visual or auditory hallucinations at the onset of sleep. The syndrome begins in adolescence or young adulthood and persists throughout life. Its cause is unknown, and it is not related to pathological lesions in the brain. Persons with narcolepsy experience an uncontrollable desire to sleep, sometimes many times in one day. Episodes may last from a few minutes to several hours. Momentary loss of muscle tone occurs during waking hours (cataplexy) or while the person is asleep. Narcolepsy may be difficult to diagnose because all people with the disorder do not experience all four symptoms. An electroencephalogram or other brain studies may be used to distinguish narcolepsy from an intracranial mass or encephalitis. Amphetamines and other stimulant drugs are prescribed effectively to prevent the attacks. Also called **sleep epilepsy.**

narcoleptic /när′kəlep′tik/, **1.** *adj,* pertaining to a condition or substance that causes an uncontrollable desire for sleep. **2.** *n,* a narcoleptic drug. **3.** *n,* a person suffering from narcolepsy.

Narcon, abbreviation for *Narcotics Anonymous*.

narcosis /närkō′sis/ [Gk, *narkosis,* numbness], a state of insensibility or stupor caused by opioid drugs. See also **narcotic.**

narcotic (narc) /narkot′ik/ [Gk, *narkotikos,* benumbing], **1.** *adj,* pertaining to a substance that produces insensibility or stupor. **2.** *n,* a narcotic drug. Narcotic analgesics, derived from opium or produced synthetically, alter perception of pain; induce euphoria, mood changes, mental clouding, and deep sleep; depress respiration and the cough reflex; constrict the pupils and cause smooth muscle spasm, decreased peristalsis, emesis, and nausea. Repeated use of narcotics may result in physical and psychological dependence. Among the narcotic drugs administered clinically for relief of pain are butorphanol tartrate, hydromorphone hydrochloride, morphine sulfate, pentazocine lactate, and meperidine hydrochloride. These drugs act by binding to opiate receptors in the central nervous system; narcotic antagonists such as naloxone hydrochloride, which is used in treating narcotic overdosage, apparently displace opiates from receptor sites. The term is now often used to refer to any illicit drug, and its use is therefore discouraged in medical settings. **Opioid** is now the preferred term.

-narcotic, -narcotical, suffix meaning "analgesic or soporific drugs": *antinarcotic, prenarcotic, pseudonarcotic*.

narcotic addict, a person who is psychologically and physically dependent on narcotic drugs.

narcotic analgesic. See **analgesic.**

narcotic antagonist. See **opioid antagonist.**

narcotic antitussive. See **antitussive.**

narcotic poisoning [Gk, *narkotikos,* be numbing; L, *potio,* drink], the toxic effects of a narcotic drug that depresses the brain centers, causing unconsciousness or coma. Narcotic drugs are generally derived from opium, but other drugs, including alcohol, can produce similar effects.

Narcotics Anonymous, a nonprofit, international organization with the goal of assisting members to live drug-free.

narcotize /när′kətiz/, to subject to the influence of narcotics.

Nardil, a trademark for an antidepressant **(phenelzine sulfate).**

nares /ner′ēz/, *sing*. **naris,** the pairs of anterior and posterior openings to the nasal cavity that allow the passage of air to the pharynx and ultimately the lungs during respiration. See also **anterior nares, posterior nares.**

narrow-angle glaucoma. See **glaucoma.**

nas, abbreviation for **nasal.**

nas. See **naso-.**

nasal (nas) /nā′zəl/ [L, *nasus,* nose], **1.** *adj,* pertaining to the nose and the nasal cavity. **2.** *n,* a speech sound produced by having air flow through the nose, such as /n/, /ng/, or /m/. **—nasally,** *adv.*

nasal airway, a flexible, curved piece of rubber or plastic, with one wide, trumpetlike end and one narrow end that can be inserted through the nose into the pharynx. Also called *nasal trumpet*.

nasal balloon tamponade, a procedure for the control of posterior epistaxis in which a nasal balloon is inserted into the nasal cavity and filled with saline solution. Alternatively, a Foley catheter can be placed through the nostril and used in the same manner.

nasal cannula, a device for delivering oxygen by way of two small tubes that are inserted into the nares.

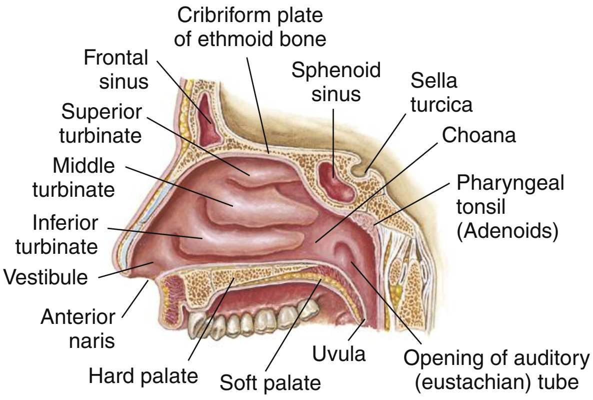
Nasal cannula *(Perry, Potter, and Elkin, 2012)*

nasal cartilage [L, *nasus,* nose, *cartilago*], a flat plate of cartilage in the lower anterior part of the nasal septum. Also called **septal cartilage.**

nasal cavity, one of a pair of cavities that open on the face through the pear-shaped anterior nares and communicate posteriorly with the pharynx. Each cavity is narrower at the top than at the bottom.

nasal decongestant, a drug that provides temporary relief of nasal symptoms in acute and chronic rhinitis and sinusitis. Most are over-the-counter products compounded with a small amount of vasoconstrictor, such as pseudoepHEDrine or phenylephrine. An antihistamine may enhance the value of a nasal decongestant in allergic rhinitis, and a corticosteroid may reduce inflammation. Prolonged use or dosage greater than recommended on the package may cause rebound vasodilation and severe congestion (rhinitis medicamentosa).

nasal drip, a method of slowly infusing liquid into a dehydrated infant by means of a catheter inserted through the nose down the esophagus.



Nasal cavity *(Seidel et al, 2011)*

nasal fin, a thickened platelike ectodermal structure between the lateral and medial nasal prominences that thins to form the oronasal membrane.

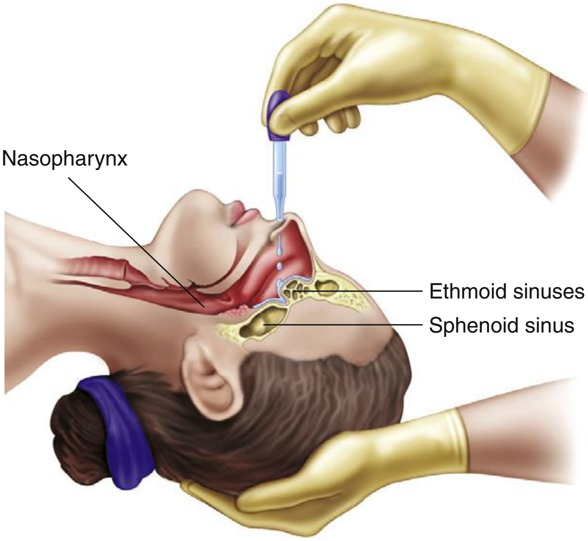
nasal fossa, one of the pair of approximately equal chambers of the nasal cavity that are separated by the nasal septum and open externally through the nares and internally into the nasopharynx through the internal nares. Each fossa is divided into an olfactory region, consisting of the superior nasal concha and part of the septum, and a respiratory region, constituting the rest of the chamber. Overhanging the three meatuses of each fossa on the lateral wall are the corresponding superior, middle, and inferior nasal conchae. The superior meatus extends obliquely about halfway along the superior border of the middle concha. The middle meatus continues into the atrium and bulges on the lateral wall at the bulla ethmoidalis. The inferior meatus courses below and laterally to the inferior nasal concha and contains the opening of the nasolacrimal duct. The olfactory region is located in the most superior part of the fossa and contains olfactory cells, olfactory nerves, and olfactory hairs. The respiratory region is lined with mucous membrane, numerous glands, nerves, a plexus of dilated veins, and blood spaces. The plexus is easily irritated, causing the membrane to swell, blocking the meatuses and the openings of sinuses.

nasal fracture reduction, repair of the paired nasal bones or cartilage. Reduction can be closed or open. Closed reduction is usually performed by digital and instrumental manipulation with the patient under topical and local anesthesia. When the fracture is severe, open reduction under general anesthesia with interosseous wire fixation of bone fragments may be necessary. Nasal fractures are the most common facial fractures and may lead to obstruction without proper attention. See also **rhinoplasty.**

nasal glioma, a neoplasm characterized by the ectopic growth of neural tissue in the nasal cavity.

nasal instillation of medication, the instillation of a medicated solution into the nostrils by an atomized spray from a squeeze bottle or a nasal inhaler. The patient holds one nostril closed while spraying the medication into the opposite nostril. Nasal spray is administered to the patient in a sitting position. The patient is asked to expectorate any solution that runs down the posterior nares into the throat.

nasalis /nāzal′is/ [L, *nasus,* nose], one of the three muscles of the nose, divided into a transverse part and an alar part. The transverse part arises from the maxilla and covers the bridge of the nose; the alar part attaches at one end to the greater alar cartilage and at the other end to skin at the end of the nose. The transverse part serves to depress the



Nasal instillation of medicine
(Harkreader, Hogan, and Thobaben, 2007)

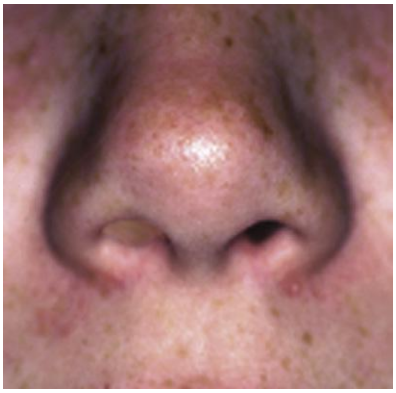
cartilaginous part of the nose and to draw the alar toward the septum. The alar part serves to dilate the nostril. Compare **depressor septi, procerus.**

nasally. See **nasal.**

nasal obstruction [L, *nasus,* nose, *obstruere*], a narrowing of the nasal cavity, thereby reducing the breathing capacity, caused by an irregular or deviated septum, nasal polyps, foreign bodies, or enlarged turbinates. Sinusitis is a common complication of the condition.

nasal placode, an oval area of thickened ectoderm on either ventrolateral surface of the head of the early embryo, constituting the first indication of the olfactory organ.

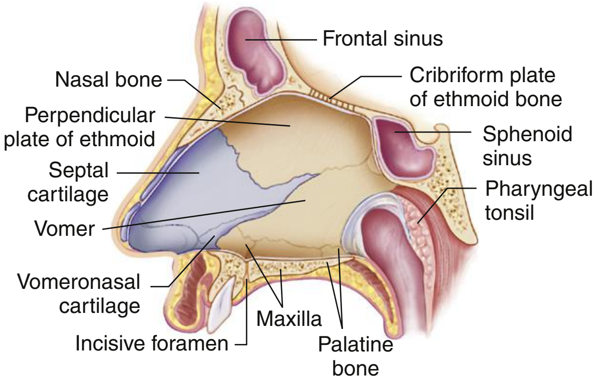
nasal polyp, a rounded, elongated piece of pulpy, dependent mucosa that projects into the nasal cavity.



Nasal polyp *(Lemmi and Lemmi, 2000)*

nasal septum, the partition dividing the nostrils. It is composed of bone and cartilage covered by mucous membrane.

nasal sinus, any one of the numerous cavities in various bones of the skull, lined with ciliated mucous membrane continuous with that of the nasal cavity. The membrane is very sensitive; easily irritated, it may cause swelling that blocks the sinuses. The nasal sinuses are divided into frontal sinuses, ethmoidal air cells, sphenoidal sinuses, and maxillary sinus.



Nasal septum *(Patton and Thibodeau, 2010)*

Nasarel, a trademark for an intranasal steroid antiinflammatory agent **(flunisolide).**

nascent /nas′ənt, nā′sənt/ [L, *nasci,* to be born], **1.** just born; beginning to exist; incipient. **2.** (in chemistry) pertaining to any substance liberated during a chemical reaction that, because of its uncombined state, is more reactive.

nascent oxygen, oxygen that has just been liberated from a chemical compound.

nasion /nā′zē·on/ [L, *nasus,* nose], **1.** the anthropometric reference point at the front of the skull where the midsagittal plane intersects a horizontal line tangential to the highest points in the superior palpebral sulci. **2.** the depression at the root of the nose that indicates the junction of the intranasal and the frontonasal sutures.

naso- nas-, prefix meaning “nose”: *nasociliary, nasolabial, nasonnement.*

nasociliary nerve, usually the first branch of the ophthalmic nerve. It branches into the communicating branch with the ciliary ganglion; the long ciliary nerves, which are sensory to the eyeball but may also contain sympathetic fibers for pupillary dilation; the posterior ethmoidal nerve, which supplies the posterior ethmoidal air cells and the sphenoid sinus; the infratrochlear nerve, which distributes to the medial part of the upper and lower eyelids, the lacrimal sac, and the skin of the upper half of the nose; and the anterior ethmoidal nerve, which supplies the anterior cranial fossa, nasal cavity, and skin of the lower half of the nose.

nasogastric /nā′zōgas′trik/ [L, *nasus,* nose; Gk, *gaster,* stomach], pertaining to the nose and stomach, as in nasogastric aspiration of the stomach’s contents.

nasogastric back wall echo, in ultrasonography, an echo from the posterior surface of the nasal cavity.

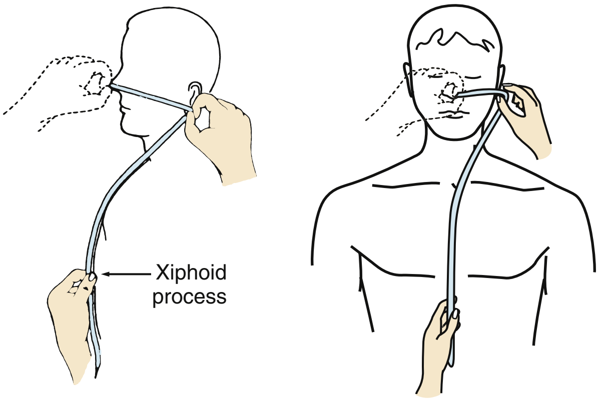
nasogastric feeding. See **gavage.**

nasogastric intubation, the placement of a nasogastric tube through the nose into the stomach to relieve gastric distension by removing gas, gastric secretions, or food; to instill medication, food, or fluids; or to obtain a specimen for laboratory analysis. After surgery and in any condition in which the patient is able to digest food but not eat it, the tube may be introduced and left in place for tube feeding until the ability to eat normally is restored.

■ METHOD: A French size 12 to 18 plastic or rubber catheter is selected. The procedure is explained to the patient. Nares are assessed for any obstructions, deformations, deformities, or tissue irritation. If the catheter is rubber, it is soaked in ice water to stiffen and lubricate it. The patient is placed in an upright sitting position, and a towel or bib is placed over the chest. The necessary length of tube is marked off; it is the same as the distance from the tip of the nose to the earlobe plus the distance to the xiphoid process. The tip of the tube may be lubricated with a water-soluble lubricating jelly, but, if a specimen is to be obtained for cytological study, water or saline solution is preferred. The tube is grasped and held 7.5 cm from the tip and is placed in the nostril, where it is advanced forward and downward. When it has been passed 7.5 cm, it is in the pharynx. The patient is then asked to bend the neck forward, to take shallow rapid breaths, and to help advance the tube by swallowing. If the patient is able to drink water, he or she should sip some to facilitate swallowing; this also provides some lubrication. After the tube has been inserted the predetermined distance, it is checked to be sure that it is in the stomach and not in the lungs. This may be done in several ways: fluoroscopy allows visualization of the placement and is the most reliable, or gastric contents may be aspirated.

■ INTERVENTIONS: In many hospitals a physician inserts the tube the first time; the nurse inserts it thereafter. Oral hygiene is performed regularly, and the tube, if left in place, is carefully secured with adhesive tape to the bridge of the nose. The tube is then connected to the appropriate equipment (suction, feeding tube bag, etc.), depending on the purpose for the tube and patient condition. Orders for tube feeding usually include the amount and timing of feeding, as well as the concentration and, sometimes, the ingredients of the formula. The formula is refrigerated and then warmed to room temperature. If the person is unconscious or unresponsive, suction equipment is kept at hand. An exact record of the feedings is kept.

■ OUTCOME CRITERIA: For the patient's comfort, the tube is selected to fit well and be suitable for the purpose of the procedure: a tight fit is irritating to the tissues, and a small tube might not allow the prescribed formula to pass through. Resistance, gagging, and wincing during tube insertion may be minimized by explaining the procedure, by a slow steady progress, and by proper lubrication of the tube and positioning of the patient.



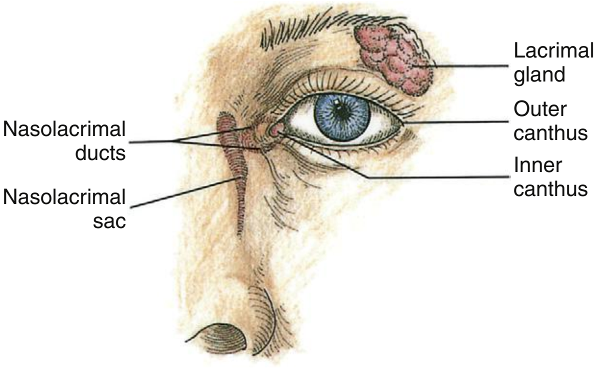
Nasogastric intubation *(Elkin, Perry, and Potter, 2007)*

nasogastric suction, the removal by suction of solids, fluids, or gases from the GI tract through a tube inserted into the stomach or intestines via the nasal cavity. See also **nasogastric intubation.**

nasogastric tube (NG tube), any tube passed into the stomach through the nose. See also **nasogastric intubation.**

nasojejunal tube /nā′zōjijo͞o′nəl/, a mercury-weighted tube inserted through the nose to allow natural peristaltic movement from the pylorus into the jejunum.

nasolabial /nā′zōlā′bē·əl/ [L, *nasus,* nose, *labium,* lip], pertaining to the nose and lip.



Nasolacrimal ducts *(Potter et al, 2011)*

nasolabial reflex [L, *nasus,* nose, *labium,* lip], a sudden backward movement of the head, arching of the back, and extension and stretching of the limbs that occur in infants in response to a light touch to the tip of the nose with an upward sweeping motion. The reflex disappears by about 5 months of age.

nasolacrimal /nā′zōlak′riməl/ [L, *nasus* + *lacrima,* tear], pertaining to the nasal cavity and associated lacrimal ducts.

nasolacrimal duct, a channel that carries tears from the lacrimal sac to the nasal cavity.

nasolacrimal groove [L, *nasus,* nose, *lacrima,* tear; D, *groeve,* a shallow depression], a groove on the nasal surface of the upper jaw.

nasomandibular fixation /nā′zōmandib′yo͝olər/ [L, *nasus* + *mandere,* to chew, *figere,* to fasten], a type of maxillomandibular fixation to stabilize fractures of the jaw by using maxillomandibular splints connected to a wire through a hole drilled in the anterior nasal spine of the maxillary bone. It has been used particularly in edentulous patients. See also **maxillomandibular fixation.**

nasomental reflex /-men′təl/ [L, *nasus,* nose, *mentum,* chin, *reflectere,* to bend back], a reflex elicited by tapping the side of the nose, thereby causing contraction of the mentalis muscle with elevation of the lower lip and wrinkling of the skin of the chin.

nasopalatine duct cyst, a nonodontogenic cyst that arises from remnants of the unobliterated nasopalatine duct, presenting as swelling, drainage, and pain in the soft tissue of the incisive papilla, lingual to the maxillary central incisors. See **incisive canal cyst.**

nasopalatine nerve, the largest of the nasal nerves, which passes across the roof to supply the medial wall of the nasal cavity, then enters the roof of the oral cavity and supplies mucosa, gingival, and glands adjacent to the incisor teeth.

nasopharyngeal /nā′zōferin′jē·əl/, pertaining to the cavity of the nose and the nasal parts of the pharynx. Also called **rhinopharyngeal.**

nasopharyngeal angiofibroma [L, *nasus* + Gk, *pharynx,* throat], a benign tumor of the nasopharynx consisting of fibrous connective tissue with many vascular spaces. The tumor usually arises in puberty and is more common in boys than in girls. Typical signs are nasal and eustachian tube obstruction, adenoidal speech, and dysphagia. Also called **juvenile angiofibroma, nasopharyngeal fibroangioma.**

nasopharyngeal cancer, a malignant neoplastic disease of the nasopharynx. Depending on the site of a nasopharyngeal tumor, there may be nasal obstruction, otitis media, hearing loss, sensory or motor nerve damage, bony destruction of the skull, or deep cervical lymphadenopathy. Diagnostic measures include nasopharyngoscopy, biopsy, and radiological examination of the skull with tomographic studies. Squamous cell and undifferentiated carcinomas are the most common lesions. Nasopharyngeal cancer occurs rarely in the United States and frequently in southern China. Exposure to dusts of nickel, chromium, wood, and leather and to isopropyl oil increases the risk of developing nasopharyngeal cancer. High titers of antibodies to the Epstein-Barr virus are found in Chinese patients with the cancer, and there is evidence of genetic susceptibility, because a certain histocompatibility antigen is associated with the disease and multiple cases occur in some families. Radiation is the most effective therapy, and chemotherapy is also used.

nasopharyngeal fibroangioma. See **nasopharyngeal angiofibroma.**

nasopharyngography /-fer′ingog′rəfē/ [L, *nasus* + Gk, *pharynx,* throat, *graphein,* to record], radiographic imaging and examination of the nasopharynx.

nasopharyngoscopy /nā′zōfer′ing·gos′kəpē/ [L, *nasus* + Gk, *pharynx,* throat, *skopein,* to look], a technique in physical examination in which the nose and throat are visually examined by using a laryngoscope, a fiberoptic device, a flashlight, and a dilator for the nares. **—nasopharyngoscopic,** *adj.*

nasopharynx /nā′zōfer′ingks/ [L, *nasus* + Gk, *pharynx,* throat], the uppermost of the three regions of the throat (pharynx), situated behind the nasal cavity and extending from the posterior nares to the level above the soft palate. On the posterior wall of the nasopharynx, opposite the posterior nares, are the pharyngeal tonsils. Swollen or enlarged pharyngeal tonsils can fill the space behind the posterior nares and may completely block the passage of air from the nose into the throat. Compare **laryngopharynx, oropharynx.** See also **adenoids, tonsil. —nasopharyngeal,** *adj.*

nasotracheal tube /-trā′kē·əl/ [L, *nasus* + Gk, *tracheia,* rough artery; L, *tubus*], a catheter inserted through the nasal cavity into the trachea. It is commonly attached to a mechanical ventilator or a resuscitator bag to administer oxygen.

Nasu-Hakola disease, a rare autosomal-recessive syndrome of bone cysts with presenile dementia.

nat-, prefix meaning “birth”: *natal, natality.*

natal /nā′təl/, **1.** [L, *natus*] pertaining to birth. **2.** [L, *nates*] pertaining to the nates, or buttocks.

natalizumab, a multiple sclerosis agent and monoclonal antibody.

■ INDICATIONS: This drug is used to treat ambulatory patients with relapsing-remitting multiple sclerosis who have not responded to other treatments. An unlabeled use is the treatment of Crohn’s disease.

■ CONTRAINDICATIONS: Progressive multifocal leukoencephalopathy; murine protein allergy; immunodeficiency (in patients with HIV, AIDS, leukemia, lymphoma, and transplants); and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include rigors, syncope, tremors, chest discomfort, hypertension, hypotension, abnormal liver function test, gastroenteritis, amenorrhea, vaginitis, urinary frequency, dermatitis, and pruritus. Life-threatening side effects include progressive multifocal leukoencephalopathy, suicidal ideation, anaphylaxis, and angioedema. Common side effects include headache, fatigue, depression, abdominal discomfort, urinary tract infection, irregular menses, rash, arthralgia, and lower respiratory tract infection.

natamycin /nat′ämi′sin/, a polyene antibiotic used in topical treatment of fungal keratitis, blepharitis, and conjunctivitis.

nateglinide /näteg′lĭ-nīd/, an antidiabetic agent that lowers blood glucose concentrations by stimulating the release of insulin from pancreatic islet beta cells. It is administered orally in the treatment of type 2 diabetes mellitus, either alone or in combination with metformin.

nates /nā′tēz/ *sing.* **natis** [L, buttocks]. See **buttocks.**

natimortality. See **mortinatality.**

National Alliance for the Mentally Ill (NAMI), a national organization for family members of patients with mental illness.

National Association for Mental Health. See **Mental Health Association.**

National Association for Practical Nurse Education and Services (NAPNES), an organization concerned with the education of practical nurses and with the services provided by licensed practical nurses in the United States.

National Association of Pediatric Nurse Associates/Practitioners (NAP-NAP), an organization of nurses who are prepared by education or experience to give primary care to pediatric patients in the United States. NAP-NAP works in conjunction with the American Academy of Pediatrics.

National Board for Certification in Occupational Therapy, a not-for-profit credentialing agency that regulates the national registration for occupational therapists and occupational therapy assistants to reflect current standards of competent practice in occupational therapy.

National Board of Surgical Technology & Surgical Assisting (NBSTSA), established in 1974, the NBSTSA administers the national certification examinations for surgical technologists and surgical assistants, and designates the CST® and CFA® credentials to candidates who successfully pass the exam. Formerly called the **Liaison Council on Certification for the Surgical Technologist.**

National Cancer Institute (NCI), an institute of the National Institutes of Health that leads a national effort to reduce the burden of cancer morbidity and mortality by stimulating and supporting scientific discoveries through basic and clinical biomedical research and training. It conducts and supports programs to understand the causes of cancer; prevent, detect, diagnose, treat, and control cancer; and disseminate information to the practitioner, patient, and public in general.

National Center for Chronic Disease Prevention and Health Promotion (NCCDPHP), an organizational component of the Centers for Disease Control and Prevention, charged with preventing premature death and disability from chronic diseases and promoting healthy personal behaviors.

National Center for Devices and Radiological Health (NCDRH), an agency of the U.S. Food and Drug Administration organized in 1982 with the responsibility of providing standards for and regulation of the manufacture and uses of medical devices. Formerly called **Bureau of Medical Devices.**

National Center for Environmental Health (NCEH), an organizational component of the Centers for Disease Control and Prevention, charged with providing national leadership in prevention and control of disease and death resulting from the interaction between people and their environment.

National Center for Health Statistics (NCHS), an organizational component of the Centers for Disease Control and Prevention, charged with providing statistical information that will guide actions and policies to improve the health of the American people.

National Center for HIV, STD, and TB Prevention (NCHSTP), an organizational component of the Centers for Disease Control and Prevention, charged with providing national leadership in preventing and controlling human immunodeficiency virus infection, sexually transmitted diseases, and tuberculosis.

National Center for Infectious Diseases (NCID), an organizational component of the Centers for Disease Control and Prevention, charged with preventing illness, disability, and death caused by infectious diseases in the United States and around the world.

National Center for Injury Prevention and Control (NCIPC), an organizational component of the Centers for Disease Control and Prevention, charged with preventing death and disability from nonoccupational injuries, including those that are unintentional and those that result from violence.

National Center for Research Resources (NCRR), an institute of the National Institutes of Health that advances biomedical research and improves human health through research projects and shared resources that create, develop, and provide a comprehensive range of human, animal, technological, and other resources.

National Center on Birth Defects and Developmental Disabilities (NCBDDD), an organizational component of the Centers for Disease Control and Prevention, charged with providing national leadership for preventing birth defects and developmental disabilities and for improving the health and wellness of people with disabilities.

National Center on Minority Health and Health Disparities (NCMHD), an institute of the National Institutes of Health whose mission is to reduce and ultimately eliminate health disparities between racial and ethnic minorities (and other groups, such as the urban and rural poor) and society as a whole. It does this by conducting and supporting basic, clinical, and behavioral research and by offering emerging programs, training, and information dissemination in this area.

National Certification Board for Therapeutic Massage and Bodywork, an agency that offers certification to therapeutic massage and bodywork practitioners who meet eligibility criteria, pass a certification exam, uphold a national code of ethics and standard of practice, and demonstrate continued education in their field.

National Committee for Quality Assurance (NCQA), a U.S. independent nonprofit accrediting body for managed health care organizations. Its focus is on improving quality of care in the managed care industry by assessing compliance of health plans to NCQA-developed standards for quality improvement, utilization management, credentialing processes, member rights and responsibilities, preventive services, and record management.

National Council Licensure Examination (NCLEX), a comprehensive integrated examination, developed and administered by the **National Council of State Boards of Nursing**, designed to test basic competency for nursing practice. The exam is administered by the individual boards of nursing that are members of the National Council of State Boards of Nursing and can be offered to candidates for licensure as registered nurses or as practical/vocational nurses.

National Council of State Boards of Nursing, an organization through which boards of nursing from all 50 states, the District of Columbia, Guam, American Samoa, The Commonwealth of the Northern Mariana Islands, Puerto Rico, and the Virgin Islands act and counsel together on matters of common interest and concern related to the safe and effective practice of nursing in the interest of public health, safety, and welfare, including the development of nurse licensure examinations like the **NCLEX-RN** and **NCLEX-PN**.

National Eye Institute (NEI), one of several institutes of the National Institutes of Health. NEI was established in 1968 to support research into the normal functioning of the human eye and visual system, the pathology of visual disorders, and the rehabilitation of the visually handicapped. See also **eye, vision.**

National Formulary (NF, N.F.), a publication containing the official standards for the preparation of various pharmaceutics not listed in the *United States Pharmacopoeia*. It is revised every 5 years.

national health insurance, a health insurance program in many countries other than the United States that is financed by taxes and administered by the government to provide comprehensive health care that is accessible to all citizens of that nation.

National Health Planning and Resources Development Act of 1974, U.S congressional legislation (PL 93-641) that established a nationwide network of health systems agencies. The act provides for the coordination and direction of national health policy through state and regional regulatory agencies.

National Health Service Corps (NHSC), a program of the U.S. Public Health Service (USPHS) in which health care personnel are placed in areas that are underserved. The Corps was established by the Emergency Health Personnel Act of 1970. Nurses, physicians, and dentists serve in rural and urban areas, usually as employees of local health care agencies. The USPHS pays most of the salary of each corps member.

National Heart, Lung, and Blood Institute (NHLBI), an institute of the National Institutes of Health whose mission is to provide leadership for a national program in diseases of the heart, blood vessels, lungs, and blood, as well as blood resources and sleep disorders. It also has administrative responsibility for the NIH Women's Health Initiative.

National Human Genome Research Institute (NHGRI), an institute of the National Institutes of Health (NIH) that supports the NIH component of the human genome project.

National Immunization Program (NIP), an organizational component of the Centers for Disease Control and Prevention, charged with preventing disease, disability, and death from vaccine-preventable diseases in children and adults.

National Institute for Occupational Safety and Health (NIOSH), an organizational component of the Centers for Disease Control and Prevention, charged with ensuring safety and health for all people in the workplace through research and prevention.

National Institute of Allergy and Infectious Diseases (NIAID), an institute of the National Institutes of Health whose mission is to understand, treat, and ultimately prevent infectious, immunological, and allergic disorders affecting human beings.

National Institute of Arthritis and Musculoskeletal and Skin Diseases (NIAMS), an institute of the National Institutes of Health that supports research into the causes, treatment, and prevention of arthritis, musculoskeletal diseases, and skin diseases.

National Institute of Biomedical Imaging and Bioengineering (NIBIB), an institute of the National Institutes of Health whose mission is to improve health by promoting fundamental discoveries, design and development, translation, and assessment of technological capabilities in biomedical imaging and bioengineering.

National Institute of Child Health and Human Development (NICHHD), a branch of the National Institutes of Health that is concerned with all aspects of the growth, development, and health of the children of the United States. It conducts research on fertility, pregnancy, growth, development, and medical rehabilitation, striving to ensure that every child is born healthy and wanted and grows up free from disease and disability.

National Institute of Dental and Craniofacial Research (NIDCR), an institute of the National Institutes of Health that provides leadership for a national research program designed to understand, treat, and ultimately prevent infectious and inherited craniofacial, oral, and dental diseases and disorders.

National Institute of Diabetes and Digestive and Kidney Diseases (NIDDK), an institute of the National Institutes of Health that conducts and supports basic and applied research and provides leadership for a national program in diabetes, endocrinology, and metabolic diseases; digestive diseases and nutrition; and kidney, urological, and hematologic diseases.

National Institute of Environmental Health Sciences (NIEHS), an institute of the National Institutes of Health whose mission is to reduce the burden of human illness and dysfunction from environmental causes by defining how environmental exposures, genetic susceptibility, and age interact to affect the individual's health.

National Institute of General Medical Sciences (NIGMS), an institute of the National Institutes of Health whose mission is to support biomedical research that is not targeted at specific diseases, resulting in increased understanding of life and laying the foundation for advances in disease diagnosis, treatment, and prevention.

National Institute of Mental Health (NIMH), an institute of the National Institutes of Health whose mission is to provide national leadership in the understanding, treatment, and prevention of mental illnesses through basic research on the brain and behavior, and through clinical, epidemiological, and services research.

National Institute of Neurological Disorders and Stroke, an institute of the National Institutes of Health whose mission is to reduce the burden of neurological diseases by supporting and conducting research (both basic and clinical) on the normal and diseased nervous system, fostering the training of investigators in the neurosciences, and seeking better understanding, diagnosis, treatment, and prevention of neurological disorders.

National Institute of Nursing Research (NINR), an institute of the National Institutes of Health that supports clinical and basic research to establish a scientific basis for the care of individuals across the life span in a variety of ways.

National Institute of Standards and Technology (NIST), a federal agency in the Department of Commerce that sets accurate measurement standards for commerce, industry, and science in the United States. The NIST compares and coordinates its standards with those of other countries and provides research and technical service to improve computer science, materials technology, building construction, and consumer product safety.

National Institute on Aging (NIA), an institute of the National Institutes of Health that leads a national program of research on the biomedical, social, and behavioral aspects of the aging process; the prevention of age-related diseases and disabilities; and the promotion of a better quality of life for older Americans.

National Institute on Alcohol Abuse and Alcoholism, an institute of the National Institutes of Health that conducts research focused on improving the treatment and prevention of alcoholism and alcohol-related problems.

National Institute on Deafness and Other Communication Disorders, an institute of the National Institutes of Health that conducts and supports biomedical research and research training on normal mechanisms, diseases, and disorders of hearing, balance, smell, taste, voice, speech, and language.

National Institute on Drug Abuse (NIDA), an institute of the National Institutes of Health that seeks to bring the power of science to bear on drug abuse and addiction through support and conduct of research across a broad range of disciplines, with rapid and effective dissemination of results of the research.

National Institutes of Health (NIH), an agency of the U.S. Department of Health and Human Services made up of several institutions and constituent divisions, including the Bureau of Health Manpower Education, the National Library of Medicine, the National Cancer Institute, and several research institutes and divisions. NIH is divided into two parts: one part is responsible for funding of biomedical research outside of NIH, and the other conducts research.

National League for Nursing (NLN), an organization concerned with the improvement of nursing education and nursing service and the provision of health care in the United States. Among its many activities are preadmission and achievement tests for nursing students and compilation of statistical data on nursing personnel and trends in health care delivery. The National League for Nursing Accrediting Commission (NLNAC), an entity of the NLN that is administratively and financially independent of the NLN, has the sole authority and responsibility for accreditation of nursing education schools and programs. It acts as the testing service for the State Board Test Pool Examinations for registered and practical nurse licensure. The Research Division and the Public Affairs Office are among the other sections of NLN. A monthly referred journal, *Nursing Education Perspectives,* is the official publication of the organization.

National League for Nursing Accrediting Commission (NLNAC), a corporation established in 2001 that is a wholly-owned subsidiary of the National League for Nursing and is responsible for accreditation of nursing education schools and programs in the United States.

National Library of Medicine (NLM), a library and information resource center that is part of the National Institutes of Health. It collects, organizes, and makes available biomedical science information to investigators, educators, and practitioners and carries out programs designed to strengthen medical library services in the United States. It offers a free search engine, PubMed, and its electronic databases include MEDLINE and MEDLINEplus.

National Male Nurses Association (NMNA), an organization that promotes the interests and practice of male nurses in the United States.

National Marrow Donor Program (NMDP), a coordinating center for bone marrow transplants, providing links with national and international registries of prospective volunteer donors of human leukocyte antigen–compatible bone marrow tissue.

National Organization of Victim Assistance, a private nonprofit organization in the United States of victims and witness assistance practitioners, criminal justice professionals, researchers, former victims, and others committed to the recognition and implementation of victims' rights and services.

National Society of Critical Care Nurses of Canada (NSCCN), an organization of Canadian critical care nurses, established originally in 1975 as the Toronto Chapter of the American Association of Critical-Care Nurses. The group became an independent Canadian organization in 1983. Publications include a bimonthly journal, *Critical Care Nurse,* and a newsletter, *CriticaList*.

National Student Nurses Association (NSNA), an organization of students in the field of nursing in the United States. Among its purposes are the improvement of nursing education to improve health care, aid in the development of the nursing student, and encourage optimal achievement in the professional role of the nurse. It publishes a journal, *Imprint,* five times a year, participates in legislative activities at all levels, and gives scholarships, awards, and career workshops.

natis. See **nates.**

Native American medicine, therapies used by many Native American Indian tribes that include their own healing herbs and ceremonies using components with a spiritual emphasis. An individual's connection to Nature and Mother Earth and communion with the spirit world is either in or out of harmony. The unique energies of the eight directions of the medicine wheel, as well as the sky, sun, moon, and earth, all play an integral part in Native American cosmology. Symptoms of illness are seen as connected with the spirit, and energy is then used as a catalyst to help patients come back into harmony. There are several forms of therapy, which include the following: sweat lodge ceremony to heal; sacred pipe; sacred sage, sweet grass, cedar, and other herbs, wafted over the patient with the use of a feather; herbs used in a tea, eaten, used in a bath, or burned with the smoke inhaled; rattles to break up blocks of dead or jammed energy; and drums to align the person's spirit with the heartbeat of Mother Earth. All diseases have been treated with the use of Native American medicine, which does not preclude the use of additional mainstream medical therapies. This medicine is a safe modality when performed by the medicine person, who is an essential part of helping patients return to a state of harmony. It should not be attempted by individuals who do not have the education or training needed.

natremia /nātrē′mē·ə/ [L, *natrium,* sodium; Gk, *haima,* blood], the presence of sodium in the blood.

natriuresis /nā′trēyo͞orē′sis/ [L, *natrium,* sodium; Gk, *ouresis,* urination], the excretion of greater than normal amounts of sodium in the urine. The condition may result from the administration of natriuretic diuretic drugs or from various metabolic or endocrine disorders.

natriuretic /nā′trēyo͞oret′ik/, **1.** *adj,* pertaining to the process of natriuresis. **2.** *n,* a substance that inhibits the resorption of sodium ions from the glomerular filtrate in the kidneys, thus allowing more sodium to be excreted with the urine.

natriuretic peptides test, a blood test to predict congestive heart failure, myocardial infarction, systemic hypertension, cor pulmonale, or heart transplant rejection.

natural antibody /nach′(ə)rəl/ [L, *natura,* nature; Gk, *anti* + AS, *bodig,* body], an antibody that is present in serum in the absence of an apparent specific antigen contact.

natural childbirth [L, *natura,* nature; AS, *cild,* child; ME, *bwith,* birth], labor and parturition accomplished by a mother with little or no medical intervention. It is generally considered the optimal way of giving birth and being born, safest for the baby and most satisfying for the mother. Prerequisites include normal gestation, an adequate birth canal, strong maternal motivation, physical and emotional preparation, and constant and intensive support of the mother during labor and birth. See also **Lamaze method.**

natural dentition, the entire array of natural teeth in the dental arches at any given time, consisting of primary or secondary dentitions or a mixture of the two. See also **tooth.**

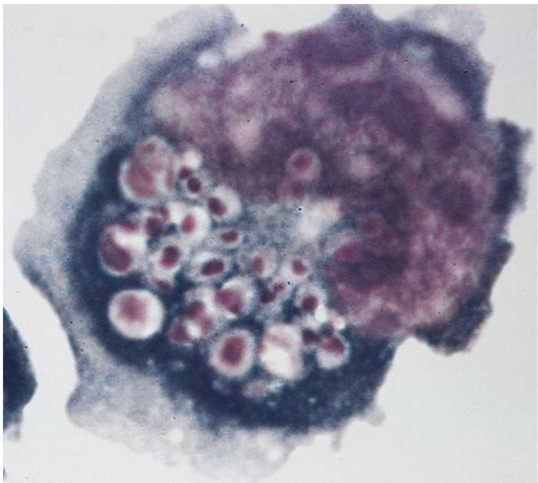
natural family planning method, any of several methods of conception control that do not rely on a medication or a physical device for effectiveness in avoiding pregnancy. Some of the methods are also used to pinpoint the time of ovulation to increase the chance of fertilization when artificial insemination or extraction of an oocyte for in vitro fertilization is to be performed. Kinds of natural family planning include **basal body temperature method of family planning, calendar method of family planning, ovulation method of family planning,** and **symptothermal method of family planning.**

natural foods, foods that have been grown, processed, packaged, and stored without the use of chemical additives. There is no formal Food and Drug Administration definition of *natural* for food-labeling purposes.

natural immunity, a usually inherent, nonspecific form of immunity to a specific disease. Kinds of natural immunity include **individual immunity, racial immunity,** and **species immunity.** Also called **genetic immunity, innate immunity.** Compare **acquired immunity.** See also **active immunity, passive immunity.**

naturalistic illness /nach′ərəlis′tik/, an illness thought to be caused by impersonal factors such as a disturbance in the Asian yin and yang equilibrium or in the equilibrium of the hot and cold forces of the Hispanic model.

natural killer cell [L, *natura* + ME, *kullen,* to kill, *cella,* storeroom], large granular lymphocyte with NK-specific markers, especially CD56. NK cells affect antibody-independent cell-mediated cytotoxicity by recognizing nonself markers on foreign and tumor cells.



Natural killer cell

(Kumar, Abbas, and Fausto, 2005/Courtesy Dr. Noelle Williams, Department of Pathology, University of Texas Southwestern Medical School)

natural law, a doctrine that holds that there is a natural moral order or law inherent in the structure of the universe.

naturally acquired immunity. See **acquired immunity.**

natural network, (in psychiatric nursing) a patient's natural contacts in the community, including church and social groups, friends, family, and occupation that support the person's function outside the institutional environment.

natural pacemaker, any cardiac pacing site in the heart tissues, as opposed to an artificial pacemaker.

natural radiation, radioactivity that emanates from the soil, groundwater, or cosmic sources. Cosmic radiation includes actinic radiation from the sun and neutrinos from beyond the solar system.

natural selection, the natural evolutionary processes by which the organisms that are best adapted to an environment tend to survive and propagate whereas those that are unfit are less likely to do so. Compare **artificial selection.**

Naturetin, a trademark for a diuretic **(bendroflumethiazide).**

nature versus nurture /nur′chər/, a name given to a long-standing controversy as to the relative influences of genetics versus the environment in the development of personality. Nature is represented by instincts and genetic factors and nurture by social influences.

naturopath /nach′ərōpath′/, a person who practices naturopathy.

naturopathic medicine, a philosophy of medicine that presumes that there is an inherent healing power in nature and in every human being. This major health system includes practices that emphasize diet, nutrition, homeopathy, and various mind-body therapies. Emphasis is placed on self-healing and treatment through changes in life style and the use of prevention techniques that promote health. Naturopathic doctors are licensed in about one quarter of all states in the United States.

naturopathy /nach′ərop′əthē/ [L, *natura* + Gk, *pathos,* disease], a system of therapeutics based on natural foods, light, warmth, massage, fresh air, regular exercise, and the avoidance of medications. Advocates believe that illness can be healed by the natural processes of the body.

Nauheim bath /nou′hīm/ [Nauheim, Germany; AS, *baeth,* bath], a spa treatment taken in water through which carbon dioxide is bubbled, followed by systematic exercises, once used in the treatment of cardiac conditions. The procedure is named after the natural waters of Bad Nauheim, Germany. Although no longer used for therapy, it may have been an antecedent to the contemporary use of exercise in cardiac rehabilitation. Also called *Nauheim treatment*.

nausea /nô′zē·ə, nô′zhə/ [Gk, *nausia,* seasickness], a sensation accompanying the urge but not always leading to vomiting. Common causes are seasickness and other motion sicknesses, early pregnancy, intense pain, emotional stress, gallbladder disease, food poisoning, central nervous system tumors, and various enteroviruses. **—nauseate,** *v.,* **nauseous,** *adj*.

nausea and vomiting of pregnancy, a common condition of early pregnancy characterized by recurrent or persistent nausea, often in the morning, that may result in vomiting, weight loss, anorexia, general weakness, and malaise. The causes of the condition are poorly understood. It usually does not begin before the sixth week after the last menstrual period and ends by the twelfth to the fourteenth week of pregnancy. Symptomatic relief is often obtained by eating small, easily digested meals frequently and by not allowing the stomach to be empty. In the past, antiemetic drugs were routinely prescribed for this complaint, but this practice is currently reserved for severe cases. Nausea and vomiting after the sixteenth week is an unusual complication of pregnancy, called persistent nausea and vomiting of pregnancy. If it is severe and intractable, hyperemesis gravidarum may ensue. Also called, *nontechnical,* **morning sickness.**

nausea management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention and alleviation of nausea. See also **Nursing Interventions Classification.**

nauseate. See **nausea.**

nausea & vomiting control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to control nausea, retching, and vomiting symptoms. See also **Nursing Outcomes Classification.**

nausea & vomiting: disruptive effects, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of observed or reported disruptive effects of nausea, retching, and vomiting on daily functioning. See also **Nursing Outcomes Classification.**

nausea & vomiting severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of nausea, retching, and vomiting symptoms. See also **Nursing Outcomes Classification.**

nauseous /nô′shəs, nô′zē·əs/ [Gk, *nausia,* seasickness], pertaining to feelings of nausea or reaction to things that may stimulate nausea.

Navane, a trademark for an antipsychotic agent **(thiothixene).**

navel. See **umbilicus.**

Navelbine, a trademark for a chemotherapeutic mitotic inhibitor (vinorelbine).

navicular /navik′yələr/, boat-shaped; sunken.

navicular bone. See **scaphoid bone.**

navicular pads, tarsal supports for flat feet. They are inserted directly under the arch of the foot. Also called **shoe cookies.**

Nb, symbol for the element **niobium.**

n.b., abbreviation for the Latin *nota bene,* "note well."

NBCOT, abbreviation for *National Board for Certification in Occupational Therapy*.

NBNA, abbreviation for *National Black Nurses Association*.

NBRC, abbreviation for *National Board for Respiratory Care*.

NBSTSA, abbreviation for **National Board of Surgical Technology & Surgical Assisting.**

NCBDDD, abbreviation for **National Center on Birth Defects and Developmental Disabilities.**

NCCAM, abbreviation for *National Center for Complementary and Alternative Medicine,* part of the National Institutes of Health.

NCRR, abbreviation for **National Center for Research Resources.**

Nd, symbol for the element **neodymium.**

N.D., abbreviation for *Doctor of Naturopathy.*

NDA, abbreviation for *National Dental Association*.

NDHA, abbreviation for *National Dental Hygienists' Association*.

Ne, symbol for the element **neon.**

NE, **1.** abbreviation for **niacin equivalent. 2.** abbreviation for **norepinephrine.**

ne-. See **neo-.**

Neal-Robertson litter, a modified spine board for transporting trauma patients with spinal injuries.

near-death experience [ME, *nere* + *deth* + L, *experientia,* trial], the subjective observations of people who either have been close to clinical death or have recovered after having been declared dead. Many claim to have witnessed similar episodes of passing through a tunnel toward a bright light and encountering people who had preceded them in death. See also **out-of-body experience.**

near drowning [ME, *nere,* almost, *drounen,* to drown], a pathological state in which the victim has survived exposure to circumstances that usually cause drowning. The return of consciousness does not necessarily ensure recovery. Intensive supportive therapy may be required for up to several days. Compare **drowning.** See also **hypothermia.**

nearest neighbor analysis, a biochemical method used to estimate the frequency with which specific pairs of bases are located next to one another.

near field, part of an electromagnetic field. See **Fresnel zone.**

nearsightedness. See **myopia.**

nebivolol, an antihypertensive.

■ INDICATION: This drug is used to treat hypertension.

■ CONTRAINDICATIONS: Cardiogenic shock, sick sinus syndrome, acute bronchospasm, atrioventricular heart block, and hypersensitivity to this agent or beta blockers prohibit its use. This drug should not be abruptly discontinued.

■ ADVERSE EFFECTS: Adverse effects of this drug include drowsiness, headache, atrioventricular heart block, edema, vomiting, abdominal pain, rash, pruritus, vasculitis, urticaria, psoriasis, hyperuricemia, hypercholesterolemia, and dyspnea. Life-threatening side effects include bradycardia, MI, thrombocytopenia, angioedema, renal failure, pulmonary edema, and bronchospasm. Common side effects include insomnia, fatigue, dizziness, mental changes, nausea, diarrhea, and impotence.

nebula /neb′yələ/ *pl.* **nebulae** [L, cloud], **1.** a slight corneal opacity or scar that seldom obstructs vision and that can be seen only by oblique illumination. **2.** a murkiness in the urine. **3.** an oily concoction that is applied with an atomizer. **4.** mass of interstellate dusts.

nebulization /neb′yəlīzā′shən/ [L, *nebula,* cloud; Gk, *izein,* to cause], a method of administering a drug by spraying it into the respiratory passages of the patient. The medication may be given with or without oxygen to help carry it into the lungs.

Nebulization *(Sanders et al, 2012)*

nebulize /neb′yəlīz/, to vaporize or disperse a liquid in a fine spray.

nebulizer /neb′yəlī′zər/, a device for producing a fine spray. Intranasal medications are often administered by a nebulizer. Also called **atomizer.**

ON/OFF
MICROair
OMRON

Nebulizer *(Courtesy Omron Healthcare, Inc.)*

NEC, abbreviation for **necrotizing enterocolitis.**

Necator americanus /nekā′tər/ [L, *necare,* to kill], a genus of nematode that is an intestinal parasite and causes hookworm disease. See also ***Ancylostoma.***

necatoriasis /nek′ətərī′əsis/ [L, *necare,* to kill; Gk, *osis,* condition], hookworm disease, specifically that caused by *Necator americanus,* the most common North American hookworm. An estimated one third of the world's population is infected with *N. americanus*. The larvae live in the soil; they reach the human digestive tract through contaminated food and water or through the skin of the feet and legs, attach to mucosa in the small bowel, and suck blood from the human host. Most infections are asymptomatic. Symptoms include diarrhea, nausea, abdominal pain, and hypochrome microcyte iron deficiency anemia in the more severe cases. Treatment consists of first correcting the anemia if present and then anthelmintic therapy, usually with pyrantel pamoate or mebendazole. Prevention includes improved sanitation for disposal of human waste to eliminate soil contamination and the avoidance of skin contact with the soil. See also **ancylostomiasis, ground itch, hookworm.**

necessity /nĕses′te/, something necessary or indispensable.

neck [AS, *hnecca*], a constricted section, such as the part of the body that connects the head with the trunk. Other such constrictions are the neck of the humerus and the neck of the uterus.

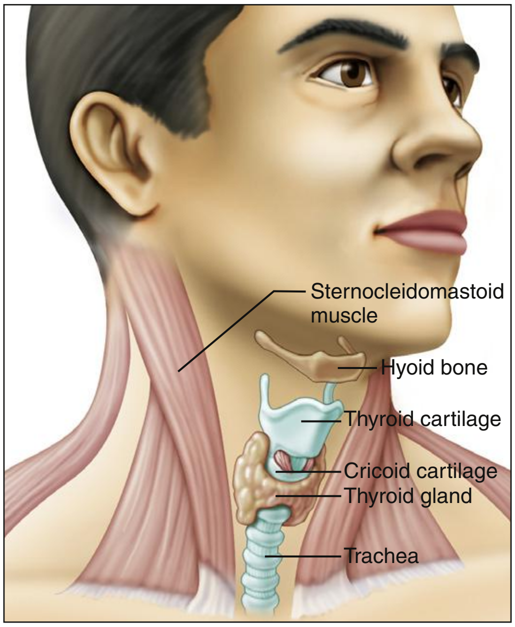
neck dissection, surgical removal of the cervical lymph nodes, performed to prevent the spread of malignant tumors of the head and neck. With the patient under general anesthesia, the cervical chain of lymph nodes with their lymphatic channels is removed in one mass to prevent the spread of cancer cells. After surgery the patient is observed closely for signs of hemorrhage and difficulty in breathing. Compare **radical neck dissection.**

neck of femur [AS, *hnecca* + L, *femur,* thigh], the part of the long bone of the thigh between the head and the greater and lesser trochanters.

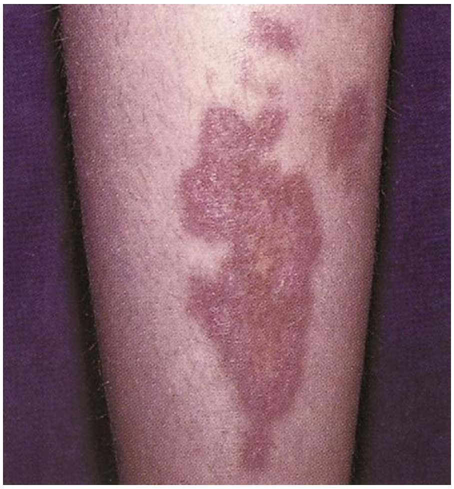
neck of gastric gland, a constricted area of a gastric gland just interior to the isthmus.

neck of uterus. See **cervix.**

neck righting reflex, **1.** an involuntary response in newborns in which turning the head to one side while the infant is supine causes rotation of the shoulders and trunk in the same



Neck structures *(Harkreader, Hogan, and Thobaben, 2007)*



Necrobiosis lipoidica *(Weston, Lane, and Morelli, 2007)*

direction. The reflex enables the child to roll over from the supine to prone position. Absence of the reflex or persistence beyond about 10 months of age may indicate central nervous system damage. **2.** any tonic reflex associated with the neck that maintains body orientation in relation to the head.

neck ring, a metal ring at the neck of a cervicothoracolumbosacral orthosis. It opens posteriorly for ease in putting on or removing the orthosis and is an attachment for a throat mold and occiput pads.

neck shaft angle, an angle created by the intersection of a line through the femoral shaft and a line through the femoral head and neck. Also called **femoral angle.**

neck sign. See **Brudzinski's sign.**

necro-, prefix meaning "death or corpse": *necronectomy, necrophilia, necrosis*.

necrobiosis /nek′rōbī·ō′sis/, **1.** the death of a small area of cells in a large area of living tissue. **2.** the normal death of tissue cells as a result of changes associated with development, aging, atrophy, or degeneration. **—necrobiotic,** *adj*.

necrobiosis lipoidica /lipoi′dikə/ [Gk, *nekros*, dead, *bios*, life, *lipos*, fat, *eidos*, form], a skin disease characterized by thin, shiny, yellow-to-red plaques on the shins or forearms. Telangiectases and crusting and ulceration of these plaques may occur. Necrobiosis lipoidica is usually associated with diabetes mellitus and occurs most often in women. Treatment includes precise control of the diabetes and, possibly, intralesional application of corticosteroids.

necrobiotic granulomas, granulomas that share some of the characteristics of both immunological and nonimmunological collections of mononuclear phagocytes. Relatively acellular areas of the skin become necrobiotic, and the collagen assumes a homogenous, amorphous appearance. See also **granuloma annulare, necrobiosis lipoidica.**

necrogenic /nek′rōjen′ik/ [Gk, *nekros*, dead, *genein*, to produce], **1.** capable of causing death, as of cells or tissue. **2.** originating or caused by infected dead matter. Also *necrogenous* /nekroj′ənəs/.

necrology (necrol) /nekrol′əjē/ [Gk, *nekros*, dead, *logos*, science], the study of the causes of death, including the compilation and interpretation of mortality statistics.

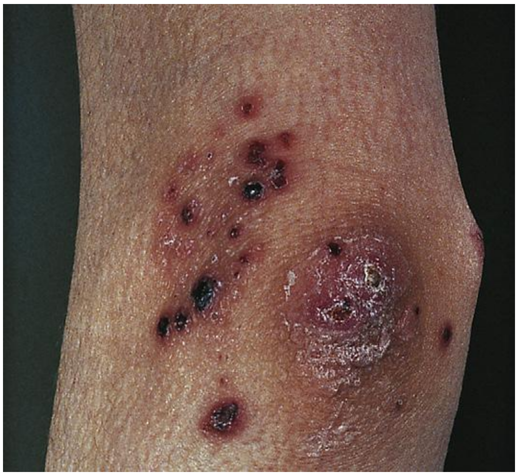
necrolysis /nekrol′isis/ [Gk, *nekros* + *lysis*, loosening], disintegration or exfoliation of dead tissue. Compare **necrosis. —necrolytic,** *adj*.

necrophilia /nek′rōfil′yə/ [Gk, *nekros* + *philein*, to love], **1.** a morbid liking for being with dead bodies. **2.** a morbid desire to have sexual contact with a dead body, usually of men to perform a sexual act with a dead woman. **—necrophile, necrophiliac,** *n*.

necrophobia [Gk, *nekros*, dead, *phobos*, fear], a morbid fear of death and dead bodies.

necropsy, necroscopy. See **autopsy.**

necrosis /nekrō′sis/ [Gk, *nekros* + *osis*, condition], localized tissue death that occurs in groups of cells in response to disease or injury. In **coagulation necrosis,** blood clots block the flow of blood, causing tissue ischemia distal to the clot. In **gangrenous necrosis,** ischemia combined with bacterial action causes putrefaction to set in. See also **gangrene.**



Tissue necrosis *(du Vivier, 2002)*

necrotaxis /nek′rōtak′sis/, the attraction of leukocytes to dead or dying cells.

necrotic /nekrot′ik/, pertaining to the death of tissue in response to disease or injury.

necrotic arachnidism, tissue destruction caused by spider venom. See also **spider bite.**

necrotizing /nek′rōtī′zing/ [Gk, *nekros,* death], causing the death of tissues or organisms.

necrotizing angiitis. See **periarteritis nodosa.**

necrotizing enteritis [Gk, *nekros* + *izein,* to cause, *enteron,* intestine, *itis*], acute inflammation of the small and large intestine by the bacterium ***Clostridium perfringens,*** characterized by severe abdominal pain, bloody diarrhea, and vomiting. Some people recover completely, some survive with chronic bowel obstruction, and some die of perforation of the intestine, dehydration, peritonitis, or septicemia.

necrotizing enterocolitis (NEC), an acute inflammatory bowel disorder that occurs primarily in preterm or low-birth weight neonates, typically within the first 2 weeks of life. It is characterized by ischemic necrosis of the GI mucosa that may lead to perforation and peritonitis. The cause of the disorder is unknown, although it appears to be a defect in host defenses, with infection resulting from normal GI flora rather than from invading organisms. Also called **pseudomembranous enterocolitis.** See also **enteritis.**

■ OBSERVATIONS: Significant predisposing factors for the condition include prematurity, hypovolemia, respiratory distress syndrome, sepsis, an indwelling umbilical catheter, exchange transfusion, and feeding with hyperosmolar or high-caloric formulas. The condition results from a reflex shunting of blood away from the GI tract, which leads to convulsive vasoconstriction of the mesenteric vessels supplying the intestines. The diminished blood supply interferes with the normal production of mucus and with other bowel functions and results in severe necrosis with bacterial invasion of the bowel wall. Formula-fed infants are more susceptible to the disorder, possibly because formula lacks the immunoglobulin A antibodies and macrophages found in breast milk that may protect the GI mucosa from damage and bacterial invasion. Initial symptoms, which usually develop after several days of life, include temperature instability (usually hypothermia), lethargy, poor feeding, vomiting of bile, abdominal distension, blood in the stools, and decreased or absent bowel sounds. Signs of deterioration are apnea, pallor, hyperbilirubinemia, oliguria, abdominal tenderness, and erythema and edema of the anterior abdominal wall or palpable masses, with eventual respiratory failure leading to death. Diagnosis is confirmed by x-ray visualization of the intestine or by the presence of increased peritoneal fluid or pneumoperitoneum.

■ INTERVENTIONS: Treatment includes discontinuation of oral feeding, IV infusion, abdominal decompression by nasogastric suction, hydration, plasma or whole blood transfusion, and administration of broad-spectrum antibiotics. With routine supportive management, improvement usually occurs within 48 to 72 hours. Oral feedings usually are not resumed for 10 days to 2 weeks. Total parenteral nutrition is necessary during that period. Surgical resection of the affected bowel segment may be necessary, especially if signs of intestinal perforation or peritonitis develop. If a large part of bowel is affected, an ileostomy or colostomy may be necessary. Stenosis of the involved bowel segment may present later complications.

■ NURSING CONSIDERATIONS: The primary concern of the nurse is to observe high-risk, formula-fed infants for early symptoms of necrotizing enterocolitis, especially for difficulty in feeding, bile-stained regurgitation, bloody stools, temperature fluctuations, or a distended shiny abdomen. After the diagnosis is confirmed, the nurse initiates nasogastric intubation for abdominal decompression and continues to monitor the baby constantly for dehydration and electrolyte balance. Daily weight is taken. Infants who are unable to take fluids by mouth require special oral care. A pacifier helps meet the infant's need to suck. Parents are encouraged to visit and are helped to meet the emotional needs of the infant and to provide tactile, auditory, and visual stimulation. The nurse explains the usual course of the disease and the medical and nursing procedures and keeps the parents informed of the infant's progress. Frequent visits to the care unit facilitate family-infant relationships and provide the nurse with an opportunity to teach proper care techniques before discharge. Most infants who develop NEC recover fully and do not have further feeding problems.

necrotizing ulcerative gingivitis (NUG), an inflammatory destructive disease of the gingivae that has a sudden onset with periods of remission and exacerbation. It is marked by ulcers of the gingival papillae that become covered by sloughed, necrotic tissue and circumscribed by linear erythema. Foul smelling breath, increased salivation, bone destruction, lymphadenopathy, and spontaneous gingival hemorrhage are additional features. It may extend to other parts of the oral mucosa, with lesions involving the palate or pharynx. It is usually associated with poor oral hygiene, immunosuppression, smoking, local trauma, poor nutritional status, inadequate sleep, or recent illness and psychological stress. It is most common in conditions in which there is crowding of the teeth and malnutrition. During World War I, this disease was nicknamed Trench Mouth. Although the disease often occurs in an epidemic pattern, it has not been shown to be contagious. Treatment includes chlorhexidine warm salt water rinses, mouthwashes, antibiotics, analgesics, and dental care to remove and disrupt bacterial flora. Also called *Vincent's infection*, **trench mouth**.

necrotizing ulcerative periodontitis (NUP), an inflammatory destructive disease of the gingiva which progresses to destruction of the periodontium. Compare **necrotizing ulcerative gingivitis (NUG).**

necrotizing vasculitis, an inflammatory condition of blood vessels characterized by necrosis, fibrosis, and proliferation of the inner layer of the vascular wall. Some cases result in occlusion and infarction. Necrotizing vasculitis may occur in rheumatoid arthritis and is common in systemic lupus erythematosus, periarteritis nodosa, and progressive systemic sclerosis. The condition is usually treated with corticosteroids.

nedocromil /ned′okro′mil/, a nonsteroidal antiinflammatory drug administered by inhalation in the treatment of bronchial asthma. It is also administered topically to the conjunctiva as the sodium salt in the treatment of allergic conjunctivitis.

nedocromil sodium, the sodium salt of nedocromil, administered topically to the conjunctiva in the treatment of allergic conjunctivitis.

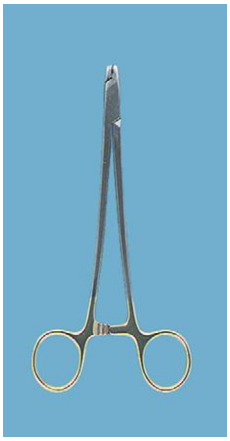
needle bath [AS, *naedl,* needle], a shower in which fine jets of water are sprayed over the body.

needle biopsy, the removal of a segment of living tissue for microscopic examination by inserting a hollow needle through the skin or the external surface of an organ or tumor and rotating it within the underlying cellular layers. Also called **fine-needle aspiration.** See also **aspiration biopsy.**

needle filter, a device, usually made of plastic, used for filtering medications that are drawn into a syringe before administration. Some syringe needles have built-in filters; other filters are separate units that are attached to the needle before use. Needle filters commonly are disposable items designed for one-time use.

needle holder, a surgical forceps used to hold and pass a suturing needle through tissue. Also called **suture forceps.**

needlestick injuries, accidental skin punctures resulting from contact with hypodermic syringe needles, IV cannula



Jarit sternal needle holder *(Tighe, 2012)*

stylets, needles used to “piggyback” IV infusions, and needles used for drawing blood or administering parenteral injections. The contact may occur accidentally during efforts to inject a patient or as a result of carelessly touching discarded medical waste. Such injuries can be dangerous, particularly if the needle has been used in treatment of a patient with a severe blood-borne infection, such as human immunodeficiency virus. To prevent injuries, used needles are not capped or broken and are disposed of in a rigid puncture-resistant container located near the site of use.

NEEP, abbreviation for **negative end-expiratory pressure.**

Neer and Horowitz classification system, a method of classifying proximal humeral fractures in children on the basis of the degree of separation of the epiphysis from the shaft.

Neer classification system, a method of classifying femoral supracondylar and intercondylar fractures. The system ranges from *type I* for minimal displacement to *type III* for conjoined supracondylar and shaft fractures. The Neer system is also applied to humeral head and neck fractures.

nefazodone hydrochloride /nĕfa′zodōn/, an antidepressant drug.

■ INDICATION: It is prescribed in the treatment of mental depression in adults.

■ CONTRAINDICATIONS: It should not be given to patients with an allergy to nefazodone hydrochloride or similar antidepressants, patients in the recovery phase of acute myocardial infarction, or patients also using monoamine oxidase inhibitors, pimozide, or carbamazepine. Caution is advised in prescribing it for patients with concurrent use of triazolam or alprazolam, a history of drug abuse, cardiovascular disease, low blood pressure, seizures, benign prostatic hyperplasia, constipation, or suicidal ideation.

■ ADVERSE EFFECTS: It has rarely caused life-threatening liver failure, so it should be discontinued immediately if there are signs of hepatic toxicity. The side effects most often reported include dry mouth, impaired vision, eye pain, flu-like symptoms, ringing in the ears, swollen limbs, and muscle pain.

negative (neg) /neg′ətiv/ [L, *negare,* to deny], **1.** (of a laboratory test) indicating that a substance or a reaction is not present. **2.** (of a sign) indicating on physical examination that a finding is not present, often meaning that there is no pathological change. **3.** (of a substance) tending to carry or carrying a negative chemical charge.

negative adaptation. See **habituation.**

negative anxiety, (in psychology) an emotional and psychological condition in which anxiety prevents a person’s normal functioning and interrupts the person’s ability to perform the usual activities of daily living.

negative balance, a state in which the amount of water or an electrolyte excreted from the body is greater than that ingested.

negative catalysis, a decrease in the rate of any chemical reaction caused by a substance that is not consumed and not affected by the reaction. Also called **inhibition.** Compare **catalysis.** See also **catalyst.**

negative electrode [L, *negare,* to deny; Gk, *elektron,* amber, *hodos,* way], a cathode, or the negative pole of an electric current or of a battery or dry cell.

negative end-expiratory pressure (NEEP), the application of subatmospheric pressure to a patient’s airway on exhalation during mechanical ventilation. The technique counterbalances the increase in mean intrathoracic pressure caused by intermittent positive-pressure breathing and is intended to reduce intrathoracic pressure for venous return to the right atrium. Generally the negative pressure is applied by using a jet or Venturi system.

negative feedback, **1.** (in physiology) a decrease in function in response to a stimulus. For example, the secretion of follicle-stimulating hormone decreases as the amount of circulating estrogen increases. **2.** *(informal)* a critical, derogatory, or otherwise negative response from one person to what another person has communicated.

negative identity, the assumption of a persona that is at odds with the accepted values and expectations of society.

negative pathognomonic symptom /pəthog′nəmon′ik/ [L, *negare,* to deny; Gk, *pathos,* disease, *gnomen,* index, *symptoma,* that which happens], any symptom that is not usually found in a specific condition and that, if present, would not be compatible with the diagnosis.

negative pi meson pion, a form of electromagnetic radiation emitted from a proton linear accelerator.

negative pi meson radiotherapy, a form of radiotherapy using a beam of subatomic particles known as negative pi mesons, or **pions,** emitted by a proton linear accelerator. When the particles are beamed at a tumor, they cause the atomic nuclei of malignant cells to explode and scatter intensely radioactive subatomic particles through the tumor. Pion radiotherapy requires fewer rad and has a 60% greater biological effect than conventional x-radiation techniques. It also may have less effect on normal tissue near the tumor. Some locally advanced neoplasms, especially those of the prostate, are destroyed. Gliomas and advanced cancers of the head and neck also may be well controlled with pion radiotherapy. Moderate acute toxicity occurs with treatment, but chronic toxicity is minimal.

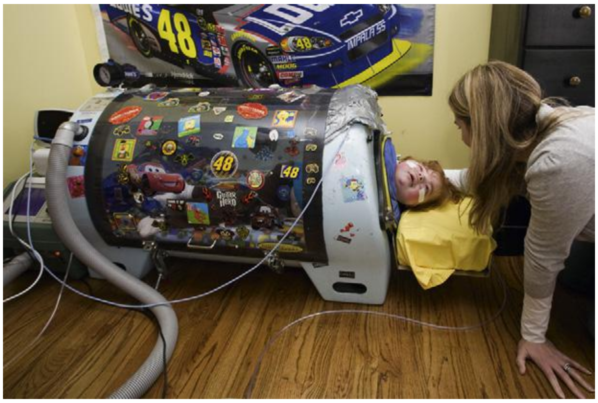
negative pressure, a less than ambient atmospheric pressure, as in a vacuum, at an altitude above sea level, or in a hypobaric chamber. Negative pressure may be used to help stimulate or cycle exhalation in intermittent positive-pressure breathing.

negative pressure isolation rooms, isolation rooms used for patients with an airborne transmitted disease. Airflow goes from the corridor into the patient’s room. As patient’s room air is exhausted, it is vented to the outside.

negative punishment, a form of behavior modification in which the removal of something after an operant (behavior) decreases the probability of the operant’s recurrence.

negative reinforcement, a form of behavior modification in which the removal of something after an operant (behavior) decreases the probability of the operant’s recurrence.

negative reinforcer, (in psychology) a stimulus that, when presented immediately after occurrence of a particular behavior, will decrease the rate of occurrence of the behavior.



Negative-pressure ventilator
(Courtesy of Christiana Care Health System)

negative relationship, (in research) an inverse relationship between two variables. As one variable increases, the other decreases. Also called **inverse relationship.** Compare **positive relationship.**

negative sequence, the sequence of bases on the strand of a double-stranded nucleic acid that is complementary to the positive-sense strand. In DNA it is the template strand on which the mRNA is synthesized.

negative staining, a technique in which an electron-dense substance is mixed with a specimen, resulting in an electron microscopic image in which the specimen appears translucent against an opaque or dark background.

negative symptom, diminishing or absence of a characteristic of normal health as an indication of disease, such as the flat affect or mutism sometimes seen in schizophrenia. Compare **positive symptom.**

negativism /neg′ətiviz′əm/ [L, *negare,* to deny], a behavioral attitude characterized by opposition, resistance, the refusal to cooperate with even the most reasonable request, and the tendency to act in a contrary manner. The resulting response may be passive, such as the immobile, rigid postures observed in catatonic schizophrenia, or active, such as in a belligerent, impulsive, or capricious act like lowering the arms when asked to raise them or sitting down when asked to stand.

negatron /neg′ətron/, an electron or beta particle with a single negative charge.

NegGram, a trademark for an antibacterial **(nalidixic acid).**

neglect /nəglekt′/, a condition that occurs when a parent or guardian fails to provide minimal physical and emotional care for a child or other dependent person.

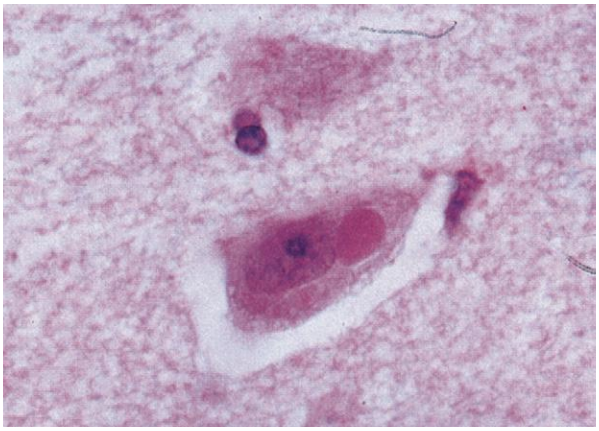
neglect cessation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as evidence that the victim is no longer receiving substandard care. See also **Nursing Outcomes Classification.**

neglect recovery, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of physical, emotional, and spiritual healing following the cessation of substandard care. See also **Nursing Outcomes Classification.**

negligence /neg′lijens/ [L, *negligentia,* carelessness], (in law) the commission of an act that a prudent person would not have done or the omission of a duty that a prudent person would have fulfilled, resulting in injury or harm to another person. In particular, in a malpractice suit, a professional person is negligent if harm to a client results from such an act or such failure to act, but it must be proved that other prudent members of the same profession would ordinarily have acted differently under the same circumstances. Negligence may be misfeasance, malfeasance, or nonfeasance.

negligence per se, (in law) a finding of negligence rendered in judgment of a professional action or inaction in violation of a statute or so at odds with common sense that beyond any doubt no prudent person would have been guilty of it.

Negri bodies /nā′grē/ [Adelchi Negri, Italian physician, 1876–1912; AS, *bodig*], intracytoplasmic inclusion bodies found in the brain and central nervous system cells of rabies victims.



Negri bodies *(Murray, Rosenthall, and Pfaller, 2009)*

NEI, abbreviation for **National Eye Institute.**

Neisseria /nīser′ē·ə/ [Albert L.S. Neisser, Polish dermatologist, 1855–1916], a genus of aerobic to facultatively anaerobic bacteria of the family Neisseriaceae. The gram-negative cocci, which appear in pairs with adjacent sides flattened, are among the normal flora of genitourinary and upper respiratory tracts. Pathogenic species include gonococcus and meningococcus forms.

Neisseria catarrhalis. See ***Moraxella catarrhalis.***

Neisseriaceae /nī′serē·ā′si·ē/ [Albert L.S. Neisser], a family of four genera of gram-negative aerobic cocci and rod-shaped bacteria occurring singly or in pairs, chains, or clusters. They are saprophytic or parasitic. The genera are *Actinobacter, Kingella,* ***Moraxella,*** and ***Neisseria.***

Neisseria gonorrhoeae [Albert L. S. Neisser; Gk, *gone,* seed, *rhoia,* flow], a gram-negative, nonmotile diplococcal bacterium usually seen microscopically as flattened pairs within the cytoplasm of neutrophils. It is the causative organism of gonorrhea. Also called **gonococcus.**

Neisseria meningitidis. See **meningococcus.**

Neisseria sicca [Albert L.S. Neisser], a species of dry or slimy white-to-yellow bacteria normally found in the human nasopharynx and in saliva and sputum.

NEJM, abbreviation for ***New England Journal of Medicine.***

nelarabine, an antineoplastic.

■ INDICATIONS: This drug is used to treat T cell lymphoblastic leukemia and T cell lymphoblastic lymphoma after relapse or treatment failure with at least two chemotherapeutic agents.

■ CONTRAINDICATIONS: Pregnancy, severe neurotoxicity, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness; insomnia; rigors; peripheral neuropathy; confusion; headache; edema; leukopenia; anemia; decreased potassium, calcium magnesium, glucose, albumin, bilirubin, aspartate aminotransferase, and alanine aminotransferase; hyperuricemia; increased glucose; myalgia; arthralgia; back pain; weakness; cough; dyspnea; wheezing; and epistaxis. Life-threatening side effects include seizures, paralysis, neutropenia, thrombocytopenia, and pleural effusion. Common side effects include fatigue, nausea, vomiting, anorexia, diarrhea, stomatitis, and constipation.

Nélaton's dislocation /nālätôNz′/ [Auguste Nélaton, French surgeon, 1807–1873], a dislocation of the ankle in which the distal ends of the tibia and fibula are separated and the talus is forced upward between the tibia and fibula.

nelfinavir, an antiviral.

■ INDICATIONS: It is used alone or in combination with other drugs to treat HIV.

■ CONTRAINDICATION: Known hypersensitivity to protease inhibitors prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include anemia, leukopenia, thrombocytopenia, and hemoglobin abnormalities. Other adverse effects include anorexia, dyspepsia, headache, asthenia, poor concentration, dermatitis, pain, bleeding, hypoglycemia, and hyperlipidemia. Common side effects include diarrhea, flatulence, and rash.

Nelson's syndrome [Donald H. Nelson, American physician, b. 1925], a pituitary adenoma that may follow bilateral adrenalectomy for Cushing's syndrome. It is characterized by a marked increase in the secretion of adrenocorticotropic hormone and melanocyte-stimulating hormone by the pituitary gland and visual problems because of optic chiasm compression. Treatment includes irradiation to decrease pituitary function and in some cases hypophysectomy. See also **Cushing's disease.**

nema-, prefix meaning "thread": *nematode, nematocide.*

-nema, suffix meaning a "threadlike stage in the development of chromosomes": *chromonema, plasmonema, uronema.*

nemaline myopathy /nem′əlēn/ [Gk, *nēma,* thread], a nonprogressive myopathy of uncertain inheritance, characterized histologically by abnormal threadlike structures in muscle cells and clinically by hypotonia with diffuse weakness of the limbs and trunk, usually beginning in infancy.

nemato-, prefix meaning "nematode or threadlike structure": *nematoblast, nematocide, nematodiasis.*

nematocides /nəmat′əsīdz/ [Gk, *nema,* thread, *eidos,* form; L, *caedere,* to kill], chemical pesticides that are used to kill nematode worms.

nematocyst /nem′ətōsist′/ [Gk, *nema,* thread, *eidos,* form, *kystis,* bag], a capsule containing a barbed, threadlike process found in certain cells on the external surface of cnidarians, such as the Portuguese man-of-war and jellyfish. The nematocysts of some cnidarians can penetrate the skin and inject a poison, causing painful and potentially fatal injury.

nematode /nem′ətōd/ [Gk, *nema* + *eidos,* form], a multicellular, parasitic animal of the phylum Nematoda. All roundworms belong to the phylum, including *Ancylostoma duodenale, Ascaris lumbricoides, Enterobius vermicularis, Necator americanus, Strongyloides stercoralis,* and several other species.

nematodiasis /nem′ətōdī′əsis/ [Gk, *nema,* thread, *eidos,* form, *osis,* condition], an infestation of nematode worms.

Nembutal, a trademark for a barbiturate **(pentobarbital).**

-nemia, suffix meaning "blood."

neoadjuvant therapy /nē′ō·ad′jəvənt/, a preliminary cancer treatment, such as chemotherapy or radiation, that usually precedes another phase of treatment.

neoantigen /-an′tijən/ [Gk, *neos,* new, *anti,* against, *genein,* to produce], a new specific antigen that develops in a tumor cell.

neobehaviorism /-bihā′vē·əriz′əm/ [Gk, *neos* + ME, *behaven,* behavior], a school of psychology based on the general principles of behaviorism but broader and more flexible in concept. It stresses experimental research and laboratory analyses in the study of overt behavior and in various subjective phenomena that cannot be directly observed and measured, such as fantasies, love, stress, empathy, trust, and personality. See also **behaviorism.**

neobehaviorist /-ist/, a disciple of the school of neobehaviorism.

neobladder /ne′oblad′er/, a continent urinary reservoir made from a detubularized segment of bowel or stomach, with implantation of ureters and urethra. It is used to replace the bladder after cystectomy.

neoblastic /-blas′tik/ [Gk, *neos* + *blastos,* germ], pertaining to a new tissue or development within a new tissue.

neocerebellum /-ser′əbel′əm/, those parts of the cerebellum that receive input via the corticopontocerebellar pathway.

neocortex /-kôr′teks/ [Gk, *neos,* new; L, *cortex,* bark], the most recently evolved part of the brain. In humans the neocortex includes all of the cerebral cortex except for the hippocampal and piriform areas.

NeoDecadron, a trademark for a topical fixed-combination drug containing a glucocorticoid (dexamethasone phosphate) and an antibacterial **(neomycin sulfate).**

neodymium (Nd), an element with the atomic number of 60. A rare earth metal, neodymium has many industrial uses. Neodymium dust is highly irritating to eyes and mucous membranes.

neogenesis. See **regeneration.**

neoglottis /-glot′is/, a vibrating structure that replaces the glottis in alaryngeal speech, such as after a laryngectomy. Also called **pseudoglottis.**

neologism /nē·ol′əjiz′əm/ [Gk, *neos* + *logos,* word], **1.** a word or term newly coined or used with a new meaning. **2.** (in psychiatry) a word coined by a psychotic or delirious patient that is meaningful only to the patient.

neomycin sulfate /ne′ō-mī′sin/, an aminoglycoside antibiotic.

■ INDICATIONS: It is prescribed orally to treat hepatic coma and infections of the intestine and to prepare the gastrointestinal tract for surgery. It is prescribed topically to treat skin infections.

■ CONTRAINDICATIONS: Renal dysfunction, intestinal obstruction, or known hypersensitivity to this drug or to any aminoglycoside medication prohibits its use. Neomycin is not administered parenterally.

■ ADVERSE EFFECTS: Among the more serious adverse effects are nausea, vomiting, diarrhea, malabsorption, or superinfection. Prolonged treatment in patients with impaired renal function may result in the toxicities of systemic aminoglycosides (e.g., ototoxicity, nephrotoxicity, neuromuscular toxicity). Hypersensitivity reactions may occur with topical administration of this drug.

neon (Ne) /nē′on/ [Gk, *neos,* new], a colorless, odorless, inert gaseous element. Its atomic number is 10; its atomic mass is 20.18. Neon has no compounds and occurs in the atmosphere in the ratio of about 18 parts per million. Some minerals and meteorites contain traces of this element. It is prepared commercially by the fractional distillation of liquefied air and is one of the first components to boil off. Neon is an excellent conductor of electricity, which ionizes the gas and causes it to emit a reddish-orange glow. This characteristic makes neon useful in devices to warn against electric current overload.

neonatal /-nā′təl/ [Gk, *neos* + L, *natus,* born], the period of time covering the first 28 days after birth.

neonatal abstinence syndrome, a behavioral pattern of irritability, tremulousness, and inconsolability exhibited in newborns exposed to heroin and methadone. Following treatment during the neonatal period, the abnormal signs usually resolve. In some infants hypertonicity has persisted for 6 months.

Neonatal Behavioral Assessment Scale (NBAS), a scale developed by T. Berry Brazelton for evaluating the neurological condition and behavior of a newborn by assessing his or her alertness, motor maturity, irritability, consolability, and interaction with people. It consists of a series of 27 reaction tests, including response to inanimate objects, pinprick, light, and the sound of a rattle or bell. The individuality of an infant may be demonstrated for parents by the scale, and some researchers theorize that the quality of the parent-child relationship may be predicted.

neonatal breathing, respiration in newborns. It begins when pulmonary fluid in the lungs is expelled by compression of the thorax during delivery and resorbed from the alveoli into the bloodstream and lymphatics. As air enters the lungs, the chest and lungs recoil to a resting position, but forceful inspirations are necessary to keep the lungs inflated. Such inspirations are triggered by changes in blood gas tension, a strong Hering-Breuer reflex, decrease in body temperature, and tactile stimuli. Irregular fetal breathing movements, which occur during rapid eye movement sleep, may be observed as early as 13 weeks of gestation. At birth the peripheral and central chemoreceptors involved in the control of respiration rate are very active, and newborns are highly sensitive to carbon dioxide during the first weeks. However, the control of rhythm breathing is not fully developed at birth.

neonatal conjunctivitis. See **ophthalmia neonatorum.**

neonatal death, the death of a live-born infant during the first 28 days after birth. Early neonatal death is usually considered to be one that occurs during the first 7 days. Compare **infant death, perinatal death.**

neonatal developmental profile, an evaluation of the developmental status of a newborn based on three examinations: a gestational age inventory, a neurological examination, and a Neonatal Behavioral Assessment score.

neonatal hepatitis, hepatitis of unknown cause with onset in the first few weeks of life. Some cases are associated with viral or bacterial infection; a few are familial. It is characterized by the transformation of hepatocytes into polynuclear giant cells and by conjugated hyperbilirubinemia with jaundice. Most patients recover completely; some develop chronic disease or fatal cirrhosis. Also called **giant cell hepatitis.**

neonatal hyperbilirubinemia. See **hyperbilirubinemia of the newborn.**

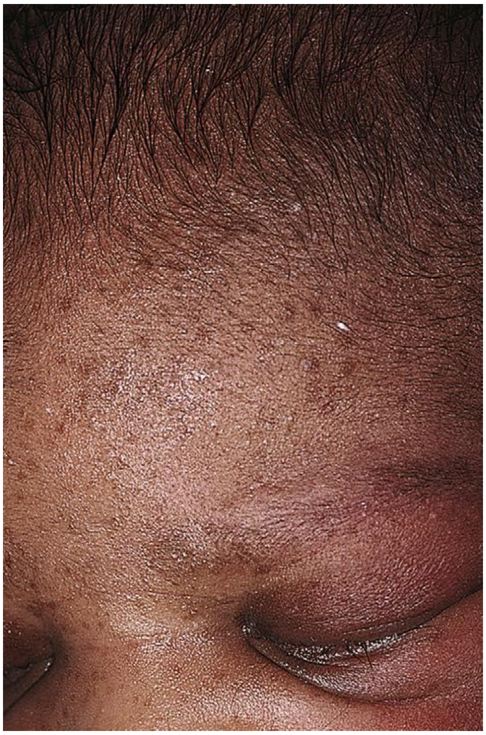
neonatal intensive care unit (NICU), a hospital unit containing a variety of sophisticated mechanical devices and special equipment for the management and care of premature and seriously ill newborns. The unit is staffed by a team of nurses and neonatologists who are highly trained in the pathophysiology of the newborn. See also **intensive care unit.**

neonatal jaundice. See **hyperbilirubinemia of the newborn.**

neonatal mortality, the statistical rate of infant death during the first 28 days after live birth, expressed as the number of such deaths per 1000 live births in a specific geographic area or institution in a given time.

neonatal period, the interval from birth to 28 days of age. It represents the time of the greatest risk to the infant. Approximately 65% of all deaths that occur in the first year of life happen during this 4-week period.

neonatal pustular melanosis, a transient skin condition of the neonate characterized by vesicles present at birth that become pustular. The lesions contain neutrophils rather than eosinophils as seen in erythema toxicum neonatorum. They disappear within 72 hours, leaving dark spots that gradually fade by about 3 months of age. The cause is unknown. The condition is twice as common in black infants as in white infants.



Neonatal pustular melanosis

(Weston, Lane, and Morrelli, 2007)

neonatal thermoregulation, the regulation of the body temperature of a newborn, which may be affected by evaporation, conduction, radiation, and convection.

■ METHOD: To prevent the loss of body heat through evaporation, the infant is patted dry with a warm towel immediately after birth. Loss of heat by conduction is prevented by wrapping the baby in a warm blanket or placing a warm blanket over the baby as the baby lies on the mother's skin and by warming all equipment that is to be used to touch, cover, or examine the infant. Loss of heat by radiation can be minimized by placing the baby under a radiant heater; on a warmed, padded surface; or in skin-to-skin contact with the mother. Loss of body heat by convection is prevented by avoiding drafts, air conditioning vents, and low ambient temperatures. Infant bassinets have high sides to prevent cross drafts.

■ INTERVENTIONS: The infant is kept covered and protected from any means of heat loss. Because the surface area of the newborn's head is proportionately large when compared with the body, heat loss from the head may be great. Therefore a cap or fold of blanket is placed around the head. Progressive family-centered maternity services, in which the practice after delivery is to place the infant skin-to-skin with the mother, often provide caps made of stockinet. An overhead radiant heater is rolled to the delivery bed to maintain a warm ambient temperature for the infant.

Classification of neoplasms

Parent tissue	*Benign tumor*	*Malignant tumor*
Epithelium		
Skin and mucous membrane	Papilloma	Squamous cell carcinoma
	Polyp	Basal cell carcinoma
		Transitional cell carcinoma
Glands	Adenoma	Adenocarcinoma
	Cystadenoma	
Endothelium		
Blood vessels	Hemangioma	Hemangiosarcoma
		Angiosarcoma
Lymph vessels	Lymphangioma	Lymphangiosarcoma
Bone marrow		Multiple myeloma
		Ewing's sarcoma
		Leukemia
		Lymphosarcoma
		Lymphangioendothelioma
Lymphoid tissue		Reticular cell sarcoma (difficult to classify because of cell embryology)
		Lymphatic leukemia
		Malignant lymphoma
Connective tissue		
Embryonic fibrous tissue	Myxoma	Myxosarcoma
Fibrous tissue	Fibroma	Fibrosarcoma
Adipose tissue	Lipoma	Liposarcoma
Cartilage	Chondroma	Chondrosarcoma
Bone	Osteoma	Osteogenic sarcoma
Synovial membrane	Synovioma	Synovial sarcoma
Muscle tissue		
Smooth muscle	Leiomyoma	Leiomyosarcoma
Striated muscle	Rhabdomyoma	Rhabdomyosarcoma
Nerve tissue		
Nerve fibers and sheaths	Neuroma	Neurogenic sarcoma
	Neurinoma (neurilemoma)	Neurofibrosarcoma
Ganglion cells	Neurofibroma	Neuroblastoma
Glial cells	Ganglioneuroma	Glioblastoma
	Glioma	Spongioblastoma
Meninges	Meningioma	
Pigmented neoplasms		
Melanoblasts	Pigmented nevus	Malignant melanoma
		Melanocarcinoma
Miscellaneous		
Placenta	Hydatidiform mole	Choriocarcinoma (chorioepithelioma)
	Dermoid cyst	Embryonal carcinoma
		Embryonal sarcoma
		Teratocarcinoma

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives,* ed 8, St Louis, 2007, Mosby.

■ OUTCOME CRITERIA: The axillary temperature is normally between 97.7° F (36.5° C) and 99.5° F (37.5° C).

neonatal tyrosinemia. See **tyrosinemia.**

neonatal unit, a unit of a hospital that provides care and treatment of newborns through the age of 28 days, and longer if necessary.

neonatal vital signs monitor, equipment in a specialized neonatal intensive care unit that measures mean blood pressure and mean heart rate from a plastic blood pressure cuff, with values digitally displayed on a monitor. See also **electronic fetal monitor.**

neonatal volvulus, volvulus in the newborn, usually cecal or midgut.

neonate /nē′ənāt/. See **newborn.**

neonatology /nē′ōnātol′əjē/ [Gk, *neos* + L, *natus,* born; Gk, *logos,* science], the branch of medicine that concentrates on the care of the neonate and specializes in the diagnosis and treatment of the disorders of the newborn. **—neonatologic, neonatological,** *adj.,* **neonatologist,** *n.*

neonatorum encephalitis /-nātôr′əm/ [Gk, *neos,* new; L, *natus,* born; Gk, *enkephalos,* brain, *itis,* inflammation], a brain inflammation that develops in the first 4 weeks of life. Also called **encephalitis neonatorum.**

neo-, ne-, prefix meaning "new": *neobiogenesis, neocyte, neonatal.*

neoplasia /nē′ōplā′zhə/ [Gk, *neos* + *plassein,* to mold], the new and abnormal development of cells that may be benign or malignant. **—neoplastic** /-plas′tik/, *adj.*

neoplasm /nē′ōplaz′əm/ [Gk, *neos* + *plasma,* formation], any abnormal growth of new tissue, benign or malignant. Also called **tumor.** See also **benign, cancer, malignant.—neoplastic,** *adj.*

neoplastic /nē′ōplas′tik/ [Gk, *neos,* new, *plassein,* to mold], pertaining to malignancy, neoplasm.

neoplastic fracture, a fracture resulting from a weakness in bone tissue caused by a benign or malignant tumor. Also called **pathological fracture.**

neoplastic pericarditis [Gk, *neos,* new, *plasma,* formation, *peri,* around, *kardia,* heart, *itis,* inflammation], inflammation of the pericardium, usually secondary to a malignant tumor within the area. Also called **carcinomatous pericarditis.**

neoplastic transformation, conversion of a tissue with a normal growth pattern into a malignant tumor.

neoplasty /nē′ōplas′tē/ [Gk, *neos,* new, *plassein,* to mold], a plastic surgery procedure to restore a part or add a new part. **—neoplastic,** *adj.*

Neosporin, trademark for a topical, fixed-combination drug containing antibacterials **(polymyxin B sulfate, neomycin sulfate,** and bacitracin zinc).

neostigmine bromide /nē′ōstig′mēn/, a reversible acetylcholinesterase inhibitor.

■ INDICATIONS: It is prescribed in situations in which it is desirable to potentiate the effects of neuronally released acetylcholine, such as in the treatment of myasthenia gravis and postoperative urinary retention, and to reverse the effects of nondepolarizing neuromuscular blockers.

■ CONTRAINDICATIONS: Bowel obstruction, urinary tract infection, or known hypersensitivity to this drug or to other bromides prohibits its use. Initial dosages should be administered only in settings equipped for cardiopulmonary resuscitation, and ephinephrine and atropine should be available.

■ ADVERSE EFFECTS: Overdosage causes cholinergic crisis with widespread muscle weakness and paralysis, including the diaphragm, which can cause severe respiratory depression. Excessive salivation and lacrimation, intestinal cramps, urinary urgency, and convulsions are other adverse effects.

neostriatum /-strī·ā′təm/, the most recently evolved part of the corpus striatum, consisting of the caudate nucleus and putamen. The neostriatum receives input from the entire cerebral cortex and other brain areas and provides output to the basal nuclei.

Neo-Synephrine, a trademark for a vasoconstrictor **(phenylephrine hydrochloride).**

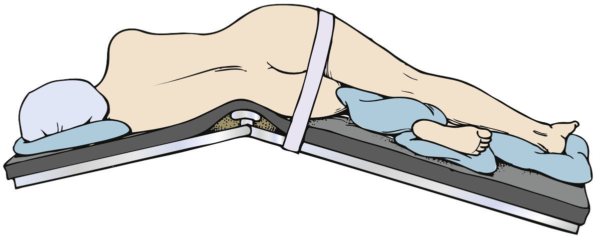
neoteny /nē·ot′ənē/ [Gk, *neos,* new, *teinein,* to stretch], the attainment of sexual maturity during the larval stage of development, such as in certain amphibians, especially salamanders.

nephelometer /nef′əlom′ətər/ [Gk, *nephele,* cloud, *metron,* measure], a photometric apparatus used to determine the concentration of solids suspended in a liquid or a gas, such as the number of bacteria in a specimen. See also **nephelometry.**

nephelometry /nef′əlom′ətrē/, a technique for detecting proteins in body fluids based on the tendency of proteins to scatter light in identifiable ways. **—nephelometric, nephelometrical,** *adj.*

nephr-. See **nephro-.**

nephrectomy /-ek′təmē/ [Gk, *nephros,* kidney, *ektomē,* excision], the surgical removal of a kidney, performed to remove a tumor or otherwise diseased kidney. In the patient with renal failure, the kidney may be the cause of extreme hypertension, and therefore one or both kidneys are removed. Before surgery the blood is typed and crossmatched for transfusion. During surgery the kidney is approached through either a flank, abdominal, or thoracoabdominal incision and removed. If the thoracic cavity is opened, a chest tube is inserted and connected to water-seal drainage. The nurse observes carefully for rapid pulse, restlessness, sweating, and a drop in blood pressure. Urinary output is measured hourly, and fluid intake and body weight are closely monitored. Deep breathing is difficult because the incision is close to the diaphragm. Pain medication is essential so that the patient can breathe deeply and move. The nurse reports at once any sudden shortness of breath and assesses the lungs for signs of spontaneous pneumothorax, which may occur if the pleura was accidentally nicked during surgery.



Surgical position for a nephrectomy *(Phillips, 2012)*

-nephric, suffix meaning "kidneys": *archinephric, cardionephric, splenonephric.*

nephritic /nəfrit′ik/ [Gk, *nephros,* kidney, *itis,* inflammation], pertaining to an inflammation of the kidney.

nephritic calculus. See **renal calculus.**

nephritic factor, a protein found in the serum of patients with membranoproliferative glomerulonephritis. It activates alternative complement pathways.

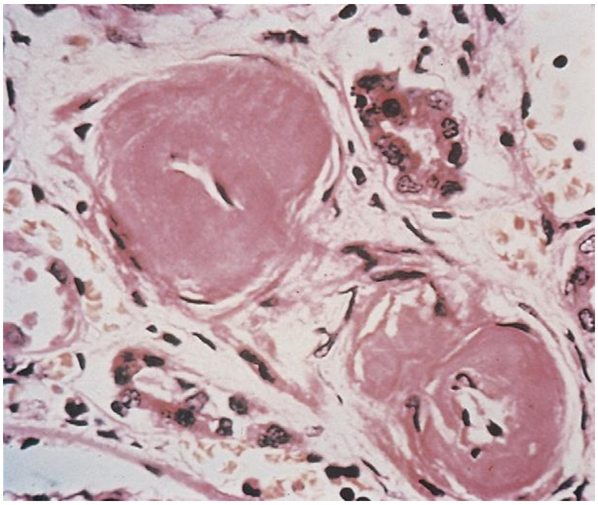
nephritic gingivitis [Gk, *nephros* + *itis,* inflammation, *gingiva,* gum; Gk, *itis,* inflammation], inflammation of the mouth and gingiva associated with kidney failure, accompanied by pain, the odor of ammonia, and increased salivation. Also called **uremic gingivitis.**

nephritic syndrome, a group of signs and symptoms of a urinary tract disorder, including hematuria, hypertension, and renal failure.

nephritis /nəfrī′tis/ [Gk, *nephros* + *itis,* inflammation], any one of a large group of diseases of the kidney characterized by inflammation and abnormal function. Kinds of nephritis include **acute nephritis, Alport's syndrome, glomerulonephritis,** *hereditary nephritis,* **interstitial nephritis,** and **parenchymatous nephritis.**

nephro-, nephr-, prefix meaning "kidneys": *nephroblastoma, nephrogram, nephrorrhagia.*

nephroangiosclerosis /nef′rō·an′jē·ō′sklerō′sis/ [Gk, *nephros* + *angeion,* vessel, *skleros,* hard, *osis,* condition], necrosis of the renal arterioles associated with hypertension. This condition is present in a small number of hypertensive individuals between 30 and 50 years of age. Early signs are headaches, blurring of vision, and a diastolic blood pressure greater than 120 mm Hg. Examination of the retina reveals hemorrhages, vascular exudates, and papilledema. The heart is usually enlarged, especially the left ventricle. Proteins and red blood cells are found in the urine. Heart and kidney failure may occur if the disease remains untreated. Treatment includes measures to lower blood pressure with diet and antihypertensive medications. Hemodialysis is used when preventive measures have failed. Also called **malignant hypertension.** See also **hypertension, renal failure.**



Nephroangiosclerosis *(Kumar et al, 2007/Courtesy Dr. M.A. Venkatachalam, Department of Pathology, University of Texas Health Sciences Center, San Antonio, Texas)*

nephroblastoma. See **Wilms' tumor.**

nephrocalcinosis /nef′rōkal′sinō′sis/ [Gk, *nephros* + L, *calx*, lime; Gk, *osis*, condition], an abnormal condition of the kidneys in which deposits of calcium form in the parenchyma at the site of previous inflammation or degenerative change. Infection, hematuria, anal colic, and decreased function of the kidney may occur.

nephrocystitis /-sistī′tis/, an inflammation involving both the kidney and the urinary bladder.

nephrocystosis /-sistō′sis/, the formation of cysts in the kidney.

nephrogenic /nef′rōjen′ik/ [Gk, *nephros* + *genein*, to produce], **1.** generating kidney tissue. **2.** originating in the kidney.

nephrogenic ascites, the abnormal presence of fluid in the peritoneal cavity of patients undergoing hemodialysis for renal failure. The cause of this type of ascites is unknown. See also **ascites.**

nephrogenic cord, either of the paired longitudinal ridges of tissue that lie along the dorsal surface of the coelom in the early developing vertebrate embryo. It is formed from the fusion of the nephrotome tissue and gives rise to the structures making up the embryonic urogenital system. See also **mesonephros, metanephros, pronephros.**

nephrogenic diabetes insipidus, an abnormal condition in which the kidneys do not concentrate the urine, resulting in polyuria, polydipsia, and very dilute urine. The secretion of antidiuretic hormone (ADH) by the pituitary is normal, and all kidney function is normal, except the lack of response to ADH. See also **diabetes insipidus.**

nephrogenic rests, remnants of renal blastema tissue found in or around the kidney, which are sometimes precursors of Wilms' tumor.

nephrogenous /nəfroj′ənəs/, pertaining to the formation and development of the kidneys.

nephrogram /nef′rōgram/, a radiograph of the kidney.

nephrography /nəfrog′rəfē/, the radiographic examination of the kidney.

nephrohypertrophy /-hīpur′trəfē/ [Gk, *nephros*, kidney, *hyper*, excessive, *trophe*, nourishment], enlargement of the kidney.

nephrolith. See **renal calculus.**

nephrolithiasis /nef′rōlithī′əsis/, a disorder characterized by the presence of calculi in the kidney. See also **renal calculus.**

nephrolithic. See **nephrolith.**

nephrolithotomy /-lithot′əmē/, the surgical removal of renal calculi.

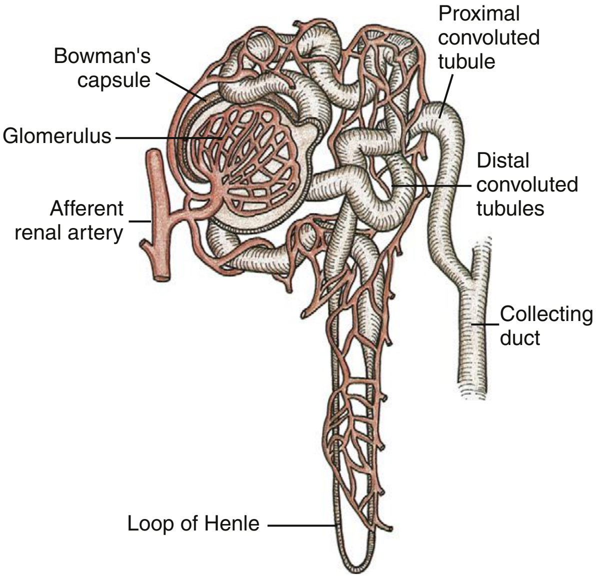
nephrology /nəfrol′əjē/ [Gk, *nephros* + *logos*, science], the study of the anatomy, physiology, and pathology of the kidney. **—nephrologic, nephrological,** *adj*.

nephrolytic /-lit′ik/ [Gk, *nephros* + *lysis*, loosening], pertaining to the destruction of a kidney.

-nephroma, suffix meaning a "tumor of the kidney or area of the kidney": *epinephroma*, *paranephroma*.

nephromere. See **nephrotome.**

nephron /nef′ron/ [Gk, *nephros*, kidney], a structural and functional unit of the kidney resembling a microscopic funnel with a long stem and two convoluted tubular sections. Each kidney contains about 1.25 million nephrons. All nephrons have a renal corpuscle and renal tubules. Juxtamedullary nephrons also have loops of Henle. Each renal corpuscle consists of a glomerulus of renal capillaries enclosed within Bowman's capsule. The renal corpuscles and the convoluted parts of the renal tubules are located in the cortex of the kidney. The loops of Henle and collecting tubules are located in the medulla. Urine is formed in the renal corpuscles and renal tubules by filtration, reabsorption, and secretion. See also **kidney, malpighian corpuscle.**



Nephron *(Potter and Perry, 2005)*

nephronia /nəfrō′nē·ə/, an inflammation of intrarenal connective tissue that occurs in a small percentage of patients with urinary tract infections.

nephronophthisis. See **medullary cystic disease.**

nephroparalysis /-pəral′isis/ [Gk, *nephros*, kidney, *paralyein*, to be palsied], a paralysis of the kidney resulting in a cessation of its functions.

nephropathic cystinosis, one of the types of cystinosis that involves kidney damage and ophthalmic symptoms.

nephropathy /nefrop′əthē/ [Gk, *nephros* + *pathos*, disease], any disorder of the kidney, including inflammatory, degenerative, and sclerotic conditions. See also **kidney disease.**

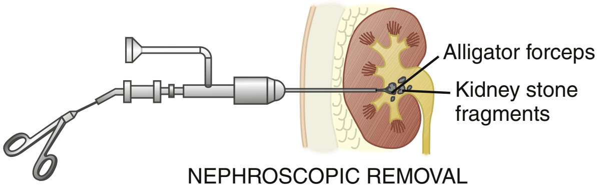
nephropexy /nef′rəpek′sē/ [Gk, *nephros* + *pexis,* fixation], a surgical operation to fixate a floating or ptotic kidney.

nephroptosis /nef′rəptō′sis/ [Gk, *nephros* + *ptosis,* falling], a downward displacement or dropping of a kidney.

nephrorrhaphy /nəfrôr′əfē/ [Gk, *nephros* + *rhaphe,* suture], an operation that sutures a floating kidney in place.

nephrosclerosis. See **nephroangiosclerosis.**

nephroscope /nef′rəskōp′/ [Gk, *nephros* + *skopein,* to look], a fiberoptic instrument used specifically for visualization of the kidney and the disintegration and removal of renal calculi. The nephroscope is inserted percutaneously.



Nephroscope *(Black and Hawks, 2009)*

nephrosis. See **nephrotic syndrome.**

nephrostoma /-stō′mə/ *pl.* **nephrostomas, nephrostomata** [Gk, *nephros* + *stoma,* mouth], the funnel-shaped ciliated opening of the excretory tubules into the coelom of the early developing vertebrate embryo. Also called *nephrostome.* **—nephrostomic,** *adj.*

nephrostomy /nəfros′təmē/, a surgical procedure in which a flank incision is made so that a catheter can be inserted into the kidney pelvis to drain the kidney, often done to relieve obstruction.

nephrostomy catheter, a catheter used with percutaneous nephrostomy, as for drainage.

nephrotic syndrome /nəfrot′ik/ [Gk, *nephros* + L, *icus,* like], an abnormal condition of the kidney characterized by marked proteinuria, hypoalbuminemia, and edema. It occurs in glomerular disease and thrombosis of a renal vein and as a complication of many systemic diseases, diabetes mellitus, amyloidosis, systemic lupus erythematosus, and multiple myeloma. The nephrotic syndrome occurs in a severe primary form. The presenting symptoms include anorexia, weakness, proteinuria, hypoalbuminuria, and edema. Treatment and prognosis depend on the underlying cause of disease. Patients with primary nephrotic syndrome usually respond favorably to corticosteroids. Loop diuretics are used to control symptomatic edema, and dialysis may be necessary. Also called **nephrosis. —nephrotic,** *adj.*

nephrotome /nef′rətom/ [Gk, *nephros* + *tome,* section], a zone of segmented mesodermal tissue in the developing vertebrate embryo lying along each side of the body dorsal to the abdominal cavity between the somite-forming dorsal mesoderm and the unsegmented lateral plate mesoderm. It is the primordial tissue for the urogenital system and gives rise to the nephrogenic cord. Also called **intermediate cell mass, intermediate mesoderm, middle plate, nephromere.** See also **mesonephros, metanephros, pronephros.**

nephrotomography /-təmog′rəfē/ [Gk, *nephros* + *tome,* section, *graphein,* to record], sectional radiographic examination of the kidneys.

nephrotomy /nəfrot′əmē/ [Gk, *nephros* + *temnein,* to cut], a surgical procedure in which an incision is made in the kidney.

nephrotoxicity, the quality of being destructive to kidney cells. **—nephrotoxic,** *adj.*

nephrotoxin /-tok′sin/, a toxin with specific destructive properties for the kidneys.

nephroureterolithiasis /nef′rōyŏŏrē′tərō′lithī′əsis/, the presence of calculi in the kidneys and ureters.

Neptazane, a trademark for a carbonic anhydrase inhibitor **(methazolamide).**

neptunium (Np) /nept(y)o͞o′nē·əm/ [planet Neptune], a transuranic, metallic element. Its atomic number is 93; its atomic mass is 237. Although neptunium is considered a synthetic element, traces of natural neptunium have been found in uranium ores.

Neri's sign /nā′rēz/ [Vincenzo Neri, Italian neurologist, 1880–1959], a sign of organic hemiplegia, consisting of the spontaneous bending of the knee of the affected side as the leg is passively lifted, the patient being in the dorsal position. With the patient standing, forward bending of the trunk will cause flexion of the knee on the affected side in lumbosacral and iliosacral lesions.

Nernst equation [Hermann W. Nernst, German physicist, 1864–1941; L, *aequare,* to make equal], an expression of the relationship between the electrical potential across a membrane and the ratio between the concentrations of a given species of permeant ion on either side of the membrane.

nerve /nurv/ [L, *nervus*], one or more bundles of impulse-carrying fibers, myelinated or unmyelinated or both, that connect the brain and the spinal cord with other parts of the body. Nerves transmit afferent impulses from receptor organs toward the brain and spinal cord and efferent impulses peripherally to the effector organs. Each nerve consists of an epineurium enclosing fasciculi of nerve fibers; each fasciculus is surrounded by its own sheath of connective tissue, or epineurium. Individual nerve fibers, which are microscopic, consist of formed elements within a matrix of protoplasm enclosed in endoneurium that are enclosed in a neurilemmal sheath. Inside the neurilemma are nerve fibers, also enclosed in a myelin sheath. See also **axon, dendrite, neuroglia, neuron, Schwann cell.**

nerve accommodation, the ability of nerve tissue to adjust to a constant source and intensity of stimulation so that some change in either intensity or duration of the stimulus is necessary to elicit a response beyond the initial reaction. Accommodation is probably caused by reduced sodium ion permeability, which results in an increased threshold intensity and subsequent stabilization of the resting membrane potential.

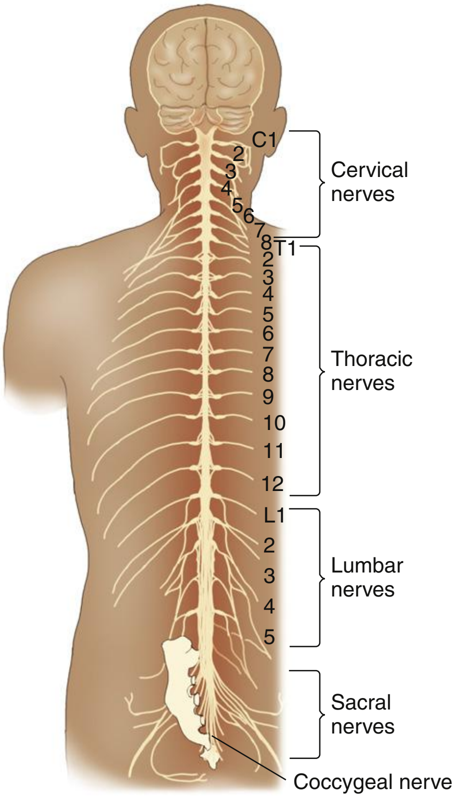
nerve agents, chemicals that interfere with the proper functioning of the nervous system. They are highly potent, and very small amounts can have serious effects. They include sarin, soman, tabun, and VX. Exposure is by inhalation or by skin or eye contact. Nerve agents can also be mixed with water and can be used to poison water supplies so that people can be exposed by drinking contaminated water or getting contaminated water on the skin. These agents act by inhibiting acetylcholinesterase, which allows the muscles to be stimulated constantly, and fatigue of the muscles used for breathing can cause death from respiratory failure. Treatment consists of removing the agent from the body and administration of an antidote (which must be done within minutes of exposure).

nerve block anesthesia. See **conduction anesthesia.**

nerve cable graft, a multistrand free nerve graft taken from elsewhere in the body to bridge a large gap in one of the main nerves in the forearm.

nerve cell. See **neuron.**

nerve compression, a pathological event that causes harmful pressure on one or more nerves, resulting in nerve damage and muscle weakness, atrophy, or paresthesias over time. Any nerve that passes over a rigid prominence is vulnerable, and the degree of damage depends on the magnitude



Nerves of the spinal cord *(Leonard, 2009)*

and duration of the compressive force. Various factors may contribute to susceptibility, such as inherited predisposition, malnutrition, trauma, and disease. Various activities associated with routine occupations may unduly compress especially vulnerable nerves, such as the median nerve, radial nerve, femoral nerve, and plantar nerves. Rest and the cessation or modification of causative activities often heal nerve damage caused by compression. Surgery may be required to correct more severe cases. Compare **nerve entrapment.**

nerve conduction test, an electrodiagnostic test of the integrity of the peripheral nerves. It involves placing an electrical stimulator over a nerve and measuring the time required for an impulse to travel over a measured segment of the nerve. The test is used in the diagnosis of nerve entrapment syndrome radiculopathies and polyneuropathies.

nerve deafness. See **sensorineural hearing loss.**

nerve endings, the fine branchlike terminations of peripheral neurons. Sensory endings are effectively dendrites lying far from the neuronal cell body, and motor nerve endings are the endings of axons and are called *motor end plates*. See also **neuron.**

nerve entrapment, an abnormal condition and type of mononeuropathy characterized by nerve damage and muscle weakness or atrophy. The peripheral nerve trunks of the body are especially vulnerable to entrapment in which repeated compression results in significant impairment. Nerves that pass over rigid prominences or through narrow bony and fascial canals are particularly prone to entrapment. The common signs of this disorder are pain and muscular weakness. Nerve damage by entrapment occurs more often when adjacent joints are affected by swelling and inflammation, such as in rheumatoid arthritis, pregnancy, and acromegaly. Signs of nerve entrapment also may develop after repeated bruising of certain nerves by various activities involving repeated motions, such as those associated with knitting and prolonged walking. One of the most common types of entrapment is **carpal tunnel syndrome.** Compare **nerve compression.**

nerve excitability [L, *nervus,* nerve, *excitare,* to rouse], the readiness of a nerve cell to respond to a stimulus. See also **all-or-none law.**

nerve fiber, a slender process, the axon of a neuron. Each fiber is classified as myelinated or unmyelinated. Myelinated fibers are further designated as A or B fibers. C fibers are unmyelinated. The A fibers are somatic. A alpha fibers are large fibers and transport impulses at a velocity of 60 to 100 meters per second; A beta fibers are smaller and transmit pressure and temperature impulses at a velocity of 30 to 70 meters per second. A gamma fibers transmit touch and pressure impulses. A delta fibers are the smallest and transmit impulses associated with sharp pain sensation. B fibers are more finely myelinated than A fibers. They are both afferent and efferent and are mainly associated with visceral innervation. The unmyelinated C fibers are efferent postganglionic autonomic and afferent fibers that conduct impulses of prolonged, burning pain sensation from the viscera and periphery.

nerve graft, the transplantation of all or part of a nerve. The procedure may be performed in cases in which the gap in a severed nerve is too large to be repaired by suture alone. The graft provides a pathway that encourages the regrowth of severed axons from the central stump of the damaged nerve. Donor material may consist of heterografts, homografts, or autografts.

nerve growth factor (NGF), a protein whose hormone-like action affects differentiation, growth, and maintenance of neurons.

nerve impulse. See **impulse.**

nerve plexus [L, *nervus,* nerve, *plexus,* plaited], an interwoven network of nerves, such as the lumbar plexus formed by the anterior primary branch of the upper four lumbar nerves.

nerve root, the part of a nerve adjacent to the center to which it is connected.

nerve root impingement, the abnormal protrusion of body tissue into the space occupied by a spinal nerve root. Causes may include disk herniation, tissue prolapse, and inflammation.

nerve sheath [L, *nervus,* nerve; AS, *scaeth*], any of several types of coatings or coverings for nerve fibers and nerve tracts. Kinds of nerve sheaths include **endoneurial, medullary, myelin,** and **neurilemma.**

nervimotor /ner′vi·mō′tər/ [L, *nervus,* nerve + *motare,* to move], pertaining to a motor nerve.

nervous emesis [L, *nervus* + Gk, *emesis,* vomiting], vomiting that is functional and psychogenic. The condition is most common among young women and is regarded as a psychological representation of a desire to reject something.

nervous prostration [L, *nervus* + *prosternere,* to throw down], a condition of irritable weakness and depression, which may be psychogenic or the result of a severe prolonged illness or exhausting experience.

nervous system [L, *nervus,* nerve; Gk, *system*], the extensive, intricate network of structures that activates, coordinates, and controls all the functions of the body. It is divided into the central nervous system, composed of the brain and the spinal cord, and the peripheral nervous system, which includes the cranial nerves and the spinal nerves. These morphological subdivisions combine and communicate to innervate the somatic and visceral parts of the body with the afferent and efferent nerve fibers. Afferent fibers carry sensory impulses to the central nervous system. Efferent fibers carry motor impulses from the central nervous system to the muscles and other organs. The somatic fibers are associated with the bones, muscles, and skin. The visceral fibers are associated with the internal organs, blood vessels, and mucous membranes. Compare **autonomic nervous system.** See also the **Color Atlas of Human Anatomy**, pp. A23–A27.

nervous tachypnea [L, *nervus* + Gk, *tachys*, rapid, *pnoia*, breath], a neurotic symptom characterized by quick, shallow breathing.

nervus abducens. See **abducens nerve.**

nervus accessorius. See **accessory nerve.**

nervus facialis. See **facial nerve.**

nervus glossopharyngeus. See **glossopharyngeal nerve.**

nervus hypoglossus. See **hypoglossal nerve.**

nervus oculomotorius. See **oculomotor nerve.**

nervus olfactorius. See **olfactory nerve.**

nervus opticus. See **optic nerve.**

nervus terminalis. See **terminal nerve.**

nervus trigeminus. See **trigeminal nerve.**

nervus trochlearis. See **trochlear nerve.**

nervus vagus. See **vagus nerve.**

Nesacaine, a trademark for a long-acting local anesthetic **(chloroprocaine).**

nesiritide, a vasodilator used to treat acutely decompensated congestive heart failure.

-ness, suffix meaning "a quality or state of being": *illness, painless*.

nested nails, a pair of nails placed side by side in the medullary canal of long bones during orthopedic surgery.

nested variable, a variable located entirely within another variable, such as the rate of a given disease in one specific city.

net charge, the arithmetic sum of positive and negative charges.

net protein utilization (NPU), a measure of protein quality based on the percentage of ingested nitrogen that is retained by the body. Because NPU does not take into account differences in the digestibility of proteins, it gives a poorly digested but good-quality protein a false low value.

net radiation, the arithmetic difference between solar radiation received and outgoing terrestrial radiation.

nettle, a perennial herb that is native to Europe and is now found throughout the United States and parts of Canada.

■ USES: It is used as a diuretic and as a treatment for hay fever and shows some evidence of efficacy for these indications.

■ CONTRAINDICATIONS: It should not be used during pregnancy and lactation, in children less than 2 years of age, or in people with hypersensitivity to this plant. It should be used only with caution in children and the elderly.

nettle rash [AS, *netele*, nettle; Fr, *rasche*, scurf], a fine urticarial eruption resulting from skin contact with stinging nettle, a common weed with leaves containing histamine. It is characterized by stinging and itching that lasts from a few minutes to several hours.

network [AS, *net* + *wearc*], a system of interconnected computers or CRT terminals and peripheral equipment in which each user has some access to others using the system while sharing data, internal and external storage devices (server), and other capabilities. A local-area network is one in which the computers are interconnected and serve the same facility or corporation.

Network Design Group, a Medicare-specific oversight group that maintains a log of enrollee complaints related to service and quality of care issues reported to the U.S. Health Care Financing Administration. It participates in investigation of complaints.

networking, 1. the process of developing and using an interaction format with professional colleagues and agencies. **2.** (in psychiatric nursing) the process of developing a set of agencies and professional personnel who are able to create a system of communication and support for psychiatric patients, usually those recently discharged from inpatient psychiatric facilities. Kinds of networks include **natural network** and **professional network. 3.** a network of supportive contacts or services, such as the Women's Health Network.

network-model HMO, a managed care system analogous to the group-model health maintenance organization (HMO), but with services provided at multiple sites by multiple groups so that a wider geographic area is served.

net wt, abbreviation for *net weight*.

Neufeld nail /nyo͞o′fəld/ [Alonzo J. Neufeld, American surgeon, 1906–1984], an orthopedic nail with a V-shaped tip and shank used for fixating an intertrochanteric fracture. The nail is driven into the neck of the femur until it reaches a round metal plate screwed onto the side of the femur. It is secured to a receptacle on the plate. Also called *Neufeld angled nail*.

Neufeld roller traction, a traction device for a fractured femur, consisting of a cast for the calf and thigh hinged at the knee. The cast is suspended by a line that passes from the anterior midthigh, around a pulley, to a spring attached to the anterior midleg.

Neuman, Betty, a nursing theorist who developed the Neuman Systems Model, first published in 1972. Her model is influenced by Gestalt theory, which states that the homeostatic process is the process by which an organism maintains its equilibrium. Major concepts include total persons approach, holism, open system, lines of resistance and defense, degree of reaction, interventions, levels of prevention, and reconstitution. A spiritual variable was added to her model later, and created-environment was added to the typology. In the Neuman Systems Model, the client is presented as a whole person, an open system in constant change and in reciprocal interaction with the environment. Neuman believes the nurse should use purposeful interventions and a total-person approach to client care to help individuals, families, and groups reach and maintain a maximum level of total wellness. Nursing intervention is aimed at the reduction of stress and adverse conditions that can affect optimal client functions.

neur-. See **neuro-.**

neural /no͝or′əl/ [Gk, *neuron*, nerve], pertaining to nerve cells and their processes.

-neural, -neuric, suffix meaning "nerve or nerves": *epineural, epithelioneural, myoneural*.

neural canal. See **neurocoele.**

neural cell-adhesion molecule, an immunoglobulin that functions as a molecular recognition molecule. See also **recognition site.**

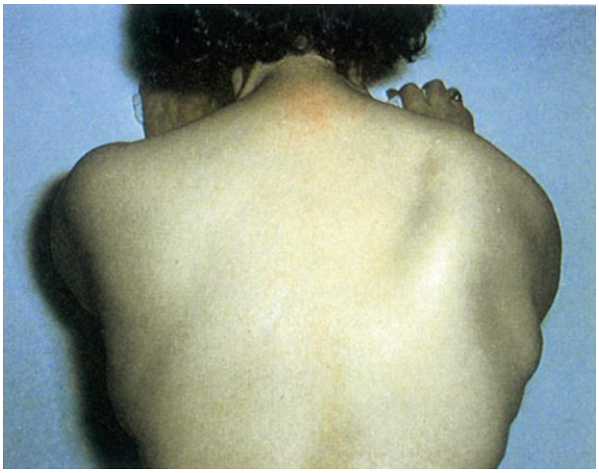
neural crest, the ectodermally derived cells along the outer surface of each side of the neural tube in the early stages of embryonic development. The cells migrate laterally throughout the embryo and give rise to spinal, cranial, enteric, and sympathetic ganglia; pigment cells; Schwann cells; and the adrenal medulla. Also called **ganglionic crest, ganglionic ridge.** See also **neural tube formation.**

neural ectoderm, the part of the embryonic ectoderm that develops into the neural tube. See also **neural tube formation.**

neural fold, either of the paired longitudinal elevations resulting from the invagination of the neural plate in the early developing embryo. The folds unite to enclose the neural groove and form the neural tube. Also called **medullary fold.** See also **neural tube formation.**

neuralgia /no͞oral′jə/ [Gk, *neuron* + *algos*, pain], an abnormal condition characterized by severe stabbing pain, caused by a variety of disorders affecting the nervous system. **—neuralgic,** *adj*.

neuralgic amyotrophy /no͞oral′jik ā′mīot′rəfē/, a brachial plexus disorder characterized by sudden pain and muscle weakness in the upper limbs and sometimes by muscular wasting or atrophy. The cause is unknown. Also called **Parsonage-Turner syndrome.**



Neuralgic amyotrophy *(Moll, 1997)*

neural groove, the longitudinal depression that occurs between the neural folds during the invagination of the neural plate to form the neural tube in the early stages of embryonic development. Also called **medullary groove.** See also **neural tube formation.**

neural impulse. See **impulse.**

neural plate, a thick layer of ectodermal tissue that lies along the central longitudinal axis of the early developing embryo and gives rise to the neural tube and subsequently to the brain, spinal cord, and other tissues of the central nervous system. Also called **medullary plate.** See also **neural tube formation.**

neural tube, the longitudinal tube, lying along the central axis of the early developing embryo, that gives rise to the brain, spinal cord, and other neural tissue of the central nervous system. Also called **cerebromedullary tube, medullary tube.** See also **neural tube defect.**

neural tube defect (NTD), any of a group of congenital malformations involving defects in the skull and spinal column that are caused primarily by the failure of the neural tube to close during embryonic development. In some instances the cleft results from an abnormal increase in cerebrospinal fluid pressure on the closed neural tube during the first trimester of development. The defect may occur at any point along the neural axis or extend the entire length of the spinal column, as in holorachischisis. The amount of deformity and disability depends on the degree of neural involvement, the most severe defect being complete cranioschisis, or the total absence of the skull and defective brain development. Other cerebral dysplasias resulting from the failure of the cranial end of the neural tube to fuse are meningoencephalocele and cranial meningocele. These defects, usually accompanied by severe mental and physical disorders, occur most often in the occipital region of the skull but may also occur in the frontal or basal regions. Most neural tube malformations are caused by incomplete fusion of one or more laminae of the vertebral column, with varying degrees of tissue protrusion and neural involvement. The two most common NTDs are spina bifida and anencephaly. Other NTDs include rachischisis, myelocele, myelomeningocele, and meningocele. In all of these conditions there is constant risk of rupture of the saclike protrusion and danger of meningeal infection. Often immediate surgical repair is necessary. Adequate folate levels during the first month after conception are important in preventing neural tube defects; the U.S. Public Health Service recommends that all women of childbearing age increase their folate intake to 400 mg per day. Many of the major neural tube defects can be determined prenatally by ultrasonic scanning of the uterus and by tests for the presence of elevated concentrations of alpha-fetoprotein levels in the amniotic fluid. Such diagnostic tests are preferably performed during the 14th to 16th week of gestation so that termination of the pregnancy is possible. See also **anencephaly, Arnold-Chiari malformation, spina bifida cystica.**

neural tube formation, the various processes and stages involved in the embryonic development of the neural tube, which subsequently differentiates into the brain, the spinal cord, and other neural tissue of the central nervous system. The primitive tube originates from a flat, single layer of ectodermal tissue that extends longitudinally along the middorsal line of the embryonic disk from the area of the primitive streak forward to the cephalic extremity. This tissue, the neural plate, grows rapidly and becomes thickened, resulting in the invagination and formation of a hollow groove, the neural groove. With continued cell division the groove becomes deeper, and the folds thicken so that they eventually meet and fuse, converting the neural groove into the neural tube. The closing of the neural tube progresses toward both the caudal and the cephalic regions. At the cephalic end the tube expands into a large vesicle with three subdivisions that differentiate into the forebrain (prosencephalon), the midbrain (mesencephalon), and the hindbrain (rhombencephalon). The epithelium of the wall of the tube develops into the various cells of the nervous system. The caudal part of the tube subsequently forms the spinal cord. Failure of any part of the neural tube to close during early embryonic development results in a number of congenital defects. See also **neural tube defect.**

neuraminic acid /noor′ah-min′ik/, a nine-carbon amino acid formed from mannosamine and pyruvate. See also **sialidase**.

neuraminidase /no͞or′əmē′nədās/, an enzyme that catalyzes the cleavage of *N*-acetyl neuraminic acid from mucopolysaccharides. A hereditary deficiency of the enzyme causes sialidosis and is associated with galactogialidosis; it is characterized by mental retardation and skeletal changes, especially dysotosis multiplex. Also called **sialidase.** See also **sialidosis.**

neuraminidase spikes, projections from surfaces of influenza viruses containing neuraminidase that are involved in the release of viruses from infected cells.

neurapraxia /no͞or′əprak′sē·ə/, the interruption of nerve conduction without loss of continuity of the axon.

neurasthenia /no͞or′əsthē′nē·ə/ [Gk, *neuron* + *a* + *sthenos*, without strength], **1.** an abnormal condition that often follows depression, characterized by nervous exhaustion and a vague functional fatigue. **2.** (in psychiatry) a stage in the recovery from a schizophrenic experience during which the patient is listless and apparently unable to cope with routine activities and relationships. **—neurasthenic,** *adj*.

-neure, suffix meaning a “nerve cell”: *ganglioneure, myoneure, sporadoneure*.

neurectomy /nŏŏrek′təmē/ [Gk, *neuron,* nerve, *ektomē,* excision], the surgical excision of a nerve segment.

neurenteric canal /nŏŏr′ənter′ik/ [Gk, *neuron* + *enteron,* intestine; L, *canalis,* channel], a tubular passage between the posterior part of the neural tube and the archenteron in the early embryonic development of lower animals. It corresponds to the notochordal canal of humans and the higher animals. Also called **archenteric canal, blastoporic canal, Braun’s canal.**

neuresthenia. See **fatigue state.**

-neuria, suffix meaning a “(specified) condition involving nerves”: *acystineuria, ovariodysneuria*.

-neuric. See **-neural.**

neurilemma /nŏŏr′əlem′ə/ [Gk, *neuron* + *lemma,* sheath], a layer of cells composed of one or more Schwann cells that forms the segmented myelin sheaths of peripheral nerve fibers. It is necessary for regeneration of peripheral nerves when they have been severed. Also spelled **neurolemma.** Also called *Schwann sheath*. **—neurilemmal, neurilemmatic, neurilemmatous,** *adj*.

neurilemmoma. See **schwannoma.**

neurimotor. See **nervimotor.**

neurinoma /nŏŏr′inō′mə/ *pl*. **neurinomas, neurinomata** [Gk, *neuron* + *oma,* tumor], **1.** a tumor of the nerve sheath. It is usually benign but may undergo malignant change. A kind of neurinoma is *acoustic neurinoma*. See also **schwannoma. 2.** a neuroma.

neuritic plaque /nŏŏrit′ik/, an extracellular deposit consisting of beta-amyloid protein mixed with branches of dying nerve cells in the brain of a patient with Alzheimer’s disease.

neuritis /nŏŏrī′tis/ *pl*. **neuritides** [Gk, *neuron* + *itis,* inflammation], an abnormal condition characterized by inflammation of a nerve. Some of the signs of this condition are neuralgia, hypesthesia, anesthesia, paralysis, muscular atrophy, and defective reflexes.

neuro-, neur-, prefix meaning “nerves”: *neuroclonic, neurohormone, neuromast*.

neuroacanthocytosis /n‿oor′ō·ə·kan′thō·sī·tō′sis/ [Gk, *neuron,* nerve + *akantha,* thorn + *kytos,* cell + *osis,* condition], an autosomal-recessive syndrome characterized by tics, chorea, and personality changes, with acanthocytes in the blood.

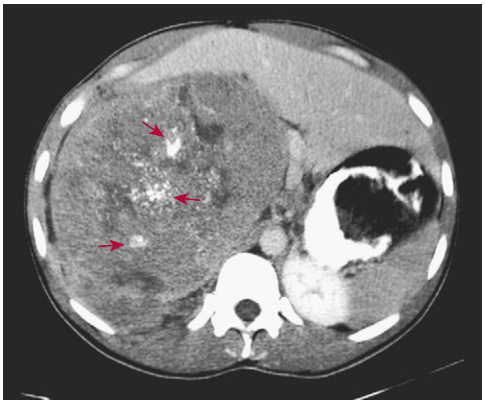
neuroanatomy /nŏŏr′ō·ənat′əmē/, the branch of biology that is concerned with the structure of the nervous system.

neuroarthropathy /-ärthrop′əthē/ [Gk, *neuron* + *arthron,* joint, *pathos,* disease], a condition in which a disease of a joint is secondary to a disease of the nervous system.

neurobiology /-bī′ol′əjē/, a branch of biology that is concerned with the anatomy and physiology of the nervous system.

neuroblast /nŏŏr′əblast/ [Gk, *neuron* + *blastos,* germ], any embryonic cell that develops into a functional neuron; an immature nerve cell. **—neuroblastic,** *adj*.

neuroblastoma /nŏŏr′ōblastō′mə/ *pl*. **neuroblastomas, neuroblastomata** [Gk, *neuron* + *blastos,* germ, *oma,* tumor], a highly malignant tumor composed of primitive ectodermal cells derived from the neural plate during embryonic life. The tumor may originate in any part of the sympathetic nervous system but is most common in the adrenal medulla. Neuroblastomas metastasize early and widely to lymph nodes, liver, lungs, and bone. Symptoms may include an abdominal mass, respiratory distress, and anemia. Hormonally active adrenal lesions may cause irritability, flushing, sweating, hypertension, and tachycardia. Before metastasis, treatment with radical surgery, irradiation, and chemotherapy are often successful. Spontaneous remissions may occur, with the tumor undergoing maturation and forming a benign ganglioneuroma. A kind of neuroblastoma is **Pepper’s syndrome.**



Neuroblastoma (indicated by arrows) metastasized to the bone marrow *(Kim and Chung, 2006)*

neurobrucellosis /-brōō′səlo′sis/, a serious complication of a brucellosis infection that affects the nervous system and may cause meningitis, stroke, cranial nerve lesions, or mycotic aneurysms. The condition usually requires treatment with antibiotics that cross the blood-brain barrier.

neurocanal. See **vertebral canal.**

neurocardiogenic syncope, a particularly serious type of vasovagal attack, the cause of which is unknown.

neurocele. See **neurocoele.**

neurocentral /-sen′trəl/ [Gk, *neuron* + *kentron,* center], pertaining to the neurocentrum and the developing vertebrae in the early stages of embryology.

neurocentrum /-sen′trəm/ [Gk, *neuron* + L, *centrum,* center], the embryonic mesodermal tissue that subsequently gives rise to the vertebrae. See also **sclerotome.**

neuro check [Gk, *neuron* + ME, *chek,* stop], *nontechnical,* a brief neurological assessment ordered by the physician to be performed every 4 hours on patients that may have evolving disease, such as stroke. The level of consciousness is evaluated as alert and oriented, lethargic, stuporous, or comatose. The movements of the extremities are determined to be voluntary or involuntary. The pupils of the eyes are observed for equality of dilation, reactivity to light, and ability to accommodate.

neurochemistry /-kem′istrē/, a branch of neurology that is concerned with the biochemistry of the nervous system.

neurocirculatory asthenia /-sur′kyələtôr′ē/ [Gk, *neuron* + L, *circulare,* to go around; Gk, *a* + *sthenos,* without strength], a psychosomatic disorder characterized by nervous and circulatory irregularities, including dyspnea, palpitation, giddiness, vertigo, tremor, precordial pain, and increased susceptibility to fatigue. The symptoms often result from or are associated with psychological stress.

neurocoele /nŏŏr′əsēl/ [Gk, *neuron* + *koilos,* hollow], a system of cavities in the central nervous system of humans and other vertebrate animals. It consists of the ventricles of the brain and the central canal of the spinal cord, which originate from the neural tube during early embryonic development. Also spelled **neurocele,** *neurocoel*. Also called **neural canal.**

neurocytolysin /-sītol′isin/, a toxic substance in snake venom that destroys nerve cell membranes.

neurocytolysis /-sītol′isis/, the destruction of nerve cells.

neurocytoma /no͝or′ōsītō′mə/ [Gk, *neuron* + *kytos,* cell, *oma,* tumor], a tumor composed of undifferentiated nerve cells that are usually ganglionic. Also called **neuroma.**

neuroderm. See **neuroectoderm.**

neurodermatitis /-dur′mətī′tis/ [Gk, *neuron* + *derma,* skin, *itis,* inflammation], a nonspecific pruritic skin disorder seen in anxious, nervous individuals. Excoriations and lichenification occur on easily accessible, exposed areas of the body such as the forearms and forehead. Sometimes loosely (and incorrectly) referred to as **atopic dermatitis.** See also **lichen simplex chronicus.**

neurodevelopmental adaptation /-dəvel′əpmen′təl/, a type of therapy that emphasizes the inhibition/integration of primitive postural patterns and promotes the development of normal postural reactions and achievement of normal tone. The therapy is used in the treatment of children with cerebral palsy.

neurodevelopmental treatment, a neurophysiological rehabilitation approach based on a hierarchical nervous system. The principles focus on the inhibition of abnormal tone by using reflex inhibiting patterns, the promotion of basic movement patterns that occur in an automatic fashion, and other protective treatment. Also called *Bobath method*.

neuroectoderm /no͝or′ō·ek′tədurm/ [Gk, *neuron* + *ektos,* outside, *derma,* skin], the part of the embryonic ectoderm that gives rise to the central and peripheral nervous systems, including some glial cells. **—neuroectodermal,** *adj*.

neuroelectric therapy, the use of a low-amperage electric current to stimulate nerve endings. The action may stimulate endogenous neurotransmitters, such as endorphins that produce symptomatic relief. A kind of neuroelectric therapy is transcutaneous electric nerve stimulation.

neuroendocrine /no͝or′ō·en′dəkrin/ [Gk, *neuron,* nerve, *endon,* within, *krinein,* to secrete], pertaining to or resembling the effects produced by endocrine glands strongly linked with the nervous system.

neuroendoscope /no͝or′o·en′doskōp′/, an endoscope for examining and performing various interventions in the central nervous system.

neuroendoscopy, the use of a neuroendoscope with the aid of a neuronavigation system to examine the central nervous system and perform minimally invasive neurosurgical procedures.

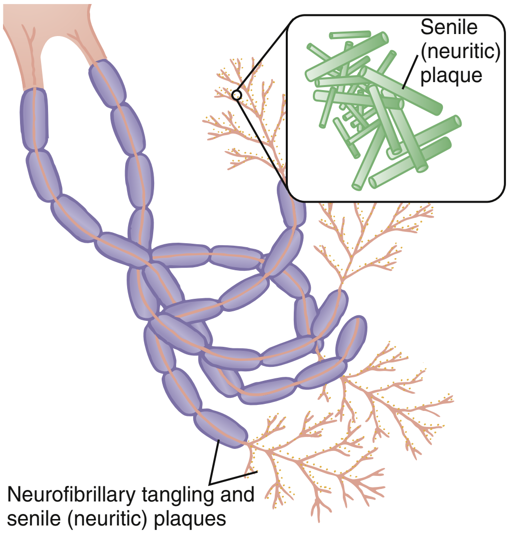
neuroepithelioma /no͝or′ō·ep′ithē′lē·ō′mə/ [Gk, *neuron* + *epi,* upon, *thele,* nipple, *oma,* tumor], an uncommon neoplasm of neuroepithelium in a sensory nerve. Also called *neuroepithelial tumor.*

neurofibril /-fī′bril/, a threadlike structure found in the cytoplasm of a neuron.

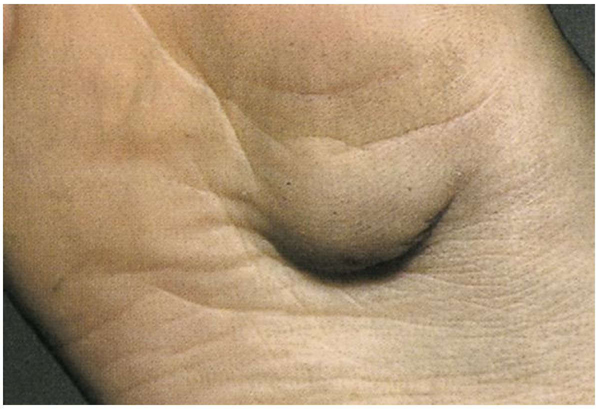
neurofibrillary tangles /-fī′briler′ē/, an intracellular clump of neurofibrils made of insoluble protein in the brain of a patient with Alzheimer's disease.

neurofibroma /no͝or′ōfībrō′mə/ *pl.* **neurofibromas, neurofibromata** [Gk, *neuron* + L, *fibra,* fiber; Gk, *oma,* tumor], a fibrous tumor of nerve tissue resulting from the abnormal proliferation of Schwann cells. Multiple growths in the peripheral nervous system are often associated with abnormalities in other tissues. See also **neurofibromatosis.**

neurofibromatosis /no͝or′ōfī′brōmətō′sis/ [Gk, *neuron* + *fibra,* fiber; Gk, *oma,* tumor, *osis,* condition], a congenital condition transmitted as an autosomal-dominant trait, characterized by numerous neurofibromas of the nerves and skin, café-au-lait spots on the skin, and developmental anomalies of the muscles, bones, and viscera. Many large, pedunculated soft-tissue tumors may develop. Bone changes may result in skeletal deformities, especially curvature of the spine. Neurofibromas may develop in the alimentary tract, bladder, endocrine glands, and cranial nerves. Also called **multiple neuroma, neuromatosis, Recklinghausen's disease, von Recklinghausen's disease.**



Neurofibrillary tangles *(Black and Hawks, 2005)*



Neurofibroma *(Weston, Lane, and Morelli, 2007)*

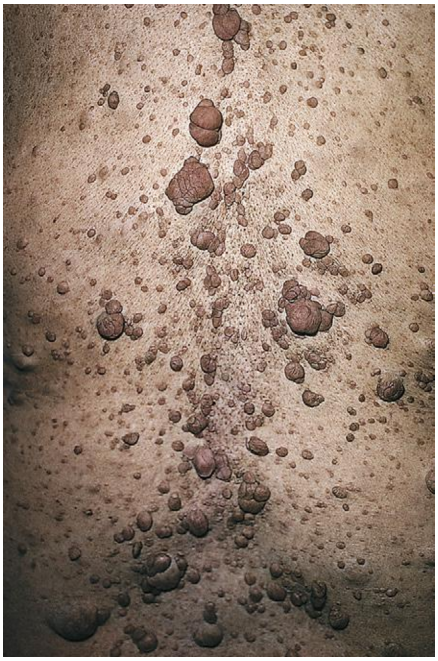
neurofilament /no͝or′ōfil′əment/ [Gk, *neuron,* nerve + L, *filare,* to spin], a cytoplasmic filament approximately 10 nm in diameter occurring in the neurons. It has a cytoskeletal function and may be involved in the intracellular transport of metabolites.

neurogen /no͝or′əjən/ [Gk, *neuron* + *genein,* to produce], a substance within the early developing embryo that stimulates the primary organizer to initiate the formation of the neural plate, which gives rise to the primary axis of the body. See also **neurotransmitter.**

neurogenesis /-jen′əsis/ [Gk, *neuron* + *genesis,* origin], the formation of the tissue of the nervous system. **—neurogenetic,** *adj*.

neurogenic /-jen′ik/ [Gk, *neuron* + *genesis,* origin], **1.** pertaining to the formation of nervous tissue. **2.** pertaining to the stimulation of nervous energy. **3.** originating in the nervous system.

neurogenic arthropathy, an abnormal condition associated with neural damage, characterized by the gradual and usually painless degeneration of a joint. One of the major



Neurofibromatosis *(Callen et al, 2000)*

causes of this condition is believed to be a minor injury that is disregarded by the affected individual because of a lack of sensation in the injured tissue. Inadequate rest and care aggravate such injuries and prevent proper healing. See also **neuropathic joint disease.**

neurogenic bladder, dysfunction of the urinary bladder caused by a lesion of the nervous system. Treatment is aimed at preventing infection, controlling incontinence, and preserving kidney function by enabling the bladder to empty completely and regularly. Kinds of neurogenic bladder are **flaccid bladder** and **spastic bladder.** Also called **neuropathic bladder.**

neurogenic claudication, claudication accompanied by pain and paresthesias in the back, buttocks, and lower limbs that is relieved by stooping, caused by mechanical disturbances resulting from posture or by ischemia of the cauda equina.

neurogenic fracture, a fracture associated with the destruction of the nerve supply to a specific bone.

neurogenic hoarseness, a sign of unilateral vocal cord paralysis. It is asymptomatic, but there may be excessive air escape during speech as a result of incomplete closure of the glottis. Extra effort is required to generate enough air flow to make speech sounds. Untreated, there is a danger of aspiration pneumonia.

neurogenic impotence, penile erectile dysfunction caused by neurological disorders. The disorders may involve the parasympathetic sacral spinal cord or the peripheral efferent autonomic fibers to the penis. See also **impotence, sexual dysfunction.**

neurogenic shock, a form of shock that results from peripheral vascular dilation.

neuroglia /no͝orog′lē·ə/ [Gk, *neuron* + *glia,* glue], the supporting or nonneuronal tissue cells of the central and peripheral nervous system. They perform the less specialized functions of the nerve network. Kinds of neuroglia include *astrocytes,* **oligodendroglia,** and **microglia.** Compare **neuron. —neuroglial,** *adj.*

neurography /no͝orog′rəfē/, **1.** the study of the action potentials of the nerves. **2.** a technique for visualization of peripheral nerve activity by graphic representation of data obtained by media contrast radiographics or by electric recording.

neurohormone /no͝or′əhôr′mōn/, a hormone produced in neurosecretory cells such as those of the hypothalamus and released into the bloodstream, the cerebrospinal fluid, or intercellular spaces of the nervous system. The product may or may not be a true systemic hormone such as epinephrine. When the hormone is not a true hormone, it may be a cell product that induces the release of a tropic hormone, which in turn stimulates an endocrine gland to release a systemic hormone. See also **neuromodulator, neurotransmitter.**

neurohypophyseal hormone /-hī′pōfiz′ē·əl/ [Gk, *neuron* + *hypo,* under, *phyein,* to grow], a hormone secreted by the posterior pituitary gland. Neurohypophyseal hormones include **oxytocin** and **vasopressin.** See also **pituitary gland.**

neurohypophysis /-hīpof′isis/ [Gk, *neuron* + *hypo,* under, *phyein,* to grow], the posterior lobe of the pituitary gland that is the release point of antidiuretic hormone (ADH) and oxytocin. Nervous stimulation from the hypothalamus controls the release of the substances into the blood. When stimulated by the hypothalamus, the neurohypophysis releases ADH by an increase in the osmotic pressure of extracellular fluid in the body. The hormone acts on the cells in the distal and collecting tubules of the kidneys, making them more permeable to water and thus reducing the volume of urine. The neurohypophysis releases oxytocin under appropriate stimulation from the hypothalamus. Oxytocin produces powerful contractions of the pregnant uterus and causes milk to flow from lactating breasts. Stimulation of the nipples of the breast by a nursing infant triggers the release of this hormone. Also called **posterior pituitary gland.** Compare **adenohypophysis.**

neuroimmunology /no͞or′ō·im′yo͞onol′əjē/ [Gk, *neuron* + L, *immunis,* freedom; Gk, *logos,* science], the study of relationships between the immune and nervous systems, such as autoimmune activity in neurological diseases.

neurol, abbreviation for **neurology.**

neurolemma. See **neurilemma.**

neurolepsis /-lep′sis/ [Gk, *neuron* + *lepsis,* seizure], an altered state of consciousness, as induced by a neuroleptic agent, characterized by quiescence, reduced motor activity, decreased anxiety, and indifference to the surroundings. Sleep may occur, but usually the person can be aroused and can respond to commands.

neurolepsy /no͝or′əlep′sē/, a mental state characterized by the blocking of autonomic reflexes, as in hypnosis or antipsychotic drug–induced disorders.

neurolept. See **neuroleptic drug.**

neuroleptanalgesia /-lept′anəljē′zē·ə/ [Gk, *neuron* + *lepsis,* seizure, *a* + *algos,* without pain], a form of analgesia achieved by the concurrent administration of a neuroleptic such as droperidol and an analgesic such as fentanyl. Anxiety, motor activity, and sensitivity to painful stimuli are reduced; the person is quiet and indifferent to surroundings and is able to respond to commands. If nitrous oxide with oxygen is also administered, neuroleptanalgesia can be converted to neuroleptanesthesia. This form of analgesia has fallen out of favor in the United States due to adverse reactions.

neuroleptanesthesia /-lept′anəsthē′zhə/ [Gk, *neuron* + *lepsis,* seizure, *anaisthesia,* lack of feeling], a form of anesthesia achieved by the administration of a neuroleptic agent, a narcotic analgesic, and nitrous oxide with oxygen. Induction of anesthesia is slow, but consciousness returns quickly after the inhalation of nitrous oxide is stopped.

neuroleptic /-lep′tik/ [Gk, *neuron* + *lepsis,* seizure], **1.** pertaining to neurolepsis. **2.** See **neuroleptic drug.**

neuroleptic anesthesia [Gk, *neuron,* nerve, *lepsis,* seizure, *anaisthesia,* lack of feeling], a form of anesthesia induced by an injection of a butyrophenone derivative with a narcotic analgesic.

neuroleptic drug, a substance that produces a sedating or tranquilizing effect. Also called **neurolept, neuroleptic.** See also **antipsychotic, tranquilizer.**

neuroleptic malignant syndrome [Gk, *neuron,* nerve, *lepsis,* seizure; L, *malignus,* bad disposition; Gk, *syn,* together, *dromos,* course], a condition characterized by hypertonicity, pallor, dyskinesia, fever, incontinence, unstable blood pressure, and pulmonary congestion. It is caused by the administration of neuroleptic drugs at normal or high doses. Reaction to these drugs is idiosyncratic.

neurolinguistic programming, a complementary therapeutic strategy based on the premise that thought is a representation of sensory experience and that behavior can be modified to achieve a desired result by changing the patient's thought patterns and mental strategies to give the patient more choices in problem solving. It is used for behavior modification and the management of psychosomatic disorders and stress.

neurolinguistics /noor′ō·ling·gwis′tiks/ [Gk, *neuron* + L, *lingua,* tongue], the study of language acquisition, processing, and production at the neurological level.

neurologic, neurological. See **neurology.**

neurological status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of the peripheral and central nervous system to receive, process, and respond to internal and external stimuli. See also **Nursing Outcomes Classification.**

neurological status: autonomic, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of the autonomic nervous system to coordinate visceral and homeostatic function. See also **Nursing Outcomes Classification.**

neurological status: central motor control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of the central nervous system to coordinate skeletal muscle activity for body movement. See also **Nursing Outcomes Classification.**

neurological status: consciousness, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as arousal, orientation, and attention to the environment. See also **Nursing Outcomes Classification.**

neurological status: cranial sensory/motor function, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of the cranial nerves to convey sensory and motor impulses. See also **Nursing Outcomes Classification.**

neurological status: peripheral, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of the peripheral nervous system to transmit impulses to and from the central nervous system. See also **Nursing Outcomes Classification.**

neurological status: spinal sensory/motor function, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability of the spinal nerves to convey sensory and motor impulses. See also **Nursing Outcomes Classification.**

neurological assessment /-loj′ik/ [Gk, *neuron* + *logos,* science; L, *icus,* like, *adsidere,* to approximate], an evaluation of the patient's neurological status and symptoms.

■ METHOD: If alert and oriented, the patient is asked about instances of weakness, numbness, headaches, pain, tremors, nervousness, irritability, or drowsiness. Information is elicited regarding loss of memory, periods of confusion, hallucinations, and episodes of loss of consciousness. The patient's general appearance, facial expression, attention span, responses to verbal and painful stimuli, emotional status, coordination, balance, cognition, and ability to follow commands are noted. Assessment of cranial nerves and deep tendon reflexes is included. If the patient is disoriented, stuporous, or comatose, demonstrated signs of these states are recorded. Observations are made of skin color and temperature; pupillary size, equality, dilation, and reactions to light; respiratory rate, rhythm, and quality; and chest movements and breath sounds. The pulse is checked; ears and nose are examined for possible drainage; strength of the handgrip is tested; and the extremities' sensations and voluntary and involuntary motions are assessed. Urinary output is determined for evidence of polyuria, and the patient's speech is evaluated for signs of slurring and aphasia. Included in the record are concurrent diseases such as hypertension, cancer, and coarctation of the aorta; past illnesses associated with head trauma; seizures; motor, sensory, or emotional disturbances; loss of consciousness; and neurological, medical, or surgical procedures. Pertinent to the assessment are the patient's sleep pattern; medication; personality changes; relationships with family and friends; and a family history of seizures, stroke, mental illness, tumors, or sudden death. Diagnostic aids that may be required for a complete evaluation include a lumbar puncture, complete blood count, myelogram, magnetic resonance imaging, echoencephalogram, brain scan, computerized tomogram, and determinations of glucose, fluid, and electrolyte levels.

■ INTERVENTIONS: The nurse may conduct the interview to obtain subjective data, examines the patient, and assembles the pertinent background information and results of the diagnostic tests.

■ OUTCOME CRITERIA: A careful neurological assessment is an important aid to the neurologist in establishing a diagnosis and the course of treatment.

neurological examination, a systematic examination of the nervous system, including an assessment of mental status, of the function of each of the cranial nerves, of sensory and neuromuscular function, of the reflexes, and of proprioception and other cerebellar functions.

neurological monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of patient data to prevent or minimize neurological complications. See also **Nursing Interventions Classification.**

neurologist /nŏŏrol′əjist/, a physician who specializes in the nervous system and its disorders.

neurology (neurol) /nŏŏrol′əjē/ [Gk, *neuron* + *logos,* science], the field of medicine that deals with the nervous system and its disorders. **—neurologic, neurological,** *adj.* **neurologist,** *n.*

neuroma /n‿oorō′mə/ *pl.* **neuromas, neuromata** [Gk, *neuron* + *oma,* tumor], a benign neoplasm composed chiefly of neurons and nerve fibers, usually arising from a nerve tissue. Pain radiating from the lesion to the periphery of the affected nerve is usually intermittent but may become continuous and severe.

-neuroma, suffix meaning a "tumor made up of nerve cells and fibers": *angiomyoneuroma, inoneuroma, myoneuroma.*

neuroma cutis, a neoplasm in the skin that contains nerve tissue and may be extremely sensitive to painful stimuli.

neuromas, neuromata. See **neuroma.**

neuroma telangiectodes. See **nevoid neuroma.**

neuromatosis /no͝or′ōmətō′sis/ [Gk, *neuron* + *oma,* tumor, *osis,* condition], a neoplastic disease characterized by numerous neuromas. Also called **multiple neuroma.** See also **neurofibromatosis.**

neuromechanism /-mek′əniz′əm/, a neurological system whose components work together to produce a central nervous system function.

neuromodulator, a substance that alters nerve impulse transmission.

neuromotor /no͝or′ōmō′tər/ [Gk, *neuron,* nerve; L, *mover,* to move], pertaining to both the nerves and muscles or to nerve impulses transmitted to muscles.

neuromuscular /no͝or′ōmus′kyo͝olər/ [Gk, *neuron* + L, *musculus,* muscle], pertaining to the nerves and the muscles.

neuromuscular blockade, the inhibition of a muscular contraction activated by the nervous system, possibly resulting in muscle weakness or paralysis.

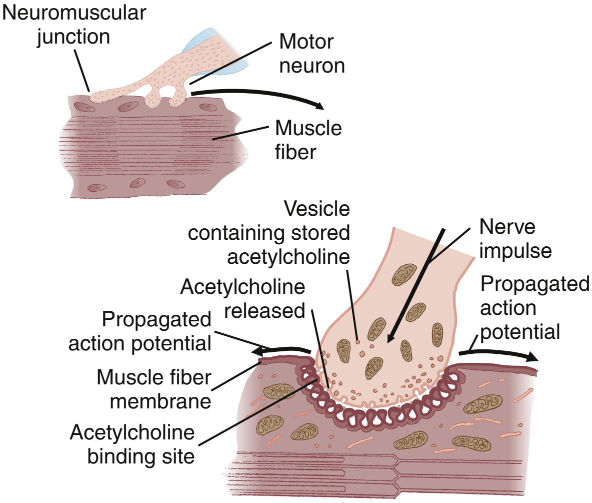
neuromuscular blocking agent, a chemical substance that interferes locally with the transmission or reception of impulses from motor nerves to skeletal muscles. Nondepolarizing agents such as metocurine, pancuronium, and tubocurarine competitively block the transmitter action of acetylcholine at the motor end plate. Depolarizing blocking agents such as succinylcholine chloride also compete with acetylcholine for cholinergic receptors of the motor end plate but work by first activating the receptor and then blocking its ability to be reset for subsequent stimulation. Neuromuscular blocking agents are used to induce muscle relaxation in anesthesia, endotracheal intubation, and electroshock therapy and as adjuncts in the treatment of tetanus, encephalitis, and poliomyelitis. Neuromuscular blocking drugs can cause bronchospasm, hyperthermia, hypotension, or respiratory paralysis and are used with caution, especially in patients with myasthenia gravis or with renal, hepatic, or pulmonary impairment and in elderly and debilitated individuals. During surgery, it is important to recognize that these agents prevent muscle movement but do not block the sensation of pain. See also **muscle relaxant.**

neuromuscular electric stimulator (NMES), a device for improving or modulating muscular activation. It may be a portable unit for home treatment of a patient over a long period of time or a large clinical model capable of producing a wider variety of waveforms and modulations of the stimulus. The NMES generates electrical pulses that produce controlled muscle contractions similar to those that occur physiologically. Unless nerve degeneration has occurred, muscles that are weak or paralyzed because of central nervous system involvement should contract when NMES is applied. The procedure may be tested first on an uninvolved muscle on the same or another extremity to establish a normal response.

neuromuscular junction, the area of contact between the ends of a large myelinated nerve fiber and a fiber of skeletal muscle. Also called **myoneural junction.** See also **motor end plate, myelin, nerve.**

neuromuscular spindle, any one of a number of small bundles of delicate muscular fibers enclosed by a capsule, in which sensory nerve fibers terminate. The spindles vary in length from 0.8 to 5 mm, accommodating as many as four large myelinated nerve fibers that pierce the capsule and lose their myelin sheaths. The nerve fibers end as naked axons encircling the intrafusal fibers with flattened expansions or ovoid disks.

neuromyal transmission /-mī′əl/ [Gk, *neuron* + *mys,* muscle; L, *transmittere,* to transmit], the passage of excitation from a motor neuron to a muscle fiber at the neuromuscular junction.



Neuromuscular junction
Motor neuron
Muscle fiber
Vesicle containing stored acetylcholine
Nerve impulse
Acetylcholine released
Propagated action potential
Propagated action potential
Muscle fiber membrane
Acetylcholine binding site

Neuromuscular junction *(Black and Hawks, 2009)*

neuromyelitis /no͝or′ōmī′əlī′tis/ [Gk, *neuron* + *myelos,* marrow, *itis,* inflammation], an abnormal condition characterized by inflammation of the spinal cord and peripheral nerves.

neuron /no͝or′on/ [Gk, nerve], the basic **nerve cell** of the nervous system, containing a nucleus within a cell body and extending one or more processes. Neurons can be classified according to the direction in which they conduct impulses or according to the number of processes they extend. *Sensory neurons* transmit nerve impulses toward the spinal cord and the brain. *Motor neurons* transmit nerve impulses from the brain and the spinal cord to the muscles and the glandular tissue. *Multipolar neurons, bipolar neurons,* and *unipolar neurons* are classified according to the number of processes they extend to the different kinds of neurons. *Multipolar neurons* have one axon and several dendrites, as do most of the neurons in the brain and the spinal cord. *Bipolar neurons,* which are less numerous than the other types, have one axon and only one dendrite. *Unipolar neurons* have one axon and no dendrites. All primary sensory afferents and some autonomic neurons are unipolar. All neurons have one axon, and most have one or more dendrites and have a slightly gray color when clustered, as in the nuclei of the brain and the spinal cord. As the generators and carriers of nerve impulses, neurons function according to electrochemical processes involving positively charged sodium and potassium ions and the changing electrical potential of the extracellular and the intracellular fluid of the neuron. Also spelled **neurone.** **—neuronal,** *adj.*

neuronal antibody, an antibody found in the cerebrospinal fluid of many systemic lupus erythematosus (SLE) patients with neuropsychiatric manifestations and in some SLE patients without such manifestations.

neuronal ceroid lipofuscinosis. See **Batten's disease.**

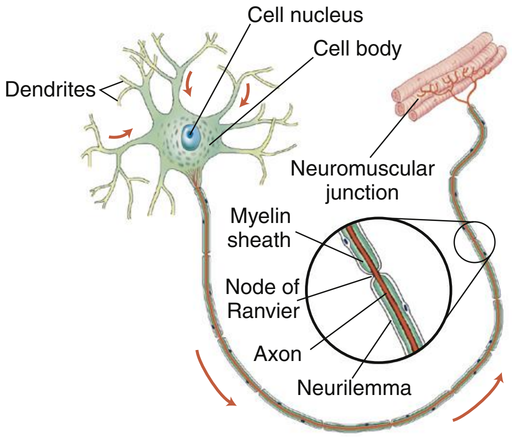
neuronal sprouting, the growth of axons or dendrites from a damaged neuron or from an intact neuron that projects to an area denervated by damage to other neurons.

neurone. See **neuron.**

neuronitis /no͝or′ənī′tis/ [Gk, *neuron* + *itis,* inflammation], inflammation of a nerve or a nerve cell, especially the cells and the roots of the spinal nerves.

neuroparalysis /-pəral′isis/, loss of muscle power as a result of a disorder involving the part of the nervous system affecting the muscle.

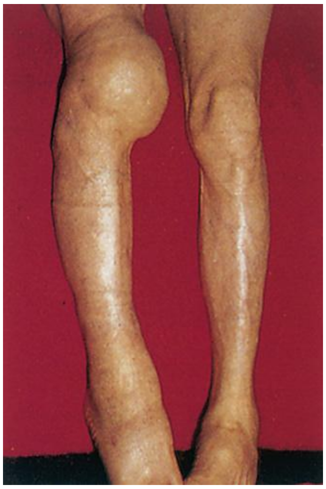
neuropathic. See **neuropathy.**



Neuron *(Leonard, 2009)*

neuropathic bladder. See **neurogenic bladder.**

neuropathic joint disease /-path′ik/ [Gk, *neuron* + *pathos,* disease], a chronic progressive degenerative disease of one or more joints, characterized by swelling, joint instability, hemorrhage, heat, and atrophic and hypertrophic changes in the bone. Pain is usually less severe than would be expected by the appearance of the joint on an x-ray film. The disease is the result of an underlying neurological disorder, such as tabes dorsalis from syphilis, diabetic neuropathy, leprosy, or congenital absence or depression of pain sensation. Early recognition of the disease and prophylactic protection of the joint may prevent further damage in some cases. Surgical reconstruction is not usually effective because healing is slow. Amputation may be necessary. Also called **Charcot's joint.**



Neuropathic joint disease *(Moll, 1997)*

neuropathic pain, pain that results from direct stimulation of the myelin or nervous tissue of the peripheral or central nervous system (except for sensitized C fibers), generally felt as burning or tingling and often occurring in an area of sensory loss. It is seen commonly in patients with uncontrolled diabetes.

neuropathic pain syndrome, a condition of autonomic hyperactivity that results in sharp, stinging, or stabbing pain. The disorder is usually noninflammatory but may result in the destruction of peripheral nerve tissue. It may also be accompanied by changes in skin color, temperature, and edema.

neuropathy /nŏŏrop′əthē/ [Gk, *neuron* + *pathos,* disease], inflammation or degeneration of the peripheral nerves, such as that associated with lead poisoning. **—neuropathic,** *adj.*

neuropeptide /noor′ō·pep′tīd/, any of several types of molecules found in brain tissue, composed of short chains of amino acids including endorphins, enkephalins, vasopressin, and others. They are often localized in axon terminals at synapses and are classified as putative neurotransmitters, although some are also hormones.

neuropeptide Y (NPY), a natural substance that acts on the brain to stimulate eating. Laboratory animals injected with NPY greatly overeat. Substances that block the NPY receptor reduce the appetite. Leptin, a hormone that stimulates weight loss, reduces the output of NPY from the hypothalamus, a major production center. Another natural substance that stimulates the urge to eat is **peptide YY.** In animal experiments it has appeared to be at least as potent as NPY.

neurophysin /-fiz′in/, one of a group of proteins released from the posterior pituitary gland at the same time as the hormone vasopressin or oxytocin. It is cleared from a larger protein of which vasopressin or oxytocin is a part.

neuroplasticity /-plastis′itē/, the capacity of the nervous system for adaptation or regeneration after trauma.

neuroplasty /nŏŏr′əplas′tē/ [Gk, *neuron,* nerve, *plassein,* to mold], plastic surgery to repair a nerve.

neuroplegia /nŏŏr′ōplē′jē·ə/ [Gk, *neuron* + *plege,* stroke], nerve paralysis caused by disease, injury, or the effect of neuroleptic drugs.

neuropore /nŏŏr′ōpôr/ [Gk, *neuron* + *poros,* pore], the opening at each end of the neural tube during early embryonic development, leading from the central canal of the neural tube to the exterior. The closure of these apertures as the tube grows and differentiates occurs with such precision that they are used to indicate horizons XI and XII in the systematic anatomical charting of human embryonic development. Kinds of neuropores are **anterior neuropore** and **posterior neuropore.** See also **horizon, neural tube formation.**

neuropraxia /-prak′sē·ə/ [Gk, *neuron,* nerve, *prassein,* to do], a condition in which a nerve remains in place after a severe injury although it no longer transmits impulses.

neuroprotection /nŏŏr′ō·prō·tek′shən/, protection against **neurotoxicity.**

neuroprotective /noor′opro-tek′tiv/, guarding or protecting against neurotoxicity.

neuropsychiatrist /-sīkī′ətrist/, a physician who deals with the relationship between neurological processes and psychiatric disorders.

neuropsychiatry /-sīkī′ətrē/, a branch of medicine that deals with problems of psychiatry as it relates to the neurological function.

neuroradiography /-rā′dē·og′rəfē/, the radiographic examination of the tissues of the nervous system.

neuroradiology /-rā′dē·ol′əjē/, the branch of radiology concerned with diagnosing diseases of the nervous system.

neurorrhaphy /nŏŏrôr′əfē/ [Gk, *neuron,* nerve, *rhaphe,* suture], a surgical procedure to suture a severed nerve.

neurosarcoidosis /-sär′koidō′sis/, a granulomatous disease that may involve any part of the nervous system but most commonly affects the cranial and spinal nerves. Cranial nerve involvement may result in facial paralysis, whereas spinal nerve involvement may manifest as mononeuritis multiplex. If the central nervous system is affected, the vasculature of the brain may be damaged, resulting in stroke.

neurosarcoma /-särkō′mə/ [Gk, *neuron* + *sarx,* flesh, *oma,* tumor], a malignant neoplasm composed of nerve, connective, and vascular tissues. Also called **malignant neuroma.**

neuroscience /no͝or′ōsī′əns/ [Gk, *neuron,* nerve; L, *scientia*], the study of neurology and related subjects, including neuroanatomy, neurophysiology, neuropharmacology, and neurosurgery.

neurosis /no͞orō′sis/, *pl.* **neuroses,** former name for a category of mental disorders in which the symptoms are distressing to the person, reality testing is intact, behavior does not violate gross social norms, and there is no apparent organic cause. Classified in *DSM-IV* under **anxiety disorders, dissociative disorders, mood disorders, sexual disorders,** and **somatoform disorders.**

-neurosis, suffix meaning a "disease of the nerves" or a "mental disorder": *angioneurosis, psychoneurosis, synneurosis.*

neuroskeleton /-skel′ətən/ [Gk, *neuron,* nerve, *skeletos,* dried up], the parts of the skeleton that surround or otherwise protect the nervous system, particularly the skull and vertebrae.

neurosome /no͝or′ōsōm/ [Gk, *neuron,* nerve + *soma,* body], **1.** the body of a neuron. **2.** any of the minute particles found in the protoplasm of a neuron.

neurosurgery /-sur′jərē/ [Gk, *neuron* + *cheirourgia,* surgery], any surgery involving the brain, spinal cord, or peripheral nerves. Brain surgery is performed to treat a wound, vascular disorders, or epilepsy; remove a tumor or foreign body; relieve pressure in intracranial hemorrhage or hydrocephaly; excise an abscess; treat parkinsonism; or relieve pain. Before surgery, diagnostic skull x-ray films, a CT, MRI, stereotactic CT or MRI, magnetic resonance angiography, ventriculogram, and/or arteriogram are done; a diagnostic electroencephalogram, lumbar tap, or brain scan may be done. A blood type and crossmatch are done. Parenteral corticosteroids are given if cerebral edema is present, and urea may be given to reduce intracranial pressure. Narcotics and hypnotics are avoided, and the nurse must confirm any that are ordered. After surgery, vital signs and changes in the level of consciousness, speech, and muscle strength are monitored closely. Any yellowish drainage from the wound may be cerebrospinal fluid and is reported immediately. Sterile dressing technique is essential. Surgery of the spine is performed to correct a defect, remove a tumor, repair a ruptured intervertebral disk, or relieve pain. After surgery, vital signs and changes in the level of consciousness, speech, and muscle strength are monitored closely. Any yellowish drainage from the wound may be cerebrospinal fluid and is reported immediately. Sterile dressing technique is essential. Surgery of the spine is performed to correct a defect, remove a tumor, repair a ruptured intervertebral disk, or relieve pain. Before surgery computed tomography or magnetic resonance imaging scans, relevant labs, and perhaps a blood type and crossmatch are done. After surgery the nurse keeps the patient's spine in good alignment. Return of sensation and motor function are monitored carefully. Kinds of spinal surgery include fusion and laminectomy. Surgery on the peripheral nerves is performed to remove a tumor, relieve pain, or reconnect a severed nerve. After surgery the nurse observes closely the return of sensation to the area. One kind of nerve surgery is **sympathectomy.**

neurosyphilis /-sif′ilis/ [Gk, *neuron* + *sys,* hog, *philein,* to love], infection of the central nervous system by ***Treponema pallidum,*** the causative agent of syphilis, which may invade the meninges and cerebrovascular system. If the brain tissue is affected, general paresis may result. If the spinal cord is infected, tabes dorsalis may result. See also **syphilis. —neurosyphilitic,** *adj.*

neurotendinous /-ten′dinəs/ [Gk, *neuron,* nerve; L, *tendo,* tendon], pertaining to both nerves and tendons.

neurotendinous spindle [Gk, *neuron* + L, *tendo,* tendon; AS, *spinel,* spindle], a capsule containing enlarged tendon fibers, found chiefly near the junctions of tendons and muscles. One or more nerve fibers pierce the side of the capsule and lose their medullary sheaths; the axons subdivide and terminate between the tendon fibers in irregular disks or varicosities. Also called **organ of Golgi.**

neurotensin /-ten′sin/, a peptide neurotransmitter found in various parts of the brain. It is involved in vasodilation, hypotension, and pain perception.

neurotensinoma /-ten′sinō′mə/, a neuroendocrine tumor of the GI tract. Its major secreted product is neurotensin. The tumor originates in nonbeta islet cells, but, unlike other neuroendocrine tumors, it has no distinguishing clinical features.

neurotic /n(y)o͝orot′ik/ [Gk, *neuron* + *osis,* condition; L, *icus,* like], **1.** *adj,* pertaining to neurosis. **2.** *adj,* pertaining to the nerves. **3.** *n,* one who is afflicted with a neurosis. **4.** *n, (informal)* an emotionally unstable person.

-neurotic, **1.** suffix meaning "a (specified) abnormal condition of the nerves": *angioneurotic, aponeurotic, vasoneurotic.* **2.** suffix meaning "an emotional disorder": *hyperneurotic, psychoneurotic.*

neurotic depression. See **dysthymic disorder.**

neurotic personality [Gk, *neuron,* nerve, *osis,* condition; L, *personalis,* of a person], a disposition characterized by traits and tendencies that increase the likelihood of a specific neurotic behavior. For example, the orderly, cautious, meticulous person may be prone to development of an obsessive-compulsive disorder.

neurotmesis /no͝or′ōtmē′sis/ [Gk, *neuron* + *tmesis,* cutting apart], a peripheral nerve injury in which the nerve is completely disrupted by laceration or traction. It requires surgical approximation, with unpredictable recovery.

neurotological /no͝or′ōtōloj′ik/, pertaining to the study of the elements of the ear as they relate to the brain and nervous system. Also called *neurotologic.*

neurotology /no͝or′ōtol′əjē/, a branch of otology concerned with those parts of the nervous system related to the ear, especially the inner ear and associated brainstem structures. Also called **otoneurology.**

neurotomy /no͝orot′əmē/, the surgical severing of a nerve or nerves.

neurotoxic /no͝or′ōtok′sik/, having a poisonous effect on nerves and nerve cells, such as the degenerative effect of ingested lead on peripheral nerves.

neurotoxicity /-toksis′itē/ [Gk, *neuron,* nerve, *toxikon,* poison], the ability of a drug or other agent to destroy or damage nervous tissue.

neurotoxin /no͝or′ōtok′sin/ [Gk, *neuron* + *toxikon,* poison], a toxin that acts directly on the tissues of the central nervous system, traveling along the axis cylinders of the motor nerves to the brain. The toxin may be secreted in the venom of certain snakes, or it may be present on the spines of a shell or in the flesh of fish or shellfish; it may be produced by certain bacteria or by the cellular disintegration of certain bacteria.

neurotransmitter /-transmit′ər/ [Gk, *neuron* + L, *transmittere,* to transmit], a chemical that modifies or results in the transmission of nerve impulses between synapses. Neurotransmitters are released from synaptic knobs into synaptic clefts and bridge the gap between presynaptic and postsynaptic neurons. Each vesicle within a synaptic knob stores as many as 10,000 neurotransmitter molecules. When a nerve impulse reaches a synaptic knob, thousands of neurotransmitter molecules squirt into the synaptic cleft and bind to specific receptors. This flow allows an associated diffusion of potassium and sodium ions that causes an action potential. Excitatory neurotransmitters decrease the negativity of postsynaptic membrane potentials; inhibitory neurotransmitters increase such potentials. Kinds of neurotransmitters include **acetylcholine, gamma-aminobutyric acid,** and **norepinephrine.**

neurotripsy /-trip′sē/, the surgical crushing of a nerve.

neurotrophic /-trof′ik/, pertaining to the nourishment of nerve cells.

neurotropic viruses /-trop′ik/ [Gk, *neuron,* nerve, *tropein,* to turn, *virus,* poison], viruses with an unexplained attraction to nerve tissue. The predilection also applies to certain toxic chemicals.

neurotropism /nŏŏrot′rəpiz′əm/ [Gk, *neuron,* nerve, *trepein,* to turn], **1.** the tendency for certain microorganisms, poisons, and nutrients to be attracted to nervous tissue. **2.** the tendency of basic dyes to be attracted to nervous tissue.

Neurpro, a trademark for **rotigotine.**

neurula /nŏŏr′ələ/ *pl.* **neurulas, neurulae** [Gk, *neuron,* nerve], an early embryo during the period of neurulation when the nervous system tissue begins to differentiate. The embryo at this level of growth represents a third stage in embryonic development, after the morula and blastocyst stages in humans and higher animals and the blastula and gastrula stages in lower animals. In humans the neurula stage occurs from about 19 to 26 days after fertilization.

neurulation /-ā′shən/ [Gk, *neuron* + L, *atus,* process], the development of the neural plate and the processes involved with its subsequent closure to form the neural tube during the early stages of embryonic development. See also **neural tube formation.**

neutral /n(y)o͞o′trəl/ [L, *neutralis,* neuter], the state exactly between two opposing values, qualities, or properties. For example, in electricity a neutral state is one in which there is neither a positive nor a negative charge; in chemistry a neutral state is one in which a substance is neither acid nor alkaline. See also **acid, base, pH.**

neutralization /-īzā′shən/ [L, *neutralis* + Gk, *izein,* to cause], the interaction between an acid and a base that produces a solution that is neither acidic nor basic. The usual products of neutralization are a salt and water. **—neutralize,** *v.*

neutral rotation, the position of a limb that is turned neither toward nor away from the body's midline. When a person is supine and the leg is neutrally rotated, the toes should point straight up.

neutral thermal environment, an environment created by any method or apparatus to maintain the normal body temperature to minimize oxygen consumption and caloric expenditure, such as in an incubator or Isolette for a premature, sick, or low–birth weight infant. See also **incubator, Isolette.**

neutron /n(y)o͞o′tron/ [L, *neuter,* neither; Gk, *elektron,* amber], (in physics) an elementary particle that is a constituent of the nuclei of all elements except the isotopic form of hydrogen ^{1}H. It has no electric charge and has approximately the same mass as a proton. Compare **electron, proton.** See also **atom.**

neutron activation analysis, the analysis of elements in a specimen, performed by exposing it to neutron irradiation. The irradiation converts many elements in the specimen to radioactive forms that can be identified by their emissions of radiation. The method has limited application to human and animal studies.

neutropenia /no͞o′trōpē′nē·ə/ [L, *neuter,* neither; Gk, *penia,* poverty], abnormal decrease in the neutrophil count associated with acute leukemia, chemotherapy, and idiosyncratic drug reactions, predisposing individuals to infection. Compare **leukopenia.** See also **neutrophil.**

neutropenic fever of unknown origin, a fever of at least 38.3° C occurring on several occasions in a patient whose neutrophil level is lower than 500/mm^3 or is expected to fall below that level within 1 or 2 days, the cause of which cannot be determined after 3 days of investigation, including 2 days of incubation of cultures.

neutrophil /no͞o′trəfil/ [L, *neuter* + Gk, *philein,* to love], polymorphonuclear, granular leukocyte whose cytoplasmic granules stain with neutral dyes. The nucleus stains dark blue and contains three to five segments connected by slender threads of nuclear membrane. The cytoplasm contains fine, inconspicuous neutral granules. Neutrophils are the circulating white blood cells essential for phagocytosis and proteolysis by which bacteria, cellular debris, and solid particles are removed and destroyed. A neutrophil count less than or equal to 500/uL may be life-threatening. See also **basophil, eosinophil, granulocyte.**

neutrophil alkaline phosphatase. See **leukocyte alkaline phosphatase.**

neutrophilia /-fil′yə/, an elevated number of neutrophils in the blood, a common cause of leukocytosis.

neutrophilic leukemia. See **polymorphocytic leukemia.**

Neviaser procedure, the surgical transfer of a coracoacromial ligament to the clavicle for the repair of an acromioclavicular separation.

nevirapine, an antiretroviral nonnucleoside reverse transcriptase inhibitor.

■ INDICATION: It is prescribed in combination for the treatment of human immunodeficiency virus infection.

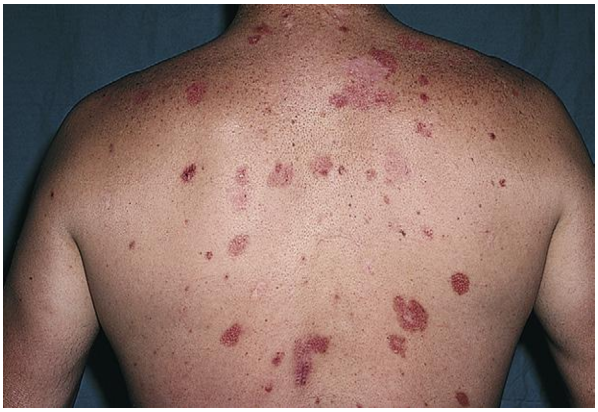
■ CONTRAINDICATIONS: It should not be given to patients with an allergy or sensitivity to the medication or to patients taking ketoconazole or oral contraceptives. When used alone, there is rapid and uniform appearance of viral resistance.

■ ADVERSE EFFECTS: The side effects most often reported include headache, rash, drug fever, and diarrhea.

nevoid amentia. See **Sturge-Weber syndrome.**

nevoid basal cell carcinoma syndrome /nē′void/, an inherited form of premalignant skin lesion. It is an autosomal-dominant trait, but the cause is unknown. It is associated with other abnormalities of the skin or bone, the nervous system, the eyes, and the reproductive system. It affects persons under the age of 20 and is accompanied by palmar pits, mandibular cysts, bifid ribs, and other birth defects.

nevoid neuroma [L, *naevus,* birthmark; Gk, *eidos,* form], a tumor of nerve tissue that contains numerous small blood vessels. Also called **neuroma telangiectodes.**



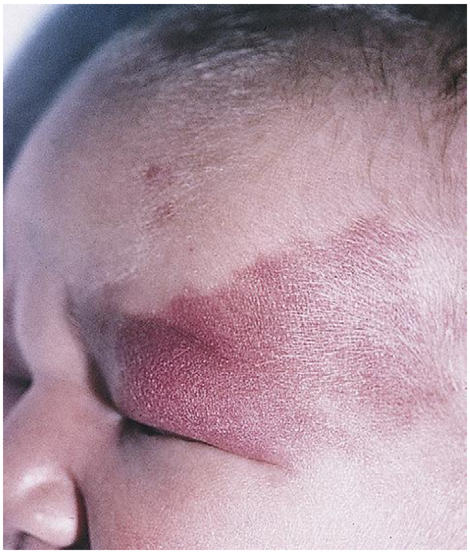
Nevoid basal cell carcinoma syndrome

(Callen et al, 2000)

nevus /nē′vəs/ [L, *naevus,* birthmark], a pigmented skin blemish that is usually benign but may become cancerous. Any change in color, size, or texture or any bleeding or itching of a nevus merits investigation. Nevus is a benign tumor composed of nevus cells that are derived from melanocytes. Types include junction, compound, dermal, and congenital. Also spelled **naevus.** Also called **birthmark, mole.** See also **blue nevus, junction nevus, nevus flammeus.**

nevus araneus. See **spider telangiectasia.**

nevus flammeus /flam′ē·əs/, a flat capillary hemangioma that is present at birth and that varies from pale red to deep reddish purple. It most commonly occurs on the occiput and rarely causes any problems. If the lesion is on any other part of the body, it tends to be darker colored and, unlike the scalp lesions, does not regress spontaneously. These lesions most often occur on the face. The depth of the color depends on whether the superficial, middle, or deep dermal vessels are involved. On the face the lesion persists and develops a thick, verrucous, nodular surface. Nevus flammeus is usually unilateral, following the distribution of a cutaneous nerve. If the lesion is on the middle of the face, Sturge-Weber syndrome is suspected. Treatment is often not satisfactory. Camouflage cosmetics are used to cover the lesion and are the treatment of choice. Also called **port-wine stain.**



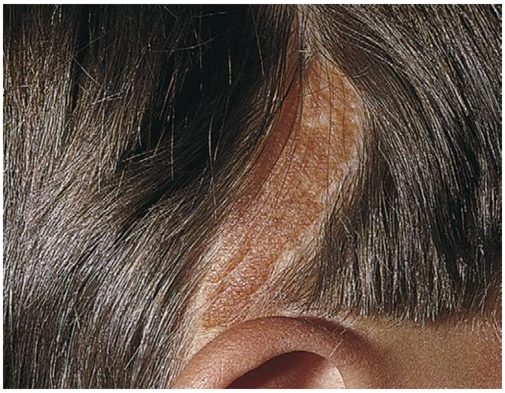
Nevus flammeus *(Callen et al, 2000)*

nevus sebaceus of Jadassohn, a congenital skin neoplasm with several cutaneous tissue elements. The most common location is the scalp, face, or neck. It may appear as a yellow or tan waxy patch of alopecia at birth. During puberty the lesion becomes raised, thick, and verrucous. It is usually treated with local excision. Untreated, the lesion may remain benign or become a malignant growth in later life.

nevus vascularis. See **capillary hemangioma.**

New Ballard Score, a system of newborn assessment of gestational maturation. It provides a valid estimation of postnatal maturation for preterm infants with gestational ages greater than 20 weeks and covers a dozen categories, including posture, arm recoil, popliteal angle, skin, plantar surface, and genitals.

newborn [AS, *niwe,* new, *boren,* to bear], a human infant from the time of birth through the 28th day of life. At birth, the gestational age and birth weight are assessed and the newborn classified accordingly, for example, large for gestational age, preterm (premature), or low birth weight. Also called **neonate, newborn infant.**



Nevus sebaceus of Jadassohn *(Callen et al, 2000)*

newborn adaptation, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the adaptative response to the extrauterine environment by a physiologically mature newborn during the first 28 days. See also **Nursing Outcomes Classification.**

newborn care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of neonate during the transition to extrauterine life and subsequent period of stabilization. See also **Nursing Interventions Classification.**

newborn infant. See **newborn.**

newborn intrapartal care, care of the newborn in the delivery area during the time after birth before the mother and infant are transferred to the postpartum unit. See also **intrapartal care, postpartal care.**

■ METHOD: The nasopharynx and mouth may be suctioned to remove excess mucus as the head is born. Depending on the preference and condition of the mother and the policies of the maternity service, the baby may then be placed on the mother’s abdomen and covered with a warm, dry blanket or taken by the nurse to an infant warmer. Apgar scores are assigned at 1 and at 5 minutes of age. Less commonly, another Apgar score is assigned at 10 minutes of age. The baby is handled gently and quietly and may be put to breast if the mother wishes; bright lights are often avoided, and maternal contact is encouraged.

■ INTERVENTIONS: The nurse is usually the first person to observe and examine the baby. Most newborns are healthy and normal. If abnormal function is observed, expert assistance may be summoned and emergency measures, including tracheal suction with suction equipment and administration of oxygen by ventilator or mask, are initiated. If there are no problems, the nurse may instill erythromycin drops in the conjunctival sacs of the eyes, trim and clamp the umbilical cord, administer an injection of vitamin K, obtain footprints for identification, and diaper and wrap the baby. If the baby needs to be transferred to a nursery or special care facility, the nurse accompanies the infant and acts as the initial liaison for the mother with the nursery.

■ OUTCOME CRITERIA: Most infants born at term are healthy and do not need any medical intervention. Hemorrhage from the umbilical cord, difficult respiration, imperforate anus, endocrine dysfunction, and various other abnormal conditions may occur, but, if a baby has good color; is alert; and can cry, suck, urinate, defecate, and respond to sound and light, the nurse may reassure the mother that the baby is almost invariably healthy and normal. The individuality of each infant is remarkable and may be pointed out to the mother.

newborn monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as measurement and interpretation of physiological status of the neonate the first 24 hours after delivery. See also **Nursing Interventions Classification.**

new drug, a drug for which the U.S. Food and Drug Administration requires premarketing approval.

New England Journal of Medicine (NEJM), a weekly professional medical journal that publishes findings of medical research and articles about controversial political and ethical issues in the practice of medicine.

new growth, a neoplasm or tumor.

Newman, Margaret A. [b. 1933], a nursing theorist who contributed to the study of nursing theories and models by defining three approaches to the discovery of nursing theory: “borrowing” of theories from related disciplines, analyzing nursing practice situations in search of conceptual relationships, and creating new conceptual systems from which theories can be derived.

new product evaluation committee. See **product evaluation committee.**

newspaper sign. See **thumb sign.**

newton /n(y)o͞o′tən/ [Isaac Newton, English scientist, 1642–1727], a unit of force in the SI system that imparts an acceleration to 1 kilogram of mass of 1 meter per second.

new tuberculin [ME, *newe* + L, *tuber,* swelling], an extract of the tubercle bacillus from which all soluble material has been removed and glycerin added.

New World leishmaniasis. See **American leishmaniasis.**

New World typhus. See **murine typhus.**

Nexavar, a trademark for **sorafenib.**

nexus /nek′səs/ *pl.* **nexus** [L, bond], **1.** a bond, especially one between members of a series or group. **2.** See **gap junction.**

Nezelof’s syndrome /nez′əlofs/ [Christian Nezelof, French physician, b. 1922], an abnormal condition characterized by absent T cell function, deficient B cell function, fairly normal immunoglobulin levels, and little or no specific antibody production. It affects both male and female siblings, indicating that it may be transmitted as an autosomal-recessive genetic disorder. The cause is unknown. Another theory is that the disorder is caused by underdevelopment of the thymus gland and the consequent inhibition of T cell development. Still another holds that the disease results from a failure to produce or to secrete thymic humoral factors, especially thymosin.

■ OBSERVATIONS: Patients with Nezelof’s syndrome have progressively severe, recurrent, and eventually fatal infections. Signs that often appear in infants or in children up to 4 years of age include recurrent pneumonia, otitis media, chronic fungal infections, upper respiratory tract infections, diarrhea, and hepatosplenomegaly. The lymph nodes and tonsils may be enlarged, or they may be totally absent in infants with the disease. Involved patients may develop a tendency toward malignancy. Infection may cause sepsis, which is the usual cause of death. Symptoms that often suggest Nezelof’s syndrome also include weight loss and poor eating habits. Definite diagnostic evidence of the disease includes defective B cell and T cell immunity despite a normal number of circulating B cells, a moderate-to-high rise in the number of T cells, a deficiency or an increase in one or more classes of immunoglobulins, a nonreactive Schick test after DPT immunization, a reduced or an absent antibody reaction after specific antigen immunization, no thymus shadow on a chest x-ray film, thymus-dependent regions with abnormal lymphoid structure, and a decrease in the number of lymphocytes in the blood.

■ INTERVENTIONS: Initial supportive treatment of Nezelof’s syndrome may include monthly injections of gamma globulin or monthly infusions of fresh frozen plasma and heavy use of antibiotics to fight infection. The plasma infusions are especially beneficial if the patient cannot produce specific immunoglobulins. Cell-mediated immune function associated with T cells can usually be temporarily restored within weeks by a fetal thymus transplant. Repeated transplants are required to maintain the immunity. Cell-mediated immunity can be only partially restored with either transfer factor therapy or repeated injection of thymosin. Histocompatible bone marrow transplants have been used, but the effectiveness of this treatment method is unclear.

■ NURSING CONSIDERATIONS: The nursing role in treating this condition is essentially supportive. Sites of gamma globulin injection in a large muscle mass are massaged after each injection, and the sites are rotated and recorded to prevent tissue damage. Gamma globulin doses greater than 1.5 mL are divided and injected into more than one site. The nurse also offers support to the parents of children affected by Nezelof’s syndrome, instructs them how to recognize the signs of infection, and explains the dangers of allowing affected children to become exposed to infection.

nF, abbreviation for *nanofarad.*

NF1, a gene associated with neurofibromatosis. The gene is normally part of a family that helps regulate the timing of cell divisions. It may become defective, leading to neurofibromatosis expression, when an itinerant sequence of a deoxyribonucleic acid molecule becomes wedged in the NF1 gene.

NF, N.F., abbreviation for ***National Formulary.***

ng, abbreviation for **nanogram.**

NGF, abbreviation for **nerve growth factor.**

NG tube, abbreviation for **nasogastric tube.**

NGU, abbreviation for **nongonococcal urethritis.**

NHGRI, abbreviation for **National Human Genome Research Institute.**

NHSC, abbreviation for **National Health Service Corps.**

Ni, symbol for the element **nickel.**

NIA, abbreviation for **National Institute on Aging.**

niacin /nī′əsin/, a white, crystalline, water-soluble vitamin of the B complex, usually occurring in various plant and animal tissues as nicotinamide. It functions as a coenzyme necessary for the breakdown and use of all major nutrients and is essential for a healthy skin, normal functioning of the GI tract, maintenance of the nervous system, and synthesis of the sex hormones. It may be used therapeutically to help reduce high blood cholesterol levels. Rich dietary sources of both niacin and its precursor tryptophan are meats, poultry, fish, liver, kidney, eggs, nuts, peanut butter, brewer’s yeast, and wheat germ. Symptoms of deficiency include muscular weakness, general fatigue, loss of appetite, various skin eruptions, halitosis, stomatitis, insomnia, irritability, nausea, vomiting, recurring headaches, tender gums, tension, and depression. Severe deficiency results in pellagra. The vitamin is not stored in the body, and daily sources are needed. Niacin toxicity is associated with large doses of nicotinic acid (may occur with a dose as low as 50 to 100 mg). Symptoms include flushing, nausea, dizziness, diarrhea, abdominal pain, and alteration of glucose tolerance. Overdose can also exacerbate preexisting conditions such as cardiac arrhythmias and abnormal liver function. Also called **nicotinic acid.** See also **pellagra.**

niacinamide /nī′əsin′əmīd/, a B complex vitamin. It is closely related to niacin but has no vasodilating action. Also called **nicotinamide.**

niacin equivalent (NE), units used to express niacin content of food. It represents preformed niacin plus tryptophan equivalents (60 mg tryptophan = 1 mg niacin).

NIAMS, abbreviation for **National Institute of Arthritis and Musculoskeletal and Skin Diseases.**

NIB, abbreviation for *National Institute for the Blind*.

NIBIB, abbreviation for **National Institute of Biomedical Imaging and Bioengineering.**

NIC, abbreviation for **Nursing Interventions Classification.**

niCARdipine /nikär′dipin/, a calcium channel blocker. It causes vasodilation and is prescribed as an antihypertensive and antianginal agent.

niche /nich/ [Fr, recess], a defect in an otherwise even surface, especially a depression or recess in the wall of an organ as seen on a radiograph or by the unaided eye.

NICHHD, abbreviation for **National Institute of Child Health and Human Development.**

Nicholas procedure, a surgical method for repairing severe injuries to the ligaments of the knee. It involves five procedures: medial meniscectomy, medial collateral ligament repair, vastus medialis advancement, semitendinosus advancement, and pes anserinus transfer. Also called **five-in-one repair.**

nick [ME, *nyke,* notch], a split in a single strand of DNA that can be made with the enzyme deoxyribonuclease or with ethidium bromide. See also **cut.**

nickel (Ni) [Ger, *Kupfernickel,* copper demon], a silver-white metallic element. Its atomic number is 28; its atomic mass is 58.71. Many people are allergic to nickel. Nickel causes more cases of allergic contact dermatitis than all other metals combined. Many cases occur from exposure to jewelry, coins, buckles, and snaps and from continued use of "carbonless" business forms. Nickel carbonyl, an extremely toxic volatile liquid, may produce serious lung damage if inhaled. Nickel is now a suspected carcinogen.

nickel dermatitis, an allergic contact dermatitis caused by the metal nickel. Exposure comes usually from jewelry, wristwatches, metal clasps, and coins. Sweating increases the degree of rash. Treatment includes avoidance of exposure to nickel and reduction of perspiration. See also **contact dermatitis.**

nick translation, a method of labeling DNA in the laboratory by using the enzyme DNA polymerase.

Nicobid, a trademark for two coenzymes, a water-soluble vitamin (B_3) **(niacin** and **niacinamide).**

Nicola procedure, the surgical transfer of the long head of the biceps tendon through the humeral head to correct chronic anterior shoulder dislocation.

Nicorette, a trademark for a nicotine resin complex **(nicotine polacrilex).**

nicotinamide. See **niacinamide.**

nicotine /nik′ətēn/ [Jean Nicot de Villemain, French ambassador to Portugal, 1530–1600], a colorless, rapidly acting toxic substance in tobacco that is one of the major contributors to the ill effects of smoking. It is used as an insecticide in agriculture and as a parasiticide in veterinary medicine. Ingestion of large amounts causes salivation, nausea, vomiting, diarrhea, headache, vertigo, slowing of the heartbeat, and, in acute cases, paralysis of respiratory muscles.

nicotine nasal spray, a product approved by the U.S. Food and Drug Administration for aiding tobacco smoking cessation in adults. One dose of the nasal spray administers 1 mg of nicotine directly into the nasal membranes. Because of the risk of becoming dependent on the nasal spray, it is recommended that patients not use it for more than 6 months. See also **nicotine replacement therapy.**

nicotine poisoning, poisoning from intake of nicotine, characterized by stimulation of the central and autonomic nervous systems followed by depression of these systems. In fatal cases, death occurs from respiratory failure. See also **acute nicotine poisoning.**

nicotine polacrilex /pōlak′rileks/, a chewing gum (nicotine resin complex) source of nicotine as an adjunct for smoking cessation.

■ INDICATION: It may be prescribed as an aid for patients who are trying to quit cigarette smoking.

■ CONTRAINDICATIONS: Use by postmyocardial infarction patients or those with severe or worsening angina pectoris or life-threatening arrhythmias is prohibited. It should be used cautiously in patients with hyperthyroidism, hypertension, type 1 diabetes mellitus, or peptic ulcers. Drug dosages may have to be adjusted in patients taking other drugs with effects that may be increased or decreased when cigarette smoking ceases. Patients should be monitored to ensure that they do not become dependent on the nicotine in the gum.

■ ADVERSE REACTIONS: The most serious adverse effects include burning and soreness of the mouth, lightheadedness, headache, hiccups, nausea, vomiting, and excessive salivation.

nicotine replacement therapy, the use of chewing gum, lozenges, and skin patches as a substitute for tobacco smoke sources to satisfy nicotine cravings.

nicotine stomatitis, oral mucosal changes that are caused by heat and irritation from smoking tobacco. The palatal mucosa may appear intensely red, later to become more keratinized and pale in color with characteristic red dots. Although nicotine stomatitis is not considered a precancerous lesion, smoking cessation is encouraged.

nicotine withdrawal syndrome, physiological and psychological effects of tobacco dependence that make it difficult for addicted smokers to cease use of nicotine. Withdrawal symptoms may be diminished by substituting nicotine in the form of chewing gum, lozenges, or transdermal skin patches.

nicotinic acid. See **niacin.**

NICU, abbreviation for **neonatal intensive care unit.**

NID, abbreviation for *National Institute for the Deaf*.

nid-, prefix meaning "to nest" or "a place where an organism can breed": *nidal, nidus*.

NIDA, abbreviation for **National Institute on Drug Abuse.**

nidation /nīdā′shən/ [L, *nidus,* nest], the process by which an embryo burrows into the endometrium of the uterus. Also called **implantation.** See also **placenta, uterus.**

-nidazole, suffix for metronidazole-type antiprotozoal substances.

NIDCD, abbreviation for **National Institute on Deafness and Other Communication Disorders.**

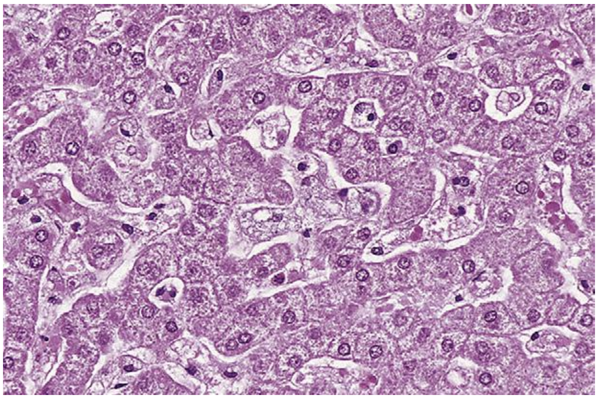
NIDCR, abbreviation for *National Institute of Dental and Craniofacial Research*.

NIDDM, abbreviation for **non-insulin-dependent diabetes mellitus.** See **type 2 diabetes mellitus.**

nidus /nī′dəs/ [L, nest], a point or origin, focus, or nucleus of a disease process.

Niebauer prosthesis /nē′bou·ər/, a Silastic prosthesis for interphalangeal and thumb joint replacement.

Niemann-Pick disease /nē′mon pik′/ [Albert Niemann, German pediatrician, 1880–1921; Ludwig Pick, German pediatrician, 1868–1935], an inherited disorder of lipid metabolism in which there are accumulations of sphingomyelin in the bone marrow, spleen, and lymph nodes. The disease, which in the United States and Canada is most common among Jewish people, begins in infancy or childhood and is characterized by enlargement of liver and spleen, anemia, lymphadenopathy, and progressive mental and physical deterioration. There is no effective treatment, and children with the disease usually die within a few years of the onset of symptoms. See also **sphingomyelin lipidosis.**



Niemann-Pick disease of the liver

(Kumar et al, 2010/Courtesy Dr. Arthur Weinberg, Department of Pathology, University of Texas Southwestern Medical Center, Dallas, Texas)

NIFEdipine /nifed′ipēn/, a calcium channel blocker.
■ INDICATIONS: It is prescribed for the treatment of vasospastic and effort-associated angina, pulmonary hypertension, and hypertension (sustained-release form only).
■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use, and immediate-release forms should not be used to treat hypertension. The practice of using short-acting sublingual nifedipine in hypertensive emergencies or pseudoemergencies is dangerous and should be abandoned.
■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, peripheral edema, palpitations, dyspnea, nausea, dizziness, flushing, and headache. When given sublingually, stroke, severe hypotension, syncope, heart block, sinus arrest, myocardial infarctions, and fetal distress are among the adverse effects reported.

nifur-, prefix for 5-nitrofuran derivatives.

night blindness. See **nyctalopia.**

night guard. See **biteguard.**

Nightingale, Florence, (1820–1910), considered the founder of modern nursing. After limited formal training in nursing in Germany and Paris, she became superintendent in 1853 of a small hospital in London. Her outstanding success in reorganizing the hospital led the British government to request that she head a mission to the Crimea, where Britain was fighting a war with Russia. After her return to England in 1856, she wrote *Notes on Hospitals* and *Notes on Nursing* and founded a training school for nurses at St. Thomas' Hospital, where she attracted well-educated, dedicated women. The graduates became matrons of the most important hospitals in Great Britain, thus raising the standards of nursing across the nation and eventually around the world. Although she was, by then, bedridden much of the time, she carried on her work on the sanitary reform of India, conducted a study of midwifery, helped establish visiting nurse services, and worked for the reform of the poor laws in which she proposed separate institutions for the sick, the insane, the incurable, and children. One of Florence Nightingale's outstanding contributions was significantly decreasing the infection-related death rate through cleanliness. After Longfellow wrote *Santa Filomena*, she became known as "The Lady with the Lamp"; the Nightingale Pledge, named after her, embodies her ideals and has inspired thousands of young graduating nurses.

Nightingale pledge, a statement of principles for the nursing profession, formulated by a committee in 1893. It is as follows: "I solemnly pledge myself before God and in the presence of this assembly: To pass my life in purity and to practice my profession faithfully. I will abstain from whatever is deleterious and mischievous, and will not take or knowingly administer any harmful drug. I will do all in my power to elevate the standard of my profession, and will hold in confidence all personal matters committed to my keeping and all family affairs coming to my knowledge in the practice of my profession. With loyalty will I endeavor to aid the physician in his work, and devote myself to the welfare of those committed to my care."

Nightingale ward, a hospital ward designed by Florence Nightingale that revolutionized hospital design. The number of beds allowed in a ward of given size was limited to permit the circulation of air and to enhance general cleanliness and the comfort of patients. Three sides of the ward were windowed to admit light and fresh air. Although multiple-bed wards are now obsolete in hospital design, the concerns and benefits that impelled Miss Nightingale to create them remain central to hospital planning.

nightingalism /nī′ting·gā′lizəm/, an ideology emphasizing self-sacrifice on the part of a nurse whose primary concern is the welfare of the patient, with minimum personal attention to the needs of the nurse. See also **Nightingale, Florence.**

nightmare /nīt′mer/ [AS, *niht,* night, *mara,* incubus], a dream occurring during rapid eye movement sleep that arouses feelings of intense inescapable fear, terror, distress, or extreme anxiety and that usually awakens the sleeper. Compare **pavor nocturnus, sleep terror disorder.**

night sight. See **hemeralopia.**

night splint, any splint or similar device applied to the affected extremity. It is used only at night.

nightstick fracture, an undisplaced fracture of the ulnar shaft caused by a direct blow.

night sweat [AS, *niht* + *swaetan*], sweating that occurs with a nocturnal fever, as in a wasting disease like pulmonary tuberculosis.

night terrors [AS, *niht* + L, *terrour*], a form of dissociated sleep, usually in children, in which there may be repeated episodes of abrupt awakening from sleep with signs of panic and anxiety. The subject may have only fragmentary dream images of a threatening nature. See also **pavor nocturnus, sleep terror disorder.**

night vision [AS, *niht,* night; L, *visio,* seeing], a capacity to see dimly lit objects. It stems from a chemophysical phenomenon associated with the retinal rods. The rods contain the highly light-sensitive chemical rhodopsin, or visual purple, which is essential for the conduction of optic impulses in subdued light. Night vision is sharpest at the periphery of the retina because of the concentration of rods. Night vision may be diminished by a deficiency of vitamin A, an important component of rhodopsin.

nightwalking [AS, *niht* + ME, *walken*], a disorder occurring during nonrapid eye movement sleep in which the subject usually sits up in bed briefly, then gets up and walks around, opening doors, eating, and so on, and eventually returns to bed. The person has no memory of the event the next day. Also called **noctambulation, sleepwalking, somnambulism.**

NIGMS, abbreviation for **National Institute of General Medical Sciences.**

nigr-, prefix meaning "black or a variation of the black color": *substantia nigra, nigrosin.*

NIH, abbreviation for **National Institutes of Health.**

nihilistic delusion /nī′hilis′tik/ [L, *nihil,* nothing, *icus,* form of, *deludere,* to deceive], a persistent denial of the existence of particular things or of everything, including oneself, as seen in various forms of schizophrenia. A person who has such a delusion may believe that he or she lives in a shadow or limbo world or that he or she died several years ago and that only the spirit, in a vaporous form, really exists. See also **delusion.**

Nikolsky's sign /nikol′skēz/ [Petr V. Nikolsky, Russian dermatologist, 1858–1940], easy separation of the stratum corneum layer of the epidermis from the basal cell layer by rubbing apparently normal skin areas, found in pemphigus and a few other bullous diseases.

nil disease. See **minimal change disease.**

nilotinib, a miscellaneous antineoplastic.

■ INDICATIONS: This drug is used to treat chronic- and accelerated-phase Philadelphia chromosome–positive chronic myelogenous leukemia that is resistant to or intolerant of imatinib.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug, pregnancy, breastfeeding, hypokalemia, hypomagnesemia, and QT prolongation prohibit its use. This drug should not be used simultaneously with grapefruit products.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, dizziness, fatigue, fever, flushing, paresthesia, palpitations, constipation, diarrhea, alopecia, erythemia, hyperamylasemia, hyperbilirubinemia, hyperglycemia, hyperkalemia, hypocalcemia, hyponatremia, hypomagnesemia, diaphoresis, arthralgia, myalgia, back and bone pain, muscle cramps, cough, and dyspnea. Life-threatening side effects include QT prolongation, torsades de pointes, hepatotoxicity, vomiting dyspepsia, pancreatitis, neutropenia, thrombocytopenia, anemia, pancytopenia, and bleeding. Common side effects include nausea, anorexia, abdominal pain, and rash.

Nilstat, a trademark for an antifungal **(nystatin).**

nilutamide, an antineoplastic hormone.

■ INDICATIONS: It is used to treat stage D2 metastatic prostatic carcinoma in combination with surgical castration.

■ CONTRAINDICATIONS: Factors that prohibit the use of this drug include known hypersensitivity to nilutamide, severe hepatic impairment, and severe respiratory disease.

■ ADVERSE EFFECTS: Hepatotoxicity and interstitial pneumonitis are life-threatening effects. Other adverse effects include hot flashes, drowsiness, insomnia, dizziness, hyperthesia, depression, decreased libido, impotence, testicular atrophy, urinary tract infection, hematuria, nocturia, gynecomastia, diarrhea, nausea, vomiting, increased liver function studies, constipation, dyspepsia, rash, sweating, alopecia, dry skin, dyspnea, upper respiratory infection, pneumonia, anemia, delayed adaption to the dark, and edema.

NIMH, abbreviation for **National Institute of Mental Health.**

nimodipine /ni-mo′dĭpēn/, a calcium channel blocking agent used as a vasodilator in the treatment of neurological deficits associated with subarachnoid hemorrhage from a ruptured intracranial aneurysm, administered orally.

90–90 traction. See **traction, 90–90.**

NINR, abbreviation for **National Institute of Nursing Research.**

ninth cranial nerve. See **glossopharyngeal nerve.**

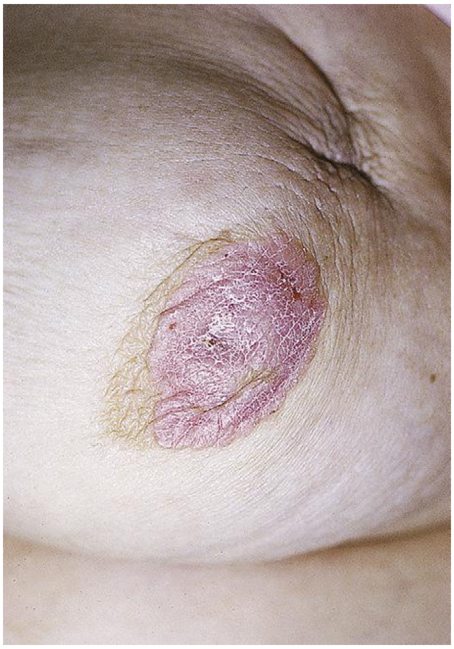
niobium (Nb) /nī·ō′bē·əm/ [Gk, *Niobe,* mythic daughter of Tantalus and Amphion], a silver-gray metallic element. Its atomic number is 41; its atomic mass is 92.906. Formerly called **columbium.**

NIOSH, abbreviation for **National Institute for Occupational Safety and Health.**

NIP, abbreviation for **National Immunization Program.**

nipple [ME, *neb,* beak], a small cylindric, pigmented structure that projects just below the center of each breast. The tip of the nipple has about 20 tiny openings to the lactiferous ducts. The skin of the nipple is surrounded by the lighter pigmented skin of the areola. The depth of pigmentation of the nipple and areola in nulliparas varies from rosy pink to brown, depending on the complexion of the individual. In pregnancy the skin of the nipple darkens but loses some of its pigmentation when lactation is completed. Stimulation of the nipple in men and women causes the structure to become erect through the contraction of radiating smooth muscle bundles in the surrounding areola. In women the nipple enlarges somewhat and becomes more sensitive after puberty. Also called **mammary papilla, papilla mammae, papilla mammaria.**

nipple cancer, an inflammatory malignant neoplasm of the nipple and areola that is usually associated with carcinoma in deeper breast structures. It represents only a small percentage of breast cancers and usually begins in the nipple and spreads to the areola. Also called **Paget's disease of the nipple.**



Nipple cancer *(Callen et al, 2000)*

nipple discharge, spontaneous exudation of material from the nipple. It may be normal, such as colostrum in pregnancy, or it may be a sign of endocrinological, neoplastic, or infectious disease.

nipple shield, a device to protect the nipples of a lactating woman. The shield is usually made of soft latex, is 4 or 5 cm wide, and has a tab on one side with which the mother may hold it. The baby nurses from an opening at the center of the shield. It is most often used to allow sore or cracked nipples to heal while maintaining lactation. Also called *nipple protector.*

Nipride, a trademark for a direct-acting vasodilator used for controlled lowering of blood pressure **(sodium nitroprusside).**

Nirschl procedure /nur′shəl/, a surgical procedure for treating chronic inflammation of the elbow. It involves excision of a segment from the hypercapsular tendon of the extensor carpi radialis brevis and removal of the head of the anterolateral condyle.

nirvanic state /nirvä′nik, nirvan′ik/, (in Buddhist meditation) a state in which mental processes cease, often leading to a radical alteration of the personality.

NIS, abbreviation for *Nursing Information System*.

nisoldipine, a calcium channel blocker.

■ INDICATIONS: It causes vasodilation and is prescribed, either alone or in combinations, for the management of hypertension.

■ CONTRAINDICATIONS: Factors that prohibit its use include hypersensitivity to nisoldipine or other dihydropyridine calcium channel blockers. High-fat meals and grapefruit juice should be avoided because these foods can cause sudden increases in the blood levels of the drug.

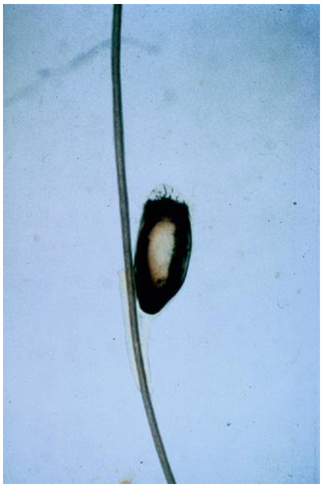
■ ADVERSE EFFECTS: Fluid retention, headache, nausea, dizziness, pharyngitis, shortness of breath, cough, and palpitations are among the more common adverse effects.

Nissl body /nis′əl/ [Franz Nissl, German neurologist, 1860–1919], any one of the large granular structures in the cytoplasm of nerve cells that stains with basic dyes and contains ribonucleoprotein.

NIST, abbreviation for **National Institute of Standards and Technology.**

NIST standard, a radioactive source standardized or certified or both by the National Institute of Standards and Technology.

nit, the egg of a parasitic insect, particularly a louse. It may be found attached to human or animal hair or to clothing fiber. See also **pediculosis.**



Nit

(Ko and Elston, 2004)

nitazoxanide, an antiprotozoal agent used to treat diarrhea caused by *Cryptosporidium parvum* or *Giardia lamblia*.

nitisinone, an orphan drug.

■ INDICATION: This drug is used to treat hereditary tyrosinemia type 1.

■ CONTRAINDICATIONS: Tyrosine or phenylalanine intake and known hypersensitivity to this drug prohibit its use.

nitr, **1.** abbreviation for **nitrocellulose. 2.** abbreviation for **nitroglycerin.**

nitr-, prefix meaning "related to nitrogen, nitrite, and nitrate."

nitrate /nī′trāt/ [Gk, *nitron,* soda], **1.** the ion NO_3^-. **2.** a salt of nitric acid.

nitric acid (HNO_3) /nī′trik/ [Gk, *nitron,* soda; L, *acidus,* sour], a colorless, highly corrosive liquid that may give off suffocating brown fumes of nitrogen dioxide on exposure to air. Traces of nitric acid may be found in rainwater during a thunderstorm. Commercially prepared nitric acid is a powerful oxidizing agent used in photoengraving and metallurgy; in the manufacture of explosives, fertilizers, dyes, and drugs; and occasionally as a cauterizing agent for the removal of warts. Organic nitrates or polyol esters of nitric acid such as nitroglycerin and amyl nitrite are effective vasodilators often used in relieving angina, but exactly how they function in dilating arterial and venous smooth muscle is not yet understood. Historically known as *aqua fortis*.

nitric oxide $(NO)^1$, a colorless gas and stable free radical commonly found in tissues of humans and other mammals. It is also prepared commercially by passing air through an electric arc. Biologically the effector molecule is commonly synthesized from the amino acid arginine. NO participates in many biological functions, such as neurotransmission, vasodilation, cytotoxicity of macrophages, lipid-lowering therapy, and inhibition of platelet aggregation. NO is involved in smooth muscle action and penile erection. It may improve oxygenation in patients with high-altitude pulmonary edema. NO deprivation may lead to high blood pressure and the formation of atherosclerotic plaque. On contact with air, NO is quickly converted to the very poisonous nitrogen dioxide (NO_2).

nitric oxide $(NO)^2$, a respiratory inhalant.

■ INDICATIONS: It is used in combination with other agents and ventilatory support in the treatment of full-term and near-term (34 weeks) neonates with hypoxic respiratory failure associated with pulmonary hypertension.

■ CONTRAINDICATIONS: Two factors that prohibit its use are dependence on right-to-left shunting of blood and known hypersensitivity.

■ ADVERSE EFFECTS: Life-threatening effects are pulmonary hemorrhage, intracranial hemorrhage, sepsis, stridor, methemoglobinemia, seizures, cerebral infarction, and posttreatment infection. Other adverse effects include atelectasis, hematuria, hyperglycemia, cellulitis, withdrawal syndrome, and hypotension.

nitrite /nī′trīt/ [Gk, *nitron,* soda], an ester or salt of nitrous acid used as a vasodilator and antispasmodic. Among the most widely used nitrites in medicine are amyl, ethyl, potassium, and sodium nitrite.

nitritoid reaction /nī′tritoid/, a group of adverse effects, including hypotension, flushing, light-headedness, and fainting, produced by administration of arsenicals or gold. The reaction is similar to that caused by administration of nitrites.

nitro-, prefix indicating presence of the group-NO_2: *nitrobenzol, nitrofuran, nitromethane*.

nitrobenzene poisoning /nī′trōben′zēn/, a toxic condition caused by the absorption into the body of nitrobenzene, a pale yellow, oily liquid used in the manufacture of aniline, shoe dyes, soap, perfume, and artificial flavors. Nitrobenzene, especially its vapors, is extremely toxic. Exposure in industry is usually by inhalation of the fumes or by absorption through the skin. Symptoms of acute poisoning include headache, drowsiness, nausea, ataxia, cyanosis, and, in extreme cases, respiratory failure. Chronic exposure to nitrobenzene may cause headache, fatigue, loss of appetite, and anemia.

Nitro-Bid, a trademark for a coronary vasodilator **(nitroglycerin).**

nitrocellulose (nitr) /-sel′yəlōs/, a mixture of nitrate esters of cellulose made by treating cotton with nitric and sulfuric acids. Solutions in a mixture of ether and alcohol are used as "plastic skin" under the name of **collodion.** Also called **pyroxylin.**

nitrofuran /-fyo͞o′ran/, one of a group of synthetic antimicrobials used to treat infections caused by protozoa or by certain gram-positive or gram-negative bacteria. The precise mechanism by which nitrofurans exert their antimicrobial effects is not known, but several bacterial and protozoal enzyme systems are inhibited. Two agents commonly prescribed are furazolidone and nitrofurantoin. Furazolidone is used to treat bacterial and protozoal diarrhea and enteritis. Nitrofurantoin is used to treat urinary tract infections caused by ***Escherichia coli*** and other enteric pathogens of the urinary tract. Systemic administration of nitrofurans is associated with many side effects, the most common being nausea and diarrhea. Serious side effects include polyneuropathies and several hypersensitivity reactions, including pneumonitis and blood dyscrasias. Nitrofurans can cause hemolytic anemia in patients with glucose-6-phosphate dehydrogenase deficiency. Lastly, they cause a harmless brown discoloration of the urine.

nitrofurantoin /nī′trōfyo͝oran′tō·in, -fyo͞o′rəntō′in/, a urinary antibacterial.

■ INDICATIONS: It is prescribed in the treatment of urinary tract infections caused by some gram-negative bacteria and a few gram-positive bacteria. Some of the more common bacteria that cause urinary tract infections are resistant to it.

■ CONTRAINDICATIONS: Kidney dysfunction or known hypersensitivity to this drug prohibits its use. It is not given to children under 1 month of age or to pregnant or lactating women. It should be used with caution in people with glucose-6-phosphate dehydrogenase deficiency, vitamin B deficiency, anemia, diabetes mellitus, or electrolyte disturbances.

■ ADVERSE EFFECTS: Among the most serious adverse effects is hypersensitivity pneumonitis, which can lead to fibrosis, neurotoxicity, and hemolytic anemia in patients with glucose-6-phosphate dehydrogenase deficiency. GI disturbances and fever are common.

nitrofurazone /-fyo͞o′rəzōn/, a topical antibacterial.

■ INDICATIONS: It is prescribed in the prophylaxis and treatment of infections in second- and third-degree burns and of the skin and mucous membranes.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are severe allergic reactions and superinfections.

nitrogen (N) /nī′trəjən/ [Gk, *nitron*, soda, *genein*, to produce], a gaseous nonmetallic element. Its atomic number is 7; its atomic mass is 14.008. It exists as a diatomic molecule, N_2. Nitrogen constitutes approximately 78% of the atmosphere and is a component of all proteins and a major component of most organic substances in living cells. Nitrogen is essential to the synthesis of necessary proteins, particularly nitrogen-containing compounds or amino acids derived directly or indirectly from plant food. Nitrogen follows a cycle from atmospheric gas into nitrogen-fixing bacteria, into green vascular plants, into humans and animals, and, by decay or in excreted nitrogenous wastes, as urea, back into the soil. Denitrifying bacteria in the soil break down nitrogenous compounds and release gaseous nitrogen. During a 24-hour period in a healthy individual the nitrogen excreted in the urine, feces, and perspiration, together with the nitrogen retained in dermal structures, such as the skin and hair, equals the nitrogen consumed in food and drink. The process of protein metabolism accounts for this nitrogen balance. When protein catabolism exceeds protein anabolism, the amount of nitrogen in the urine exceeds the amount of nitrogen consumed in foods, producing a negative nitrogen balance or a state of tissue wasting. A positive nitrogen balance exists in the body when the nitrogen intake in foods is greater than that excreted in urine. Conditions usually associated with positive nitrogen balance include those related to growth, pregnancy, and convalescence from a tissue-wasting illness. **—nitrogenous,** *adj.*

nitrogen balance, the relationship between the amount of nitrogen taken into the body, usually as food, and that excreted from the body in urine and feces. Most of the body's nitrogen is incorporated into protein. Positive nitrogen balance, which occurs when the intake of nitrogen is greater than its excretion, implies tissue formation and growth. Negative nitrogen balance, which occurs when more nitrogen is excreted than is taken in, indicates wasting or destruction of tissue.

nitrogen cycle [Gk, *nitron,* soda, *genein,* to produce, *kyklos,* circle], the circulation of nitrogen through natural processes in either of two ways: from the soil to organisms that excrete nitrogen products back into the soil or by bacterial fixation of atmospheric nitrogen through other organisms that decay and release the element back into the atmosphere.

nitrogen dioxide (NO_2), a brownish irritating gas that can be released from silage and the reaction of nitric acid with metals. It may produce symptoms of pulmonary damage in workers who perform ensilage tasks. Some studies indicate that measurable changes in pulmonary function occur when healthy individuals are exposed to NO_2 concentrations of two to three parts per million.

nitrogen fixation, the process by which free nitrogen in the atmosphere is converted by biological or chemical means to ammonia and to other forms usable by plants and animals. Biological nitrogen fixation is the more important process and is accomplished by microorganisms in the soil, either free living or in close association with root nodules of certain plants. In contrast, chemical nitrogen fixation, as is used in industry, requires extremely high temperatures and pressures.

nitrogen mustard. See **mechlorethamine hydrochloride.**

nitrogen narcosis, a condition of depressed central nervous system functions as a result of high partial pressure of nitrogen. See also **decompression sickness.**

nitrogen washout curve, a curve obtained by plotting the concentration of nitrogen in expired alveolar gas during oxygen breathing as a function of time. As a person inhales pure oxygen after breathing ambient air, the nitrogen concentration in exhaled air decreases. In healthy subjects, the concentration is less than 2% after 4 minutes.

nitroglycerin (nitr) /-glis′ərin/, a potent smooth muscle relaxant and vasodilator used in transdermal patches and in a paste as well as in oral and sublingual tablets. Also called **glyceryl trinitrate.**

■ INDICATIONS: It is prescribed for the prevention or relief of angina pectoris. There are recommended limits to the amount of nitroglycerin use before calling for emergency assistance (no more than 3 sublingual tablets at 5-minute intervals). The drug should not be used continuously, because tolerance develops within 24 to 48 hrs. Nitroglycerin is also used to treat pulmonary hypertension, to help treat congestive heart failure following acute myocardial infarction, and to treat hypertensive emergencies during cardiovascular surgery.

■ CONTRAINDICATIONS: Head trauma, severe anemia, narrow-angle glaucoma, and known hypersensitivity to this drug or other organic nitrates prohibit its use. It should not be used by patients taking sildenafil or similar agents for treating erectile dysfunction.

■ ADVERSE EFFECTS: Among the most serious adverse effects are hypotension, flushing, headache, and syncope.

nitroglycerin tablets, tablets of glyceryl trinitrate, a volatile ester prepared by the action of nitric and sulfuric acids on glycerol, available by prescription. A tablet placed under the tongue provides prompt relief of chest pain from angina, and sustained release forms (and patches) are available for preventing angina. To derive benefit from these drugs, they must not be used continuously: the body desensitizes to them.

nitromersol /-mur′sol/, an organic mercurial antiseptic that is not a highly effective germicide, sometimes used for the disinfecting of surgical instruments and as an antiseptic on the skin and mucous membranes.

nitroprusside sodium. See **sodium nitroprusside.**

nitrosamines /nīt′rəsam′ēnz/, potentially carcinogenic compounds produced by reactions of nitrites with amines or amides normally present in the body. Nitrites are produced by bacteria in saliva and in the intestine from nitrates normally present in vegetables and in nitrate-treated fish, poultry, and meats. More than 70% of ingested nitrates are from vegetables.

nitroso-, prefix indicating presence of the group -N:O: *nitrosobacteria, nitrososubstitution*.

nitrosourea /nītrō′sōy͝oorē′ə/, one of a group of alkylating drugs used as antineoplastic drugs in the chemotherapy of brain tumors, multiple myeloma, Hodgkin's disease, adenocarcinomas, hepatomas, chronic leukemias, lymphomas, myelomas, and cancers of the breast and ovaries. They have been less successful in therapy for cancers of the lungs, head, neck, and GI tract. Like other alkylating agents, they have severe toxic effects, including bone marrow depression. Nausea and vomiting are almost always present. These drugs can cause fetal harm and should not be used during pregnancy. Carmustine and lomustine are typical examples of this group. See also **alkylating agent.**

Nitrospan, a trademark for a coronary vasodilator **(nitroglycerin).**

Nitrostat, a trademark for a coronary vasodilator **(nitroglycerin).**

nitrous acid (HNO_2), a weak acid and clinical laboratory reagent formed by the action of strong acids on inorganic nitrites. An aqueous solution of nitrous acid gradually decomposes into nitric oxide and nitric acid.

nitrous oxide (N_2O, NOx) /nī′trəs/, a colorless, odorless gas, first used as an anesthetic agent in 1844, is the least potent of currently used inhalation anesthetics. It provides analgesia but not complete amnesia or akinesia and is usually supplemented with other drugs. Because high concentrations of nitrous oxide are required, hypoxia is a risk and supplemental oxygen is needed. Nitrous oxide is associated with an increased incidence of nausea and vomiting, environmental pollution, spontaneous abortion in healthcare workers exposed, and suspected teratogenicity. It has many contraindications to its use. Despite these shortcomings it remains in use in the United States because of its rapid onset and offset, relative lack of cardiac or respiratory depression, and its low cost. It is most often used to supplement other anesthetic agents, especially during an inhalation induction of children. Nitrous oxide remains a commonly administered dental anesthetic.

Nix, a trademark for a topical pediculicide **(permethrin).**

Nizoral, a trademark for an antifungal agent **(ketoconazole).**

NK cell, abbreviation for **natural killer cell.**

NLM, abbreviation for **National Library of Medicine.**

NLN, abbreviation for **National League for Nursing.**

Nitrous oxide administration *(Bird and Robinson, 2005)*

NLNAC, abbreviation for **National League for Nursing Accrediting Commission.**

nm, abbreviation for **nanometer.**

N-m, abbreviation for *newton meter.*

N/m^2, abbreviation for *newton per square meter.*

NMDP, abbreviation for **National Marrow Donor Program.**

NMDS, abbreviation for **nursing minimum data set.**

NMES, **1.** abbreviation for *neuromuscular electric stimulator.* **2.** abbreviation for *neuromuscular electrical stimulation*.

NMNA, abbreviation for **National Male Nurses Association.**

NMR, abbreviation for **nuclear magnetic resonance.** See **magnetic resonance.**

NNRTI, abbreviation for **nonnucleoside reverse transcriptase inhibitors.**

No, symbol for the element **nobelium.**

NO, abbreviation for **nitric oxide.**

N_2O, symbol for **nitrous oxide.**

Noack's syndrome /no′äks/ [Margot Noack, German physician, b. 1909], an autosomal-dominant type of acrocephalopolysyndactyly. See also **acrocephalopolysyndactyly, acrocephalosyndactyly,** Also called **Carpenter's syndrome,** *Goodman's syndrome,* **Sakati-Nyhan syndrome.**

nobelium (No) /nōbel′ē·əm/ [Alfred Nobel Institute, Stockholm, Sweden], a synthetic, transuranic metallic element. Its atomic number is 102, and the atomic mass of its most stable isotope is 259.

NOC, abbreviation for **Nursing Outcomes Classification.**

Nocardia /nōkär′dē·ə/ [Edmund I. E. Nocard, French veterinarian, 1850–1903], a genus of weakly gram-positive aerobic bacteria, some species of which are pathogenic, such as *Nocardia asteroides*. See also **nocardiosis.**

nocardiosis /nōkär′dē·ō′sis/ [Edmund I. E. Nocard; Gk, *osis,* condition], infection with ***Nocardia*** species, most often *N. asteroides,* an aerobic gram-positive species of actinomycetes. It can cause pneumonia, often with cavitation, and chronic abscesses in the brain and subcutaneous tissues, and it can cause cutaneous disease through wounds contaminated with soil. The organism enters via the respiratory tract and spreads by the bloodstream, especially in those who are immunocompromised because of such conditions as HIV infection, organ transplantation, and Cushing's syndrome. Surgical drainage of abscesses and sulfonamide therapy for 12 to 18 months cures between 50% and 60% of the cases treated. Combination antibiotic therapy may be required.

nocebo /nose′bo/, an adverse, nonspecific side effect occurring in conjunction with a medication but not directly resulting from the pharmacological action of the medication.

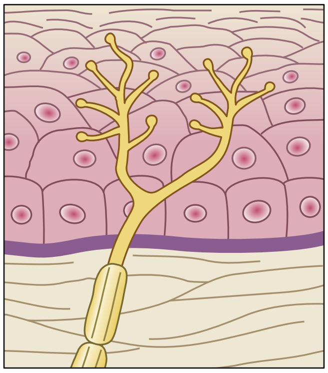
noci-, prefix meaning "to cause harm, injury, or pain": *nociassociation, nociceptive, nociceptor.*

nociceptive /nō′sēsep′tiv/ [L, *nocere,* to injure, *capere,* to receive], pertaining to a neural receptor for painful stimuli.

nociceptive reflex [L, *nocere,* to injure, *capere,* to receive, *reflectere,* to bend back], a reflex caused by a painful stimulus.

nociceptive stimulus [L, *nocere,* to injure, *capere,* to receive, *stimulus,* goad], a painful, sometimes detrimental or injurious, stimulus.

nociceptor /nō′sēsep′tər/, a somatic and visceral free nerve ending of thinly myelinated and unmyelinated fibers. It usually reacts to tissue injury but also may be excited by endogenous chemical substances.



Nociceptors *(Patton and Thibodeau, 2010)*

no code [AS, *na,* not; L, *caudex,* book], a note written in the patient record and signed by a qualified, usually senior or attending physician instructing the staff of the institution not to attempt to resuscitate a particular patient in the event of cardiac or respiratory failure. This instruction is usually given only when a patient is so gravely ill that death is imminent and inevitable. Also used is **DNR** ("do not resuscitate.") See also **code,** def. 5.

noct-, prefix meaning "night": *nocturia, nocturnal.*

noct., abbreviation for the Latin word *nocte,* meaning "at night."

noctambulation. See **somnambulism.**

nocturia /noktŏŏr′ē·ə/ [L, *nocturnus,* by night; Gk, *ouron,* urine], excessive urination at night. It may be a symptom of cardiac, renal, or prostatic disease or bladder outlet obstruction. The condition may also occur in people who drink excessive amounts of fluids, particularly alcohol or coffee, before bedtime or in older patients who have excess body fluids that are mobilized by lying down. Also called **nycturia.** Compare **enuresis.**

nocturnal /noktur′nəl/ [L, *nocturnus,* by night], **1.** pertaining to or occurring during the night. **2.** describing an individual or animal that is active at night and sleeps during the day.

nocturnal emission, involuntary emission of semen during sleep, usually in association with an erotic dream. Also called **wet dream.**

nocturnal enuresis [L, *nocturnus,* by night; Gk, *enourein*], involuntary urination while asleep at night.

nocturnal hemoglobinuria. See **hemoglobinuria.**

nocturnal myoclonus, a sleep disorder that usually affects older adults and is marked by thrashing or kicking movements. The condition may be exacerbated by the use of tricyclic depressants used to induce sleep.

nocturnal paroxysmal dyspnea. See **paroxysmal nocturnal dyspnea.**

nocturnal penile tumescence (NPT) [L, *nocturnus,* by night, *penile,* pertaining to the penis, *tumescere,* to begin to swell], a normal condition of penile erection that occurs during sleep throughout most of the lifetime of a male. The occurrence of NPT is important in the diagnosis of impotence because its presence indicates that impotence may be psychogenic.

nod-, prefix meaning "knot": *nodal, nodose, nodulus.*

nodal /nō′dəl/ [L, *nodus,* knot], pertaining to a node, particularly the *atrioventricular node.*

nodal event /nō′dəl/, an occurrence that may cause anxiety, such as birth, death, divorce, marriage, or a child leaving home.

node /nōd/ [L, *nodus,* knot], **1.** a small rounded mass. **2.** a lymph node. **3.** a single computer terminal in a network of terminals and computers.

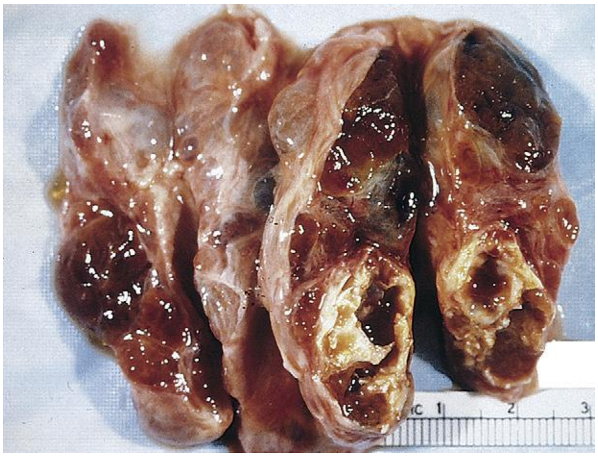
nodular /nod′yələr/ [L, *nodus,* knot], (of a structure or mass) small, firm, and knotty. See also **node, nodule.**

nodular circumscribed lipomatosis, a condition in which circumscribed, encapsulated lipomas are distributed around the neck symmetrically, randomly, or like a collar. The adipose deposits may be painful and tender.

nodular cutaneous angiitis, inflammation of small arteries accompanied by skin lesions.

nodular fasciitis, an inflammation of the fascia that causes the formation of nodules.

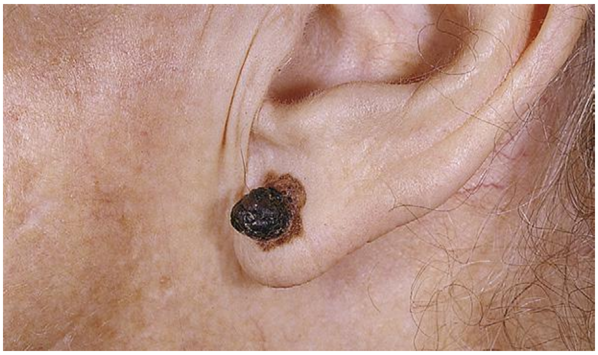
nodular goiter [L, *nodus,* knot; Gk, *guttur,* throat], an enlarged goiter that contains nodules.



Nodular goiter *(Kumar et al, 2007)*

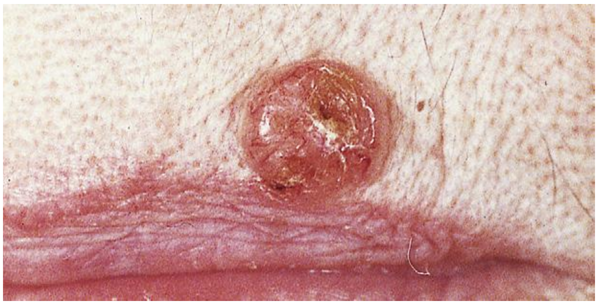
nodular hyperplasia of the liver, the presence of a regenerative nodule or nodules in the liver.

nodular melanoma, a melanoma that is nodular and uniformly pigmented, usually bluish-black, and sometimes surrounded by an irregular halo of pale, unpigmented skin. The lesion is always raised and may be dome-shaped or polypoid. Most often the tumor is found in middle-aged adults and occurs in 10% to 15% of patients with melanoma. See also **lentigo maligna melanoma, superficial spreading melanoma.**



Nodular malignant melanoma *(Courtesy Department of Dermatology, School of Medicine, University of Utah)*

nodule /nod′yo͞ol/ [L, *nodulus,* small knot], **1.** a small node. **2.** a small nodelike structure.



Nodule *(du Vivier, 1993)*

-noia, suffix meaning "(condition of the) mind or will": *aponoia, hypernoia, hyponoia.*

noise, random signals or disturbances that interfere with the normal flow of data through pathways of computers and other electronic devices.

noise-induced hearing loss, a gradual loss of hearing caused by exposure to loud noise over an extended period of time, such as in an individual who works in a noisy environment. The hearing loss is sensorineural in nature and greatest in the higher frequencies. Although an early hearing loss may be temporary, it becomes permanent with increased exposure to noise. Compare **acoustic trauma.**

noise pollution, an unwanted noise level in the environment, causing discomfort and possibly threatening health.

nok, abbreviation for *next of kin.*

Nolvadex, a trademark for an antiestrogen **(tamoxifen).**

noma /nō′mə/ [Gk, *nome,* distribution], an acute, necrotizing ulcerative process involving mucous membranes of the mouth or genitalia. The condition is most commonly seen in severely malnourished, debilitated persons, especially children with poor nutrition and hygiene. There is rapid spreading and painless destruction of bone and soft tissue accompanied by a putrid odor caused by oral anaerobic bacteria, especially *Fusobacterium nucleatum.* Treatment involves high-dose penicillin, debridement, and improved nutrition. Healing eventually occurs, but often with disfiguring defects. Also called **gangrenous stomatitis.**

-noma, suffix meaning a "spreading, invasive gangrene": *mullerianoma, pelidnoma.*

nomen-, prefix meaning "a name or pertaining to names": *nomenclature.*

nomenclature /nō′mənklā′chər, nōmen′-/ [L, *nomen,* name, *clamare,* to call], a consistent, systematic method of naming used in a scientific discipline to denote classifications and avoid ambiguities in names, such as binomial nomenclature in biology and chemical nomenclature in chemistry.

-nomia, suffix meaning "aphasia involving names or naming ability": *anomia, paranomia, dysnomia.*

Nomina Anatomica, the book of official international nomenclature for anatomy as designated by the International Congress of Anatomists.

nominal aphasia /nom′inəl/ [L, *nomen* + Gk, *a* + *phasis,* without speech], a type of speech disorder in which the person uses incorrect names in identifying objects. Minor episodes may result from anxiety, fatigue, or senility. Severe cases can indicate a focal lesion on the left side of the brain.

nominal damages. See **damages.**

nominal data. See **categoric data.**

nomo-, prefix meaning "usage or law": *nomogenesis, nomogram, nomotopic.*

nomogram /nom′əgram, nō′mə-/ [Gk, *nomos,* law, *gramma,* a record], **1.** a graphic representation, by any of various systems, of a numeric relationship. **2.** a graph on which a number of variables are plotted so that the value of a dependent variable can be read on the appropriate line when the values of the other variables are given.

-nomy, suffix meaning "received knowledge in a field": *pathonomy, physionomy, psychonomy.*

non-, prefix meaning "not": *noninvasive, noncompliant.*

nona-, noni-, prefix meaning "nine": *nonan, nonigravida, nonipara.*

nonabsorbable surgical sutures /nonəbsôr′bəbəl/ [L, *non,* not, *absorbere* + Gk, *cheirourgos,* surgeon; L, *sutura*], sutures of silk, nylon, steel, or other materials that resist absorption. They are used mainly in deep tissues where it is important for them to remain in place.

nonadaptive immunity /-adap′tiv/, an immune response that persists after repeated exposures to the same antigen.

nonadherent cell /-ədhir′ənt/, a cell such as a lymphocyte that will not adhere to a smooth surface of laboratory equipment.

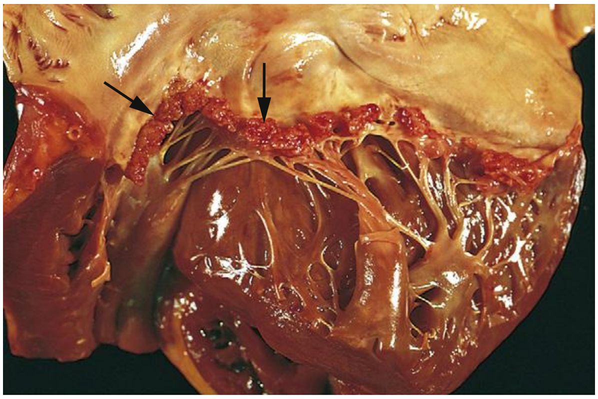
nonadherent dressing [L, *non* + *adhesio,* sticking to; OFr, *dresser,* to arrange], a dressing designed specifically not to stick to the dried secretions of a wound.

nonadhesive skin traction /-ədhē′siv/ [L, *non,* not, *adhesio,* sticking to], a type of skin traction in which the therapeutic pull of traction weights is applied over the body structure involved with foam-backed traction straps that do not stick to the skin. Nonadhesive skin traction straps may be easily removed to facilitate skin care and are usually used when continuous traction is not required. The straps decrease the patient's vulnerability to skin breakdown by spreading the traction pull over a wide area of skin surface. Compare **adhesive skin traction.**

non-A, non-B hepatitis. See **hepatitis C.**

nonbacterial prostatitis, prostatitis with pain and increased numbers of inflammatory cells but without history of urinary tract infection.

nonbacterial thrombotic endocarditis /-baktir′ē·əl/ [L, *non* + *bakerion,* small rod], one of the three main types of endocarditis, characterized by various kinds of lesions affecting the heart valves, most often on the left side of the heart. The disease may be the first step in the development of bacterial endocarditis, and the lesions may cause peripheral arterial embolisms, resulting in death. The disease equally affects men and women between 18 and 90 years of age and causes heart murmurs in about 30% of cases. There is no successful treatment, but anticoagulation therapy may be used to reduce the incidence of peripheral arterial embolism. See also **Libman-Sacks endocarditis.**



Nonbacterial thrombotic endocarditis *(Kumar et al, 2007)*

noncardiogenic pulmonary edema. See **adult respiratory distress syndrome.**

noncellulose polysaccharides /-sel′yəlōs/, food substances such as hemicellulose, pectins, gums, mucilages, and algal products that absorb water and swell to a larger bulk. They slow emptying of food from the stomach, bind bile acids, provide fermentation material for the colon, and prevent spastic colon pressure.

noncommunicating hydrocephalus. See **hydrocephalus.**

noncompetitive inhibition /-kəmpet′itiv/, (in pharmacology) a form of inhibition in which a substance (drug) occupying a receptor cannot be displaced from the receptor by increasing the number of other molecules through the principle of mass action. The drug is irreversibly bound to the receptor.

non compos mentis /non′ kom′pos men′tis/ [L, not of sound mind], a legal term applied to a person declared to be mentally incompetent.

nondepolarizing blocking agent, a compound that causes paralysis of skeletal muscle by blocking neural transmission at the neuromuscular junction. It acts by competitive binding to and inactivation of the cholinergic receptors of the motor end plate without depolarizing the postsynaptic membrane.

nondirective therapy /-direk′tiv/ [L, *non* + *digere,* to direct], a psychotherapeutic approach in which the psychotherapist refrains from giving advice or interpretation as the client is helped to identify conflicts and to clarify and understand feelings and values. Compare **directive therapy.** See also **client-centered therapy.**

nondisjunction /-disjungk′shən/ [L, *non* + *disjungere,* to disjoint], failure of homologous pairs of chromosomes to separate during the first meiotic division or of the two chromatids of a chromosome to split during anaphase of mitosis or the second meiotic division. The result is an abnormal number of chromosomes in the daughter cells. Compare **disjunction.** See also **monosomy, trisomy.**

nonessential amino acid /-esen′shəl/, any amino acids that are not essential to the diet because the body can synthesize their molecules from other amino acids. See also **amino acid, essential amino acid.**

nonfat milk. See **skimmed milk.**

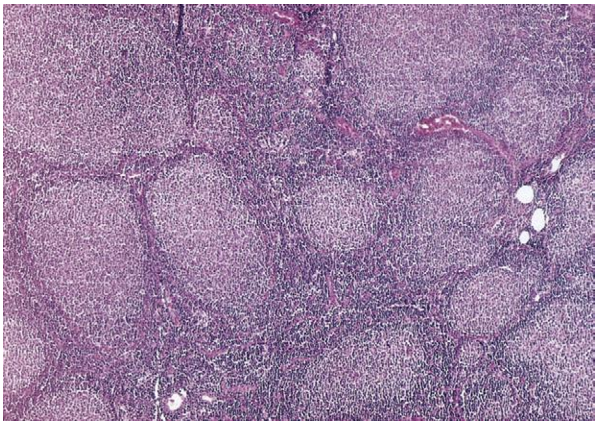
nonfeasance /nonfē′zəns/ [L, *non* + *facere,* to do], a failure to perform a task, duty, or undertaking that one has agreed to perform or has a legal duty to perform. Compare **malfeasance, misfeasance.** See also **negligence.**

nongonococcal urethritis (NGU) /-gon′əkok′əl/ [L, *non* + Gk, *gone,* seed, *kokkos,* berry], an infectious condition of the urethra in males that is characterized by mild dysuria and a small to moderate amount of penile discharge. The discharge may be white or clear, thin or mucoid, or, less often, purulent. The infection is often caused by the obligate intracellular parasite *Chlamydia trachomatis*. Untreated NGU may result in urethral stricture, epididymitis, proctitis, and chronic inflammation of the urethra. Women exposed to the exudate during coitus may develop a hypertrophic erosion of the cervix and purulent cervical mucus. An infant passing through the cervix and vagina of a mother infected with *C. trachomatis* may develop conjunctivitis and nasopharyngeal infection in the first few days after birth and pneumonia at 3 to 4 months. Diagnosis of NGU is made by excluding gonococcal urethritis through microscopic examination and bacteriological culture of the exudate. Nearly 50% of all cases of urethritis are nongonococcal. Most cases of NGU are successfully treated with tetracycline or erythromycin. Sexual contacts are treated whether or not they are symptomatic.

nonheme iron /non′hēm/, one of two forms of dietary iron. It is less efficiently absorbed than heme iron. All plant food sources and 60% of animal food sources contain nonheme iron.

nonhemolytic jaundice /-hē′məlit′ik/ [L, *non* + Gk, *haima,* blood, *lysein,* to loosen; Fr, *jaune,* yellow], a form of jaundice that is caused by a liver disease rather than the destruction of red blood cells.

Non-Hodgkin's lymphoma (NHL) /- hoj′kənz/, solid tumors of peripheral lymphoid tissue classified by histological features and lymphocyte morphology. Distinguished from Hodgkin's, lymphoma, a proliferation of Reed-Sternberg cells with accumulation of reactive peripheral blood cells. Non-Hodgkin's, lymphoma prevalence peaks at 50 years of age and may be mild or aggressively malignant, depending upon cell category. Once called **lymphosarcoma** or sarcoma.



Non-Hodgkin's lymphoma *(Kumar et al, 2007/Courtesy Dr. Robert McKenna, Department of Pathology, University of Texas Southwestern Medical School, Dallas, Texas)*

nonigravida /nō′nigrav′idə/ [L, *nonus,* nine, *gravidus,* pregnancy], a woman pregnant for the ninth time.

noni juice, the juice of *Morinda citrifolia*.

nonimpact printer /-im′pakt/, a computer printer that produces an image on a medium such as paper by ink jet or by thermal, electromagnetic, or xerographic means. Compare **impact printer, dot-matrix printer.**

noninfective valvular mass /-infek′tiv/, a growth or swelling on one of the heart valves associated with autoimmune diseases or with cardiac or extracardiac malignancies. Such masses are frequently asymptomatic and are discovered only at autopsy.

noninflammatory diarrhea /-inflam′ətôr′ē/, a profuse watery diarrhea without fever or vomiting that begins 6 to 24 hours after ingesting food contaminated by bacterial toxins produced by either ***Clostridium perfringens*** or ***Bacillus cereus.*** The food poisoning usually involves raw meat or other proteinaceous foods exposed to warm temperatures for several hours.

non–insulin-dependent diabetes mellitus. See **type 2 diabetes mellitus.**

noninvasive /-invā′siv/ [L, *non* + *in,* into, *vadere,* to go], pertaining to a diagnostic or therapeutic technique that does not require the skin to be broken or a cavity or organ of the body to be entered, for obtaining a blood pressure reading by auscultation with a stethoscope and sphygmomanometer.

noninvasive ventilation, mechanical ventilation that does not use an artificial airway, such as positive pressure ventilation with a nasal or face mask.

nonionic /-ī·on′ik/, pertaining to compounds without a net negative or positive charge.

nonionizing radiation /-ī′ənī′zing/ [L, *non* + Gk, *ion,* going, *izein,* to cause], radiation for which the mechanism of action in tissue does not directly ionize atomic or molecular systems through a single interaction.

nonipara /nōnip′ərə/ [L, *nonus,* nine, *parere,* to bear], a woman who has given birth to nine offspring.

nonketotic hyperglycinemia /nonkētot′ik/, a usually fatal autosomal-recessive aminoacidopathy with accumulation of glycine in body fluids, particularly the blood, urine, and cerebrospinal fluid. It has neonatal onset and is characterized by lethargy, metabolic acidosis with ketosis, absence of cerebral development, seizures, myoclonic jerks, and frequently coma and respiratory failure. It is caused by a defect in one or more of the enzymes involved in the cleavage of glycine. Also called **methylmalonicacidemia, propionicacidemia.**

nonmyelinated nerve fiber /-mī′əlinā′tid/ [L, *non* + Gk, *myelos,* marrow; L, *nervus,* nerve, *fibra,* fiber], a nerve fiber that lacks the fatty myelin insulating sheath. Such fibers form the gray matter of the nervous system, as distinguished from the white matter of myelinated fibers. Also called **nonmedullated nerve fiber.**

Nonne-Milroy-Meige syndrome. See **Milroy's disease.**

nonnucleoside reverse transcriptase inhibitors (NNRTI), a class of antiretroviral drugs that inhibit human immunodeficiency virus replication by blocking the reverse transcriptase enzyme essential for viral replication. These drugs have a different mechanism of action and side-effect profile from other reverse transcriptase inhibitors. See also **nucleoside reverse transcriptase inhibitors.**

nonnutritive sucking, a nursing intervention from the Nursing Interventions Classification (NIC) defined as provision of sucking opportunities for the infant. See also **Nursing Interventions Classification.**

nonnutritive sweetener /-no͞o′tritiv/, a chemical additive such as saccharin, aspartame, acesulfame, or sucralose that gives a sweet taste to foods without contributing significant calories. The sugar substitute is either not metabolized or so intensely sweet that the calorie count is negligible.

nonorganic hearing loss. See **functional hearing loss.**

nonossifying fibroma /-os′ifī′ing/, a sharply circumscribed, eccentrically located lesion in the metaphyses of long bones in children. Microscopic examination reveals whorl patterns of spindle cells, fibrous tissue, numerous xanthoma cells, and occasional giant cells.

nonosteogenic fibroma /non′ostē·əjen′ik/, a common bone lesion characterized by degeneration and proliferation of the medullary and cortical tissue near the ends of the diaphyses of the large long bones of the lower extremities. Frequently the lesion causes no symptoms and is only discovered during radiographic examination of the skeleton for other reasons.

nonpalpable testis /-pal′pəbəl/, a testis that cannot be felt and may be intraabdominal or absent.

nonparametric test of significance /-per′əmet′rik/ [L, *non* + Gk, *para,* beside, *metron,* measure], (in statistics) one of several tests that uses a qualitative approach to analyze rank order data and incidence data that cannot be assumed to have a normal distribution. Kinds of nonparametric tests of significance include *chi-square* and **Spearman's rho.**

nonparous /-per′əs/ [L, *non, parere,* to bear], indicating a woman who has never given birth to a child. Also **nulliparous.**

nonpenetrating wound /-pen′ətrā′ting/ [L, *non,* not, *penetrare,* to penetrate; AS, *wund*], a wound that does not break the surface of the skin.

nonpermissive host /-pərmis′iv/, an animal or cell that resists the replication of an infectious agent.

nonpolar /-pō′lər/ [L, *non* + *polus,* pole], pertaining to molecules that have low polarity and have a hydrophobic affinity, tending to exclude or avoid water. Nonpolar substances tend to dissolve in nonpolar solvents. Compare **polar.**

nonpolar solvent /-pō′lər/, a liquid solvent without significant partial charges on any atoms, as in the hydrocarbons, or where the polar bonds are arranged in such a way that the effects of their partial charges cancel out, as in carbon tetrachloride. Liquid hydrocarbons are the most common examples. Also called **fat solvent.**

nonproductive cough /-prəduk′tiv/ [L, *non* + *producere,* to produce], a sudden, noisy expulsion of air from the lungs that may be caused by irritation or inflammation and does not remove sputum from the respiratory tract. In patients with respiratory tract infections, the condition may be treated by administering expectorants such as ammonium chloride, ammonium carbonate, sodium iodide, potassium iodide, ipecac, or terpin hydrate, which "liquefy" respiratory tract secretions and may result in productive coughing. If suppression of coughing is required (when there is no sputum to be expelled), antitussives that depress the cough reflex may be prescribed, including codeine or dextromethorphan. Intratracheal suctioning may be necessary when secretions cause severe respiratory difficulty and coughing is unproductive. Compare **productive cough.**

nonproductive infection. See **abortive infection.**

nonproprietary name /-prəprī′əter′ē/ [L, *non* + *proprietas,* owner, *nomen,* name], the chemical or generic name of a drug or device, as distinguished from a brand name or trademark. A nonproprietary name may be indicated by the letters USAN, for United States Adopted Names. See also **USAN.**

nonprotein nitrogen (NPN) /-prō′tēn/ [L, *non* + Gk, *proteios,* first rank, *nitron,* soda, *genein,* to produce], the nitrogen in the blood that is not a constituent of protein, such as the nitrogen associated with urea, uric acid, creatine, and polypeptides. Approximately one half of the nonprotein nitrogen in the blood is associated with urea.

nonrapid eye movement. See **sleep.**

nonrebreather /non′rēbrē*th*′ər/, a breathing system having one-way valves so that exhaled carbon dioxide is expelled from the system and not inhaled again.

nonreflex bladder. See **flaccid bladder.**

nonresponse bias, (in epidemiology) errors that may develop when a part of those selected and identified as study subjects cannot or will not participate in the study. The bias may occur when the group of nonrespondents differs systematically from respondents with respect to exposure or disease status. To minimize this bias, a high participation rate is necessary, or a survey is made of nonresponders to determine whether or how they might differ with regard to the risk of disease or exposure.

nonreversible inhibitor /-rivur′səbəl/ [L, *non* + *revertere,* to turn back, *inhibere,* to restrain], an effector substance that binds permanently to an active site of an enzyme, inhibiting the normal catalytic activity of the enzyme.

nonsecretor /-səkrē′tər/ [L, *non* + *secernere,* to separate], a person who does not secrete ABO blood group substances in mucous secretions of the saliva or gastric juice. The condition is genetically determined.

nonseg., abbreviation for *nonsegmented*.

nonseminomatous testicular tumors /-sem′inom′ətəs/, any of a variety of histological types of testicular carcinoma, including embryonal cell carcinoma, teratocarcinoma, and tumors with mixed elements. Treatment for most cases depends on the stage of the cancer at the time of diagnosis.

nonsense mutation, a mutation in which one of the three terminator codons in the mRNA used to signal the end of a polypeptide appears in the middle of a genetic message and causes premature termination of transcription and release of incomplete, generally nonfunctional polypeptides from the ribosome. The three types are **amber mutation, ochre mutation, opal mutation.**

nonsexual generation. See **asexual reproduction.**

nonshivering thermogenesis /-shiv′əring/, a natural method by which newborns can produce body heat by increasing their metabolic rate.

non–small cell carcinoma, a general term comprising all lung carcinomas except small cell carcinoma, including adenocarcinoma of the lung, large cell carcinoma, and squamous cell carcinoma.

non–small cell carcinoma of lung, a major category of histological types of lung carcinomas, including adenocarcinoma of the lung, large cell carcinoma, and squamous cell carcinoma. Treatment depends on the stage of development of the cancer at the time of initial presentation. The treatment of choice for otherwise physically fit patients with early stages of disease is resection.

nonspecific binding (NSB) /-spəsif′ik/, in ligand binding assay, the part of a tracer used in a competitive-binding assay that is found in the bound fraction, independent of the binding reaction.

nonspecific immunosuppression, a therapy, including the use of immunosuppressive drugs and high doses of radiation, that blunts or abolishes the response of the immune system to all antigens.

nonspecific urethritis (NSU) [L, *non,* not, *species,* form], inflammation of the urethra of unknown origin. Onset of symptoms is often related to sexual intercourse. The acute phase of NSU is seldom seen in women, but the chronic phase is a common urological difficulty among women. The condition is noted by urethral discharge in men and by reddening of the urethral mucosa in women. Treatment with antibiotics is not always successful. See also **nongonococcal urethritis.**

nonspecific vaginitis [L, *non,* not, *species,* form, *facere,* to make, *vagina,* sheath; Gk, *itis,* inflammation], a term formerly used for any vaginal inflammation for which no specific pathogen could be identified. Most cases of vaginitis today are found to be caused by infections of ***Gardnerella vaginalis*** in combination with anaerobic bacteria, although nearly one third of all cases are caused by a protozoa, ***Trichomonas vaginalis.***

nonspecular reflection, diffuse ultrasound reflections (scatter) at rough surfaces or irregular boundaries.

nonspherocytic hemolytic anemia. See **congenital nonspherocytic hemolytic anemia.**

nonsteroidal antiinflammatory drug (NSAID) /-stir′oidəl/, any of a group of drugs having antipyretic, analgesic, and antiinflammatory effects. They counteract or reduce inflammation by inhibiting cyclooxygenase, the enzyme responsible for prostaglandin synthesis. NSAIDs may be indicated in the treatment of mild-to-moderate pain, rheumatoid arthritis, osteoarthritis, ankylosing spondylosis, gouty arthritis, fever, nonrheumatic inflammation, and dysmenorrhea. Classic examples include aspirin, ibuprofen, and ketoprofen. Newer drugs such as celecoxib, refecoxib, and valdecoxib selectively block only the inductible form of cyclooxygenase (COX-2), the form of the enzyme that appears in cells at sites of inflammation, and tend to have fewer side effects.

nonstress test (NST) /non′stres/, an evaluation of the fetal heart rate response to natural contractile activity or to an increase in fetal activity. Also called **fetal activity determination.**

nonsuppurative osteomyelitis /-sup′yərā′tiv/, tuberculosis of the bone.

nonthrombocytopenic purpura /-throm′bōsī′təpē′nik/, a disorder characterized by purplish or reddish skin areas. The condition does not involve a decrease in the number of platelets.

nontoxic /-tok′sik/, not poisonous. Also **atoxic.**

nontreponemal antigen test, any of various tests detecting serum antibodies to reagin (cardiolipin and lecithin) derived from host tissue in the diagnosis of the ***Treponema pallidum*** infection of syphilis.

nontropical sprue /-trop′ikəl/ [L, *non,* not; Gk, *tropikos,* of the solstice; D, *sprouw*], a malabsorption syndrome resulting from an inborn inability to digest foods that contain gluten. See also **celiac disease, tropical sprue.**

nonulcerative blepharitis /-ul′sərətiv′/ [L, *non* + *ilcus,* ulcer; Gk, *blepharon,* eyelid, *itis,* inflammation], a form of blepharitis characterized by greasy scales on the margins of the eyelids around the lashes and hyperemia and thickening of the skin. Nonulcerative blepharitis is often associated with **seborrheic dermatitis**.

nonunion /-yo͞o′nyən/, pertaining to a fractured bone that fails to heal properly. See also **false joint.**

nonvascularized graft, a graft in which the blood supply to the grafted tissue is not maintained.

nonvenereal syphilis. See **endemic syphilis.**

nonverbal communication /-vur′bəl/, the transmission of a message without the use of words. It may involve any or all of the five senses. See also **body language.**

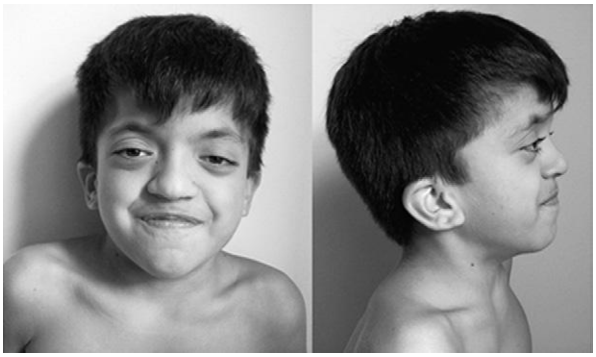
nonviable /-vī′əbəl/ [L, *non* + *vita,* life], unable to exist independently after birth.

nonvital bleaching, a procedure performed in which an oxidizing agent such as hydrogen peroxide or urea peroxide is placed directly within the pulp chamber and sealed closed. This results in lightening the shade of tooth color.

nonvital pulp [L, *non,* not, *vita,* life, *pulpa,* flesh], dead dental pulp caused by a disease or trauma that interferes with the blood supply. Also called **dead pulp.**

nonvital tooth. See **pulpless tooth.**

Noonan's syndrome, the phenotype of Turner's syndrome (webbed neck, ptosis, hypogonadism, congenital heart disease, and short stature) without gonadal dysgenesis. Formerly called *male Turner's syndrome* until the female counterpart was identified.



Noonan's syndrome *(Tartaglia, Gelb, Zenker, 2001)*

nootropic /nō·ətrop′ik/, a chemical designed to increase brain metabolism.

Norcuron, a trademark for an IV neuromuscular blocking drug **(vecuronium bromide).**

norepinephrine (NE) /nôr′epinef′rin/, an adrenergic hormone (catecholamine) that acts to increase blood pressure by vasoconstriction but does not affect cardiac output. It is synthesized by the adrenal medulla, the peripheral sympathetic nerves, and the central nervous system. It is available as a drug, levarterenol, which is used to maintain the blood pressure in acute hypotension secondary to trauma, heart disease, or vascular collapse.

norepinephrine bitartrate, a commercial preparation of an endogenous agonist of alpha-1, alpha-2, and beta-1 adrenergic.

■ INDICATION: It is prescribed in the treatment of shock that persists after hypovolemia has been corrected.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or bisulfite preservatives prohibits its use. Hypovolemia and vascular thrombosis are contraindications unless it is used as a short-term lifesaving procedure to maintain perfusion of vital organs. It is not used in conjunction with cyclopropane or halothane anesthesia because of the increased risk of arrhythmia.

■ ADVERSE EFFECTS: Among the more serious adverse effects are local tissue necrosis at the site of injection, bradycardia, and headache. Overdosage can cause hypertension, peripheral or cardiac ischemia or infarctions, hemorrhagic strokes, and convulsions.

no response (NR), the condition in which the maximum decrease in treated tumor volume is less than 50%.

norethindrone /nôreth′indrōn/, a progestin.

■ INDICATIONS: It is prescribed in the treatment of abnormal uterine bleeding and endometriosis and is used alone or as a component in oral contraceptive medications.

■ CONTRAINDICATIONS: Thrombophlebitis, liver dysfunction, unusual vaginal bleeding, breast cancer, or known hypersensitivity to this drug prohibits its use. It is not recommended for use during pregnancy and should be used with caution in patients with asthma, diabetes, cardiac or renal dysfunction, hyperlipidemia, migraines, seizure disorders, or psychic depression.

■ ADVERSE EFFECTS: Among the more serious adverse effects are breakthrough bleeding, amenorrhea, GI disturbances, breast changes, and masculinization of the female fetus. The drug should be discontinued immediately if vision problems (e.g., double vision, complete or partial loss of vision) or migraine headaches appear. Progestin-only contraceptives have a higher rate of failure.

norethindrone acetate and ethinyl estradiol, a combination oral contraceptive containing a progestin (norethindrone) and an estrogen (ethinyl estradiol).

■ INDICATIONS: It is prescribed for contraception, the treatment of acne and moderate to severe vasomotor symptoms in menopause, and the prevention of osteoporosis in postmenopausal women at high risk. Unlabeled uses include hypermenorrhea, endometriosis, and female hypogonadism.

■ CONTRAINDICATIONS: Thrombophlebitis, severe hypertension, coronary artery disease, diabetes with vascular complications, migraine headaches, breast or reproductive organ cancer, unusual vaginal bleeding, gallbladder disease, liver dysfunction or tumor, or known hypersensitivity to this drug prohibits its use. It is not given during lactation, pregnancy, or suspected pregnancy or to women over the age of 35 who smoke more than 15 cigarettes per day.

■ ADVERSE EFFECTS: Among the more serious adverse effects are thrombophlebitis, embolism, hypertension, myocardial infarction, cerebrovascular accident, depression, headache, premenstrual syndrome, cramps, breakthrough bleeding, porphyria, embolism, jaundice, and gallbladder disease.

Norflex, a trademark for a skeletal muscle relaxant with anticholinergic properties **(orphenadrine citrate).**

norfloxacin /nôrflok′səsin/, an oral antibacterial drug.

■ INDICATIONS: It is prescribed for the treatment of bacterial urinary tract infections, sexually transmitted gonorrhea, and proctitis.

■ CONTRAINDICATIONS: Hypersensitivity to quinolones or pregnancy or lactation prohibits its use. It should be used with caution in patients younger than 18 years because of arthropathy. Concomitant use of nitrofurantoin drugs is not recommended, and concomitant use of corticosteroids can increase the risk of arthropathy in the elderly.

■ ADVERSE EFFECTS: Typical side effects include nausea, dizziness, and headache. Severe hypersensitivity reactions, tendon rupture, and numerous other effects have been reported with relatively low incidence.

Norgesic Forte, a trademark for a fixed-combination drug containing a muscle relaxant with anticholinergic activity **(orphenadrine citrate), aspirin,** and **caffeine,** used for the relief of mild-to-moderate pain of acute musculoskeletal disorders.

norgestimate /nor-jes′t-māt/, a synthetic progestational agent used in combination with an estrogen component as an oral contraceptive.

norgestrel /nôrjes′trəl/, a progestin.

■ INDICATIONS: It is prescribed alone or in combination with estrogen as a contraceptive.

■ CONTRAINDICATIONS: Thrombophlebitis, liver dysfunction, unusual vaginal bleeding, breast cancer, or known hypersensitivity to this drug prohibits its use. The drug should be used with caution in patients with a history of depression.

■ ADVERSE EFFECTS: Among the more serious adverse effects are thrombophlebitis, embolism, depression, amenorrhea, dysfunctional uterine bleeding, breast changes, and masculinization of a female fetus. It should be discontinued immediately if vision changes, such as a complete or partial loss of vision or double vision, occur.

Norinyl, a trademark for several formulations of oral contraceptives containing a progestin **(norethindrone)** and an estrogen **(mestranol** or **ethinyl estradiol).**

norm [L, *norma,* rule], **1.** a measure of a phenomenon generally accepted as the ideal standard performance against which other measures of the phenomenon may be measured. **2.** abbreviation for **normal.**

norma basalis /nôr′mə basā′lis/ [L, rule; Gk, *basis,* foundation], the inferior surface of the base of the skull with the mandible removed, formed by the palatine bones, the vomer, the pterygoid processes, and parts of the sphenoid and temporal bones.

normal (N, norm) /nôr′məl/ [L, *norma,* rule], **1.** describing a standard, average, or typical example of a set of objects or values. **2.** describing a chemical solution in which 1 L contains 1 g of a substance or the equivalent in replaceable hydrogen ions. **3.** describing people in a nondiseased population. **4.** a gaussian distribution.

-normal, suffix meaning "relating to a norm": *centinormal, decanormal, prenormal.*

normal curve. See **bell-shaped curve.**

normal dental function, the correct and healthy action of opposing teeth during chewing.

normal diet. See **regular diet.**

normal distribution, (in statistics) a theoretic distribution frequency of variable data usually represented graphically by a bell-shaped curve that reaches a peak about the mean.

normal dwarf. See **primordial dwarf.**

normal flora. See **flora.**

normal human serum albumin, an isotonic preparation of pooled human serum albumin for treating hypoproteinemia, hypovolemia, and threatened or existing shock.

normal hydrogen electrode. See **standard hydrogen electrode.**

normalization promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting parents and other family members of children with chronic illnesses or disabilities in providing normal life experiences for their children and families. See also **Nursing Interventions Classification.**

normal last shoes, orthopedic shoes for infants and children constructed with a normal sole.

normal phase, a chromatographic mode in which the mobile phase is less polar than the stationary phase.

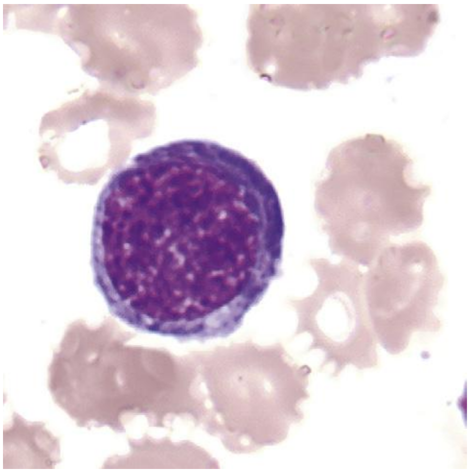
normal pressure hydrocephalus [L, *norma,* rule, *premere,* to press; Gk, *hydor,* water, *kephale,* head], a condition in which there is dilation of the ventricles without an increase in intracranial pressure. Classic symptoms are gait disturbance, memory/cognitive problems, and urinary incontinence. Diagnosis is made by lumbar puncture to remove cerebrospinal fluid and by watching to see if any of the symptoms improve.

normal saline, physiological saline solution.

normal saline solution [L, *norma,* rule, *sal* + *solutus,* dissolved], a 0.9% w/v (grams of solute per milliliter of solution) sterile solution of sodium chloride in water that is isotonic with blood and injectable intravenously.

normal salt solution. See **physiological salt solution.**

normal sinus rhythm (NSR) [L, *norma,* rule, *sinus,* hollow; Gk, *rhythmos*], the normal heartbeat initiated by the pacemaker in the sinus node, with a heart rate of 60 to 100 beats/min.



Basophilic normoblast *(Carr and Rodak, 2008)*

normal solution (N/I, N) [L, *norma,* rule, *solutus,* dissolved], a solution that contains the gram-equivalent weight of a reagent per liter.

normal strain, a quantity described by the quotient of the change of length of a line and its original length.

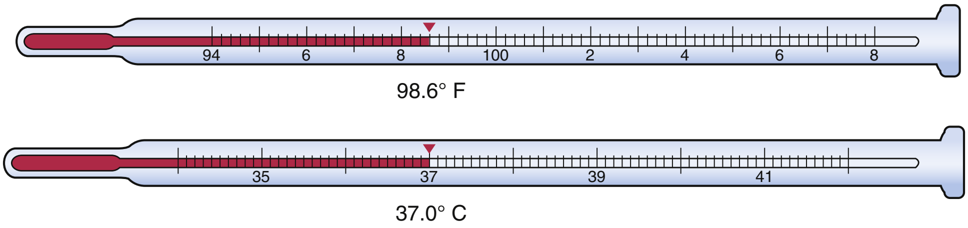
normal stress, (in physics) a quantity described by the quotient of distributed force and area when the force is perpendicular to the area.

normal temperature [L, *norma,* rule, *temperatura*], for a normal person at rest, an oral clinical temperature of 98.6° F or 37° C. Actual "normal" temperatures may range a fraction of a degree or increments of a whole degree higher or lower because of effects of sleep, exercise, eating, sleeping, metabolism, and the ambient temperature. Rectal temperature also averages a fraction of a degree higher than oral temperatures, and axillary readings are usually lower than oral temperatures.

normo-, prefix meaning "normal": *normocytic, normotensive.*

normoblast /nôr′məblast/ [L, *norma* + Gk, *blastos,* germ], nucleated bone marrow red blood cell precursor. Developmental stages include the pronormoblast, the basophilic normoblast, the polychromatophilic normoblast, and the orthochromic normoblast. After the extrusion of the nucleus of the normoblast, the young erythrocyte becomes known as a reticulocyte and enters the circulating blood. Compare **erythrocyte.** See also **reticulocyte. —normoblastic,** *adj.*

normochromic /nôr′məkrō′mik/ [L, *norma* + Gk, *chroma,* color], pertaining to a blood cell having normal



Normal temperature readings *(Sorrentino, 2012)* color resulting from the presence of an adequate amount of hemoglobin. Compare **hypochromic.** See also **red cell indexes.**

normocyte /nôr′məsīt/ [L, *norma* + Gk, *kytos,* cell], an ordinary, normal adult red blood cell of average size having a diameter of 7 µm. Compare **macrocyte, microcyte. —normocytic,** *adj.*

Normodyne, a trademark for an antihypertensive drug **(labetalol hydrochloride).**

normoglycemic /-glīsē′mik/, pertaining to a normal blood glucose level.

normotensive /-ten′siv/, pertaining to the condition of having normal blood pressure. Normal blood pressure is typically 120/80 but may be lower in younger individuals or athletes. **—normotension,** *n.*

normoventilation /-ven′tilā′shən/, the alveolar ventilation rate that produces an alveolar carbon dioxide pressure of about 40 mm Hg at any metabolic rate.

normoxia /nôrmok′sē·ə/, an ambient oxygen pressure of about 150 (plus or minus 10) torr or the partial pressure of oxygen in atmospheric air at sea level.

Noroxin, a trademark for an oral antibacterial drug **(norfloxacin).**

Norpace, a trademark for an antidysrhythmic cardiac depressant **(disopyramide phosphate).**

Norpramin, a trademark for an antidepressant **(desipramine hydrochloride).**

Nor-QD, a trademark for an oral contraceptive containing a progestin **(norethindrone)** but no estrogen.

North American blastomycosis, an infection caused by inhaling the fungus *Blastomyces dermatitidis*. It may resemble bacterial pneumonia, and x-ray films of the chest may show cavities. Painless, well-demarcated verrucous or ulcerated skin lesions occur on the face and hands. Occasionally lesions of the oral mucous membrane may be mistaken for squamous cell carcinoma. The disease may progress to involve bones and the brain; many viscera are infected in fatal cases. Diagnosis is made by microscopic examination of body secretions. Treatment is ketoconazole/itraconazole or amphotericin B given intravenously, depending on the severity, or in the most severe cases a combination of amphotericin B and sulfonamides. Also called **Gilchrist's disease.** Compare **paracoccidioidomycosis.**

North American coral snake antivenin, antivenin to *Micrurus fulvius*.

North American Nursing Diagnosis Association (NANDA), a professional organization of registered nurses created in 1982. The purpose of the organization is "to develop, refine, and promote a taxonomy of nursing diagnostic terminology of general use to the professional."

North Asian tick-borne rickettsiosis, an infection, acquired in the Eastern Hemisphere, caused by *Rickettsia sibirica,* transmitted by ticks. It resembles **Rocky Mountain spotted fever.** Usual findings include a generalized maculopapular rash involving palms and soles, fever, and lymph node enlargement. It is rarely fatal and responds quickly to treatment with chloramphenicol. No vaccine is available. See also **boutonneuse fever, relapsing fever.**

North Asian tick typhus. See **Siberian tick typhus.**

Northern blot test, an electrophoretic test for identifying the presence or absence of particular mRNA molecules and nucleic acid hybridization. See also **Southern blot test, Western blot test.**

Norton risk scale /nor′tən/, a tool for estimating a patient's risk for developing pressure ulcers. The patient is rated from 1 to 4 on five different factors, with a score of 14 or more indicating high risk.

nortriptyline hydrochloride /nôrtrip′tilēn/, a tricyclic antidepressant.

■ INDICATIONS: It is prescribed in the treatment of mental depression. Unlabeled uses include chronic pain, anxiety, enuresis, and attention-deficit/hyperactivity disorder.

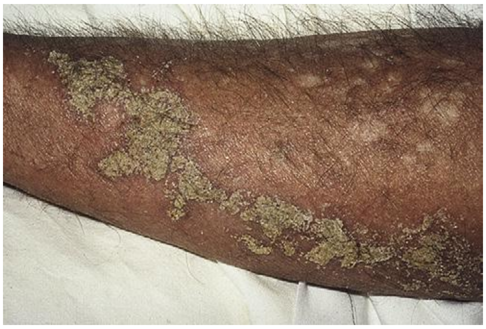
■ CONTRAINDICATIONS: Concomitant administration of monoamine oxidase inhibitors, recent myocardial infarction, pregnancy or known hypersensitivity to this drug or to other tricyclic medications prohibits its use. It is used with caution in patients who have a seizure disorder or a cardiovascular disease.

■ ADVERSE EFFECTS: Among the more serious adverse effects are sedation and GI, cardiovascular, and neurological reactions. It interacts with many other drugs.

Norvir, a trademark for a protease inhibitor **(ritonavir).**

Norwalk agent [Norwalk, Ohio, site where first identified], a virus that produces gastroenteritis symptoms. The infection is transmitted from one person to another and is involved in 40% of the nonbacterial diarrhea cases in children and adults.

Norwegian scabies [Norway; L, *scabere,* to scratch], a severe infestation of human skin by an itch mite, ***Sarcoptes scabiei.*** The condition is associated with intense itching, crusting and scaling of the skin, and insect egg burrows that appear as discolored lines in the affected skin areas. Compare **scabies.**



Norwegian scabies

(Conlon and Snydman, 2000/Courtesy Dr. R. Muller)

nose [AS, *nosu*], the structure that protrudes from the anterior part of the face and serves as a passageway for air to and from the lungs. The nose filters the air, warming, moistening, and chemically examining it for impurities that might irritate the mucous lining of the respiratory tract. The nose also contains receptor cells for smell, and it aids the faculty of speech. It consists of an internal and an external part. The external part, which protrudes from the face, is considerably smaller than the internal part, which lies over the roof of the mouth. The hollow interior part is separated into a right and a left cavity by a septum. Each cavity is divided into the superior, middle, and inferior meati by the projection of nasal conchae. The external part of the nose is perforated by two nostrils (anterior nares), and the internal part by two posterior nares. The pairs of sinuses that drain into the nose are the frontal, maxillary, ethmoidal, and sphenoidal sinuses. Ciliated mucous membrane lines the nose, closely adhering to the periosteum. The mucous membrane is continuous with the skin through the nares and with the mucous membrane of the nasal part of the pharynx through the choanae. The mucous membrane contains the olfactory cells that form the olfactory nerve that enters the cranium.

nosebleed [AS, *nosu* + ME, *blod,* blood], abnormal hemorrhage from the nose. Emergency responses to nosebleed include seating the patient upright with the head thrust forward to prevent swallowing of blood. Pressure with both thumbs directly under the nostril and above the lips may block the main artery supplying blood to the nose. Alternatively, pressure with both forefingers on each side of the nostril often slows bleeding by blocking the main arteries and their branches. Continued bleeding may require the insertion of cotton or other absorbent material within the nostril and reapplication of pressure. Cold compresses on the nose, lips, and back of the head may help control hemorrhage. Continued bleeding may require cautery. Also called **epistaxis.**

nose drops, a medicated solution to be dropped into the nose.

NOSIE, abbreviation for **nurses' observation scale for inpatient evaluation.**

noso-, prefix meaning "disease": *nosochthonography, nosogeny, nosophobe*.

nosocomial /nos′əkō′mē·əl/ [Gk, *nosokomeian,* hospital], **1.** pertaining to a hospital. **2.** pertaining to a secondary disorder associated with hospitalization but unrelated to the primary condition of the patient.

nosocomial fever of unknown origin, a fever of at least 38.3° C occurring on several occasions in a hospitalized patient in whom neither fever nor infection was present on admission and for which a cause cannot be determined after 3 days of investigation, including 2 days of incubation of cultures.

nosocomial infection, an infection acquired at least 72 hours after hospitalization, often caused by ***Candida albicans, Escherichia coli,*** hepatitis viruses, herpes zoster virus, ***Pseudomonas,*** or ***Staphylococcus.*** Also called **hospital-acquired infection.**

nosology /nōsol′əjē/ [Gk, *nosos,* disease, *logos,* science], the science of classifying diseases. See also **nomenclature.**

nostrils. See **anterior nares.**

notch [Fr, *noche*], an indentation or a depression in a bone or other organ, such as the auricular notch or the cardiac notch.

nothing by mouth (NPO) [L, *nil per os,* nothing by mouth], a patient care instruction advising that the patient is prohibited from ingesting food, beverage, or medicine. It is usually posted above the bed of a patient who is about to undergo surgery or special diagnostic procedures requiring that the digestive tract be empty or who is unable to tolerate food and fluids by mouth for some reason.

no-threshold curve, a linear dose-response curve that assumes that there is no detectable threshold below which there is no harm. As applied in nuclear medicine, there is no identifiable concentration of radiation below which no response curve occurs.

notifiable [L, *nota,* mark, *facere,* to make], pertaining to certain conditions, diseases, and events that must, by law, be reported to a governmental agency, such as birth, death, smallpox, certain other communicable diseases, and certain violations of public health regulations.

notifiable diseases, diseases that are classified as reportable by each state and territorial health department, which also prescribes the manner and time of reporting.

noto-, prefix meaning "the back": *notochord, notogenesis, notomyelitis*.

notochord /nō′tōkôrd/ [Gk, *noton,* back, *chorde,* cord], an elongated strip of mesodermal tissue that originates from the primitive node and extends along the dorsal surface of the developing embryo beneath the neural tube, forming the primary longitudinal skeletal axis of the body of all chordates. In humans and other higher vertebrates, the structure is replaced by vertebrae, although a remnant of it remains as part of the nucleus pulposus of the intervertebral disks. See also **neural tube. —notochordal,** *adj*.

notochordal canal /no′tōkôr′dəl/ [Gk, *noton* + *chorde,* cord; L, *canalis,* channel], a tubular passage that extends from the primitive pit into the head process during the early stages of embryonic development in mammals. It perforates the splanchnopleure layer so that the yolk sac and the amnion are connected temporarily. Also called **chordal canal.**

notochordal plate. See **head process.**

notogenesis /nō′tōjen′əsis/ [Gk, *noton* + *genein,* to produce], the formation of the notochord. **—notogenetic,** *adj*.

notomelus /nətom′ələs/ [Gk, *noton* + *melos,* limb], a congenital malformation in which one or more accessory limbs are attached to the back.

Nott retinoscopy, a type of dynamic retinoscopy in which the fixation target is 40 cm from the eye. The test is first done with the object farther away than the target distance and then continued while the target is moved toward the patient until neutrality is observed.

nourish /nur′ish/ [L, *nutrire,* to suckle], to furnish the essential foods or nutrients for maintaining life.

nourishment /nur′ishmənt/, **1.** the act or process of nourishing or being nourished. **2.** any substance that nourishes and supports the life and growth of living organisms.

Novahistine, a trademark for a fixed-combination drug containing an antihistamine **(chlorpheniramine maleate)** and an adrenergic decongestant (pseudoepHEDrine).

Novantrone, a trademark for a synthetic antineoplastic anthracenedione **(mitoxantrone).**

Novocain, a trademark for a local anesthetic **(procaine hydrochloride).**

NOx, abbreviation for a mixture of oxides of nitrogen, including nitric oxide, nitrogen dioxide, and nitrous oxide.

Noxafil, a trademark for **posaconazole.**

noxious /nok′shəs/ [L, *noxius,* harm], harmful, injurious, or detrimental to health.

Noyes test /noiz/, an orthopedic knee test performed with the knee extended and the thigh relaxed. The knee is partially dislocated anterolaterally. As the knee is gradually flexed, the dislocation is reduced at about 30 degrees of flexion.

Np, symbol for the element **neptunium.**

NP, abbreviation for **nurse practitioner.**

NPH Iletin, a trademark for an insulin suspension **(isophane).**

NPH Insulin, a trademark for an insulin suspension **(isophane).**

NPN, abbreviation for **nonprotein nitrogen.**

NPO, abbreviation for **nothing by mouth.**

***n*-propyl alcohol (C_3H_7OH)** /en′prō′pil/, a clear, colorless liquid used as a solvent for resins.

NPT, abbreviation for **nocturnal penile tumescence.**

NPU, abbreviation for **net protein utilization.**

NPY, abbreviation for **neuropeptide Y.**

NR, **1.** abbreviation for **no response. 2.** abbreviation for *nodal rhythm*.

NREM, abbreviation for **nonrapid eye movement.** See **sleep.**

NRTI, abbreviation for **nucleoside reverse transcriptase inhibitors.**

NSAIA, abbreviation for *nonsteroidal antiinflammatory analgesic*. See **nonsteroidal antiinflammatory drug**.

NSAID, abbreviation for **nonsteroidal antiinflammatory drug.**

NSB, abbreviation for **nonspecific binding.**

NSCCN, abbreviation for **National Society of Critical Care Nurses of Canada.**

n-s/m^2, abbreviation for *newton second per square meter.*

NSNA, abbreviation for **National Student Nurses Association.**

NSR, abbreviation for **normal sinus rhythm.**

NSU, abbreviation for **nonspecific urethritis.**

N-telopeptide test (NTx), a urine test that detects levels of N-telopeptide, a biochemical marker of bone metabolism and the most sensitive and specific indicator of bone resorption. It is used primarily to monitor the effect of antiresorptive therapy in women with osteoporosis.

NTP, ntp, abbreviation for *normal temperature and pressure*.

n-type semiconductor. See **semiconductor.**

nu /n(y)o͞o/, N, ν, the thirteenth letter of the Greek alphabet.

Nubain, a trademark for a synthetic opioid analgesic (nalbuphine hydrochloride), used as an adjunct to anesthesia.

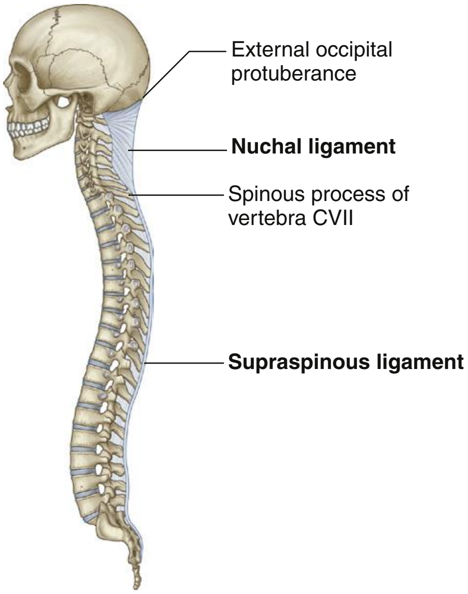
nuc, abbreviation for *nuclear.*

nucha /no͞o′kə/ *pl.* **nuchae** [Fr, *nuque,* nape], the nape, or back of the neck. **—nuchal,** *adj.*

nucha-, prefix meaning "the neck": *nuchal, subnuchal*.

nuchal cord /no͞o′kəl/ [Fr, *nuque,* nape; Gk, *chorde*], an abnormal but common condition in which the umbilical cord is wrapped around the neck of the fetus in utero or of the baby as it is being born. It is usually possible to slip the loop or loops of cord gently over the child's head. Sometimes it is a single loose loop, and the shoulders may deliver through it. If it is tight, it may be clamped in two places and cut with sterile, blunt tipped scissors. The condition occurs in more than 25% of deliveries, more often with long cords than with short ones.

nuchal ligament, the fibrous membrane that reaches from the external occipital protuberance and median nuchal line to the spinous process of the seventh vertebra. A fibrous lamina from the ligament attaches to the posterior tubercle of the atlas and the spinous processes of the cervical vertebrae, forming a septum between muscles on either side of the neck.



External occipital protuberance
Nuchal ligament
Spinous process of vertebra CVII
Supraspinous ligament

Nuchal ligament
(Drake, Vogl, and Mitchell, 2010)

nuchal line, one of the curved lines that extend laterally from the external occipital protuberance, a midline projection visible on the occipital bone.

nuchal rigidity, a resistance to flexion of the neck, a condition seen in patients with meningitis.

nuchocephalic reflex /no͞o′kəsefal′ik/, a test for diffuse cerebral dysfunction, such as in senility. When the shoulders are turned to the left or the right, the head fails to turn in the same direction within a half-second.

Nuck's canal, Nuck's diverticulum. See **processus vaginalis peritonei.**

nucle-. See **nucleo-.**

-nuclear, suffix meaning "nucleus": *circumnuclear, endonuclear, multinuclear.*

nuclear agenesis. See **Möbius' syndrome.**

nuclear envelope, a double membrane that surrounds the nucleus of a eukaryotic cell. Also called **karyotheca.**

nuclear family /n(y)o͞o′kle·ər/ [L, *nucleus,* nut kernel, *familia,* household], a family unit consisting of the biological parents and their offspring. The nuclear family is a relatively recent product of Western society. The nuclear family unit is less efficient than an extended family unit in providing information and vital services to family members, such as child rearing, child care, and care of older family members. Compare **extended family, matrifocal family.**

nuclear fission. See **fission.**

nuclear hyaloplasm. See **karyolymph.**

nuclear isomer. one of two or more nuclides with the same number of neutrons and protons in the nucleus (the same atomic number, or Z, and the same atomic mass, or A) but existing in different energy states.

nuclear magnetic resonance. See **magnetic resonance.**

nuclear medicine, a medical discipline that uses radiation emitted by radioactive isotopes in the diagnosis and treatment of disease. Forms of radiation important in nuclear medicine include alpha and beta particles, gamma rays, and x-rays. Radioactive elements used in nuclear medicine, called radionuclides or radiopharmaceuticals, are produced artificially. Radiopharmaceuticals are used as tracers for assessing the structure, function, secretion, excretion, and volume of a particular organ or tissue. They are also used to analyze biological specimens and to treat specific diseases such as thyroid cancer. An important component of nuclear medicine is imaging, which involves administering radiopharmaceuticals to a patient orally, intravenously, or by inhalation to localize a specific organ or system and its structure and function. Scanning instruments convert the radioactive emissions into an image of the organ or system.

nuclear medicine technologist, an allied health professional who uses radioactive and stable nuclides to make diagnostic evaluations of the anatomical or physiological conditions of the body and who provides therapy with unsealed radioactive sources. Responsibilities include application of a special knowledge of radiation physics and safety regulations to limit radiation exposure; preparation and administration of radiopharmaceuticals; use of radiation detection devices and other kinds of laboratory equipment that measure the quantity and distribution of radionuclides deposited in a patient specimen; and performance of in vivo and in vitro diagnostic procedures.

nuclear physics, the study of atomic nuclei and their reactions.

nuclear problem, (in psychology) an underlying reason for an individual's reaction to a precipitating event.

nuclear radiology, the branch of radiology that uses radioactive materials in the diagnosis and treatment of health disorders.

nuclear sap. See **karyolymph.**

nuclear scanning, a diagnostic technique that uses an injected, ingested, or inhaled radioactive material and a scanning device to determine the size, shape, location, and function of various body parts. Also called **radionuclide organ imaging.**

nuclear spin, an intrinsic form of angular momentum possessed by atomic nuclei containing an odd number of nucleons (protons or neutrons).

nuclear transplantation, the transfer of the nucleus of one cell into the cytoplasm of another.

nucleic acid /no͞oklē′ik/ [L, *nucleus* + *acidus,* sour], a high–molecular-weight polymeric compound composed of nucleotides, each consisting of a purine or pyrimidine base, a ribose or deoxyribose sugar, and a phosphate group. Nucleic acids are involved in the determination and transmission of genetic characteristics. Kinds of nucleic acid are **deoxyribonucleic acid** and **ribonucleic acid.** See also **nucleotide.**

nucleic acid amplification, amplification of a specific nucleic acid sequence, such as to test for the presence of a given virus or bacteria in a sample. Types include DNA amplification, ligase chain reaction, and polymerase chain reaction.

nucleic acid amplification technique, any of various in vitro methods by which a DNA or RNA sequence is amplified, making it more readily detectable for various procedures or tests. The original, and still most commonly used, is the polymerase chain reaction.

nucleic acid test, any of various tests that use molecular biology techniques to detect and identify microorganisms, including viruses, on the basis of their nucleic acids. It includes culture confirmation tests, which identify organisms grown in culture, and direct tests, which can identify the organisms directly in a specimen. Direct tests can be further subdivided on the basis of whether their target nucleic acids are nonamplified or amplified for the test; the former are based on identification of a unique target sequence by using a labeled probe; the latter are classified as nucleic acid amplification tests.

nucleo-, nucle-, prefix meaning "nucleus": *nucleochylema, nucleokeratin, nucleolus.*

nucleocapsid /no͞o′klē·ōkap′sid/ [L, *nucleus* + *capsa,* box], a viral enclosure consisting of a capsid or protein coat and a nucleic acid that it surrounds. Some viruses consist solely of bare nucleocapsids; others have more complex enclosures.

nucleochylema. /no͞o′klē·ōkīlē′mə/ [L, *nucleus* + Gk, *chylos,* juice, *haima,* blood], the ground substance of the nucleus, as distinguished from that of the cytoplasm.

nucleochyme. See **karyolymph.**

nucleocytoplasmic /no͞o′klē·ōsī′tōplas′mik/ [L, *nucleus* + Gk, *kytos,* cell, *plasma,* something formed], of or relating to the nucleus and cytoplasm of a cell.

nucleocytoplasmic ratio, the ratio of the volume of a nucleus of a cell to the volume of the cytoplasm. The proportion is usually constant for a specific cell type, and an increase is indicative of malignant neoplasms. Also called **karyoplasmic ratio, nucleoplasmic ratio.**

nucleohistone /no͞o′klē·ōhis′tōn/ [L, *nucleus* + Gk, *histos,* tissue], a complex consisting of DNA and a histone protein that is the basic constituent of the chromatin in a cell nucleus.

nucleolar organizer /no͞oklē′ələr/ [L, *nucleolus,* little nut kernel; Gk, *organon,* instrument, *izein,* to cause], a part of the nucleus of the cell, thought to consist of heterochromatin, that is responsible for the formation of the nucleolus. Also called *nucleolar zone,* **nucleolus organizer.**

nucleolus /no͞oklē′ələs/ *pl.* **nucleoli** [L, little nut kernel], any one of the small, dense structures composed largely of ribonucleic acid that are situated within the cytoplasm of cells. Nucleoli are essential in the formation of ribosomes that synthesize cell proteins.

nucleolus organizer. See **nucleolar organizer.**

nucleon /n(y)o͞o′klē·on/, a collective term applied to protons and neutrons within the nucleus.

nucleophilic /-fil′ik/, pertaining to some molecules, particularly nucleic acids and proteins, having electrons that can be shared and thus form bonds with alkylating agents.

nucleoplasm /no͞o′klē·əplaz′əm/ [L, *nucleus* + Gk, *plasma,* something formed], the protoplasm of the nucleus as contrasted with that of the cell. Also called **karyoplasm.** Compare **cytoplasm. —nucleoplasmic,** *adj.*

nucleoplasmic ratio. See **nucleocytoplasmic ratio.**

nucleoplasmin, an acidic protein found in the nucleus that binds to histone and participates in nucleosome assembly.

nucleoprotein /-prō′tēn/ [L, *nucleus* + Gk, *proteios,* first rank], a molecule in which protein is combined with nucleic acid in a cell nucleus.

nucleoside /no͞o′klē·əsīd′/, a component of a nucleotide that consists of a nitrogenous base linked to a pentose sugar.

nucleoside analog, a structural analog of a nucleoside, a category that includes both purine analogs and pyrimidine analogs.

nucleoside monophosphate kinase, a liver enzyme that catalyzes the reversible transfer of a phosphate group from adenosine triphosphate, producing adenosine diphosphate and a nucleoside diphosphate.

nucleoside reverse transcriptase inhibitors (NRTI), a class of antiretroviral drugs that mimic one or more of the components of deoxyribonucleic acid (DNA) or ribonucleic acid and interrupt the viral replication process. The drugs (nucleoside analogs) work by being incorporated into the DNA made by the viral reverse transcriptase enzyme that is essential for viral replication. Inserting a nucleoside analog into the new viral DNA strand terminates the viral chain, halting the replication process before it is completed. Examples of nucleoside analogs include zidovudine (AZT), didanosine (ddI), zalcitabine (ddC), stavudine (d4T), and lamivudine (3TC). See also **nonnucleoside reverse transcriptase inhibitors.**

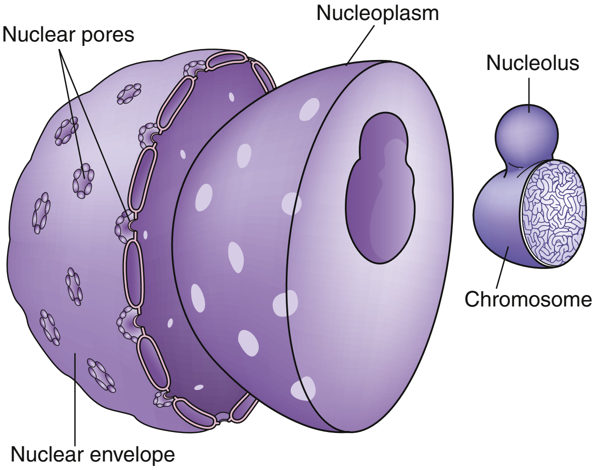
nucleosome /no͞o′klē·əsōm′/ [L, *nucleus* + Gk, *soma,* body], any one of the repeating DNA-histone complexes that appear as beadlike structures at distinct intervals along a chromosome.

5′-nucleotidase /no͞o′klē·ot′idās/, an enzyme, elevated in some liver disorders and cancer of the pancreas. It is infrequently measured in the blood to diagnose certain liver and bone diseases. This enzyme is widely distributed throughout the body but is found in high concentrations in the liver and pancreas. The normal accumulation in serum is 0.1 to 6 units.

5′-nucleotidase test, an infrequently performed blood test used to help diagnose liver disease, particularly cholestasis. It provides information similar to that from the alkaline phosphatase (ALP) test. However, unlike ALP, 5′-nucleotidase is specific to the liver, so this test is used to confirm liver disease when ALP results are uncertain.

nucleotide /no͞o′klē·ətīd′/, a compound consisting of one or more phosphate groups, a pentose sugar, and a nitrogenous base. Chains of nucleotides form DNA and RNA; free nucleotides, such as adenosine triphosphate and guanosine triphosphate, are important energy carriers in all cells.

nucleus /n(y)o͞o′klē·əs/ *pl.* nuclei [L, nut kernel], **1.** the central controlling body within a living cell, usually a spheric unit enclosed in a membrane and containing genetic codes for maintaining life systems of the organism and for issuing commands for growth and reproduction. **2.** a group of nerve cells of the central nervous system having a common function, such as supporting the sense of hearing or smell. **3.** the center of an atom consisting of an element-specific number of protons and neutrons. A probability cloud of electrons exists around the atomic nucleus. **4.** the central element in an organic chemical compound or class of compounds. Formerly called **cytoblast. —nuclear,** *adj.*



Nucleus *(Huether and McCance, 2008)*

nucleus pulposus, the gelatinous center of a vertebral disk. See **pulpy nucleus.**

nuclide /no͞o′klīd/ [L, *nucleus,* nut kernel], a species of atom characterized by the constitution of its nucleus, in particular by the number of protons and neutrons. Thus, Co-59 and Co-60 are both isotopes of cobalt and are each nuclides. Co-60 is a radionuclide because it undergoes radioactive decay.

nudge control, a mechanical device on a prosthesis that can be pressed by the chin to lock or unlock one or more joints of the prosthesis.

NUG, abbreviation for **necrotizing ulcerative gingivitis.**

Nuhn's gland /noonz/ [Anton Nuhn, German anatomist, 1814–1889], a gland on the inferior surface and near the apex and midline of the tongue.

nuke, a slang term for nucleoside analog. See also **nucleoside reverse transcriptase inhibitors.**

null cell [L, *nullus,* not one, *cella,* storeroom], a lymphocyte that develops in the bone marrow and lacks the characteristic surface markers of the B and T cells (surface immunoglobulin or the pan-T antigen). Null cells represent a small proportion of the lymphocyte population. Stimulated by the presence of an antibody, null cells can attack certain cellular targets directly. They kill tumor or viral-infected cells, although not with the specificity of cytotoxic T cells. A null cell is a type of **natural killer cell.** Compare **B cell, T cell.** See also **cytotoxin, immune gamma globulin.** The term null cell is no longer in common use.

null hypothesis (H_0), (in research) a hypothesis that predicts that an observed difference is due to chance alone and not a systematic cause.

nulli-, prefix meaning "none": *nullipara, nulligravida.*

nulligravida /nul′igrav′ədə/, a woman who has never been pregnant.

nullipara /nulip′ərə/ *pl.* **nulliparae** [L, *nullus,* not one, *parere,* to bear], a woman who has not given birth to a viable infant. The designation "para 0" indicates nulliparity. Compare **multipara, primipara.**

nulliparity /nul′iper′itē/ [L, *nullus,* none, *parere,* to bear], the status of a woman who has never borne a child.

nulliparous /nulip′ərəs/ [L, *nullus,* none, *parere,* to bear], never having given birth.

num, abbreviation for *number, numeral.*

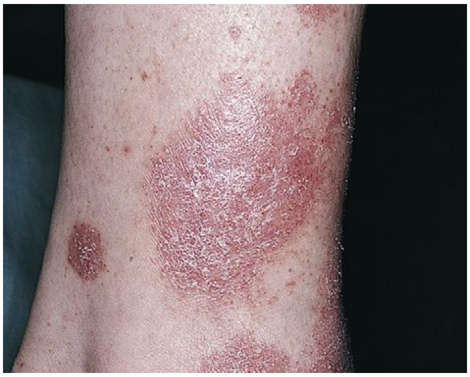
numbness /num′nəs/ [ME, *nomen,* loss of feeling], a partial or total lack of sensation in a body part resulting from any factor that interrupts the transmission of impulses from the sensory nerve fibers. Numbness is often accompanied by tingling.

numeric pain scale /n(y)o͞omer′ik/, a pain assessment system in which patients are asked to rate their pain on a scale from 1 to 10, with 10 representing the worst pain they have experienced or could imagine.

numeric taxonomy, a system of classifying organisms on the basis of the overall similarities of the measurable phenotypic characters they share. The system is used to classify strains of bacteria, as well as to separate closely related species of plants and animals.

nummular dermatitis /num′yələr/ [L, *nummuli,* petty cash; Gk, *derma,* skin, *itis,* inflammation], a skin disease characterized by coin-shaped, vesicular, or scaling eczema-like lesions, commonly on the forearms and front of the calves. The cause is unknown.

nummular psoriasis. See **psoriasis.**



Nummular dermatitis *(Callen et al, 2000)*

Numorphan, a trademark for an opioid analgesic **(oxymorphone hydrochloride).**

Nupercainal, a trademark for a local anesthetic (dibucaine hydrochloride).

Nuremberg tribunal [Nuremberg, Germany; L, *tribunus,* platform for administration of justice], an international tribunal planned and implemented by the United Nations War Crimes Commission to detect, apprehend, try, and punish people accused of war crimes. In preparation for the prosecution of World War II criminals, the U.S. War Department assigned Andrew Ivy, M.D., to devise a set of principles to govern the participation of human beings in medical research, which became known as the Nuremberg code. The principle and practice of informed consent were reinforced by the precedent set in the trials in which Nazi physicians were declared guilty of crimes against humanity in performing experiments on human beings who were not volunteers and did not consent. See also **Helsinki Accords.**

nurse [L, *nutrix*], **1.** *n,* a person educated and licensed in the practice of nursing; one who is concerned with "the diagnosis and treatment of human responses to actual or potential health problems" (American Nurses Association).

The practice of the nurse includes data collection, diagnosis, planning, treatment, and evaluation within the framework of the nurse's singular concern with the patient's response to the problem, rather than to the problem itself. The concerns of the nurse are thus broader and less discrete and circumscribed than the traditional concerns of medicine. In a cooperative participatory relationship with the client or patient, the nurse acts to promote, maintain, or restore the health of the person; wellness is the goal. A collegial collaborative relationship with other health professionals who share a mission and a common database furthers the practice of nursing. Guided by humanitarian, ethical principles, the nurse practices in a personal, nurturing, and protective manner that promotes health in all ways. The nurse may be a generalist or a specialist and, as a professional, is ethically and legally accountable for the nursing activities performed and for the actions of others to whom the nurse has delegated responsibility. **2.** *v*, to provide nursing care. See also **five-step nursing process, nursing, registered nurse.**

nurse anesthetist, a registered nurse qualified by advanced study in an accredited program in the specialty of nurse anesthesia to manage patient care during the administration of anesthesia in selected surgical situations. Nurse anesthetists are primarily involved in the direct administration of anesthesia to a single patient but often have other duties such as airway management in emergency situations. See certified registered nurse anesthetist.

nurse cell, a cell that transfers nutrients to an oocyte via a cytoplasmic bridge. Compare **Sertoli cell.**

nurse-client interaction, any process in which a nurse and a client exchange or share information, verbally or nonverbally. It is fundamental to communication and is an essential component of the nursing assessment.

nurse-client relationship, a therapeutic relationship between a nurse and a client built on a series of interactions and developing over time. All interactions do not develop into relationships but may nonetheless be therapeutic. The relationship differs from a social relationship in that it is designed to meet the needs only of the client. Its structure varies with the context, the client's needs, and the goals of the nurse and the client. Its nature varies with the context, including the setting, the kind of nursing, and the needs of the client. The relationship is dynamic and uses cognitive and affective levels of interaction. It is time-limited and goal-oriented and has three phases. During the first phase, the phase of establishment, the nurse establishes the structure, purpose, timing, and context of the relationship and expresses an interest in discussing this initial structure with the client. Data collection for the nursing care plan continues, and basic goals for the relationship are stated. During the middle, developmental, phase of the relationship, the nurse and the client get to know each other better and test the structure of the relationship to be able to trust one another. The nurse is careful to assess correctly the degree of dependency that is necessary for the particular client. Plans may be devised for improved ways of coping with problems and achieving goals. The nurse is alert to the danger of losing objectivity during this phase. The last phase, termination, ideally occurs when the goals of the relationship have been accomplished, when both the client and the nurse feel a sense of resolution and satisfaction.

nurse clinician, a nurse who is prepared to identify and diagnose problems of clients by using increased knowledge and skills gained through advanced study in a specific area of nursing practice. The specialist may function independently within standing orders or protocols and collaborates with associates to implement a care plan that is focused on the client.

nurse coordinator, a registered nurse who coordinates and manages the activities of nursing personnel engaged in specific nursing services, such as obstetrics or surgery, for two or more patient care units.

Nurse Corps, the branch within each of the armed services comprising the nurses within that service, such as the Army Nurse Corps. In each of the armed services, the members of the Nurse Corps have the rank, title, responsibilities, and status of commissioned officer.

nurse educator, a registered nurse whose primary area of interest, competence, and professional practice is the education of nurses at the university level. Minimum education required is master's of science in nursing.

nurse manager. See **head nurse.**

nurse midwife, a registered nurse qualified by advanced education and clinical experience in obstetric and neonatal care and certified by the American College of Nurse Midwives. The nurse midwife manages the perinatal care of women having a normal pregnancy, labor, and childbirth. See also **certified nurse-midwife.**

nurse navigator, a registered nurse who coordinates, advocates and assists patients to cope successfully with the complexity of a specific hospital, physician's office, hospital service, or hospital area.

nurse practice act, a statute enacted by the legislature of each of the states or by the appropriate officers of the districts or possessions. The act delineates the legal scope of the practice of nursing within the geographic boundaries of the jurisdiction. The purpose of the act is to protect the public.

nurse practitioner (NP), a registered nurse who has advanced education in nursing (a master's of science in nursing) and clinical experience in a specialized area of nursing practice. NPs are certified by passing an examination administered by a professional organization such as the American Nurses' Credentialing Center. They collaborate with other health care providers to deliver primary care to patients with common acute or stable chronic medical conditions in ambulatory care settings. Some NPs also function in a specialty, tertiary, or long-term care setting. NPs may offer a variety of services, such as complete physical examinations, health assessments, and patient education. Specialty certification is required for family nurse practitioner (FNP), women's health care nurse practitioner (RNC), neonatal nurse practitioner (NNP), pediatric nurse practitioner (CPNP), adult nurse practitioner (ANP), school nurse practitioner (SNP), gerontological nurse practitioner (GNP), acute care nurse practitioner (CS), and psychiatric/mental health nurse practitioner (PMHNP). The list of NP specialties is expected to expand further in the near future to include mental health, campus health, and occupational health. The scope of all advanced nursing practice is influenced by state laws, federal laws, insurance practices, and regional acceptance. In many states NPs may obtain prescriptive authority. Some insurance organizations recognize NPs as primary health care providers and allow direct reimbursement for their services. Also called **advanced practice nurse.** See also specific kinds of nurse practitioner.

nursery diarrhea /nur′sərē/ [L, *nutrix,* nurse; Gk, *dia,* through, *rhein,* to flow], diarrhea of the newborn. In nurseries outbreaks of diarrhea caused by ***Escherichia coli, Salmonella,*** echoviruses, or adenoviruses are potentially life-threatening to the infant. The neonate may be infected at the time of birth by organisms from the mother's stool or infected later by organisms spread by the hands of hospital personnel. The most serious aspect of the disease is fluid loss, leading to dehydration and electrolyte imbalance. Care includes maintaining fluid and electrolyte balance and administering antibiotics, if appropriate. Good handwashing technique, use of disposable nursing bottles and nipples, and early isolation of infected infants reduce the possibility of such outbreaks.

nurse's aide, a person who is employed to carry out basic nonspecialized tasks in the care of patients, such as bathing and feeding, making beds, and transporting patients, under the supervision and direction of a registered nurse. Many hospitals offer education and orientation programs for newly hired nurse's aides and inservice education for continued training.

Nurses' Association of the American College of Obstetrics and Gynecology. See **Association of Women's Health, Obstetric, and Neonatal Nurses.**

Nurses' Coalition for Action in Politics. See **American Nurses Association—Political Action Committee.**

nurses' observation scale for inpatient evaluation (NOSIE), a systematic, objective behavioral rating scale that is applied by nurses to patient behavior.

nurses' registry, an employment agency that provides nurses to work in temporary positions at facilities. See also **float nurse.**

nurses' station, an area in a clinic, unit, or ward in a health care facility that serves as the administrative center for nursing care for a particular group of patients. It is usually centrally located and may be staffed by a unit secretary or clerk who assists with paperwork, telephone, and other communication. Before going on duty, nurses usually meet there to receive daily assignments, review the patients' charts, and update the files. In a critical care unit, the nurses' station may also contain panels of visual display terminals that allow centralized monitoring of many patients and computer terminals that allow access to information in the patients' records or to a data bank of clinical information. In other parts of a hospital, the nurses' station is equipped in any of various ways appropriate to the care of the patients in that area or unit.

nursing, **1.** the practice in which a nurse assists "the individual, sick or well, in the performance of those activities contributing to health or its recovery (or to a peaceful death) that he would perform unaided if he had the necessary strength, will or knowledge. And to do this in such a way as to help him gain independence as rapidly as possible" (Virginia Henderson). **2.** "the diagnosis and treatment of human responses to actual or potential health problems" (American Nurses Association). There are four principal characteristics that further define nursing care: the phenomena that concern nurses; the use of theories to observe the need for nursing intervention and to plan nursing action; the nursing action taken; and an evaluation of the effects of the actions relative to the phenomena. This definition of nursing provides a framework for the nursing process, including data collection, diagnosis, planning, treatment, and evaluation. The nursing process is supported by standards of nursing practice that are congruent with the definition and that provide more specific guidelines for practice. These standards include systematic, continuous collection of data concerning the health status of the client in recorded form that is accessible and that may be communicated. A nursing diagnosis is derived from the data collected. A plan for nursing care incorporates goals derived from the nursing diagnosis and the priorities and approaches to achieve the goals as indicated by the nursing diagnosis. Nursing actions, which are selected and performed with the client's participation, provide for promotion, maintenance, or restoration of the client's health and serve to maximize the client's health care abilities. The progress or lack of progress toward the goal is mutually determined by the client and the nurse, resulting in reassessment, reordering of priorities, establishment of new goals, and revision of the plan for nursing care. Nursing touches on, intersects with, and complements other professional roles in health care, addressing itself to a wide range of health-related responses in people who are well and in those who are not. Nursing seeks to diagnose and treat the response to the problem; thus the concerns of nursing are less circumscribed and discrete than those of other health-related professions. These concerns include the following: limitations of the client's self-care ability; impaired ability to function in any fundamental area such as sleeping, breathing, eating, maintaining circulation; pain, anxiety, fear, loneliness, grief, or other physical or emotional problems related to health, illness, or treatment; impaired social or intellectual processes; impaired ability to make decisions and choices; alteration of self-image as required by the change in health; dysfunctional perception of health or health care activities; extra demands posed by such normal life processes as birth, growth, or death; and difficulty in affiliative relationships. Various concepts, principles, processes, and actions developed and examined in nursing research guide the steps in the nursing process from initial observation and diagnosis through evaluation, based on intrapersonal, interpersonal, and systems theories. The boundary for nursing practice is not static; it tends to move outward as the needs and capacities of society change. Collegial, collaborative practice with members of other health care professions further softens the boundaries of nursing practice. All health care professionals share a mission and a scientific data base, and to some degree their practices overlap. At its core, nursing is nurturative, generative, and protective; preventive care is a part of every nurse's practice. Nurses value independence and self-respect. They are guided by an ethical and humanitarian philosophy in which every human being deserves respect, regardless of racial, social, cultural, sexual, economic, religious, or other factors. The nurse practices in the context of a relationship with the client, family, or group that is professional and yet close, in an interpersonal sense. The function of a nurse involves the physical intimacy of laying on of hands; compassion and constant recognition of the person's dignity are essential. Nursing is practiced by specialists and generalists. Generalists provide most nursing care; specialists, having added to their basic knowledge an organized and systematized body of knowledge and competencies, practice in specialized areas of nursing. Nursing care is given to people at all stages of life in the home, hospital, place of employment, school, or any environment where nursing care is needed. Nurses are ethically and legally accountable for their practice and for delegation of responsibilities to others. **3.** the professional practice of a nurse. **4.** the process of acting as a nurse, of providing care that encourages and promotes the health of the person or persons being served. See also **nursing process.** **5.** See **breastfeeding.**

nursing assessment, an identification by a nurse of the needs, preferences, and abilities of a patient. Assessment includes an interview with and observation of a patient by the nurse and considers the symptoms and signs of the condition, the patient's verbal and nonverbal communication, the patient's medical and social history, and any other information available. Among the physical aspects assessed are vital signs, skin color and condition, motor and sensory nerve function, nutrition, rest, sleep, activity, elimination, and consciousness. Among the social and emotional factors included in assessment are religion, occupation, attitude toward hospital and health care, mood, emotional tone, and family ties and responsibilities. Assessment is extremely important because it provides the scientific basis for a complete nursing care plan.

nursing assistant, a person trained in basic nursing techniques and direct patient care who practices under the supervision of a registered nurse. Also called *certified nursing assistant*. See also **licensed practical nurse.**

nursing audit, a review of the patient record designed to identify, examine, or verify the performance of certain specified aspects of nursing care by using established criteria. A **concurrent nursing audit** is performed during ongoing nursing care. A **retrospective nursing audit** is performed after discharge from the care facility, using the patient's record. Often a nursing audit and a medical audit are performed collaboratively, resulting in a **joint audit.**

nursing bottle caries. See **early childhood caries.**

nursing care plan, a plan, based on a nursing assessment and a nursing diagnosis, carried out by a nurse. It has four essential components: identification of the nursing care problems or nursing diagnoses and statement of the nursing approach to solve those problems; statement of the expected benefit to the patient; statement of the specific actions by the nurse that reflect the nursing approach and achieve the goals specified; and evaluation of the patient's response to nursing care and readjustment of that care as required. The nursing care plan is begun when the patient is admitted to the health service, and, after the initial nursing assessment, a diagnosis is formulated and nursing orders are developed. The goal of the process is to ensure that nursing care is consistent with the patient's needs and progress toward self-care. A written nursing care plan should be a part of every patient's chart. See also **diagnosis, nursing assessment, nursing diagnosis, nursing orders, problem-solving approach to patient-centered care.**

nursing diagnosis, a statement of a health problem or of a potential problem in the client's health status that a nurse is licensed and competent to treat. Four steps are required in the formulation of a nursing diagnosis. A data base is established by collecting information from all available sources, including interviews with the client and the client's family, a review of any existing records of the client's health, observation of the client's response to any alterations in health status, a physical assessment, and a conference or consultation with others concerned in the client's care. The data base is continually updated. The second step includes analysis of the client's responses to the problems, healthy or unhealthy, and classification of those responses as psychological, physiological, spiritual, or sociological. The third step is the organization of the data so that a tentative diagnostic statement can be made that summarizes the pattern of problems discovered. The last step is confirmation of the sufficiency and accuracy of the data base by evaluation of the appropriateness of the diagnosis to nursing intervention and by the assurance that, given the same information, most other qualified practitioners would arrive at the same nursing diagnosis. In use, each diagnostic category has three parts: the term that concisely describes the problem, the probable cause of the problem, and the defining characteristics of the problem. A number of nursing diagnoses have been identified and are listed as accepted by the North American Nursing Diagnosis Association, and they are updated and refined at periodic meetings of the group.

nursing differential, an allowance added to payments to hospitals for services rendered to Medicaid patients in recognition of the cost of providing nursing services to such patients that is greater than the cost to the general patient population.

nursing director, a nurse whose function is the administrative and clinical leadership of the nursing service of a division of a health care facility, such as a nursing director of maternal and infant care nurses. Also called **nursing supervisor.**

nursing ethics [L, *nutrix,* nurse; Gk, *ethikos,* character], the values or moral principles governing relationships between the nurse and patient, the patient's family, other members of the health professions, and the general public. See also **Code for Nurses.**

nursing goal, a general goal of nursing involving activities that are desirable but difficult to measure, such as self-care, good nutrition, and relaxation. Compare **nursing objective.**

nursing health history, data collected about a patient's level of wellness, changes in life patterns, sociocultural role, and mental and emotional reactions to illness.

nursing home. See **extended care facility.**

nursing intervention, any act by a nurse that implements the nursing care plan or any specific objective of that plan, such as turning a comatose patient to avoid the development of decubitus ulcers or teaching insulin injection technique to a patient with diabetes before discharge from the hospital. The patient may require intervention in the form of support, limitation, medication, or treatment for the current condition or to prevent the development of further stress. As stress increases, the need to adapt and the need for nursing intervention increase. See also **adaptation, nursing process, stress.**

nursing intervention model, (in nursing research) a conceptual framework used to determine appropriate nursing interventions. The model is a holistic representation of the patient and the health care system. The patient's physiological, psychological, sociocultural, and developmental status; the patient's stressors and ability to react to them; and the levels and patterns of available health care are observed. The goal is to learn what nursing interventions would be most effective for the particular problem within the particular health care system.

Nursing Interventions Classification (NIC), a comprehensive, standardized system to classify treatments performed by nurses. It is a clinical tool developed by a research team at the University of Iowa that describes and defines the knowledge base for nursing curricula and practice. There are at present 542 nursing interventions that describe the treatments nurses perform. Each intervention has been labeled, defined, and given a list of appropriate activities. The full range of activities that nurses perform on behalf of patients are included, both independent and collaborative interventions and both direct and indirect care. A taxonomy is provided to help the nurse find what is most relevant to her or his practice area. NIC interventions have been linked to NANDA diagnoses. It is considered part of the clinical decision making of the nurse to decide and document the nursing diagnoses, desired outcomes, interventions used, and outcomes achieved. The NIC system provides a standardized language to document interventions.

nursing licensure compact, an agreement between two or more states or other jurisdictions that the licensing of a type of nursing or a nursing specialty in one place will be valid in the other.

nursing minimum data set (NMDS), a minimum set of items of information with uniform definitions and categories concerning the specific dimension of nursing, which meets the information needs of multiple data users in the health care system. It is the first attempt to standardize the collection of essential nursing data.

nursing objective, a specific aim planned by a nurse to decrease a person's stress, to improve the ability to adapt, or both. A nursing objective may be physical, emotional, social, or cultural and may involve the person's family, friends, and other patients. It is the purpose of any specific nursing order or nursing intervention. Some common nursing objectives are adequate understanding by the patient of certain details of the condition, adequate and comfortable daily elimination, a certain amount of rest, a balanced diet, and participation in specific items of self-care. Compare **nursing goal.**

nursing observation, an objective evaluation made by a nurse of the various aspects of a client's condition. It includes the person's general appearance, emotional affect, nutritional status, habits, and preferences, as well as body temperature, skin condition, and any abnormal processes, including those of which the client complains. The client's religious preference, ethnic background, and familial relationships are also noted. Compare **nursing assessment, nursing intervention.**

nursing orders, specific instructions for implementing the nursing care plan, including the patient's preferences, timing of activities, details of health education necessary for the particular patient, role of the family, and plans for care after discharge. Nursing orders must be signed by the professional nurse who writes them. They should not duplicate the orders of the medical staff or of other members of the health team.

Nursing Outcomes Classification (NOC), a comprehensive, standardized system to classify outcomes of nursing interventions. It is a clinical tool developed by a research team at the University of Iowa that describes and defines the knowledge base for nursing curricula and practice. NOC outcomes have been linked to NANDA diagnoses. At present, NOC includes 385 nursing outcomes for use for individual patients or individual family caregivers in the home. NOC outcomes have been linked to NANDA diagnoses. It is considered part of the clinical decision making of the nurse to decide and document the nursing diagnoses, desired outcomes, interventions used, and outcomes achieved.

nursing process, the process that serves as an organizational framework for the practice of nursing. It encompasses all of the steps taken by the nurse in caring for a patient: assessment, nursing diagnosis, planning, implementation, and evaluation. The rationale for each step is founded in nursing theory. The process requires a systematic approach to the person's situation, beginning with assessment and including an evaluation and reconciliation of the perceptions by the person, the person's family, and the nurse. A plan for the nursing actions to be taken may then be made, and, with the participation of the person and the person's family, the plan may be set. The plan developed with the person and the person's family is then implemented. The outcome is evaluated with the person and the person's family. The steps follow each other at the start of the process but may need to be taken concurrently in some situations. The process does not reach completion with evaluation. The steps are begun again, allowing recurrent evaluation of the assessment, plan, goals, and actions. See also **five-step nursing process, nursing.**

nursing process model, a conceptual framework in which the nurse-patient relationship is the basis of the nursing process. The nursing process is represented as dynamic and interpersonal, the nurse and the patient being affected by each other's behavior and by the environment around them. Each successful two-way communication is termed a "transaction" and can be analyzed to discover the factors that promote transactions. The constraints that the various systems in the environment (personal, interpersonal, and social) place on the development of the relationship are also examined. The nurse views the patient as a person with whom to have transactions that achieve defined adaptive objectives toward the goal of health.

nursing research, a detailed systematic study of a problem in the field of nursing. Nursing research is practice- or discipline-oriented and is essential for the continued development of the scientific base of professional nursing practice.

Nursing Research, a bimonthly refereed journal containing papers and other materials concerning nursing research. The goal of the journal is to stimulate research in nursing and disseminate research findings.

nursing rounds, chart rounds, walking rounds, teaching rounds, or grand rounds that are held specifically for nurses and that focus on nursing care. See also **rounds.**

nursing specialty, a nurse's selected professional field of practice, such as surgical, pediatric, obstetric, or psychiatric nursing. Compare **subspecialty.**

nursing supervisor. See **nursing director.**

nursing theorist, a person who develops integrated concepts or frameworks of nursing roles, functions, objectives, and activities and their relationships to clients and the roles of other health professionals.

nursing theory, an organized framework of concepts and purposes designed to guide the practice of nursing.

nursology /nursol′əjē/ [L, *nutrix,* nurse; Gk, *logos,* science], a conceptual framework for the study and practice of nursing. It requires the nurse to interact with the patient in an "authentic" way, without aloofness and the distance of professionalism; the nurse must take the risk of caring. As a method, nursology requires that the nurse cut through the defenses and fears that prevent self-knowledge. The nurse tries to know the patient on an intuitive, subjective level and then, using reflection, on an objective, scientific level. The nurse recognizes that each person has an "angular view" of the whole truth. Comparison of the views of others is necessary for a perspective that allows a synthesis, often paradoxic but closer to the truth than any one person's angular view. Nursology is intended to provide a model for nursing methods and research. The nurse and the patient have the opportunity to grow, and the science of nursing may emerge from the "angular" investigations and syntheses.

NursoyTM, a trademark for a hypoallergenic nutritional supplement for infants.

nurture /nur′chər/, to feed, rear, foster, or care for, such as in the nourishment, care, and training of growing children.

nutation /no͞otā′shən/ [L, *nutare,* to nod], the act of nodding, especially involuntary nodding as occurs in some neurological disorders.

nutcracker esophagus. See **symptomatic esophageal peristalsis.**

nutcracker phenomenon, compression of the left renal vein between the aorta and the superior mesenteric artery, causing hypertension in the kidney with flank pain and sometimes fever and gross hematuria. Also called *nutcracker syndrome*.

nutmeg poisoning, a toxic effect of ingesting the dried kernels of the seeds of nutmeg *(Myristica fragrans)* or its volatile oils. The oils contain terpenes and myristicin, which have stimulant and carminative effects. A dose of one to three kernels may produce convulsions for up to 60 hours.

nutraceuticals /noo′träsoo′tĭkalz/, **1.** functional foods. **2.** foods thought to have a beneficial effect on human health.

Nutramigen, a trademark for a milk-substitute formula that is prepared from a soy isolate base and is lactose free. It is prescribed for infants with galactosemia and as a protein supplement for people with lactose intolerance.

nutri-, prefix meaning "nourishment": *nutriceptor, nutrient, nutritorium*.

nutrient /no͞o′trē·ənt/ [L, *nutriens,* food that nourishes], a chemical substance that provides nourishment and affects the nutritive and metabolic processes of the body. Nutrients are essential for growth, reproduction, and maintenance of health.

Nutmeg

(Auerbach, 2012/Courtesy Dr. Daniel Brooks and Tammy Tyree, NP)

nutrient artery of the humerus, one of a pair of branches of the deep brachial arteries, arising near the middle of the arm and entering the nutrient canal of the humerus.

nutrient canal. See **interdental canal.**

nutrient density, the relative ratio obtained by dividing a food's contribution to the needs for a nutrient by its contribution to calorie needs.

nutrient enema [L, *nutriens* + Gk, *enienai,* injection], the introduction of saline or glucose into the body via the rectum. See also **enteral nutrition.**

nutrient supplements, vitamins and other nutrients that may not be necessary for healthy adults with an adequate intake of proper nutrients but that may be needed under certain circumstances for elderly adults or persons in a debilitated or undernourished state.

nutriment /no͞o′trimənt/ [L, *nutriens,* food that nourishes], any substance that nourishes and aids the growth and the development of the body. See also **food.**

nutrition /n(y)o͞otrish′ən/ [L, *nutriens*], **1.** nourishment. **2.** the sum of the processes involved in the taking in of nutrients and their assimilation and use for proper body functioning and maintenance of health. The successive stages include ingestion, digestion, absorption, assimilation, and excretion. **3.** the study of food and drink as related to the growth and maintenance of living organisms.

nutritional /n(y)o͞otrish′ənəl/ [L, *nutrire,* to nourish], pertaining to the quality of food or eating behavior that provides nourishment through assimilation of food to tissues.

nutritional-alcoholic cerebellar degeneration. See **alcoholic-nutritional cerebellar degeneration.**

nutritional anemia [L, *nutrire,* to nourish; Gk, *a* + *haima,* without blood], a disorder characterized by the inadequate production of hemoglobin or erythrocytes caused by a nutritional deficiency of iron, folic acid, or vitamin B_{12}. See also **iron deficiency anemia, megaloblastic anemia, pernicious anemia.**

nutritional care, the substances, procedures, and setting involved in ensuring the proper intake and assimilation of nutriments, especially for the hospitalized patient.

■ METHOD: Depending on the patient's condition, nutritional requirements may be provided by regular meals with menus selected from the ordered diet, by tube feeding, or by parenteral hyperalimentation. Meals are served on attractive trays in an environment conducive to eating. Distasteful procedures are avoided before and after mealtime. Patients who are unable to feed themselves are assisted, and abnormal intake of food is recorded and reported. Supplemental nourishment is supplied when indicated, and fluids are offered between meals. The nutritional assessment includes observations of the patient's appetite; food preferences; allergies; height; intake and output; weight; measurements of the head, arms, abdomen, and skinfold thickness; skin color and turgor; and condition of the mouth, eyes, nails, and hair. Any cutaneous lesions, thyroid enlargement, dental caries, loose teeth, ill-fitting dentures, gum problems, nausea, vomiting, dehydration, diarrhea, or constipation is noted.

■ INTERVENTIONS: The nurse sees that food is presented attractively, offers a washcloth and oral hygiene before and after meals, and, when necessary, feeds the patient to maintain an adequate intake. If indicated, such as in obese patients or those with disorders requiring a highly restricted diet, the nurse restricts food intake as ordered. Tube feedings are administered as ordered.

■ OUTCOME CRITERIA: Obvious good health, maintenance of a normal body mass index, and the absence of GI symptoms usually indicate that the individual's nutritional requirements are being fulfilled.

nutritional counseling, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of an interactive helping process focusing on the need for diet modification. See also **Nursing Interventions Classification.**

nutritional monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of patient data to prevent or minimize malnourishment. See also **Nursing Interventions Classification.**

nutritional science, a body of science that relates to the processes involved in nutrition.

nutritional status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which nutrients are available to meet metabolic needs. See also **Nursing Outcomes Classification.**

nutritional status: biochemical measures, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as body fluid components and chemical indices of nutritional status. See also **Nursing Outcomes Classification.**

nutritional status: energy, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which nutrients and oxygen provide cellular energy. See also **Nursing Outcomes Classification.**

nutritional status: food and fluid intake, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the amount of food and fluid taken into the body over a 24-hour period. See also **Nursing Outcomes Classification.**

nutritional status: nutrient intake, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as nutrient intake to meet metabolic needs. See also **Nursing Outcomes Classification.**

nutrition base, a person's normal nutritional requirements before modification to accommodate a specific condition.

nutritionist /n(y)o͞otrish′ənist/ [L, *nutrire,* to nourish], a professional who has completed academic degrees of BS, MS, EdD, or PhD in foods and nutrition.

nutrition management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting with or providing a balanced dietary intake of foods and fluids. See also **Nursing Interventions Classification.**

nutrition therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration of food and fluids to support metabolic processes of a patient who is malnourished or at high risk for becoming malnourished. See also **Nursing Interventions Classification.**

Nutting, Mary Adelaide, (1858–1947), a Canadian-born American nursing educator and reformer. As head of Johns Hopkins School of Nursing in Baltimore beginning in 1894, she improved course content and teaching facilities, instituted a 6-month preparatory course, reduced the 12-hour day to 8 hours, and abolished the monthly payment system to students. At Teachers College, Columbia University, she created and developed the Department of Nursing and Health and became the first professor of nursing in the world. With Lavinia Dock she wrote *History of Nursing* (published 1907–1912), a classic in nursing literature.

Nuvigil, a trademark for armodafinil.

nux vomica /nuks′ vom′ikə/ [L, *nux*, nut, *vomere*, to vomit], the dried ripe seeds of a small Asian tree, *Strychnos nux vomica*, a source of the alkaloids strychnine and brucine. The seeds are powdered, and the strychnine content is reduced to a little more than 1% by the addition of lactose for use as a bitter tonic and nerve stimulant. It is unsafe at this concentration. Homeopathic remedies of nux vomica are much more diluted and are considered safe.

nV, abbreviation for *nanovolt*.

nvm, abbreviation for *nonvolatile matter.*

NVMA, abbreviation for *National Veterinary Medical Association*.

nyctalopia /nik′təlō′pē·ə/ [Gk, *nyx*, night, *alaos*, obscure, *ops*, eye], poor vision at night or in dim light resulting from decreased synthesis of rhodopsin, vitamin A deficiency, retinal degeneration, or a congenital defect. Also called **day sight, night blindness. —nyctalopic,** *adj*.

nycto-, prefix meaning “night or darkness”: *nyctohemeral*, *nyctophilia*, *nyctophobia*.

nyctophobia /nik′tō-/ [Gk, *nyx* + *phobos*, fear], an anxiety reaction characterized by an obsessive, irrational fear of darkness.

nycturia. See **nocturia.**

nympho-, **1.** prefix meaning “the labia minora”: *nymphocaruncular, nymphohymeneal*. **2.** prefix indicating a relationship to the female gender: *nymphomaniac*.

nymphomania /nim′fəmā′nē·ə/ [Gk, *nymphe*, maiden, *mania*, madness], a psychosexual disorder of women characterized by an insatiable desire for sexual satisfaction, often resulting from an unconscious conflict concerning personal adequacy. Compare **satyriasis.** See also **sexual disorder.**

nymphomaniac /-mā′nē·ak/, **1.** *n*, a person with or displaying characteristics of possessing an insatiable desire for sexual satisfaction. **2.** *adj*, pertaining to or exhibiting nymphomania. **—nymphomaniacal** /nim′fəmənī′əkəl/, *adj*.

nystagmus /nīstag′məs/ [Gk, *nystagmos*, nodding], involuntary, rhythmic movements of the eyes. The oscillations may be horizontal, vertical, rotary, or mixed. Jerking nystagmus, characterized by faster movements in one direction than in the opposite direction, is more common than pendular nystagmus, in which the oscillations are approximately equal in rate in both directions. Jerking nystagmus occurs normally when an individual observes a moving object, but on other occasions it may be a sign of barbiturate intoxication or of labyrinthine vestibular, vascular, or neurological disease. Labyrinthine vestibular nystagmus, most frequently rotary, is usually accompanied by vertigo and nausea. Vertical nystagmus is considered pathognomonic of disease of the tegmentum of the brainstem; nystagmus occurring only in the abducting eye is said to be a sign of multiple sclerosis. Seesaw nystagmus, in which one eye moves up and the other down, may be observed in bilateral hemianopia. Pendular nystagmus occurs in albinism, in various diseases of the retina and refractive media, and in miners after many years of working in darkness. In miners the eye movements are very rapid, increase on upward gaze, and are often associated with vertigo, head tremor, and photophobia. **Electronystagmography,** used in testing for vestibular disease and evaluating patients with vertigo, hearing loss, or tinnitus, records changes in the electrical field around the eyes. Nystagmus is measured as the person gazes at various objects and is placed in various positions and when cold or warm water or air is introduced into the external auditory canal. This final test causes nystagmus of equal intensity in normal individuals. In patients with an inner ear or neural disorder, nystagmus may be more intense, diminished, or absent. Also called **nystaxis. —nystagmic,** *adj*.

nystatin /nis′tətin/, an antifungal antibiotic.

■ INDICATIONS: It is prescribed in oral, topical, and vaginal formulations for the treatment of fungal infections of the GI tract, skin, and vagina.

■ CONTRAINDICATION: Known hypersensitivity to this drug is the only contraindication.

■ ADVERSE EFFECTS: There are no known serious adverse effects. Mild GI distress and mild skin reactions may occur.

nystaxis. See **nystagmus.**

O

O, symbol for the element **oxygen.**

Ω, symbol for **ohm.**

O_2, symbol for *oxygen molecule*.

oario-. See **ovario-.**

OASDHI, abbreviation for **Old Age, Survivors, Disability and Health Insurance Program.**

oat cell carcinoma [AS, *ate,* oat; L, *cella,* storeroom; Gk, *karkinos,* crab, *oma,* tumor], a malignant, usually bronchogenic epithelial neoplasm consisting of small, tightly packed round, oval, or spindle-shaped epithelial cells that stain darkly and contain neurosecretory granules and little or no cytoplasm. Tumors produced by these cells do not form bulky masses but usually spread along submucosal lymphatics. Many malignant tumors of the lung are of this type. Usually surgical resection is not possible and chemotherapy and radiation therapy are not effective in treatment; thus the long-term prognosis is poor. Also called **small cell carcinoma.**

oatmeal bath, a colloid treatment for pruritus and other skin disorders. The procedure may consist of covering the patient with a layer of muslin containing oatmeal and pouring warm water over the fabric. The bath has a soothing effect. In a variation of the therapy, starch is substituted for oatmeal.

OAV syndrome. See **Goldenhar's syndrome.**

OAWO, abbreviation for **opening abductory wedge osteotomy.**

ob., abbreviation for the Latin word *obit,* "died."

ob-, prefix meaning "against, in the way, oppose": *obdormition, obduction, obtuse*.

OB, *informal*. **1.** abbreviation for **obstetrician. 2.** abbreviation for **obstetrics.**

obduction /əbduk′shən/ [L, *obductio,* a covering], a forensic medical autopsy.

Ober and Barr procedure, a surgical method for treating weak biceps muscles by transfer of the brachioradialis muscle.

Ober procedure, a surgical method for treating paralytic clubfoot by transfer of the posterior tibial tendon to the third cuneiform or metatarsal.

Obersteiner-Redlich zone /ō′bərshtī′nər rād′lish, ō′bərstē′nər red′lik/ [H. Obersteiner, Austrian neurologist, 1847–1942; Emil Redlich, Austrian neurologist, 1866–1930], a thin line of demarcation between fibers of the peripheral nervous system and the spinal cord or brainstem. It is produced by a basal lamina separating the Schwann cells and collagen of the peripheral nervous system from the neuroglia of the central nervous system.

Ober test [Frank R. Ober, American surgeon, 1861–1925], an examination for tightness in the tensor fasciae latae, a muscle that flexes and rotates the thigh. The patient lies on one side with the lower hip and knee flexed on the table and the upper hip extended while the knee is flexed. Inability to place the upper knee on the table indicates tightness in the muscle.

obese /ōbēs′/ [L, *obesus,* swollen], pertaining to a corpulent or excessively heavy individual. A body mass index of greater than or equal to 30.0 indicates obesity. Because the "average" human body is approximately 25% fat, the proportion may be doubled for a medically defined obese person. See also **body mass index.**

obesity /ōbē′sitē/ [L, *obesitas,* fatness], an abnormal increase in the proportion of fat cells, mainly in the viscera and subcutaneous tissues of the body. Obesity may be exogenous or endogenous. **Hyperplastic obesity** is caused by an increase in the number of fat cells in the increased adipose tissue mass. **Hypertrophic obesity** results from an increase in the size of the fat cells in the increased adipose tissue mass.

■ OBSERVATIONS: Obesity is manifested as excess body weight for height. Overweight is determined by a body mass index (BMI) of 25 to 29.9 kg/m^2, and obesity is a BMI = 30 kg/m^2. Body fat distribution can be assessed by waist-to-hip ratios, with a ratio of greater than 1.0 for men and greater than 0.8 for women signaling increased risk of obesity. Morbidity and mortality are increased in the obese. Complications include predisposition to diabetes mellitus, hypertension, hyperlipidemia, coronary artery disease, cerebrovascular disease, osteoarthritis, sleep apnea, and certain cancers.

■ INTERVENTIONS: Treatment is aimed at weight reduction and modification of risk factors such as diabetes, hypertension, and elevated lipid levels. There are three major components in weight loss therapy: diet therapy, physical activity, and life-style and behavioral modifications. Any number of approaches have been espoused that incorporate one or all of the three components. None has proved consistently successful for losing weight and maintaining weight loss. These include pharmacological drugs that suppress appetite or limit nutrient absorption; nutritional consult and diets that limit calories, fat, and carbohydrates; behavioral counseling and support networks; and surgery, such as gastroplasty, gastric partitioning, gastric bypass, and lipectomy. Blood pressure, glucose, and lipid levels are regularly monitored, and persistent elevations are treated pharmacologically.

■ NURSING CONSIDERATIONS: Nursing interventions are aimed at reinforcement of long-term life-style changes, including a balanced diet and regular exercise. Instruction is aimed at developing mutually agreed-on diet and exercise goals and successful management of blood pressure, lipid levels, and glucose levels.

obex /ō′beks/, a small triangular membrane formed at the caudal angle of the rhomboid fossa or fourth ventricle.

obfuscation /ob′fəskā′shən/ [L, *obfuscare,* to darken], the act of making something confused, clouded, or obscure.

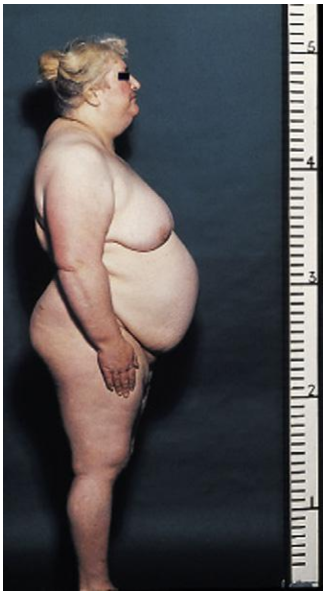
OBG, abbreviation for *obstetrics and gynecology*.

OB-Gyn, *(informal)* abbreviation for *obstetrics and gynecology*.

object /ob′jəkt/, (in psychology) something through which an instinct can achieve its goal; in psychoanalytic terms, a person other than self. See also **object relations.**

object blindness, an inability to recognize objects or analyze spatial relationships. The condition is associated with lesions of the right cerebral hemisphere in right-handed patients. Also called **visual agnosia.** See also **hysteric blindness, psychic blindness.**

object constancy, the ability to perceive an object as unchanging even under different conditions of observation. See also **object permanence.**



Obesity *(Forbes and Jackson, 2003)*

objective /əbjek′tiv/ [L, *objectare,* to set against], **1.** *n,* a goal. **2.** *adj,* pertaining to a phenomenon or clinical finding that is observed; not subjective. An objective finding is often described in health care as a sign that can be seen, heard, felt, or measured.

objective data collection, the process in which data relating to the client's problem are obtained through direct physical examination, including observation, palpation, percussion, and auscultation, and by laboratory analyses and radiological and other studies. Compare **subjective data collection.**

objective lens, a lens that accepts light from the output phosphor of a radiographic image-intensifier tube and converts the light into a parallel beam for recording an image on film.

objective sign [L, *objectum,* something cast before, *signum,* sign], a clinical observation that can be seen, heard, measured, or otherwise recorded by an examining physician, nurse, or other health care provider.

objective symptom [L, *objectum,* something cast before; Gk, *symptoma,* that which happens], a symptom accompanied by signs that tend to confirm the patient's physical complaint and enable the examining physician, nurse, or other health care provider to deduce the cause.

objective tinnitus, a noise produced in the ear that can be heard by another person, particularly someone using a stethoscope. See also **tinnitus.**

object permanence, a capacity to perceive that something exists even when it is not seen.

object relations, an emotional bond between one person and another, as contrasted with interest in and love for the self. It is usually described in terms of capacity for loving and reacting appropriately to others. An object relation is delayed or not achieved in borderline personality disorders.

obligate /ob′ligit, -gāt/ [L, *obligare,* to bind], characterized by the ability to survive only in a particular set of environmental conditions, such as an obligate parasite, which can survive only within the host organism. Compare **facultative.**

obligate aerobe, an organism that cannot grow in the absence of oxygen. Compare **facultative aerobe.** See also **aerobe.**

obligate anaerobe, an organism that cannot grow in the presence of oxygen, such as *Clostridium tetani, C. botulinum,* and *C. perfringens.* Compare **facultative anaerobe.** See also **anaerobe, anaerobic infection.**

obligate parasite. See **parasite.**

obligatory water loss /əblig′ətôr′ē/, the volume of water required for daily urinary excretion of metabolic waste products. This amount of water loss is necessary to maintain normal health. See also **optional water loss.**

oblique /əblēk′/ [L, *obliquus,* slanted], a slanting direction or any variation from the perpendicular or the horizontal.

oblique bandage, a circular bandage applied spirally in slanting turns, usually to a limb.

oblique fiber, any of the collagenous filaments that are bundled together, extending from the alveolus to the cementum of the tooth in an apical direction on lateral view. Oblique fibers constitute approximately two thirds of the periodontal fibers.

oblique fissure of the lung, **1.** the groove marking the division of the lower and the middle lobes in the right lung. **2.** the groove marking the division of the upper and the lower lobes in the left lung.

oblique fracture, a slanted fracture of the shaft along the bone's long axis.

oblique illumination. See **illumination.**

oblique popliteal ligament, an extension of the tendon of semimembranosus that reinforces the fibrous membrane of the knee joint posteromedially.

oblique presentation [L, *obliquus,* slanted, *praesentare,* to show], a presentation in which the long axis of the fetus is oblique to the long axis of the mother.

obliquity of pelvis /əblik′witē/ [L, *obliquus,* aslant], an abnormal tilt of the pelvis with respect to the spinal column.

obliquus externus abdominis. See **external abdominal oblique muscle.**

obliquus internus abdominis. See **internal abdominal oblique muscle.**

obliteration /əblit′ərā′shən/ [L, *obliterare,* to efface], the removal or loss of function of a body part by surgery, disease, or degeneration.

obliterative phlebitis /əblit′ərətiv′/ [L, *obliterare,* to efface; Gk, *phleps,* vein, *itis,* inflammation], a form of phlebitis in which the inflammation results in permanent closure of the vessel. Also called **adhesive phlebitis.**

OBS, abbreviation for **organic brain syndrome.** See **organic mental disorder.**

observation [L, *observare,* to watch], **1.** the act of watching carefully and attentively. **2.** a report of what is seen or noticed, such as a nursing observation.

observation hip, a condition in which a patient experiences a limp, pain in the hip, and limited hip motion. Causes include toxic synovitis, infection, and avascular necrosis.

obsession [L, *obsidere,* to haunt], a persistent and recurrent thought or idea with which the mind is continually and involuntarily preoccupied and that cannot be expunged by logic or reasoning.

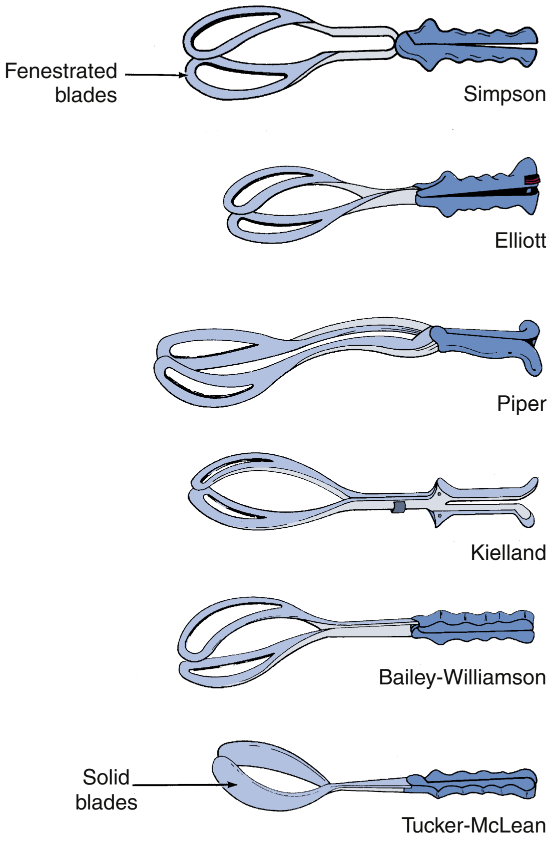
obsessive-compulsive /əbses′iv/ [L, *obsidere,* to haunt, *compellere,* to impel], **1.** characterized by or relating to the tendency to perform repetitive acts or rituals or think repetitive thoughts, usually as a means of releasing tension or relieving anxiety. **2.** describing a person who has an obsessive-compulsive disorder.

obsessive-compulsive disorder (OCD), an anxiety disorder characterized by recurrent and persistent thoughts, ideas, and feelings or repetitive acts sufficiently severe to cause marked distress, consume considerable time, or significantly interfere with the patient's occupational, social, or interpersonal functioning. See also **compulsive ritual.**

obsolescence /ob′səles′əns/ [L, *obsolescere,* to decay], **1.** a falling into disuse because of age or loss of function. **2.** a state of being useless.

obstetric anesthesia [L, *obstetrix,* midwife; Gk, *anaisthesia,* lack of feeling], any of various procedures used to provide anesthesia for childbirth, including local anesthesia for episiotomy or episiotomy repair; regional anesthesia for labor or delivery, such as by paracervical block or pudendal block; or, for a wider block, epidural, spinal, caudal, or saddle block. Anesthesia for cesarean section may be achieved with an epidural or spinal block or by general anesthesia.

obstetric forceps, forceps used to assist delivery of the fetal head. They vary in weight, length, shape, and mechanism of action, but all consist of a pair of instruments comprising a handle, a shank, and a blade. The blade is curved and sometimes has openings. The shank is long enough to allow the blade to reach the fetal head. The several styles of forceps are designed to assist in various clinical situations. The station of the fetus in the pelvis, the position of the head in relation to the pelvis, the size of the fetus, and the preference of the operator all affect the choice of forceps. Kinds of obstetric forceps include **Barton forceps, Elliot forceps, Kielland's forceps,** and **Simpson forceps.** See also **forceps delivery.**



Obstetric forceps *(Lowdermilk et al, 2012)*

obstetrician (OB) /ob′stətrish′ən/, a physician who specializes in the branch of medicine concerned with pregnancy and childbirth.

obstetric, obstetrical. See **obstetrics.**

obstetric position. See **lateral recumbent position.**

obstetrics (OB) /əbstet′riks/ [L, *obstetrix,* midwife], the branch of medicine concerned with pregnancy and childbirth, including the study of the physiological and pathological function of the female reproductive tract and the care of the mother and fetus throughout pregnancy, childbirth, and the immediate postpartum period. **—***obstetric, obstetrical, adj.*

obstetrix. See **midwife.**

obstipation /ob′stipā′shən/ [L, *obstipare,* to press], **1.** a condition of extreme and persistent constipation caused by obstruction in the intestinal system. See also **constipation.** **2.** a process of blocking. **—***obstipant, n., obstipate, v.*

obstruction /əbstruk′shən/ [L, *obstruere,* to build against], **1.** something that blocks or clogs. **2.** the act of blocking or preventing passage. **3.** the condition of being obstructed or clogged. **—***obstruct, v., obstructive, adj.*

obstruction series, a test, consisting of a series of x-ray films, performed on the abdomen of patients with suspected bowel obstruction, paralytic ileus, perforated viscus, abdominal abscess, kidney stones, appendicitis, or foreign body ingestion.

obstructive, the act of blocking or clogging. See **obstruction.**

obstructive airway disease /əbstruk′tiv/, any respiratory disease characterized by air trapping caused by either decreased airway diameter or increased airway secretions, or both. It includes chronic bronchitis and emphysema. See also **chronic obstructive pulmonary disease, cystic fibrosis.**

obstructive anuria [L, *obstruere,* to build against; Gk, *a* + *ouron,* without urine], an almost complete absence of urination caused by blockage of the urinary tract. See also **obstructive uropathy.**

obstructive biliary cirrhosis [L, *obstruere,* to build against, *bilis,* bile; Gk, *kirrhos,* yellow-orange, *osis,* condition], a form of secondary cirrhosis in which a stricture develops in the bile ducts. The condition may develop after cholecystectomy, gallstones, or a tumor.

obstructive constipation [L, *obstruere,* to build against, *constipare,* to crowd together], a condition in which feces are retained in the intestine because of a blockage in the lumen. Also called **alvine constipation.**

obstructive hydroureter, megaureter in the segment proximal to an obstruction, such as that caused by aperistalsis that interferes with passage of urine.

obstructive jaundice. See **cholestasis.**

obstructive nephropathy, nephropathy caused by obstruction of the urinary tract (usually the ureter), with hydronephrosis, slowing of the glomerular filtration rate, and tubular abnormalities.

obstructive sleep apnea, a form of sleep apnea involving a physical obstruction in the upper airways. The condition tends to affect mainly obese people, particularly those with secondary pulmonary insufficiency or a constitutional defect. A nonobese person with a congenital abnormality of the upper airways also may experience obstructive sleep apnea. The condition is usually marked by recurrent sleep interruptions, snoring, choking and gasping spells on awakening, and drowsiness caused by loss of normal sleep. Uncorrected, the disorder often leads to central sleep apnea, pulmonary failure, and cardiac abnormalities. See also **pickwickian syndrome.**

obstructive uropathy, any pathological condition that blocks the flow of urine. Causes of the condition include prostate enlargement, renal calculi, and congenital stenosis. The condition may lead to impairment of kidney function and an increased risk of urinary infection.

obtund /obtund′/ [L, *obtundere,* to blunt], **1.** to deaden pain. **2.** to render insensitive to unpleasant or painful stimuli by reducing the level of consciousness, such as by anesthesia or a strong opioid analgesic. **—obtundation, obtundity,** *n.*, **obtunded, obtundent,** *adj.*

obtundation /ob′tundā′shən/ [L, *obtundere,* to blunt, *atus,* process], a greatly reduced level of consciousness. The patient is not yet comatose but is close, arousing only with very strong stimulus.

obtunded, obtundent, obtundity. See **obtund.**

obturation /ob′t(y)ərā′ahən/ [L, *obturare,* to stop up], an obstruction of an opening, such as an intestinal blockage.

obturator /ob′tərā′tər, ob′tyərā′tər/ [L, *obturare,* to close], **1.** a device used to block a passage or a canal or to fill in a space, such as a prosthesis implanted to bridge the gap in the roof of the mouth in a cleft palate. **2.** *nontechnical.* an obturator muscle or membrane. **3.** a device that is placed into a large-bore cannula during insertion to prevent potential blockage by residual tissues.

obturator artery, an artery that supplies the adductor region of the thigh.

obturator canal, a passageway between the pelvic cavity and the adductor region of the thigh formed in the superior aspect of the obturator foramen between bone, a connective tissue membrane, and muscles that fill the foramen. The upper margin of the canal is marked by the obturator groove.

obturator dislocation. See **dislocation of the hip.**

obturator externus, the flat, triangular muscle covering the outer surface of the anterior wall of the pelvis. It arises in several pelvic structures, including the rami of the pubis and the ramus of each ischium, and inserts into the trochanteric fossa of the femur. It functions to rotate the thigh laterally. Compare **obturator internus.**

obturator foramen, a large opening on each side of the lower part of the hip bone, formed posteriorly by the ischium, superiorly by the ilium, and anteriorly by the pubis.

obturator internus, a muscle that covers a large area of the inferior aspect of the lesser pelvis, where it surrounds the obturator foramen. It functions to rotate the thigh laterally and to extend and abduct the thigh when it is flexed. Compare **obturator externus, piriformis.**

obturator membrane, a tough fibrous membrane that covers the obturator foramen of each side of the pelvis.

obturator muscles [L, *obturare,* to close, *musculus*], a pair of thigh muscles, the external and internal obturators. The external obturator flexes and rotates the thigh laterally, and the internal obturator abducts and rotates the thigh laterally.

obturator nerve, a branch of the lumbar plexus that supplies the adductor region of the thigh.

obturator sign [L, *obturare,* to close, *signus,* sign], a sign of appendicitis or other peritoneal inflammation. The internal rotation of the right leg with the leg flexed to 90 degrees at the hip and knee and a resultant tightening of the internal obturator muscle may cause abdominal discomfort indicative of, for example, appendicitis.

obv, abbreviation for *obverse.*

oc-. See **ob-.**

OC, abbreviation for **oral contraceptive.**

OCA, abbreviation for **oculocutaneous albinism.**

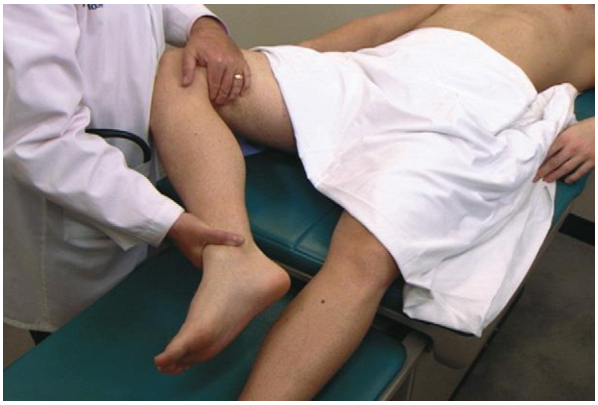
occ, abbreviation for **occipital.**

occipit-, occipito-, prefix meaning "back of the head": *occipital, occipitofrontal.*

occipita. See **occiput.**

occipital (occ) /oksip′itəl/, **1.** pertaining to the back of the head. **2.** situated near the occipital bone, such as the occipital lobe of the brain.

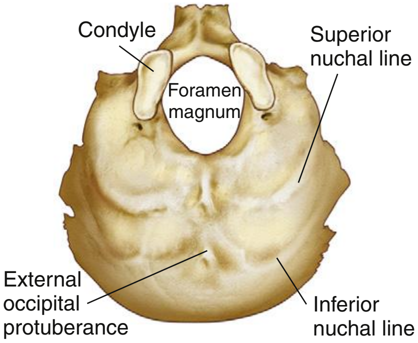
occipital anchorage, an orthodontic anchorage in which the resistance is borne by the top and back of the head and the force is transmitted to the teeth by means of the headgear and heavy elastics connected with attachment on the teeth.



Obturator sign *(Swartz, 2009)*

occipital artery, one of a pair of tortuous branches from the external carotid arteries that divides into six branches and supplies parts of the head and scalp. Each terminal part at the vertex of the skull is accompanied by the greater occipital nerve.

occipital bone, the cuplike bone at the back of the skull, marked by a large opening, the foramen magnum, that communicates with the vertebral canal. The occipital bone articulates with the two parietal bones, the two temporal bones, the sphenoid, and the atlas.



Occipital bone

occipital condyles, paired structures on each anterolateral border of the foramen magnum that articulate with the atlas.

occipital condyle syndrome, a condition characterized by a stiff neck and severe localized occipital pain that intensifies with neck flexion. It is associated with unilateral involvement of the twelfth nerve, dysarthria, and dysphagia.

occipitalization /oksip′ital′īzā′shən/, a process of bony ankylosis of the atlas with the occipital bone.

occipital lobe, one of the five lobes of each cerebral hemisphere, occupying a relatively small pyramidal part of the occipital pole. The occipital lobe lies beneath the occipital bone and presents medial, lateral, and inferior surfaces. Compare **central lobe, frontal lobe, parietal lobe, temporal lobe.**

occipital sinus, the smallest of the cranial sinuses and one of six posterior superior venous channels associated with the dura mater. Compare **inferior sagittal sinus, straight sinus, superior sagittal sinus.**

occipito-. See **occipit-.**

occipitoaxial ligament. See **membrana tectoria.**

occipitobregmatic /oksip′itōbregmat′ik/ [L, *occiput,* back of the head; Gk, *bregma,* front of the head], pertaining to the occiput and the bregma.

occipitofrontal /oksip′itōfrun′təl/ [L, *occiput* + *frons,* forehead], pertaining to the occiput and the frontal bone of the skull.

occipitofrontalis /oksip′itōfrəntal′is/, one of a pair of thin, broad muscles covering the top of the skull, consisting of an occipital belly and a frontal belly connected by an extensive aponeurosis. It is the muscle that draws the scalp and raises the eyebrows. Compare **temporoparietalis.**

occipitomastoid suture, the articulation across the lower part of the calvaria between the temporal bone and the occipital bone.

occipitoparietal fissure. See **parietooccipital sulcus.**

occiput /ok′sipət/, *pl.* **occipita** /oksip′itə′/, occiputs, the back part of the head.

occlude. See **occlusion.**

occluded /əklo͞o′did/ [L, *occludere,* to close up], closed, plugged, or obstructed.

occlusal /əklo͞o′səl/ [L, *occludere,* to close up], pertaining to a closure, such as the contact between the teeth of the upper and lower jaws.

occlusal adjustment, the intentional mechanical grinding of selected biting surfaces of teeth to improve the contact of or relationship between opposing tooth surfaces, their supporting structures, the muscles of mastication, and the temporomandibular joints. See also **bite.**

occlusal contouring, the modification by grinding of occlusal tooth irregularities, such as uneven marginal ridges and extruded or malpositioned teeth. See also **bite.**

occlusal form, the shape of the occluding surfaces of a tooth, a row of teeth, or any dentition.

occlusal harmony, a combination of healthy and nondisruptive occlusal relationships between the teeth and their supporting structures, the associated neuromuscular mechanisms, and the temporomandibular joints.

occlusal lug. See **occlusal rest.**

occlusal plane [L, *occludere,* to close up, *planum,* level ground], a plane passing through the occlusal or biting surfaces of the teeth. It represents the mean of the curvature of the occlusal surface. Also called **biteplane.** See also **curve of Spee.**

occlusal radiograph, an intraoral radiograph or dental image made with the film or image receptor placed on the occlusal surfaces of one of the arches. It shows the relationship of teeth to underlying structures in the alveolar process, such as cysts and abscesses.

occlusal recontouring, the reshaping of an occlusal surface of a natural or artificial tooth.

occlusal relationship, the relationship of the mandibular teeth to the maxillary teeth when they are in a defined contact position. See also **Angle's Classification of Malocclusion.**

occlusal rest, an indent created on the top surface of a posterior tooth to support a removable partial denture. Also called **occlusal lug.**

occlusal rest angle, the angle formed by an occlusal rest with its upright minor connector of a removable partial denture framework. Also called **rest angle.**

occlusal spillway, a natural groove that crosses a cusp ridge or a marginal ridge of a tooth.

occlusal surface [L, *occludere,* to close up, *superficies,* surface], the chewing surface of a primary or secondary posterior tooth in one arch that makes contact or near contact with the corresponding surface of a tooth in the opposite arch. Also called **masticatory surface.**

occlusal trauma, injury to a tooth and surrounding structures caused by malocclusive stresses, including trauma, temporomandibular joint dysfunction, and bruxism.

occlusion /əklo͞o′zhən/ [L, *occludere,* to close up], **1.** (in anatomy) a blockage in a canal, vessel, or passage of the body; the state of being closed. **2.** (in dentistry) any contact between the incising or masticating surfaces of the maxillary and mandibular teeth. **—occlude,** *v.,* **occlusive,** *adj.*

occlusion rim, an artificial dental structure with occluding surfaces attached to temporary or permanent denture bases, used for recording the relation of the maxilla to the mandible and for positioning the teeth. Also called **bite block.**

occlusive /əklo͞o′siv/, **1.** pertaining to something that effects an occlusion or closure, such as an occlusive dressing. **2.** See **occlusion.**

occlusive dressing, a dressing that prevents air from reaching a wound or lesion and that retains moisture, heat, body fluids, and medication. It may consist of a sheet of thin plastic affixed with transparent tape.

occlusive mesenteric infarction, mesenteric infarction caused by occlusion of one of the mesenteric arteries, such as by a thrombus or mechanical compression.

occlusive mesenteric ischemia, mesenteric ischemia caused by occlusion of one of the mesenteric arteries, such as by a thrombus or mechanical compression.

occlusometer. See **gnathodynamometer.**

occult /əkult′/ [L, *occultare,* to hide], hidden or difficult to observe directly, such as occult prolapse of the umbilical cord or occult blood.

occult blood, blood that is not obvious on examination and is from a nonspecific source, with obscure signs and symptoms. It may be detected by means of a chemical test or by microscopic or spectroscopic examination. Occult blood is often present in the stools of patients with GI lesions.

Occult blood test *(Perry, Potter, and Elkin, 2012)*

occult blood test [L, *occultare,* to hide; AS, *blod* + L, *testum,* crucible], a test for the presence of microscopic amounts of blood in the feces secondary to bleeding in the digestive tract. The minimal amounts of occult blood normally passed into the GI tract are not usually significant enough to cause a positive result for occult blood testing. Benign and malignant GI tumors, ulcers, inflammatory bowel disease, arteriovenous malformations, and diverticulosis can cause the appearance of occult blood in the stool, as can swallowed blood from oral or nasal pharyngeal bleeding.

occult carcinoma, a small carcinoma that does not cause overt symptoms. The carcinoma may remain localized, be discovered only incidentally at autopsy after death resulting from another cause, or metastasize and be discovered as a result of metastatic disease. Also called **latent carcinoma.**

occult ectopic ACTH syndrome, a medical condition that mimics the clinical and biochemical picture of Cushing's disease. The cause is usually a tumor that secretes adrenocorticotropic hormone in the lungs, thymus, pancreas, adrenal medulla, or thyroid gland.

occult fracture, a fracture that cannot be detected by radiographic standard examination until several weeks after injury. The break is most likely to occur in the ribs, tibia, metatarsals, hip, or navicular. It is accompanied by the usual signs of pain and trauma and may produce soft tissue edema. Magnetic resonance imaging or a bone scan may be used to confirm a suspected occult fracture.

occupancy /ok′yəpənsē′/ [L, *occupare,* to take possession of], the ratio of average daily hospital census to the total number of beds maintained during the reporting period.

occupancy factor (T), the level of human occupancy of an area adjacent to a source of radiation. It is used to determine the amount of shielding required in the walls. T is rated as full, for an office or laboratory next to an x-ray facility; partial, for corridors and restrooms; or occasional, for stairways, elevators, closets, and outside areas.

occupation, an activity that has unique meaning and purpose for a person.

occupational accident /ok′yəpā′shənəl/ [L, *occupare,* to take possession of, *accidere,* to happen], an injury to an employee that occurs in the workplace. Occupational accidents account for over 95% of occupational disabilities. In most cases the injured worker is eligible for compensation.

occupational asthma, an abnormal condition of the respiratory system resulting from exposure in the workplace to allergenic or other irritating substances. The condition is most common among people working with detergents, Western red cedar, cotton, flax, hemp, grain, flour, and stone. See also **asthma, byssinosis, occupational lung disease.**

occupational deafness, a loss of hearing resulting from noise levels in the workplace. See also **noise-induced hearing loss.**

occupational dermatoses, skin disorders associated with exposure to toxic chemicals or other agents in the workplace. An estimated 80% of cases of contact dermatitis are the result of exposure to chemical irritants. Common agents of contact dermatitis in the workplace are glass fibers, cutting fluids, chemical stains, and polyhalogenated aromatic compounds such as phenol, naphthalene, and aniline herbicide intermediates. Factors influencing development of dermatoses include skin thickness, skin permeability, anatomical site, concentration of chemical, surface area of exposure, and type of substance in which the toxic chemical is dissolved or mixed.

occupational disability, a condition in which a worker is unable to perform the functions required to complete a job satisfactorily because of an occupational disease or an occupational accident.

occupational disease, a disease that results from a particular type of employment, usually from the effects of long-term exposure to specific substances or continuous or repetitive physical acts.

occupational health, the ability of a worker to function at an optimum level of well-being at a worksite as reflected in terms of productivity, work attendance, disability compensation claims, and employment longevity.

occupational history, a part of the health history in which questions are asked about the person's occupation, source of income, effects of the work on the worker's health or the worker's health on the job, the duration of the job, and to what degree the occupation satisfies the person. Any adverse effects known to be associated with the work or the place of work are investigated by further questions by the interviewer; for example, a tennis player might be asked about musculoskeletal problems, or a taxi driver about function of the urinary tract.

occupational lung disease, any of a group of abnormal conditions of the lungs caused by the inhalation of dusts, fumes, gases, or vapors in an environment where a person works. See also **chronic obstructive pulmonary disease, metal fume fever, occupational asthma, silo filler's disease.**

occupational medicine, a field of preventive medicine concerned with the medical problems and practices relating to occupations and especially to the health of workers in various industries.

occupational neurosis. See **occupational stress.**

occupational performance tasks, activities that can be used to measure the potential ability or actual proficiency in the handling of certain objects and use of skills related to a given occupation.

occupational socialization, the adaptation of an individual to a given set of job-related behaviors, particularly the expected behavior that accompanies a specific job.

occupational stress, a disorder associated with a job or work. The anxiety may be expressed in the form of extreme tension and anxiety and the development of physical symptoms such as headache or cramps. Also called **occupational neurosis.** See also **burnout.**

occupational therapist (OT), an allied health professional who is nationally certified to practice occupational therapy. The OT uses purposeful activity and interventions to maximize the independence and health of any client who is limited by physical injury or illness, cognitive impairment, psychosocial dysfunction, mental illness, or a developmental or learning disability. Services include the assessment, treatment, and education of the client or family; interventions directed toward developing daily living skills, work readiness, or work performance; and facilitation of the development of sensory-motor, perceptual, or neuromuscular functioning or range of motion.

occupational therapy (OT), a health rehabilitation profession designed to help people of all ages with physical, developmental, social, or emotional deficits regain and build skills that are important for functional independence, health and well-being. See also **occupational therapist.**

occupational therapy aide, a person who, under the supervision of an occupational therapist (OT) or OT assistant, performs clerical and other treatment-related tasks necessary for the implementation of occupational therapy programs.

occupational therapy assistant. See **certified occupational therapy assistant.**

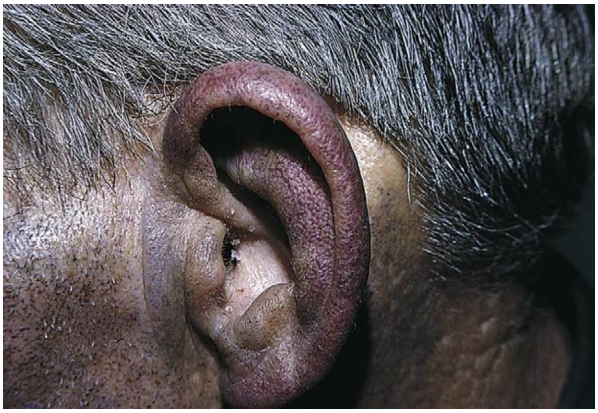
occupational therapy practice framework, document that describes the domain and process of occupational therapy.

occurrence policy /əkur′əns/ [L, *occurere,* to run, *politica,* pertaining to the state], a professional liability insurance policy that covers the holder during the period an alleged act of malpractice occurred. Occurrence policies are said to have a "long tail" because the statute of limitations on malpractice allegations is unlimited. Thus an individual could be sued years after an event took place. If the individual held an occurrence type of malpractice policy, there would be protection under that policy. Under a claims-made policy there would not be protection unless the policy was current.

OCD, abbreviation for **obsessive-compulsive disorder.**

ochre mutation, a genetic alteration that causes the synthesis of polypeptide chain to terminate prematurely because the triplet of nucleotides that normally codes for the next amino acid in the chain becomes uracil-adenine-guanine, the sequence that signals the end of the chain. It is one of three possible **nonsense mutations.** See also **amber mutation, opal mutation.**

ochronosis /ō′krənō′sis/ [Gk, *ochros,* yellow, *osis*], an inherited error of protein metabolism characterized by an accumulation of homogentisic acid, resulting in degenerative arthritis and brown-black pigment deposited in connective tissue and cartilage. It is often caused by alkaptonuria or poisoning with phenol. Bluish macules may be noted on the sclera, fingers, ears, nose, genitalia, buccal mucosa, and axillae. Urine color may be dark. See also **alkaptonuria.**



Ochronosis *(Callen et al, 2000)*

OCN, abbreviation for *Oncology Certified Nurse*.

oconitic pressure. See **colloid osmotic pressure.**

OCT, **1.** abbreviation for **oxytocin challenge test.** **2.** abbreviation for *ornithine carbamoyltransferase*. See **ornithine carbamoyltransferase deficiency.**

octacosanol, a dietary supplement. Also called *1-octacosanol*.

■ USES: It is used for herpes, inflammation of the skin, amyotrophic lateral sclerosis (ALS), and physical endurance. It is probably not effective for ALS, and there are insufficient reliable data for other indications.

■ CONTRAINDICATIONS: Octacosanol should not be used during pregnancy and lactation or in children.

octan /okʹtan/, occurring at 7-day intervals, or every 8th day.

octanoic acid breath test, a breath test for gastric emptying. The patient is administered a test meal containing octanoic acid labeled with carbon 13, and the breath is assessed at intervals for levels of labeled carbon dioxide; excessive carbon dioxide is seen when gastric emptying is inadequate.

octa-, octi-, octo-, prefix meaning ‘the number eight or series of eight’: *octigravida, octapeptide, octagenarian*.

octaploid, octaploidic. See **polyploid.**

octi-. See **octa-.**

octigravida /ok′tigravʹədə/ [L, *octo*, eight, *gravidus*, pregnancy], a woman who is pregnant for the eighth time.

octinoxate /oktin′ok-sāt/, an absorber of ultraviolet B radiation, used topically as a sunscreen. Also called **octyl methoxycinnamate.**

octisalate /okʹtĭsal′āt/, a substituted salicylate that absorbs ultraviolet light in the UVB range, used as a sunscreen.

octo-. See **octa-.**

octocrylene /ok′to-krilʹēn/, a sunscreen that absorbs ultraviolet rays in the UVB range.

octopus /ok′təpəs/, any of numerous carnivorous marine mollusks having eight tentacles.

octreotide, an antidiarrheal and hormone.

■ INDICATIONS: The two brand names of this drug are used for different purposes. Sandostatin is used to treat acromegaly, carcinoid tumors, and vasoactive intestinal peptide tumors (VIPomas). Sandostatin LAR Depot is used for long-term maintenance of acromegaly, carcinoid tumors, and VIPomas.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include seizure, arrhythmias, congestive heart failure, hepatitis, GI bleeding, and pancreatitis. Other adverse effects are depression, anxiety, tremors, paranoia, chest pain, shortness of breath, thrombophlebitis, ischemia, hypertension, palpitations, galactorrhea, diabetes insipidus, increased liver function tests, urinary tract infection, pollakiuria, hematoma and inflammation of the injection site, bruising, rash, urticaria, and pain. Common side effects include headache, dizziness, fatigue, weakness, sinus bradycardia, conduction abnormalities, hyperglycemia, ketosis, hypothyroidism, hypoglycemia, diarrhea, nausea, abdominal pain, vomiting, flatulence, distension, constipation, and joint and muscle pain.

octreotide scan, a nuclear scan performed to detect neuroendocrine tumors, both primary and metastatic.

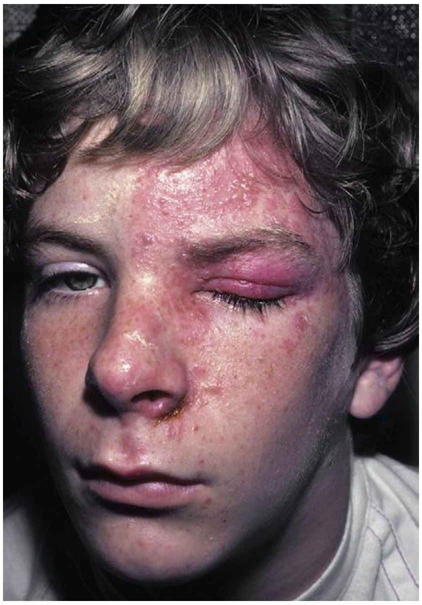
octyl methoxycinnamate /ok′til mĕthokʹsesin′ämāt/. See **octinoxate.**

ocul., abbreviation for the Latin word *oculis*, “pertaining to the eyes.”

ocular /okʹyələr/ [L, *oculus*, eye], **1.** *adj*, pertaining to the eye. **2.** *n*, an eyepiece of an optic instrument.

ocular dysmetria, a visual disorder in which the eyes are unable to fix the gaze on an object or follow a moving object with accuracy. It is often characterized by overshooting, in which the eyes move further than the intended object of fixation. It is a sign of cerebellar disease.

ocular herpes [L, *oculus*, eye; Gk, *herpein*, to creep], a herpesvirus infection of the eye. See also **herpes simplex keratitis, herpes zoster ophthalmicus.**



Ocular herpes *(Habif, 2010)*

ocular hypertelorism, a developmental defect involving the frontal region of the cranium, characterized by an abnormally widened bridge of the nose and increased distance between the eyes. The condition is often associated with other cranial and facial deformities and some degree of mental retardation. Also called **orbital hypertelorism.**

ocular hypertension, a condition of intraocular pressure that is higher than normal but that has not resulted in a constricted visual field or increased cupping of the optic nerve head. See also **glaucoma.**

ocular hypotelorism, a developmental defect involving the frontal region of the cranium, characterized by an abnormal narrowing of the bridge of the nose and decreased distance between the eyes with resulting convergent strabismus. The condition is often associated with other cranial and facial deformities, primarily microcephaly, trigonocephaly, and some degree of mental retardation. Also called **orbital hypotelorism.**

ocular melanoma, malignant melanoma arising from the structures of the eye, usually the choroid, ciliary body, or iris, and occurring most often in the fourth and fifth decades of life; the most common site of metastasis is the liver, and such metastasis is often fatal.

ocular myopathy, slowly progressive weakness of ocular muscles, characterized by decreased mobility of the eye and drooping of the upper lid. The disorder may be unilateral or bilateral and may be caused by damage to the oculomotor nerve, an intracranial tumor, or a neuromuscular disease.

ocular refraction [L, *oculus,* eye, *refringere,* to break apart], an examination of vision to determine the need for corrective lenses.

oculo-, prefix meaning "eye": *oculofacial, oculomycosis, oculopathy.*

oculoauriculovertebral dysplasia. See **Goldenhar's syndrome.**

oculocephalic reflex /ok′yəlō′səfal′ik/ [L, *oculus* + Gk, *kephale,* head; L, *reflectere,* to bend backward], a test of the integrity of brainstem function. When the patient's head is quickly moved to one side and then to the other, the eyes will normally lag behind the head movement and then slowly assume the midline position. Failure of the eyes to either lag properly or revert back to the midline indicates a lesion on the ipsilateral side at the brainstem level. Also called **doll's head maneuver.**

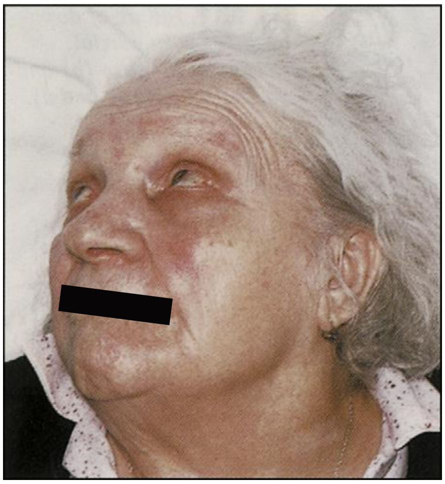
oculocerebral-hypopigmentation syndrome /ok′yəlō′sərē′brəl/ [L, *oculus,* eye + *cerebrum,* brain], an autosomal-recessive syndrome marked by cutaneous hypopigmentation, microphthalmos, small opaque corneas, gingival hypertrophy, and cerebral defect manifested by spasticity, mental and physical retardation, and athetoid movements. Also called **Cross syndrome.**

oculocerebrorenal syndrome. See **Lowe's syndrome.**

oculocutaneous albinism (OCA) /ok′yo͞olōkyo͞otā′nē·əs/, a human albinism occurring in 10 types, all distinguished in their incidence and genetic, biochemical, and clinical characteristics but having in common varying degrees of decreased melanotic pigment of the skin, hair, and eyes; hypoplastic foveas; photophobia; nystagmus; and decreased visual acuity.

oculoglandular syndrome /ok′yəlōglan′dyələr/, a granulomatous form of conjunctivitis affecting one eye, associated with a visibly enlarged and tender lymph node on the same side. The most common causes are cat-scratch disease and tularemia.

oculogyric crisis /ok′yəlōjī′rik/ [L, *oculus* + *gyrare,* to turn around], a paroxysm in which the eyes are held in a fixed position, usually up and sideways, for minutes or several hours, often occurring in postencephalitic patients with signs of parkinsonism. In some cases the eyes are held down or sideways, and there may be spasm or closing of the lids. Oculogyric crises may be precipitated by emotional stress and neuroleptic overdose, and patients with the disorder frequently show psychiatric symptoms.

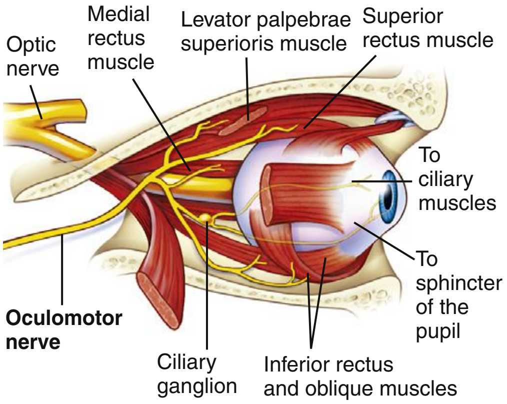


[redacted]

Oculogyric crisis *(Perkin et al, 2011/Dr. P. Piccini, Senior Lecturer in Neurology, The Hammersmith Hospital, London, UK)*

oculomotor /-mō′tər/ [L, *oculus,* eye, *motor,* mover], pertaining to movements of the eyeballs.

oculomotor nerve [L, *oculus* + *motor,* mover], one of a pair of cranial nerves essential for eye movements, supplying certain extrinsic and intrinsic eye muscles. They pass through the superior orbital fissure, connecting to the brain in nucleus III. Also called **nervus oculomotorius, third cranial nerve.**



Oculomotor nerve

oculomotor nucleus [L, *oculus,* eye, *motor,* mover, *nucleus,* nut kernel], a nucleus of a third cranial nerve arising in the midbrain.

oculus. See **eye.**

Ocusert Pilo, a trademark for an acetylcholinesterase inhibitor used to treat glaucoma (pilocarpine).

OD, **1.** abbreviation for *oculus dexter,* a Latin phrase meaning "right eye." **2.** abbreviation for *Doctor of Optometry.* **3.** abbreviation for **overdose.**

OD, *(informal)* abbreviation for **overdose.**

odaxetic /ō′dakset′ik/ [Gk, *odaxein,* a biting pain], causing a tactile sensation of itching or biting.

OD'd /ōdēd′/, *slang.* overdosed, usually referring to a person who has suffered adverse effects from an excessively large dose of a drug of abuse.

Oddi's sphincter [Ruggero Oddi, Italian surgeon, 1864–1913; Gk, *sphigein,* to bind], a band of circular muscle fibers around the lower part of the common bile duct and pancreatic duct, near the common duct junction with the duodenum.

-ode, suffix meaning a “type of pathway”: *anode, cathode, electrode*.

odont-. See **odonto-.**

odontalgia. See **toothache.**

odontectomy /ōdontek′təmē/ [Gk, *odous,* tooth, *ektomē,* cut out], the extraction of a tooth by removal of the bone from around the roots before force is applied.

-odontia, -odontic, suffix meaning “teeth”: *periodontia, mesodontic*.

odontiasis /ō′dontī′əsis/, the process of teething.

-odontie. See **-odontia.**

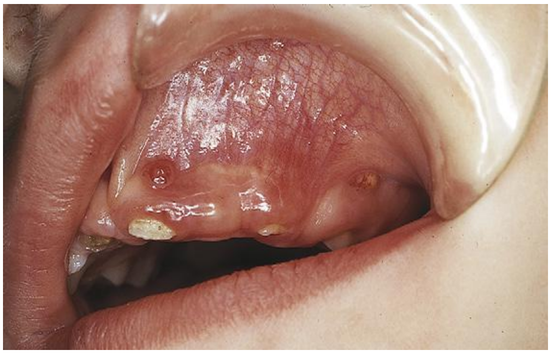
odontitis /ō′dontī′tis/ [Gk, *odous* + *itis,* inflammation], abnormal enlargement of a tooth pulp, usually resulting from inflammation of the odontoblasts (cells responsible for dentin formation) rather than of the mature, or erupted, tooth. It may be caused by infection, tumor, or trauma.

odonto-, odont-, prefix meaning “teeth”: *odontoblast, odontopathy*.

odontoblast /ōdon′təblast′/ [Gk, *odous,* tooth, *blastos,* germ], one of the connective tissue cells in the periphery of the dental pulp that develops into the primary and secondary dentin of a tooth. Also called *dentinoblast*.

odontodynia. See **toothache.**

odontodysplasia /-displā′zhə/ [Gk, *odous* + *dys,* bad, *plasis,* forming], an abnormality in the development of the teeth, characterized by deficient formation of enamel and dentin. The teeth have a ghostlike appearance in radiographs or dental images. It most often affects the maxillary central and lateral incisors, usually on one side of the midline. Also called **ghost teeth.** See also **shell teeth.**



Odontodysplasia *(Regezi, Sciubba, and Pogrel, 2000)*

odontogenesis /-jen′əsis/ [Gk, *odous,* tooth, *genein,* to produce], the origin and formation of developing teeth. Also called **odontogeny.**

odontogenesis imperfecta. See **dentinogenesis imperfecta.**

odontogenic /ōdon′tōjen′ik/ [Gk, *odous* + *genein,* to produce], **1.** pertaining to the generation of teeth. **2.** developing in tissues that produce teeth.

odontogenic cyst, **1.** a cyst derived from epithelium, usually containing fluid or semisolid material, that develops along lines of embryonic fusion or during various stages of tooth formation and development and is nearly always enclosed within bone. Odontogenic cysts are subclassified as developmental or inflammatory in origin. Examples are dentigerous cyst, eruption cyst, primordial cyst, odontogenic keratocyst, and gingival cyst of the newborn. **2.** any of a variety of lesions of mouth tissues, including the relatively common dentigerous cyst, which is associated with the crown of an unerupted third molar or maxillary cuspid.

odontogenic fibroma, a benign neoplasm of the jaw derived from the embryonic part of the tooth germ, dental follicle, or dental papilla or from the periodontal membrane.

odontogenic fibrosarcoma, a malignant neoplasm of the jaw that develops in a mesenchymal component of a tooth or tooth germ.

odontogenic keratocyst, a distinctive developmental odontogenic cyst which arises from the dental lamina, containing clear fluid and a cheesy material resembling keratin debris. This usually asymptomatic lesion can occur at any age and is found upon radiographic or dental imaging. Large lesions may present with pain, swelling, or drainage.

odontogenic myxoma, a rare tumor of the jaw that may develop from the mesenchyme of the tooth germ.

odontogeny. See **odontogenesis.**

odontoid ligament. See **alar ligament.**

odontoid process [Gk, *odous* + *eidos,* form; L, *processus*], the toothlike projection that rises perpendicularly from the upper surface of the body of the second cervical vertebra (axis) and that serves as a pivot point for the rotation of the atlas (first cervical vertebra), enabling the head to turn. Also called the **dens.**

odontoid vertebra. See **axis.**

odontology /ō′dontol′əjē/ [Gk, *odous* + *logos,* science], the scientific study of the anatomy and physiology of the teeth and of the surrounding structures of the oral cavity.

odontoma /ō′dontō′mə/ [Gk, *odous* + *oma,* tumor], the most common of odontogenic tumors, a benign tumor consisting of cementum, dentin, enamel, and pulp tissue that may be arranged in the form of teeth (compound odontoma) or as an unrecognizable mass of enamel and dentin (complex odontoma). Also called **gestant anomaly.**

odontoperiosteum. See **periodontium** (def. 1).

odor /ō′dər/ [L, a smell], a scent or smell. The sense of smell is activated when airborne molecules stimulate receptors of the first cranial nerve.

odoriferous /ō′dərif′ərəs/ [L, *odor,* smell, *ferre,* to bear], pertaining to something that produces a smell, particularly one that is strong or offensive.

odorous /ō′dərəs/ [L, *odor,* smell], pertaining to something that has an odor, smell, or fragrance.

ODTS, abbreviation for **organic dust toxic syndrome.**

odynacusis [Gk, *odyne,* pain, *akouein,* to hear], a painful sensitivity to noise.

-odyne, -odynia, odyno-, combining form meaning “pain”: *anodyne, coccyodynia, odynolysis*.

odynophagia /od′inōfā′jə/ [Gk, *odyne,* pain, *phagein,* to swallow], a severe sensation of burning, squeezing pain while swallowing caused by irritation of the mucosa or a muscular disorder of the esophagus, such as gastroesophageal reflux; bacterial or fungal infection; tumor; achalasia; or chemical irritation.

oedema. See **edema.**

Oedipus complex /ed′ipəs, ē′dəpəs/ [Gk, *Oedipus,* mythic king who slew his father and married his mother], **1.** (in psychoanalysis) a child’s desire for a sexual relationship with the parent of the opposite sex, usually with strong negative feelings for the parent of the same sex. **2.** a son’s desire for a sexual relationship with his mother. Compare **Electra complex.** See also **phallic stage.**

OEM, abbreviation for *optical electron microscope*.

OER, abbreviation for **oxygen enhancement ratio.**

oesophagectomy. See **esophagectomy.**

oesophagitis. See **esophagitis.**

oesophagoscopy. See **esophagoscopy.**

oesophagus. See **esophagus.**

oestriol. See **estriol.**

oestrogen. See **estrogen.**

oestrone. See **estrone.**

o/f, abbreviation for *oxidation/fermentation*.

OFD, abbreviation for *oral-facial-digital*.

off-center grid, in radiology, a focused grid that is perpendicular to the central-axis x-ray beam but is shifted laterally, resulting in a cutoff across the entire grid.

off-cycle time, (in managed care) a time during which open enrollment in a health plan is usually not permitted.

off-focus radiation, (in radiology) x-rays produced by stray electrons that interact at positions on the anode at points other than the focal spot.

Office of the Inspector General (OIG) of the United States, an agency within the U.S. Department of Health and Human Services that enforces Medicare regulations and investigates and prosecutes charges of Medicare fraud and abuse.

off-level grid, (in radiology) a grid that is not perpendicular to the central-axis x-ray beam. The cause is often a malpositioned x-ray tube rather than an improperly positioned grid.

off-line, pertaining to access to computer information not directly connected to a computer. Compare **online.**

ofloxacin /oflak′səsin/, a fluoroquinolone antibiotic.

■ INDICATIONS: It is used to treat lower respiratory tract infections, genitourinary infections, skin and skin structure infections, and conjunctivitis.

■ CONTRAINDICATION: A known hypersensitivity to quinolones prohibits its use.

■ ADVERSE EFFECTS: Among the most common adverse effects are dizziness, headache, fatigue, somnolence, diarrhea, nausea, and vomiting.

Ogden classification system, a system for categorizing 17 different kinds of epiphyseal fractures.

Ogden plate, a long metal plate used for fixing long bone fractures. It is designed to accommodate preexisting intramedullary devices, such as rods or the stem of a prosthesis, and has slots that can accept encircling bands.

Ogen, a trademark for an estrogen **(estropipate).**

Ogsten line, a line drawn through the knee from the adduction tubercle to the intercondylar notch, used as a guide for transection of the condyle in the surgical repair of knock-knee.

OH, symbol for **hydroxyl.**

o.h., abbreviation for the Latin term *omni hora*, "hourly."

OHD, abbreviation for *organic heart disease*.

OHF, abbreviation for **Omsk hemorrhagic fever.**

ohm (Ω) [Georg S. Ohm, German physicist, 1787–1854], a unit of measurement of electric resistance. One ohm is the resistance of a conductor in which an electrical potential of 1 volt produces a current of 1 ampere. See also **ampere, Ohm's law, volt, watt.**

Ohm's law [Georg S. Ohm], the principle that the strength or intensity of an unvarying electric current is directly proportional to the electromotive force and inversely proportional to the resistance of the circuit.

-oi, a plural-forming suffix in borrowings from Greek: *auloi, catanephroi, mesonephroi*.

-oid, suffix meaning "resembling or having the appearance of" something specified: *alkaloid, spheroid, trochoid*.

OIG, abbreviation for Office of the Inspector General. See **Office of the Inspector General of the United States.**

oiko-, eco-, prefix meaning "house": *oikofugic, oikology, oikophobia*.

oil [L, *oleum*], any of a large number of greasy liquid substances not miscible in water. Oil may be fixed or volatile and is derived from animal, vegetable, or mineral matter.

oil-in-water emulsion, an emulsion in which oil is the dispersed liquid and an aqueous solution is the continuous phase. Water can be used to dilute such an emulsion or to remove it, as from skin or clothing.

oil retention enema, an enema containing about 200 to 250 mL of an oil-based solution given to soften a fecal mass. The patient is asked to retain the solution for 30 minutes to several hours. See also **lubricating enema.**

ointment [L, *unguentum,* a salve], a semisolid, externally applied preparation, usually containing a drug. Various ointments are used as local analgesic, anesthetic, antibiotic, astringent, depigmenting, irritant, and keratolytic agents. Also called **salve, unction, unguent.**

ointment base, a vehicle for the medicinal substances carried in an ointment.

-ol, suffix designating a member of the alcohol group: *ethanol, methanol, naphthol*.

-ol, -ole, suffix meaning an "oil": *benzol, furol, petrol, cholesterol*.

olanzapine, an antipsychotic and neuroleptic.

■ INDICATIONS: It is used to treat psychotic disorders.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Neuroleptic malignant syndrome is a rare but life-threatening effect. Other adverse effects are orthostatic hypotension, tachycardia, chest pain, blurred vision, dry mouth, nausea, vomiting, anorexia, constipation, abdominal pain, weight gain, urinary retention, urinary frequency, enuresis, impotence, amenorrhea, gynecomastia, breast engorgement, premenstrual syndrome, rash, dyspnea, rhinitis, cough, pharyngitis, extrapyramidal symptoms, seizures, headache, fever, insomnia, somnolence, agitation, nervousness, hostility, dizziness, hypertonia, tremor, euphoria, joint pain, and twitching.

Old Age, Survivors, Disability and Health Insurance Program (OASDHI), a benefit program, administered by the U.S. Social Security Administration, that provides cash benefits to workers who are retired or disabled, their dependents, and survivors, commonly referred to as Social Security. The program also provides health insurance benefits for people over 65 and disabled people under 65. It is commonly referred to as **Medicare.**

old dislocation, a dislocation in which inflammatory changes have occurred.

Older Americans Act Amendment of 1987, U.S. federal legislation authorizing support of Title III nutrition services for state and county programs on aging. The services include both congregate and home-delivered meals, with related nutrition education.

Older Americans Resources and Services Scale, a scale of instrumental activities of daily living, consisting of eight questions designed to assess the person's degree of involvement with family and society.

old-old, persons 85 years of age and older.

old tuberculin [ME, *ald* + L, *tubercle*], the original formula for an extract of the tubercle bacillus used in the treatment of tuberculosis by Koch, using a glycerin-broth culture of *Mycobacterium tuberculosis* after filtration and concentration of the liquid.

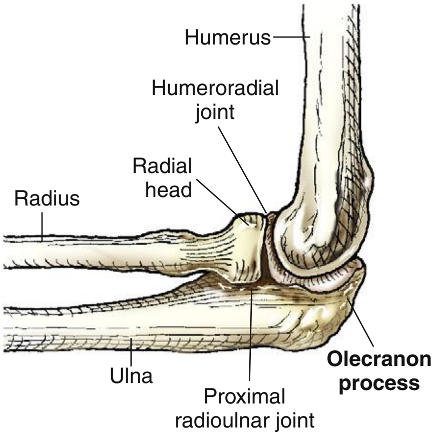
Old World leishmaniasis. See **cutaneous leishmaniasis.**

-ole, **1.** suffix meaning a "small or little example of the noun named": *arteriole*. **2.** See **-ol.**

oleandomycin. See **troleandomycin.**

oleandrism /ō′lē·an′drizəm/, a toxic effect of ingesting or inhaling the cardiac glycoside contained in the roots, bark, flowers, and seeds of oleander *(Nerium oleander)*, an evergreen ornamental shrub. Symptoms range from nausea and vomiting to bradycardia and cardiac arrest.

olecranon /ōlek′rənon/ [Gk, *olekranon,* tip of the elbow], a proximal projection of the ulna that forms the tip of the elbow and fits into the olecranon fossa of the humerus when the forearm is extended at the proximal extremity of the ulna. The anterior surface of the olecranon forms part of the trochlear notch that articulates with the humerus. Also called **olecranon process.**



Olecranon process *(Frank, Long, and Smith, 2012)*

olecranon bursa, the bursa of the elbow.

olecranon fossa, the depression in the posterior surface of the humerus that receives the olecranon of the ulna when the forearm is extended. Compare **coronoid fossa.**

olecranon process. See **olecranon.**

olefiant gas. See **ethylene.**

olefin /ō′ləfin/ [L, *oleum,* oil, *facere,* to make], any of a group of unsaturated aliphatic hydrocarbons containing one or more double bonds in the carbon chain. Also called **alkene.**

oleic acid /ōlē′ik/ [L, *oleum,* oil, *acidus,* sour], a colorless, monounsaturated omega-9 fatty acid occurring in almost all natural fats. It is a liquid at room temperature. Commercial oleic acid is used in soaps, cosmetics, ointments, lubricants, and food additives.

oleo-, eleo-, prefix meaning "oil": *oleocreosote, oleodistearin, oleoresin.*

oleoresin /ō′lē·ōrez′in/ [L, *oleum,* oil + *resin*], **1.** any natural combination of a resin and a volatile oil, such as exudes from pines and other plants. **2.** a compound prepared by exhausting a drug by percolation with a volatile solvent, such as acetone, alcohol, or ether, and evaporating the solvent.

oleovitamin /ō′lē·ōvī′təmin/, a preparation of fish-liver oil or edible vegetable oil that contains one or more of the fat-soluble vitamins or their derivatives.

oleovitamin A, an oily preparation, usually fish-liver oil or fish-liver oil diluted with an edible vegetable oil, containing the natural or synthetic form of **vitamin A.**

oleovitamin D_2. See **calciferol.**

Olestra, a trade name for a synthetic fat substitute derived from sucrose and eight acids of vegetable oils. Olestra adds no calories or fats to the food into which it is incorporated. Because the molecules of Olestra are larger and more tightly packed than those of ordinary fats, they cannot be broken down by digestive enzymes and cannot enter the bloodstream. Adverse effects reported include cramping and loose stools in some people and inhibition of absorption of some vitamins. A newer formulation is fortified with certain fat-soluble vitamins.

olfaction /olfak′shən/ [L, *olfacere,* to smell], **1.** the act of smelling. **2.** the sense of smell. **—olfactory,** *adj.*

olfactory anesthesia. See **anosmia.**

olfactory bulb [L, *olfactus,* sense of smell, *bulbus,* swollen root], the area of the forebrain where the olfactory nerves terminate and the olfactory tracts arise.

olfactory center [L, *olfactus,* sense of smell; Gk, *kentron*], the part of the brain responsible for the subjective appreciation of odors, a complex group of neurons located near the junction of the temporal and parietal lobes.

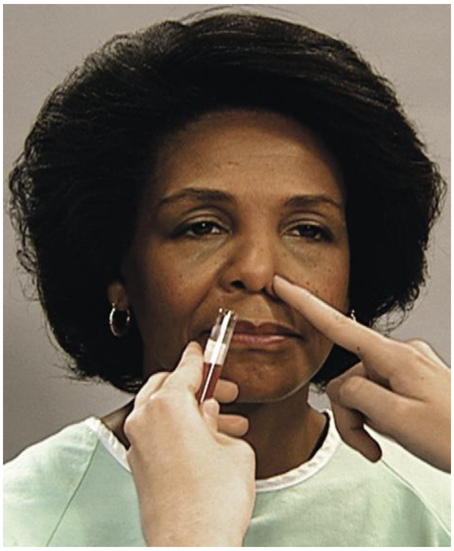
olfactory cortex [L, *olfactus,* sense of smell, *cortex,* bark], the part of the cerebral cortex, including the piriform lobe and the hippocampus formation, that is concerned with the sense of smell. Also called **archeocortex.**

olfactory foramen, one of several openings in the cribriform plate of the ethmoid bone.

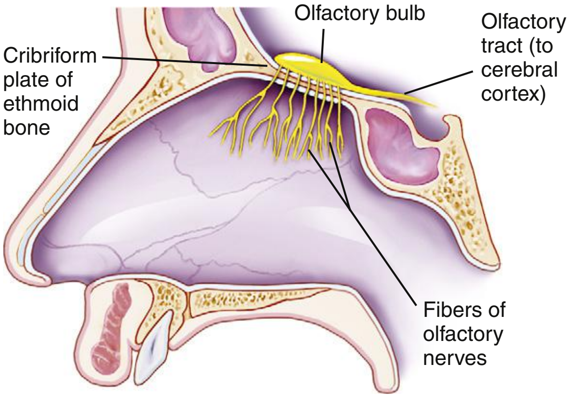
olfactory hallucination [L, *olfactus,* sense of smell, *alucinari,* to wander mentally], a condition in which an individual has false perceptions of odors, which are usually repugnant or offensive. The hallucinations are sometimes associated with guilt feelings.

olfactory lobe [L, *olfactus,* sense of smell; Gk, *lobos,* lobe], a structure involved in the sense of smell in lower animals. Vestiges of the tissue are found in the cerebral hemispheres of humans.

olfactory nerve, one of a pair of nerves associated with the sense of smell. They are composed of numerous fine filaments that ramify in the mucous membrane of the olfactory area. The fibers of the olfactory nerve are nonmedullated and unite into fasciculi that form a plexus under the mucous membrane and rise in grooves or canals in the ethmoid bone. The fibers pass into the skull and form synapses with the dendrites of the mitral cells. The area in which the olfactory nerves arise is situated in the most superior part of the mucous membrane that covers the superior nasal concha. The olfactory sensory



Olfactory nerve assessment *(Seidel et al, 2011)* endings are modified epithelial cells and the least specialized of the special senses. The olfactory nerves connect with the olfactory bulb and the olfactory tract, which are components of the part of the brain associated with the sense of smell. Also called **first cranial nerve, nervus olfactorius.**



Olfactory bulb
Olfactory tract (to cerebral cortex)
Cribriform plate of ethmoid bone
Fibers of olfactory nerves

Olfactory nerve

olfactory organ [L, *olfactus,* sense of smell], the apparatus in the mucous membrane of the nose responsible for the sense of smell. It includes the sensory nerve endings and the olfactory bulb of the brain.

olfactory receptors [L, *olfactus,* sense of smell, *recipere,* to receive], bipolar nerve cells located in the nasal epithelium. Axons of the cells are receptors of the olfactory nerve.

olig-. See **oligo-.**

oligemia /ol′ijē′mē·ə/ [Gk, *oligos,* little, *haima,* blood], a condition of hypovolemia or reduced circulating intravascular volume. Also spelled *oligaemia.*

oligo-, prefix meaning "few, little": *oligocholia, oligodontia, oligosialia.*

oligoclonal banding /ol′igōklō′nəl/, a process by which cerebrospinal fluid IgG is distributed, after electrophoresis, in discrete bands. Approximately 90% of multiple sclerosis patients show oligoclonal banding.

oligodactyly /ol′igōdak′tilē/ [Gk, *oligos* + *dactylos,* finger], a congenital anomaly characterized by the absence of one or more of the fingers or toes. Also called *oligodactylia, oligodactylism.* —*oligodactylic, adj.*

oligodendroblastoma. See **oligodendroglioma.**

oligodendrocyte /ol′igōden′drəsīt/ [Gk, *oligos* + *dendron,* tree, *kytos,* cell], a type of neuroglial cell with dendritic projections that coil around axons of neural cells. The projections continue as myelin sheaths over the axons.

oligodendroglia /ol′igōdendrog′lē·ə/, one of three types of glia cells that, with the nerve cells, compose the central nervous system and are characterized by sheetlike processes that wrap around individual axons to form a myelin sheath of nerve fibers.

oligodendroglioma /ol′igōden′drōglī·ō′mə/ *pl. oligodendrogliomas, oligodendrogliomata* [Gk, *oligos* + *dendron,* tree, *glia,* glue, *oma,* tumor], an uncommon brain tumor composed of nonneural ectodermal cells that form part of the supporting connective tissue around nerve cells. The lesion, a firm reddish-gray mass with calcified spots and a distinct margin, may be large. The tumor develops most often in frontal, parietal, and paraventricular sites but also may occur in the cerebellum. Also called **oligodendroblastoma.**

oligodontia /ol′igōdon′shə/ [Gk, *oligos* + *odous,* tooth], a genetically determined dental defect characterized by the development of fewer than the normal number of teeth.

oligogenic /ol′igōjen′ik/ [Gk, *oligos* + *genein,* to produce], pertaining to hereditary characteristics produced by one or only a few genes.

oligohydramnios /-hidram′nē·əs/ [Gk, *oligos* + *hydor,* water, *amnion,* fetal membrane], an abnormally small amount or absence of amniotic fluid.

oligomeganephronia /ol′igōmeg′ənefrō′nē·ə/ [Gk, *oligos* + *megas,* large, *nephros,* kidney], a type of congenital renal hypoplasia associated with chronic renal failure in children. The condition is characterized by a decreased number of functioning nephrons and hypertrophy of other renal elements without the presence of aberrant tissue. Also called *oligomeganephronic renal hypoplasia.* **—***oligomeganephronic, adj.*

oligomenorrhea /-men′ôrē′ə/ [Gk, *oligos* + L, *men,* month, *rhoia,* flow], abnormally light or reduced menstruation. Also spelled *oligomenorrhoea.* **—***oligomenorrheic, adj.*

oligonucleotide /-nōō′klē·ətīd′/, a compound formed by linking a small number of nucleotides.

oligopeptide /-pep′tīd/, a peptide composed of fewer than 20 amino acids.

oligopnea, oligopnoea. See **bradypnea.**

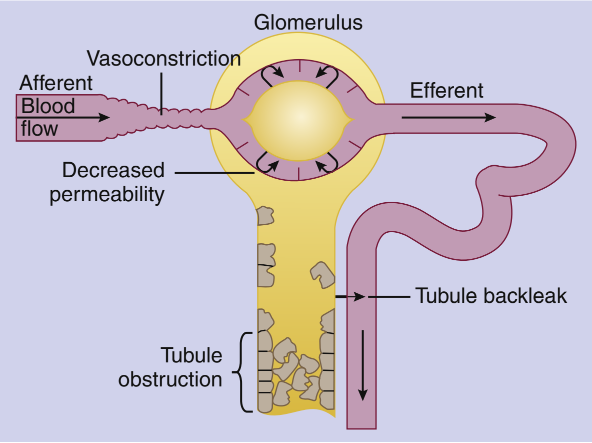
oligosaccharide /-sak′ərīd/, a compound formed by a small number of monosaccharide units.

oligospermia /ol′igōspur′mē·ə/ [Gk, *oligos* + *sperma,* seed], an insufficient number of spermatozoa in the semen. Also called **oligozoospermatism.** Compare **azoospermia.**

oligotroph /ol′igətrof′/, an organism that can survive in a nutrient-poor environment.

oligozoospermatism. See **oligospermia.**

oliguria /ol′igyŏŏr′ē·ə/ [Gk, *oligos* + *ouron,* urine], a diminished capacity to form and pass urine—less than 500 mL in every 24 hours—so that the end products of metabolism cannot be excreted efficiently. It is usually caused by imbalances in body fluids and electrolytes, renal lesions, or urinary tract obstruction. Also called *oliguresis.* —*oliguric, adj.* Compare **anuria.**



Oliguria *(Goldman et al, 2008)*

olisthetic /ōlisthet′ik/, pertaining to olisthy, or bone slippage.

olisthy /ōlis′thē/ [Gk, *olisthanein,* to slip], the slippage of a bone from its normal anatomical site, as in a slipped disk. **—olisthetic,** *adj.*

olivary body /ol′iver′ē/ [L, *oliva* + AS, *bodig*], an olivary nucleus on the medulla oblongata, part of an aggregate of small, densely packed nerve cells.

olivopontocerebellar /ol′ivōpon′tōser′ibel′ər/ [L, *oliva,* olive, *pons,* bridge, *cerebellum,* small brain], pertaining to the olivae, the middle peduncles, and the cerebellum.

olivopontocerebellar atrophy (OPCA), a group of hereditary ataxias characterized by mixed clinical features of pure cerebellar ataxia, dementia, Parkinson-like symptoms, spasticity, choreoathetosis, retinal degeneration, myelopathy, and peripheral neuropathy. Various forms of OPCA are transmitted by autosomal-dominant or autosomal-recessive inheritance.

Ollier's disease. See **enchondromatosis.**

Ollier's dyschondroplasia /ol′ē·āz′/ [Louis X.E.L. Ollier, French surgeon, 1830–1900; Gk, *dys,* bad, *chondros,* cartilage, *plasis,* formation], a rare disorder of bone development in which the epiphyseal tissue responsible for growth spreads through the bones, causing abnormal irregular growth and deformity. The long bones and the ilia are most often affected. Orthopedic procedures to correct deformities may be necessary and helpful, but invalidism is the usual prognosis. See also **hereditary multiple exostoses.**

olmesartan medoxomil, an antihypertensive agent.

-ology, suffix meaning "the study or science of": *biology, pathology, physiology.*

-olol, suffix meaning "beta blocker."

olopatadine /o′lopat′ahdēn/, a histamine H_1 receptor antagonist used as the hydrochloride salt in the topical treatment of allergic conjunctivitis.

o.m., abbreviation for the Latin term *omni mane,* "every morning."

oma-. See **omo-.**

-oma, suffix meaning a "tumor": *capsuloma, lymphadenoma, neurinoma.*

Omaha System, a method of community health nursing practice, documentation, and data management based on a nursing process model. It incorporates three standardized schemes: the problem classification scheme, the intervention scheme, and the problem rating scale for outcomes.

omalgia /ōmal′jə/ [Gk, *omos,* shoulder, *algos,* pain], pain in the shoulder.

omalizumab, a monoclonal antibody.

■ INDICATIONS: This drug is used to treat moderate to severe persistent asthma.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include earache, dizziness, fatigue, pain, viral infections, sinusitis, upper respiratory infections, pharyngitis, pruritus, dermatitis, injection site reactions, arthralgia, fracture, and leg and arm pain. A life-threatening side effect is malignancy.

omarthritis /ō′märthrī′tis/, inflammation of the shoulder joint.

ombudsman /om′bədzmən/ [ONorse, *umbothsmathr,* commission man], a person who investigates and mediates patients' problems and complaints in relation to a hospital's services. Also called **patient representative.**

OMD, abbreviation for **organic mental disorder.**

omega /ōmē′gə, ōmā′gə, om′əgə/, Ω, ω, the 24th letter of the Greek alphabet.

omega-3 fatty acid, a fatty acid with a double bond located at the third carbon atom away from the omega (methyl) end of the molecule. Major sources are cold-water fish and vegetable oils. Omega-3 fatty acids, such as eicosapentaenoic acid and docosahexaenoic acid, appear to have protective functions in preventing the formation of blood clots and reducing the risk of coronary heart disease. See also **essential fatty acid.**

omega-6 fatty acid, an unsaturated fatty acid in which the double bond closest to the omega (methyl) end of the molecule occurs at the sixth carbon from that end. Major sources are vegetable and seed oils.

omega-9 fatty acid, a polyunsaturated fatty acid found in animal and vegetable fats.

omega-oxidation, a metabolic pathway of fatty acid oxidation involving the carbon atom farthest removed from the original carboxyl group.

omenta. See **omentum.**

omental /ōmen′təl/ [L, *omentum,* membrane of the bowels], relating to the omentum.

omental appendix, a peritoneal accumulation of fat associated with the colon.

omental bursa, a cavity in the peritoneum behind the stomach, the lesser omentum, and the lower border of the liver and in front of the pancreas and duodenum.

omental foramen, a restricted opening connecting the two sacs of the peritoneum. Also called **epiploic foramen.**

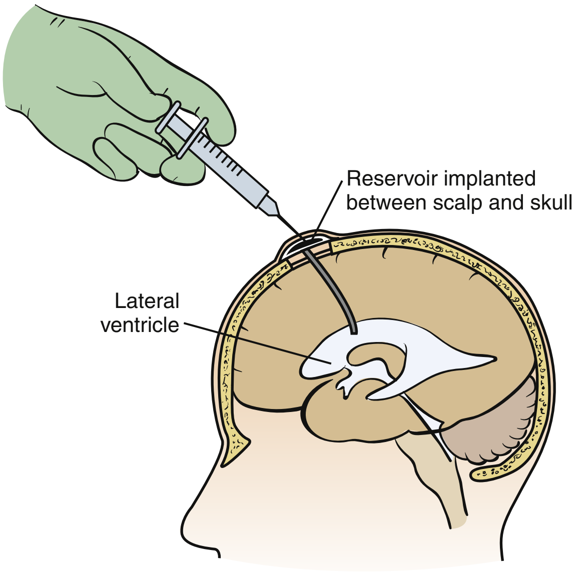
omentectomy /ō′mentek′təmē/, the surgical excision of a portion of the omentum or the complete omentum.

omentum /ōmen′təm/ *pl.* **omenta,** *omentums* [L, membrane of the bowels], an extension of the peritoneum that enfolds one or more organs adjacent to the stomach. See also **greater omentum, lesser omentum. —omental,** *adj.*

omicron /ōm′ikron/, O, o, the 15th letter of the Greek alphabet.

omission /ōmish′ən/ [L, *omittere,* to neglect], (in law) intentional or unintentional neglect to fulfill a duty required by law.

Ommaya reservoir, a device placed under the scalp and used to deliver anticancer drugs to the cerebrospinal fluid.



Ommaya reservoir *(Black and Hawks, 2009)*

omni-, combining form meaning "all": *omnicide, omniform.*

omnifocal lens /om′nēfō′kəl/ [L, *omnis,* all, *focus,* hearth, *lentil*], an eyeglass lens designed for both near and far vision with the reading part in a variable curve.

Omnipen, a trademark for an antibacterial **(ampicillin).**

omnipotence /omnip′ətəns/, (in psychology) an infantile perception that the outside world is part of the organism and within it, which leads to a primitive feeling of all-powerfulness.

omnivorous /omniv′ərəs/ [L, *omnis,* all, *vorare,* to devour], eating both plants and animals.

omn. noct., abbreviation for the Latin term *omni nocte,* "every night."

omn. quad. hor., abbreviation for the Latin term *omni quadrante hora,* "every quarter of an hour."

omo-, oma-, prefix meaning "shoulder": *omoclavicular, omodynia, omohyoid.*

omohyoid, a muscle that depresses and fixes the hyoid bone.

omophagia /om′ōfā′jē·ə/ [Gk, *ōmos,* raw, *phagein,* to eat], the eating of raw foods, particularly raw meat or fish.

omphal-. See **omphalo-.**

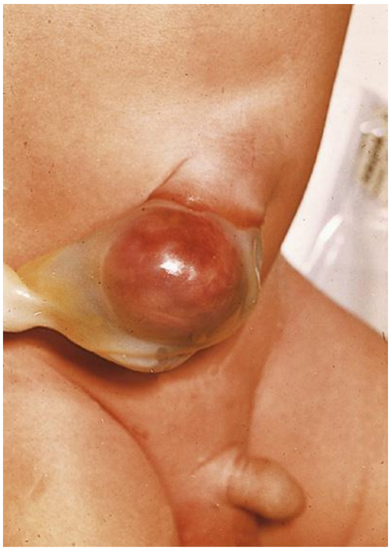
omphalic /omfal′ik/ [Gk, *omphalos,* navel], pertaining to the umbilicus.

omphalitis /om′fəlī′tis/, an inflammation of the umbilical stump marked by redness, swelling, and purulent exudate in severe cases. This condition is rare in developed countries.

omphalo-, omphal-, prefix meaning 'the navel': *omphalocele, omphaloma, omphalosite.*

omphaloangiopagus. See **allantoidoangiopagus.**

omphalocele /om′fəlōsēl′/ [Gk, *omphalos* + *kele,* hernia], congenital herniation of intraabdominal viscera through a defect in the abdominal wall around the umbilicus. The defect is usually closed surgically soon after birth. Compare **gastroschisis.**



Omphalocele *Neonatology ([O'Doherty, 1986]).*

omphalodidymus. See **gastrodidymus.**

omphalogenesis /-jen′əsis/ [Gk, *omphalos* + *genesis,* origin], the formation of the umbilicus or yolk sac during embryonic development. —*omphalogenetic, adj.*

omphalomesenteric artery. See **vitelline artery.**

omphalomesenteric circulation. See **vitelline circulation.**

omphalomesenteric duct. See **yolk stalk.**

omphalomesenteric fistula, an abnormal passageway between the umbilicus and the terminal ileum, formed by persistence of the intraembryonic part of the yolk stalk.

omphalomesenteric vein. See **vitelline vein.**

omphalopagus. See **monomphalus.**

omphalosite /om′falōsīt′/ [Gk, *omphalos* + *sitos,* food], the underdeveloped parasitic member of unequal conjoined twins united by the vessels of the umbilical cord. The omphalosite has no heart, derives its blood supply from the placenta of the autosite, and is incapable of independent existence after birth. See also **allantoidoangiopagus.**

OMS, abbreviation for **Organisation Mondiale de la Santé.** See **World Health Organization.**

Omsk hemorrhagic fever (OHF) /ômsk/, an acute infection seen in regions of the former U.S.S.R., caused by a flavovirus transmitted by the bite of an infected tick or by handling infected muskrats. It is characterized by fever, headache, epistaxis, GI and uterine bleeding, and other hemorrhagic manifestations. Treatment is supportive; recovery usually occurs.

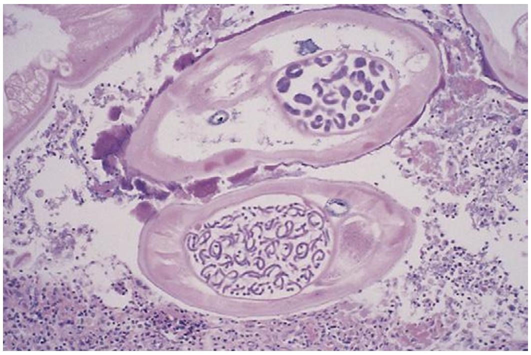
-on, **1.** suffix meaning an "elementary atomic particle": *electron, nucleon, proton.* **2.** suffix meaning a "unit": *magneton, photon.* **3.** suffix meaning a "(nonmetallic) chemical element": *carbon, krypton, silicon.*

o.n., abbreviation for the Latin term *omni nocte,* "every night."

onanism /ō′nəniz′əm/, coitus interruptus; withdrawal of the penis just before ejaculation during sexual intercourse. See also **masturbation.**

Oncaspar, a trademark for an oncolytic agent **(pegaspargase).**

Onchocerca /ong′kōsər′kə/ [Gk, *onkos,* tumor + *kerkos,* tail], a genus of nematode parasites of the superfamily Filarioidea that infects humans and ruminants. The adults live and breed in subcutaneous fibroid nodules. The young (the microfilariae) are carried by the lymph and are found chiefly in the skin, subcutaneous connective tissues, and eyes. *O. volvulus* is a common parasite of humans that breeds in fast-flowing rivers and streams in tropical regions of the Americas and Africa, particularly West Africa. It is the cause of human onchocerciasis and is transmitted by the bites of buffalo gnats.



***Onchocerca* volvulus** *(Kumar et al, 2010)*

onchocerciasis /ong′kōsərkī′əsis, sī′əsis/ [Gk, *onkos,* swelling, *kerkos,* tail, *osis,* condition], a form of filariasis common in Central and South America and Africa, characterized by subcutaneous nodules, pruritic rash, and eye lesions. It is transmitted by the bites of black flies that deposit *Onchocerca volvulus* microfilariae under the skin. The microfilariae migrate to the subcutaneous tissue and eyes, and fibrous nodules form around the developing adult worms. Hypersensitive reactions to the dying microfilariae include extreme pruritus, a cellulitis-like rash, lichenification, depigmentation, and rarely, elephantiasis. Involvement of the eye may include keratitis, iridocyclitis, and rarely, blindness from choroidoretinitis. Diagnosis is made by demonstrating microfilariae by skin biopsy or in the eye by slit lamp. Treatment is diethylcarbamazine for the microfilariae and surgical excision of nodules to remove adult worms. Protective clothing and control of black flies with DDT are the best preventives. Ivermectin is used to treat this condition. Also called **river blindness.**

onco-, prefix meaning "swelling, mass, or tumor": *oncology*.

oncofetal protein /-fē′təl/ [Gk, *onkos* + L, *fetus,* pregnant; Gk, *proteios,* first rank], a protein normally produced by fetal tissue and also by cancerous tissues in adult life.

oncogene /ong′kōjēn/ [Gk, *onkos* + *genein,* to produce], a potentially cancer-inducing gene. Under normal conditions such genes play a role in the growth and proliferation of cells, but, when altered in some way by a cancer-causing agent such as radiation, a carcinogenic chemical, or an oncogenic virus, they may cause the cell to be transformed to a malignant state.

oncogenesis /ong′kōjen′əsis/ [Gk, *onkos* + *genesis,* origin], the process initiating and promoting the development of a neoplasm through the action of biological, chemical, or physical agents. Compare **carcinogenesis, sarcomagenesis, tumorigenesis.**

oncogenic /ong′kōjen′ik/ [Gk, *onkos,* swelling, *genein,* to produce], pertaining to the origin and development of tumors or cancer.

oncogenic viruses, an epidemiological class of viruses that are acquired by close contact or injection and cause usually persistent infection. They may induce cell transformation and malignancy.

oncogenous osteomalacia /ongkoj′ənəs/, a bone disorder caused by mesenchymal tumors. Patients may have normal-to-low serum calcium levels, a low serum phosphorus level, and an elevated serum alkaline phosphatase level.

oncological emergencies /ong′kōloj′ik/, cancer-related disorders that require emergency medical or surgical care. An example is **superior vena cava syndrome,** in which an expanding tumor mass compresses the thin-walled vena cava, causing obstruction in the venous blood flow from the upper part of the body. Other examples include **cardiac tamponade**, cerebral herniation syndrome, **hypercalcemia**, and **spinal cord compression.**

oncologist /ongkol′əjist/, a physician who specializes in the study and treatment of neoplastic diseases, particularly cancer.

oncology /ongkol′əjē/ [Gk, *onkos,* swelling, *logos,* science], **1.** the branch of medicine concerned with the study of malignancy. **2.** the study of cancerous growths.

Oncology Nursing Society (ONS), an organization of nurses interested or specializing in cancer patient nursing. The national publication of the ONS is *Oncology Nursing Forum*.

oncolysis /ongkol′isis/, **1.** the destruction or disposal of neoplastic cells. **2.** the reduction of a swelling or mass.

oncolytic /ong′kōlit′ik/, pertaining to the destruction of tumor cells.

oncornaviruses. See **Oncovirinae.**

oncoscint scan, a nuclear scan used to detect recurrent metastatic colorectal or ovarian cancer.

oncotic /ongkot′ik/ [Gk, *onkos,* a swelling], pertaining to or resulting from the presence of a swelling.

oncotic pressure [Gk, *onkos,* a swelling; L, *premere,* to press], the osmotic pressure of a colloid in solution, such as when there is a higher concentration of protein in the plasma on one side of a cell membrane than in the neighboring interstitial fluid. Also called **colloid osmotic pressure.**

oncotic pressure gradient, the difference between the osmotic pressure of blood and that of tissue fluid or lymph. It is an important force in maintaining fluid balance between the vascular space and the interstitium.

Oncovin, a trademark for an antineoplastic **(vinCRIStine sulfate).**

Oncovirinae /ong′kōvir′inē/, a subfamily of ribonucleic acid viruses, including types A, B, C, and D genera of oncoviruses. They are classified on the basis of morphology and type of host. Also called **oncornaviruses.** See also **oncovirus.**

oncovirus /ong′kōvī′rəs/ [Gk, *onkos* + L, *virus,* poison], a member of a family of viruses associated with leukemia and sarcoma in animals and, possibly, in humans.

Ondine's curse /ondēnz′/ [L, *Undine,* mythic water nymph; ME, *curs,* invocation], apnea caused by loss of automatic control of respiration. The term refers to a syndrome in patients with a defect in central chemoreceptor responsiveness to carbon dioxide. The patient is able to breathe voluntarily but has hypercapnia and hypoxemia. Ondine's curse may result in pickwickian syndrome or sleep apnea and may be one cause of sudden infant death syndrome. The syndrome may occur as a result of opioid or other drug overdose, after bulbar poliomyelitis or encephalitis, or after surgery involving the brainstem or the higher segments of the cervical spinal cord, as in cervical cordotomy for intractable pain.

-one, suffix for organic compounds: *acetone, ketone, quinone*.

one-and-a-half spica cast, an orthopedic cast that covers the trunk cranially to the nipple line, one leg caudally as far as the toes, and the other leg caudally as far as the knee. For stability, a diagonal crossbar connects the parts of the cast encasing the legs. This type of cast is used for immobilization during healing of a fractured femur or after surgical hip repair or for correction and maintenance of the correction of a hip deformity. Compare **bilateral long-leg spica cast, unilateral long-leg spica cast.**

one-child sterility. See **acquired sterility.**

one gene/one enzyme hypothesis, a general rule, proposed in 1941 by G. Beadle and E. Tatum, that each gene in a chromosome controls the synthesis of one enzyme. A modification of this idea, the one gene/one polypeptide hypothesis, accommodates the fact that all gene products are polypeptides but not all polypeptides are enzymes. A further modification, the one cistron/one polypeptide concept, accommodates alternate splicing and alternative promoter sequences.

one gene/one polypeptide, a principle that each gene in a chromosome determines a particular polypeptide. An exception allows many genes to specify only functional ribonucleic acid.

oneiro-, prefix meaning "dream": *oneirodynia, oneirology, oneiroscopy*.

one-to-one care, a method of organizing nursing services in an inpatient care unit by which one registered nurse assumes responsibility for all nursing care provided one patient for the duration of one shift.

one-to-one relationship, a mutually defined, collaborative goal-directed client-therapist relationship for the purpose of psychotherapy.

one-way speaking valve, a valve, placed on the end of a tracheostomy tube, that opens during inhalation and closes during exhalation, so that the exhaled air is directed through the vocal cords and out the mouth and nose, allowing a person who has had a tracheostomy to speak. See also **Passy-Muir valve.**

-onide, suffix for acetal-derived topical steroids.

-onium, suffix for quaternary ammonium derivatives.

onlay [AS, *ana,* up, *licagan,* to lie], **1.** a cast type of metal restoration retained by friction, dental luting cement, and mechanical forces in a prepared tooth, used for restoring one or more of the tooth's cusps and adjoining occlusal surfaces. Compare **inlay. 2.** an occlusal rest part of a removable partial denture, extended to cover the entire occlusal surface of a tooth.

onlay graft, a bone graft in which the transplanted tissue is laid directly onto the surface of the recipient bone.

online, access to information directly connected with and accessible to a computer. Compare **off-line.**

on/off phenomenon, a periodic loss of the efficacy of levodopa in the treatment of Parkinson's disease, without obvious relationship to the timing of levodopa administration. Also called **random off.**

ONS, abbreviation for **Oncology Nursing Society.**

onset of action, the time required after administration of a drug for a response to be observed.

ontogenesis. See **ontogeny.**

ontogenetic /on′tōjənet′ik/, **1.** of, relating to, or acquired during ontogeny. **2.** describing an association based on visible morphological characteristics and not necessarily indicative of a natural evolutionary relationship. Also called *ontogenic*.

ontogeny /ontoj′ənē/ [Gk, *ontos,* being, *genein,* to produce], the development of one organism from a single-celled ovum to the time of birth, including all phases of differentiation and growth. Compare **phylogeny.** See also **comparative anatomy.**

onych-. See **onycho-.**

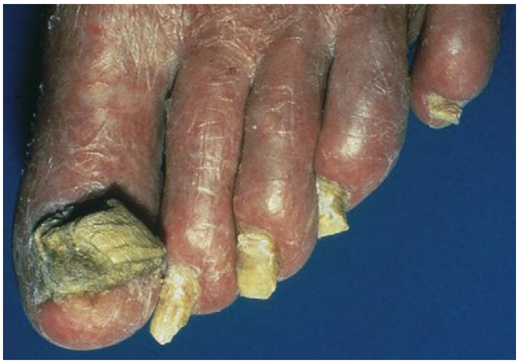
onychia /ōnik′ē·ə/ [Gk, *onyx,* nail], inflammation of the nailbed. Compare **paronychia.**

-onychia, suffix meaning a "condition of the fingernails or toenails": *celonychia, melanonychia, pachyonychia*.

onycho-, onych-, prefix meaning "the nails": *onychogenic, onychohelcosis, onychopathology*.

onychodystrophy [Gk, *onyx,* nail, *dys,* bad, *trophe,* nourishment], a condition of malformed or discolored fingernails or toenails.

onychogryphosis /on′ikōgrifō′sis/ [Gk, *onyx* + *gryphein,* to curve, *osis,* condition], thickened, curved, clawlike overgrowth of fingernails or toenails.



Onychogryphosis *(Hordinsky, Sawaya, and Scher, 2000)*

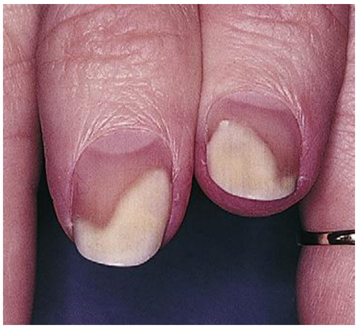
onycholysis /on′ikol′isis/ [Gk, *onyx* + *lysein,* to loosen], separation of a nail from its bed, beginning at the free margin, associated with psoriasis, dermatitis of the hand, fungal infection, ***Pseudomonas*** infection, and many other conditions.

onychomycosis /on′ikō′mīkō′sis/ [Gk, *onyx* + *mykes,* fungus, *osis,* condition], any fungal infection of the nails.

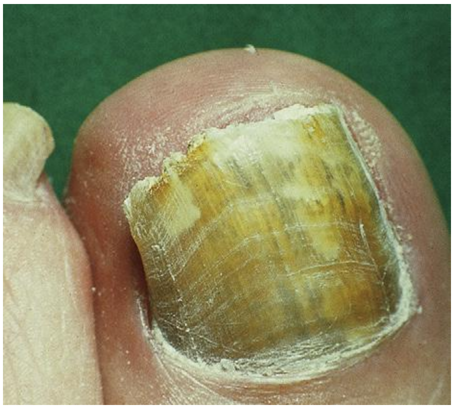
onycho-osteodysplasia. See **nail-patella syndrome, osteoonychodysplasia.**

onychophagia. See **nail biting.**

onychosis [Gk, *onyx,* nail, *osis,* condition], a condition of atrophy or dystrophy of the nails, usually caused by a dermatosis such as a fungal infection.



Onycholysis *(Callen et al, 2000)*



Onychomycosis *(Conlon and Snydman, 2000)*

onychotillomania /on′ikōtil′əmā′nē·ə/ [Gk, *onyx,* nail, *tillein,* to pluck, *mania,* madness], a nervous habit of picking at the nails to the point of tissue damage (i.e., bleeding).

onychotomy /on′ikot′əmē/, a surgical incision into a nailbed.

oo-, prefix meaning "egg or ovum": *ooblast, oocytase, ootid*.

oob, abbreviation for *out of bed*.

oobe, abbreviation for **out-of-body experience.**

ooblast /ō′əblast/ [Gk, *oon,* egg, *blastos,* germ], a female germ cell from which a mature ovum is developed.

oocenter. See **ovocenter.**

oocyesis /ō′əsī·ē′sis/ [Gk, *oon* + *kyesis,* pregnancy], an ectopic ovarian pregnancy.

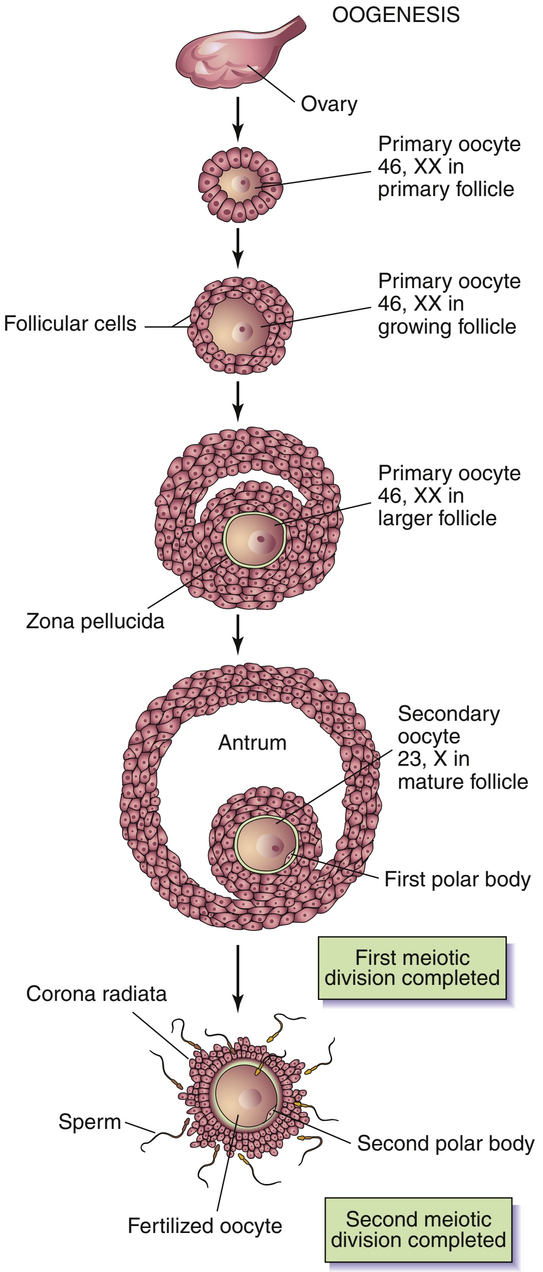
oocyst /ō′əsist/ [Gk, *oon* + *kystis,* bag], a stage in the development of sporozoa consisting of a zygote enclosed by cyst wall. Oocysts of malarial parasites are found in the stomachs of infected mosquitoes. Oocysts of toxoplasma organisms are contained in the feces of infected cats. Compare **oocyte.**

oocyte /ō′əsīt/ [Gk, *oon* + *kytos,* cell], a primordial or incompletely developed ovum.

oocyte donation, a method of assisted reproductive technology in which an oocyte from a fertile woman is aspirated for incubation in the uterus of a woman who has female factor infertility, such as after oophorectomy or premature menopause. Fertilization may be either in vitro or in utero.

oocytin /ō′əsī′tin/, the substance in a spermatozoon that stimulates the formation of the fertilization membrane after penetration of an ovum.

oogamy /ō·og′əmē/ [Gk, *oon* + *gamos,* marriage], **1.** sexual reproduction by the fertilization of a large nonmotile female



Oogenesis *(Moore and Persaud, 2008)*

gamete by a smaller, actively motile male gamete, such as occurs in certain algae and the malarial parasite ***Plasmodium.*** **2.** heterogamy. Compare **isogamy.** —*oogamous, adj.*

oogenesis /ō′əjen′əsis/ [Gk, *oon* + *genesis,* origin], the formation of the female gametes, or ova. The female infant is born with the entire number of primary oocytes that will function throughout reproductive life. Only a fraction of these survive until puberty, and only a small percentage will be ovulated. Follicles containing the primary oocytes are found in varying stages of development in the ovary of the sexually mature woman. Egg and sperm formation differ considerably in the number and size of gametes resulting from gametogenesis, the total number of gametes produced in a lifetime, and the time sequence for the initiation of the meiotic divisions and the completion of the cycle. Also called **ovogenesis.** Compare **spermatogenesis.** See also **gametogenesis, meiosis, menstrual cycle, ovulation.** —*oogenetic, adj.*

oogonium /ō′əgō′nē·əm/ *pl. oogonia* [Gk, *oon* + *gonos,* offspring], the precursor cell from which an oocyte develops in the fetus during intrauterine life. Also called **ovogonium.** See also **oogenesis.**

ookinesis /ō′əkinē′sis/ [Gk, *oon* + *kinesis,* movement], the chromosomal movement occurring in the nucleus of the egg cell during maturation and fertilization. Also called *ookinesia*. See also **oogenesis.** —**ookinetic,** *adj.*

ookinete /ō′əkinēt′/ [Gk, *oon* + *kinein,* to move], the motile elongated zygote that is formed by the fertilization of the macrogamete during the sexual reproductive phase of the life cycle of a sporozoan, specifically the malarial parasite ***Plasmodium.*** It penetrates the lining of the stomach of the female ***Anopheles*** mosquito and attaches to the outer wall, where it forms an oocyst and gives rise to sporozoites.

ookinetic. See **ookinesis.**

oolemma. See **zona pellucida.**

oophor-. See **oophoro-.**

oophoralgia /ō′əfôral′jə/ [Gk, *oophoron,* ovary, *algos,* pain], a pain in an ovary.

oophorectomy /ō′əfərek′təmē/ [Gk, *oophoron,* ovary, *ektomē,* excision], the surgical removal of one or both ovaries. It is performed to remove a cyst or tumor, excise an abscess, treat endometriosis, or in breast cancer to remove the source of estrogen, which stimulates some types of cancer. If both ovaries are removed, sterility results, and menopause is abruptly induced; in premenopausal women one ovary or a part of one ovary may be left intact unless a malignancy is present. The operation routinely accompanies a hysterectomy in menopausal or postmenopausal women. Regional or general anesthesia is used. Unless a malignancy is present, estrogen may be given to treat the unpleasant side effects of the abrupt onset of menopause. Also called **ovariectomy.**

oophoritis /ō′əferī′tis/, an inflammatory condition of one or both ovaries, usually occurring with salpingitis or another infection.

oophoro-, oophor-, ootheco-, prefix meaning "ovary": *oophorocytosis, oophorogenous, oophoroma.*

oophorosalpingectomy /ō′əfôr′əsal′pinjek′təmē/ [Gk, *oophoron* + *salpinx,* tube, *ektomē,* excision], the surgical removal of one or both ovaries and the corresponding fallopian tubes, performed to remove a cyst or tumor, excise an abscess, or treat endometriosis. A bilateral procedure causes sterility and induces menopause, unless a malignancy is present; estrogen therapy may be started to relieve the unpleasant side effects of the abrupt onset of menopause.

oophorosalpingitis /ō′əfôr′əsal′pinjī′tis/ [Gk, *oophoron,* ovary, *salpinx,* tube, *itis,* inflammation], an inflammation involving both the ovary and the fallopian tube.

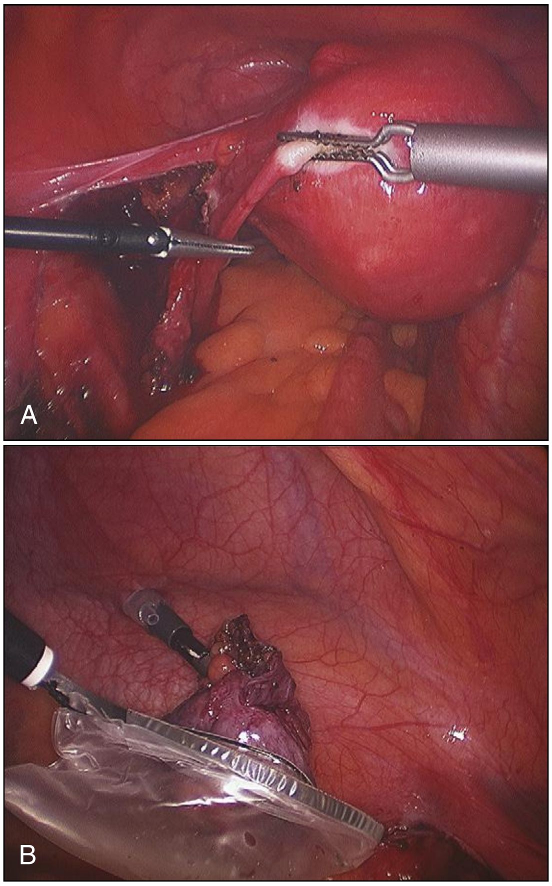
ooplasm /ō′əplaz′əm/ [Gk, *oon* + *plasma,* something formed], the cytoplasm of the egg, or ovum, including the yolk in lower animals. Also called **ovoplasm.**

oosperm /ō′əspurm/ [Gk, *oon* + *sperma,* seed], a fertilized ovum; the cell resulting from the union of the pronuclei of the spermatozoon and the ovum after fertilization; a zygote.

ootheco-. See **oophoro-.**

ootid /ō′ətid/ [Gk, *ootidion,* small egg], the nearly mature ovum after penetration by the spermatozoon and completion of the second meiotic division but before the fusion of the pronuclei to form the zygote. It is one of the four cells resulting from oogenesis. See also **meiosis, oogenesis.**

OP, **1.** abbreviation for *operative procedure*. **2.** abbreviation for **outpatient.**



Oophorectomy. *A,* The fallopian tube and utervarian ligament are ligated close to the uterus. *B,* The specimen is removed in an Endocatch bag
(Bristow and Amstrong, 2010)

opacity /ōpas′itē/ [L, *opacitus,* shadiness], pertaining to an opaque quality of a substance or object, such as cataract opacity.

opalescent /ō′pəl·es′ənt/, showing a milky iridescence, like an opal.

opal mutation, a genetic alteration that causes the synthesis of a polypeptide chain to terminate prematurely because the triplet of nucleotides that normally codes for the next amino acid in the chain becomes uracil-adenine-guanine, the sequence that signals the end of the chain. One of the three possible **nonsense mutations.** See also **amber mutation, ochre mutation.**

opaque /ōpāk′/ [L, *opacus,* obscure], **1.** pertaining to a substance or surface that neither transmits nor allows the passage of light. **2.** neither transparent nor translucent.

OPCA, abbreviation for **olivopontocerebellar atrophy.**

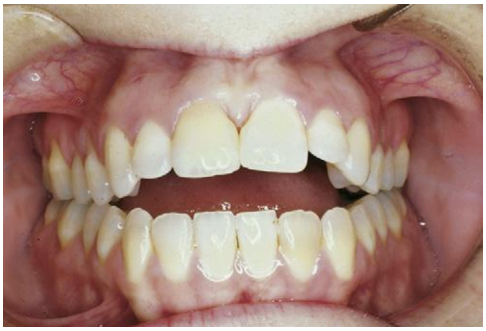
OPD, abbreviation for *Outpatient Department.*

-ope, suffix meaning a "person having an eye defect": *asthenope, hyperope, protanope.*

open amputation [AS, *offan,* open; L, *amputare,* to cut away], a kind of amputation in which a straight, guillotine cut is made without skin flaps. Open amputation is performed if an infection is probable, developing, or recurrent. The cross section is left open for drainage, and skin traction is applied to prevent retraction. Antibiotic therapy is begun, and surgical closure is completed when the infection clears. Compare **closed amputation.** See also **gangrene.**

open-angle glaucoma. See **glaucoma.**

open bite, an abnormal dental condition in which the anterior teeth in the maxilla do not occlude those in the mandible in any mandibular position. Compare **closed bite.**



Open bite *(Proffit and Fields, 2000)*

open-cavity tympanomastoidectomy, tympanomastoidectomy with removal of the posterior wall of the ear canal, such as radical mastoidectomy and modified radical mastoidectomy. See also **mastoidectomy.**

open-chain exercise, exercise in which the distal aspect of the extremity is free in space and not in contact with the ground.

open charting, a system of medical record keeping in which the patient has access to his or her chart.

open circuit, an electric circuit in which current flow ceases.

open-circuit breathing system, a breathing apparatus used in cardiopulmonary therapy in which rebreathing does not occur. Gas is inspired through a breathing branch or limb that is connected to a gas source or open to the ambient atmosphere. Expired gas flows through a directional valve into a collecting reservoir or into the ambient atmosphere.

open dislocation, a joint displacement accompanied by a break in the skin. Formerly called **compound dislocation.**

open drainage. See **drainage.**

open-drop anesthesia, the oldest and simplest anesthetic technique. It is no longer used in the United States. A volatile liquid anesthetic agent such as ether is dripped, one drop at a time, onto a porous cloth or mask held over the patient's face. It is difficult to control the anesthetic depth and pollution of the OR. Chloroform and ether were the major general anesthetics adaptable to open-drop administration.

open-enrollment period, a time during which individuals can enroll in a health care plan.

open fracture. See **compound fracture.**

open fracture grading system, a system for dividing open fractures into five categories, ranging from a clean wound that communicates to the fracture site and measures less than 1 cm (grade I) to a fracture requiring repair of arteries (grade V).

open heart surgery, any heart surgery in which the chest is opened, including minimally invasive surgery. Conventional open heart surgery uses a cardiopulmonary bypass machine. Minimally invasive techniques may not.

opening abductory wedge osteotomy (OAWO), a procedure for treating a bunion deformity, in which a bone graft is used to open the wedge cut into the bone and bring the first metatarsal closer to the second.

opening of ileocecal valve, the slitlike or oval orifice in the ileocecal valve, seen in the cadaver. It has two flaps or lips, one above and one below, that form the valve and project at thickened folds into the lumen of the large intestine. In the living individual this structure is the ostium ileale.

opening pressure, the amount of pressure measured in a manometer after insertion of a spinal needle into the subarachnoid space.

opening wedge osteotomy, a procedure for treating bunion deformity in which a proximal cut is made in the metatarsal to reduce the deformity. It is performed with or without tendon transfers.

open magnetic resonance imaging (open MRI), a procedure that allows visualization of soft-tissue structures of the body. Because the patient is not enclosed within the magnetic resonance unit, claustrophobic reactions do not occur with open magnetic resonance imaging, but the scan does take substantially longer to complete. As with traditional magnetic resonance imaging, patients must remain motionless, and images may be degraded by motions related to heart contractions, respiration, and bowel peristalsis. Contraindications to MRI are pacemakers, metallic aneurysm clips, and some metallic prostheses and foreign objects. Compare **magnetic resonance imaging.** See also **magnetic resonance.**

open medical staff, (in managed care) the opening of hospital medical staff membership to all physicians in the community who meet membership and clinical privilege requirements.

open MRI, abbreviation for **open magnetic resonance imaging.**

open operation, a surgical procedure that provides a full view of the structures or organs involved through membranous or cutaneous incisions. Compare **laparoscopy, minimally invasive surgery.**

open-panel HMO, a health maintenance organization (HMO) in which physicians treat both HMO and private patients.

open PHO, a physician-hospital organization in which all physicians on the hospital medical staff can participate.

open pneumothorax [AS, *open* + Gk, *pneuma,* air, *thorax,* chest], the presence of air or gas in the chest as a result of an open wound in the chest wall.

open reduction [AS, *open* + L, *reducere,* to lead back], a surgical procedure for reducing a fracture or dislocation by exposing the skeletal parts involved.

open rhinolalia. See **hypernasality.**

open system, a system that interacts with its environment.

open-wedge osteotomy, a straight cut made across a bone, leaving a wedge-shaped gap in the bone.

open wound [AS, *open* + *wund*], a wound that disrupts the integrity of the skin.

operable /op′ərəbəl/ [L, *operare,* to work], amenable to surgical intervention, as a disease or injury may be.

operant /op′ərənt/ [L, *operare,* to work], any act or response occurring without an identifiable stimulus. The result of the act or response determines whether or not it is repeated.

operant conditioning, a form of learning used in behavior therapy in which the person undergoing therapy is rewarded for the correct response and punished for the incorrect response. Also called **instrumental conditioning, shaping.**

operant level, the frequency or form of a performance under baseline conditions before any systematic conditioning procedures are introduced.

operating field, an isolated area where surgery is performed; it must be kept sterile by aseptic techniques. Also called *operative field*. See also **surgical asepsis.**

operating microscope /op′ərā′ting/ [L, *operare* + Gk, *mikros,* small, *skopein,* to look], a binocular microscope used in delicate surgery, especially surgery of the eye or ear. The standing type of operating microscope has a motorized zoom system operated by a foot pedal that quickly changes the magnification. The operating microscope that attaches to a surgeon's head has interchangeable lenses for different magnifications. Also called **surgical microscope.**

operating room (OR, O.R.), **1.** a room in a health care facility in which surgical procedures requiring anesthesia are performed. **2.** *(informal)* a suite of rooms or an area in a health care facility in which patients are prepared for surgery and undergo surgical procedures.

operating room technician. See **Certified Surgical Technologist.**

operating system (OS), the main system programs of a computer that manage the hardware and application resources, including data input and output. Applications require an operating system to support and enable their function.

operating telescope, a magnifying lens that gives low magnification and a wide field of vision.

operation /op′ərā′shən/, any surgical procedure, such as an appendectomy or a hysterectomy.

operationalization of behavior /op′ərā′shənal′īzā′shən/, (in psychology) the stating of a patient's complaints or problems in specific, observable behavioral terms.

operative cholangiography /op′ərətiv′/ [L, *operare* + Gk, *chole,* bile, *angeion,* vessel, *graphein,* to record], a procedure for radiographically outlining the major bile ducts during surgery. It involves the injection of a radiopaque contrast medium directly into the ducts. The procedure is usually performed to detect residual calculi in the biliary tract. See also **cholangiography.**

operative dental surgeon. See **dental surgeon.**

operative dentistry, that phase of dentistry concerned with restoration of parts of the teeth that are defective through disease, trauma, or abnormal development to a state of normal function, health, and esthetics, including preventive, diagnostic, biological, mechanical, and therapeutic techniques, as well as material and instrument science and application.

operator gene /op′ərā′tər/ [L, *operare* + Gk, *genein,* to produce], a section of bacterial DNA that regulates the transcription of structural genes in an operon by interacting with a repressor protein. The operator gene serves as the starting point in the coding sequence.

operatory /op′ərətor′ē/ [L, *operare,* to work], the dental surgical working area of a dental office, in which treatment is provided to patients.

operculum /ōpur′kyo͝oləm/ *pl. opercula, operculums* [L, lid], a lid or covering, such as the mucous plug that blocks the cervix of the gravid uterus or the temporal operculum of the cerebral temporal hemisphere that overlaps the insula as an extension of the superior surface of the temporal lobe. —*opercular, adj.*

operon /op′əron/ [L, *operare,* to work], a section of bacterial DNA consisting of an operator gene and one or more structural genes with related functions. Transcription of the structural genes is controlled by the operator gene in conjunction with a regulator gene. See also **operator gene, regulator gene.**

ophid-, prefix meaning "snake or snakelike": *ophiasis, ophidiophobia, ophidism.*

-ophidia, suffix meaning "venomous snakes": *thanatophidia, toxicophidia.*

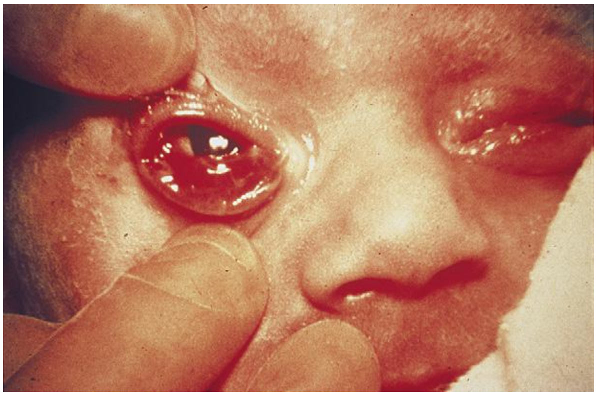
ophth, abbreviation for **ophthalmology.**

ophthalm-. See **ophthalmo-.**

ophthalmia /ofthal′mē·ə/ [Gk, *ophthalmos,* eye], severe inflammation of the conjunctiva or the deeper parts of the eye. Some kinds of ophthalmia are **ophthalmia neonatorum, sympathetic ophthalmia,** and **trachoma.**

-ophthalmia, suffix meaning a "pathological or anatomical condition of the eye": *allophthalmia, echinophthalmia, polemophthalmia.*

ophthalmia neonatorum /nē′ōnətôr′əm/, a purulent conjunctivitis and keratitis of the newborn resulting from exposure of the eyes to chemical, chlamydial, bacterial, or viral agents. Chemical conjunctivitis usually occurs as a result of the instillation of silver nitrate in the eyes of a newborn to prevent a gonococcal infection. Also called **neonatal conjunctivitis.** See also **conjunctivitis.**



Ophthalmia neonatorum *(Cohen and Powderly, 2004/ Courtesy Dr. M. Puolakkainne)*

ophthalmic /ofthal′mik/ [Gk, *ophthalmos,* eye], pertaining to the eye.

ophthalmic administration of medication, the administration of a drug by instillation of a cream, an ointment, or a liquid drop preparation in the conjunctival sac. The correct strength and amount of the drug are selected, and the medication is instilled into the eye or eyes as directed. The order usually specifies O.D. for right eye, O.S. for left eye, or O.U. for both eyes. Ophthalmic preparations are often refrigerated for storage but are given at room temperature. For administration the patient is positioned comfortably, lying back on a bed or examining table or sitting up with the neck hyperextended. The cul-de-sac of the conjunctival sac is exposed by gentle traction on the tissue just below the lower eyelid. The medication is placed into the sac as the patient is instructed to look away from the point of instillation. The dispenser is not allowed to touch the eye, and the medication is not placed directly on the cornea. The eyelid is slowly released, and the patient is asked to roll the eye around a few times to spread the medication over the entire surface of the eye. Applying pressure with the finger at the inner canthus may decrease systemic absorption.

ophthalmic dispensing optician, an allied health professional who adapts and fits corrective eyewear, including eyeglasses and contact lenses, as prescribed by an ophthalmologist or optometrist. Degree programs are usually 2 years.

ophthalmic herpes zoster. See **herpes zoster ophthalmicus.**

ophthalmic laboratory technician, a person who, working from a prescription written by an ophthalmologist or optometrist, cuts, grinds, edges, and finishes lenses and fabricates eyewear.

ophthalmic medical technician, an allied health professional who assists ophthalmologists by collecting data and administering treatment ordered by the ophthalmologist. These specialists are qualified to take medical histories; administer diagnostic tests; make anatomical and functional ocular measurements; test ocular functions, including visual acuity, visual fields, and sensorimotor functions; administer topical ophthalmic medications; and instruct the patient in home care and the use of contact lenses. Ophthalmic medical technologists perform all duties performed by technicians but are expected to do so at a higher level of expertise.

ophthalmic nerve [Gk, *ophthalmos,* eye; L, *nervus,* nerve], the first division of the trigeminal nerve (CN V), supplying sensory innervation to the forehead, scalp, lacrimal gland, eye, and side of the nose.

ophthalmic solution, a specially prepared sterile preparation free of foreign particles for instillation of a medication into the eye.

ophthalmic vein, one of two venous channels in the orbit, the superior ophthalmic vein and the inferior ophthalmic vein, that communicate with the cavernous sinus. This communication can be a route by which infections spread from outside to inside the cranial cavity.

ophthalmic vesicle. See **optic vesicle.**

ophthalmitis /of′thalmī′tis/ [Gk, *ophthalmos,* eye, *itis,* inflammation], an inflammation of the eye.

ophthalmo- /ofthal′mō-/, **ophthalm-,** prefix meaning "eye": *ophthalmodynia, ophthalmolith, ophthalmostat.*

ophthalmodynamometer /-din′əmom′ətər/ [Gk, *ophthalmos,* eye, *dynamis,* force, *metron,* measure], an instrument for measuring pressure on the sclera while the fundus is studied with an ophthalmoscope. It may be used to measure blood pressures in the ophthalmic artery.

ophthalmodynia /-din′ē·ə/ [Gk, *ophthalmos,* eye, *odyne,* pain], a pain in the eye.

ophthalmologic, opthalmological. See **ophthalmology.**

ophthalmologist /of′thalmol′əjist/, a physician who specializes in ophthalmology.

ophthalmology (ophth) /of′thalmol′əjē/ [Gk, *ophthalmos* + *logos,* science], the branch of medicine concerned with the study of the physiology, anatomy, and pathology of the eye and the diagnosis and treatment of disorders of the eye. **—ophthalmologic, ophthalmological,** *adj.*

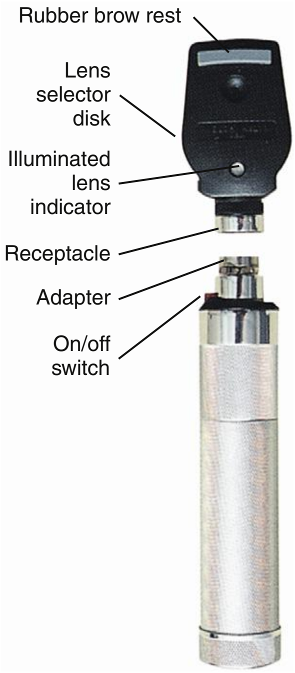
ophthalmopathy /of′thəlmop′ə·thē/ [Gk, *ophthalmos,* eye + *pathos,* disease], any disease of the eye.

ophthalmoplasty /ofthal′mōplas′tē/ [Gk, *ophthalmos,* eye, *plassein,* to mold], plastic surgery of the eye or the area around the eye.

ophthalmoplegia /ofthal′məplē′jē·ə/ [Gk, *ophthalmos* + *plege,* stroke], an abnormal condition characterized by paralysis of the motor nerves of the eye. Bilateral ophthalmoplegia of rapid onset is associated with acute myasthenia gravis, acute thiamine deficiency, botulism, and acute inflammatory cranial polyneuropathy. These diseases are potentially very destructive and require prompt attention. In some patients with myopathic ophthalmoplegia, structural abnormalities and biochemical disorders may be evident in limb muscles. Ophthalmoplegia is also associated with ocular dystrophy.

ophthalmoplegia plus. See **Kearns-Sayre syndrome.**

ophthalmoscope /ofthal′məskōp/ [Gk, *ophthalmos* + *skopein,* to look], a device for examining the interior of the eye. It includes a light, a mirror with a single aperture through which the examiner views, and a dial holding several lenses of varying strengths. The lenses are selected to allow clear visualization of the structures of the eye at any depth. If the patient or the examiner ordinarily requires extensive correction of a refractive error, the examination may require that the corrective lenses should be worn for the examination. Also called **funduscope.**



Ophthalmoscope *(Seidel et al, 2011)*

ophthalmoscopy /of′thalmos′kəpē/, the technique of using an ophthalmoscope to examine the eye. Also called **fundoscopy, funduscopy.** See also **fundus microscopy.**

ophthalmospasm /ofthal′mōspaz′əm/ [Gk, *ophthalmos,* eye, *spasmos*], a sudden involuntary contraction of the eyeball.

-opia, -opic, -opical, -ops, -opsia, -opsy, -opy, suffix meaning a "(specified) visual condition": *boopia, myopia, nonopia, senopia.*

opiate /ō′pē·it/ [Gk, *opion,* poppy juice], **1.** a drug that contains opium, derivatives of opium, or any of several semisynthetic or synthetic drugs with opium-like activity. **2.** *(informal)* any soporific or opioid drug. **3.** pertaining to a substance that causes sleep or relief of pain. Morphine and related opiates may produce unwanted side effects such as respiratory depression, nausea, vomiting, dizziness, and constipation. Patients with reduced blood volume are more susceptible to the hypotensive effect of morphine and related drugs. Opiates are used with extreme caution in obese patients and in those with head injuries, emphysema, or other problems associated with decreased respiratory function. In patients with prostatic hypertrophy, morphine may cause acute urinary retention, requiring repeated catheterization. Also called **opioid.**

opiate poisoning [Gk, *opion,* poppy juice; L, *potio,* drink], toxic effects of a potent opioid, including depression of the brain centers, causing unconsciousness and a failure to breathe. Acute intoxication is characterized by euphoria, flushing, itching, and constriction of pupils, followed by reduced rate of respiration, hypotension, lowered body temperature, and abnormally slow heartbeat. Withdrawal is marked by effects generally the opposite of opiate poisoning, depending on the size of the dose and the duration of dependence.

opiate receptor [Gk, *opion,* poppy juice; L, *recipere,* to receive], transmembrane proteins that bind to endogenous opioid neuropeptides and exogenous morphine and similar natural or synthetic compounds. The three major classes of these receptors are designated mu, kappa, and delta. Morphine preferentially stimulates mu receptors to produce analgesia, euphoria, respiratory depression, constipation, and pinpoint pupils. Some other drugs (e.g., butorphanol) can selectively block mu receptors while stimulating kappa receptors; this provides moderate to high pain relief with low abuse potential. Stimulation of delta receptors can also contribute to analgesia. The receptors are found in high concentrations in the dorsal horn of the spinal cord and in the brain regions involved with pain modulation or pain transmission. Endogenous agonists at these receptors include endorphins, enkephalins, and dynorphins.

-opic, -opical. See **-opia.**

opinion /əpin′yən/ [L, *opinari,* to suppose], **1.** (in law) a statement by the court, usually in writing, of the reasoning behind its decision or judgment in a particular case. **2.** a statement prepared for a client by an attorney that represents the attorney's understanding of the law as it pertains to a legal question posed by the client.

opioid /ō′pē·oid/ [Gk, *opionm,* poppy juice, *eidos,* form], strictly speaking, pertaining to natural and synthetic chemicals that have opium-like effects similar to morphine, though they are not derived from opium. Examples include endorphins or enkephalins produced by body tissues or synthetic methadone. Morphine and related drugs are often included in this category because the term narcotic has lost its original meaning.

opioid antagonist, a drug that blocks mu, kappa, or delta opioid receptors, used primarily in the treatment of opioid-induced mu receptor-mediated respiratory depression. The opioid antagonist naloxone is administered parenterally, whereas naltrexone is administered orally.

opioid receptor, any of a number of types of receptors for opiates and opioids. At least seven different types are postulated at different locations in the body, grouped into three major classes (delta, kappa, and mu) according to the specific substances they bind and to the specific physiological effect or effects that binding causes or inhibits.

opisthion /ō·pis′thē·on/ [Gk, *opisthion,* rear, posterior], a landmark located at the midpoint of the posterior border of the foramen magnum.

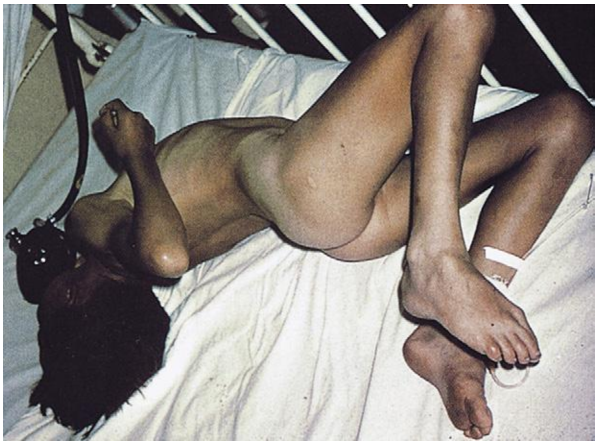
opistho-, prefix meaning "backward or relating to the back": *opisthognathism, opisthoporeia, opisthotonos.*

opisthorchiasis /ō′pisthôrkī′əsis/ [Gk, *opisthen,* behind, *orchis,* testicle, *osis,* condition], infection with one of the species of *Opisthorchis* liver flukes commonly found in the Philippines, India, Thailand, and Laos. Carcinoma of the intrahepatic bile ducts may be a late complication. Adequate cooking of freshwater fish prevents the disease.

Opisthorchis sinensis. See ***Clonorchis sinensis.***

opisthotonos /ō′pisthot′ənəs/ [Gk, *opisthios,* posterior, *tonos,* straining], a prolonged severe spasm of the muscles causing the back to arch acutely, the head to bend back on the neck, the heels to bend back on the legs, and the arms and hands to flex rigidly at the joints. It is related to meningitis.

opium /ō′pē·əm/ [Gk, *opion,* poppy juice], a milky exudate from the unripe capsules of *Papaver somniferum* and *Papaver album* yielding 9.5% or more of anhydrous morphine. It is an opioid analgesic, a hypnotic, and an astringent. Opium contains several alkaloids, including codeine, morphine, and papaverine. See also **codeine, morphine sulfate, opium tincture, papaverine hydrochloride, paregoric.**



Opisthotonos *(Farrar, 1993)*

opium alkaloid, one of several alkaloids isolated from the milky exudate of the unripe seed pods of *Papaver somniferum,* a species of poppy indigenous to the Near East. Two of the alkaloids, codeine and morphine, are used clinically for the relief of pain, but their use entails the risk of physical or psychological dependence. Morphine is the standard against which the analgesic effect of newer drugs for relief of pain is measured. The opium alkaloids and their semisynthetic derivatives, including heroin, act on the central nervous system, producing analgesia, change in mood, drowsiness, and mental slowness. The effects in a person who has pain are usually pleasant. Euphoria and pain-free sleep are not uncommon, but nausea and vomiting sometimes occur. In usual doses the analgesic effects are achieved without loss of consciousness. The opium alkaloids have several other effects on the various systems of the body: coughing is suppressed; the electrical activity pattern of the brain resembles that of sleep; the pupils constrict; respiration is depressed in rate, minute volume, and tidal exchange; the secretory activity and motility of the GI tract are diminished; and biliary and pancreatic secretions are reduced. The use of morphine as an antidiarrheal preceded its use as an analgesic by hundreds of years. Prepared in a tincture, it remains the most effective constipating agent available. Papaverine, another opium alkaloid, does not cause analgesia but is used clinically as a vasodilator.

opium tincture, an analgesic and antidiarrheal.

■ INDICATIONS: It is prescribed in the treatment of intestinal hyperactivity, cramping, and diarrhea.

■ CONTRAINDICATIONS: Drug dependence, the presence of toxic matter in the bowel, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are drug dependence, toxic megacolon, and central nervous system depression.

opo-, prefix meaning “juices or certain fluids, including hormones”: *opsinuria.*

Oppenheim reflex /op′ənhīm/ [Herman Oppenheim, German neurologist, 1858–1919], a variation of Babinski’s reflex elicited by firmly stroking downward on the anterior and medial surfaces of the tibia, characterized by extension of the great toe and fanning of other toes. It is a sign of pyramidal tract disease. Compare **Chaddock reflex, Gordon’s reflex.** See also **Babinski’s reflex.**

opponens digiti minimi, a muscle that originates from the hook of the hamate and from the adjacent flexor retinaculum and inserts into the medial margin and palmar surface of the fifth metacarpal, rotating it toward the palm.

opponens pollicis, the largest of the three thenar muscles. It rotates and flexes the first metacarpal on the trapezium, so bringing the pad of the thumb into a position facing the pads of the fingers.

opportunistic infection [L, *opportunus,* convenient, *icus,* form], **1.** an infection caused by normally nonpathogenic organisms in a host whose resistance has been decreased by disorders such as diabetes mellitus, human immunodeficiency virus (HIV) infection, or cancer; a surgical procedure such as a cerebrospinal fluid shunt or a cardiac or urinary tract catheterization; or immunosuppressive drugs. Long-term use of antibiotics or other drugs may also affect the immune system, creating opportunity for microorganisms not usually pathogenic to become pathogens. People with HIV are particularly susceptible to such infections. **2.** an unusual infection with a common pathogen, such as cellulitis, meningitis, or otitis media.

opportunistic pathogen, an organism that exists harmlessly as part of the normal human body environment and does not become a health threat until the body’s immune system fails.

opposition [L, *opponere,* to oppose], the relation between the thumb and the other digits of the hand for the purpose of grasping objects between the thumb and fingers.

oprelvekin /o-prel′vĕ-kin′/, recombinant interleukin-11, used as a stimulator of hematopoiesis to prevent thrombocytopenia after myelosuppressive chemotherapy.

ops-, opto-, opti-, optico-, prefix meaning “visible or vision or sight”: *optoblast, optometer, optostriate.*

-ops, -opsia. See **-opia.**

opscan, abbreviation for *optical scanning.*

opsin, a protein that combines with retinal to form visual pigments (rhodopsin and iodopsin) in the photoreceptor cells of the retina.

opsonin /op′sənin/ [Gk, *opsonein,* to supply food], an antibody or complement split product that, on attaching to foreign material, microorganisms, or other antigens, enhances phagocytosis of that substance by leukocytes and other macrophages. **—opsonize,** *v.*

opsonization /op′sənizā′shən/ [Gk, *opsonein* + *izein,* to cause], the action of opsonin. Also called *opsonification.*

opsonize. See **opsonin.**

-opsy. See **-opia.**

opti-. See **ops-.**

optic [Gk, *optikos,* sight], pertaining to the eyes or to sight. Also spelled **optical.**

-optic, -optical, suffix meaning “vision”: *bioptic, panoptic, preoptic.*

optic activity /op′tik/, the rotation of the plane of polarized light clockwise or counterclockwise. Substances that rotate the plane of polarized light to the right are dextrorotatory; those that rotate the plane to the left are levorotatory.

optical. See **optic.**

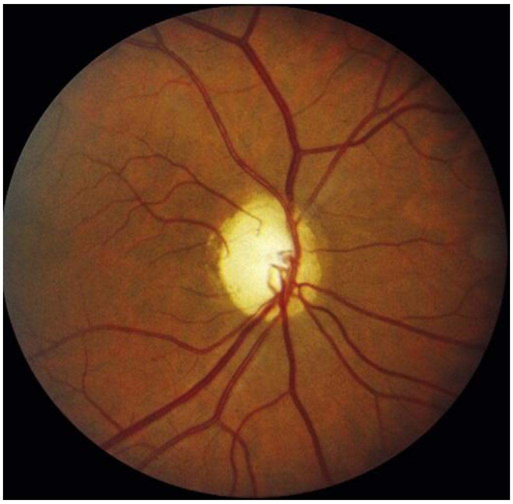
optical biopsy, any technique that uses the interaction of light and tissue to provide information about the tissue.

optical disk, a large-capacity digital data storage device used to store digital images.

optically stimulated luminescence dosimeter (OSL dosimeter), a personal radiation monitoring device similar to the thermoluminescence dosimeter but using aluminum oxide to absorb the energy of x-rays and a laser rather than heat to release the stored energy and measure the dose of ionizing radiation received. See also **thermoluminescent dosimetry.**

optic angle. See **visual angle.**

optic atrophy, wasting of the optic disc resulting from degeneration of fibers of the optic nerve and optic tract. In primary optic atrophy the disc is white and sharply margined, the central depression (physiological cup) is enlarged, and the optic foramen of the sclera is clearly visible. In secondary atrophy the disc is gray, its margins are blurred, the depression is filled in, and the foramen is difficult to detect. Optic atrophy may be caused by a congenital defect, inflammation, occlusion of the central retinal artery or internal carotid artery, alcohol, arsenic, lead, tobacco, or other toxic substances. Degeneration of the disc may also accompany arteriosclerosis, diabetes, glaucoma, hydrocephalus, pernicious anemia, and various neurological disorders.



Optic atrophy *(Willis, 2008)*

optic brightener, a compound that absorbs ultraviolet light and emits visible light.

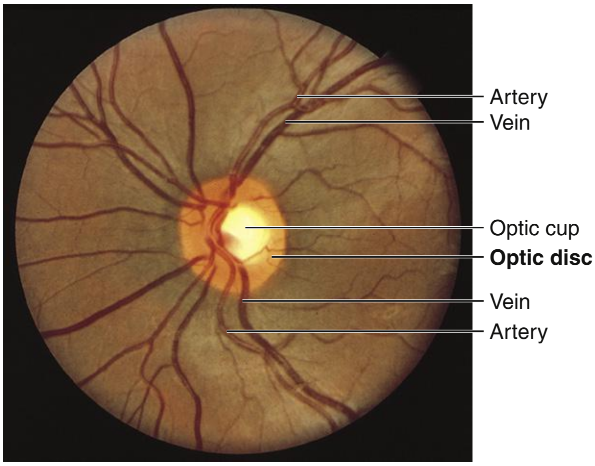
optic chiasm [Gk, *optikos,* sight, *chiasma,* crossed lines], a point near the thalamus and hypothalamus where parts of each optic nerve cross over.

optic coupling, the attachment of the crystal window of a scintillator to the window of a photomultiplier tube. It maximizes the transmission of light from the scintillator to the interior of the photomultiplier tube.

optic cup, a two-layered embryonic cavity that develops in early pregnancy. The optic cup is completed by the seventh week with the closing of the choroidal fissure. The cup initially develops from the infolding of the optic vesicle after the vesicle separates from the embryonic ectoderm. The cells of the optic cup differentiate to form the retina that first develops its layers of rods and cones in the central part of the cup, growing as the layer gradually spreads toward the cup margin. The outer layer of the cup persists as the pigmented layer of the retina; the inner layer develops the nervous elements and the supporting fibers of the retina. Compare **optic stalk.**

optic density, a number describing the blackening of an x-ray film in any specified location. In general, the optic density is the logarithm of the ratio of incident light intensity to the intensity of light transmitted through that area and is measured with a densitometer.

optic disc, the small blind spot on the surface of the retina, located about 3 mm to the nasal side of the macula. It is the point where the fibers of the retina leave the eye and become part of the optic nerve. It is the only part of the retina that is insensitive to light. At its center the porus opticus marks the point of entrance of the central artery of the retina. Also called *(informal)* **blind spot, discus nervi optici.**



Optic disc *(Swartz, 2009/Courtesy Karen Ann Klima, BA, CRA, COMT, The Johns Hopkins Center for Hereditary Eye Diseases, The Wilmer Eye Institute)*

optic fissure. See **retinal fissure.**

optic foramen [Gk, *optikos,* sight, *foramen,* hole], an aperture in the root of the lesser wing of the sphenoid bone transmitting the optic nerve.

optic glioma, a slow-growing tumor on the optic nerve or in the chiasm, composed of glial cells. Symptoms may include loss of vision, secondary strabismus, exophthalmos, and ocular paralysis.

optician /optish′ən/ [Gk, *optikos,* sight], a person who grinds and fits eyeglasses and contact lenses by prescription. To become an optician, a person must graduate from high school and complete a 4- or 5-year apprenticeship. In some states licensure is required.

optic illusion [Gk, *optikos,* sight; L, *illudere,* to mock], a false visual image derived from a misinterpretation of sensory stimuli caused by physical or psychological factors or both. A common optic illusion is the appearance of railroad tracks merging in the distance.

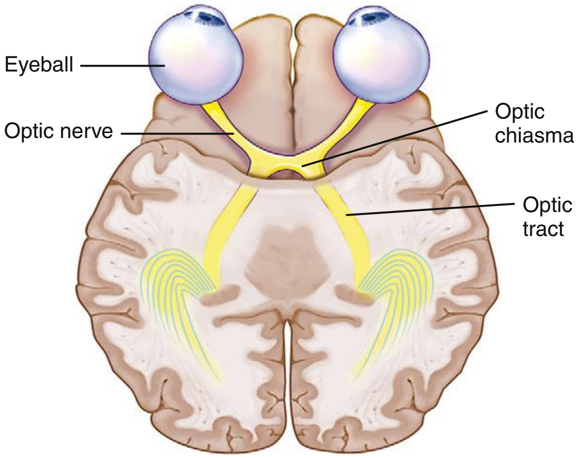
optic laser, optic maser. See **laser.**

optic nerve, one of a pair of nerves that transmit visual impulses. The optic nerve is not a true cranial nerve but is rather an extension of the brain. It consists mainly of coarse myelinated fibers that arise in the retinal ganglionic layer, traverse the thalamus, and connect with the visual cortex. At the optic chiasm the fibers from the inner or nasal half of the retina cross to the optic tract of the opposite side. The remaining fibers from the temporal or outer half of each retina are uncrossed and pass to the visual cortex on the same side. The visual cortex functions in the perception of light, shade, and objects. The optic nerve fibers correspond to a tract of fibers within the brain. Also called **nervus opticus, second cranial nerve.**

optic neuritis [Gk, *optikos,* sight, *neuron,* nerve, *itis,* inflammation], inflammation, degeneration, or demyelinization of the optic nerve or optic disc caused by a wide variety of diseases. Loss of vision is the cardinal symptom. Also called **retrobulbar neuritis.**

optic neuropathy [Gk, *optikos,* sight, *neuron,* nerve, *pathos,* disease], a disease, generally noninflammatory, of the eye, characterized by dysfunction or destruction of the optic nerve tissues. Causes include an interruption in the blood supply, compression by a tumor or aneurysm, a nutritional deficiency, and toxic effects of a chemical. The disorder, which can lead to blindness, usually affects only one eye.

optico-. See **ops-.**



Optic nerve

opticokinetic. See **optokinetic.**

optic papilla. See **papilla.**

optic radiation [Gk, *optikos,* sight; L, *radiare,* to shine], a system of fibers from the lateral geniculate body of the thalamus that pass through the sublenticular part of the internal capsule to the striate area.

optic righting, one of the five basic neuromuscular reactions that enable a person to change body positions. It involves a reflex that automatically orients the head to a new optical or visual fixation point, depending on the body position change.

optic righting reflex [Gk, *optikos,* sight; AS, *riht* + L, *reflectere,* to bend back], a reflex that restores normal posture and head position with the help of visual clues.

optics /op′tiks/ [Gk, *optikos,* sight], **1.** (in physics) a field of study that deals with the electromagnetic radiation of wavelengths shorter than radio waves but longer than x-rays. **2.** (in physiology) a field of study that deals with vision and the process by which the functions of the eye and the brain are integrated in the perception of shapes, patterns, movements, spatial relationships, and color.

optic stalk, one of a pair of slender embryonic structures that becomes the optic nerve. In the embryo the optic stalk develops during the second week and attaches the optic vesicle to the wall of the brain. The stalk becomes complete during the seventh week of pregnancy when the choroidal fissure closes and is later converted into the optic nerve when retinal nerve fibers fill the cavity of the stalk. A few fibers grow into the stalk from the brain. About the tenth week after birth, the fibers of the optic nerve receive their myelin sheaths. Compare **optic cup.**

optic system assessment, an evaluation of the patient's eyes, vision, and current and past disorders or injuries that may be responsible for abnormalities in the individual's optic system.

■ METHOD: The patient is interviewed to determine if vision is blurred, double, decreased, or absent in one or both eyes or diminished peripherally at night or in bright light. The interviewer asks if halos or lights are seen and if the patient collides with unfamiliar objects or is unable to distinguish objects held too close or too far; if the eyes water, itch, or feel tender, painful, or fatigued; and if an injury to the eye, face, or head has occurred. Observations are made of the patient's general appearance, vital signs, kind of eyeglasses or contact lenses worn, the amount of tearing, ability to blink, tendency to rub the eyes, and visual acuity. Evidence is recorded of conjunctivitis, drainage, optic hemorrhage, edema or ptosis of the eyelids, exophthalmos, strabismus, nystagmus, scleral edema, chalazion, lacerations, contusions, or a foreign body in the eye. Carefully noted are signs of aging; glaucoma; cataract; retinal detachment; and the presence of multiple sclerosis, diabetes mellitus, myasthenia gravis, gonorrhea, thyroid dysfunction, sinus problems, or cerebral trauma or tumors. The patient's report of previous eye operations or treatments, head or face trauma, arteriosclerosis, glomerulonephritis, retinal degeneration, episodes of coma, therapy with oxygen, and drug misuse are investigated, as well as a family history of glaucoma or diabetes. Also explored are the possibility that the patient has a hazardous job or recreation (and note is made of any safety precautions taken); the individual's misuse of alcohol; and use of medication, especially antibiotics, antiemetics, miotics, mydriatics, and acetazolamide. Diagnostic aids available for the evaluation include a test of visual fields, an x-ray film of the orbit and skull, an ophthalmoscopic examination, tonometry, a brain scan, and microscopic studies of conjunctival scrapings.

■ INTERVENTIONS: A health care provider conducts the interview, observes the patient, and assembles pertinent background data and the results of the diagnostic procedures.

■ OUTCOME CRITERIA: A careful assessment of the patient's eyes and vision and of certain aspects of the medical, family, and social history is a significant aid in establishing the diagnosis of an optic system disorder.

optic thermometer, a temperature-measuring device in which the properties of transmission and reflection of visible light are temperature dependent, the detection of which can be related to tissue temperature.

optic tract [Gk, *optikos,* sight; L, *tractus*], a flat band of nerve fibers running backward and laterally around each cerebral peduncle from the optic chiasma to the lateral geniculate body. Each tract carries information from the two eyes.

optic vesicle, an early embryonic outgrowth from the ventrolateral wall of the forebrain. Its cells develop into the retina and optic nerve of the eye. Also called **ophthalmic vesicle.**

Optimine, a trademark for an antihistamine **(azatadine maleate).**

optional water loss /op′shənəl/, a volume of average daily water loss, in addition to obligatory water loss, depending on physical activities, climate, and other factors. See also **obligatory water loss.**

opto-. See **ops-.**

optokinetic /op′tōkinet′ik/ [Gk, *optikos,* sight, *kinesis,* motion], pertaining to movement of the eyeballs in response to the movement of objects across the visual field, such as in optokinetic nystagmus. Also **opticokinetic.**

optometric vision therapy, a treatment plan prescribed to correct or improve specific dysfunctions of the vision system. It includes, but is not limited to, the treatment of strabismus (turned eye), other dysfunctions of binocularity (eye teaming), amblyopia (lazy eye), accommodation (eye focusing), ocular motor function (general eye movement ability), and visual-motor and visual-perceptual abilities.

optometric vision therapy technician (OVTT), an allied health professional, supervised by an optometrist, who participates in evaluating clients and in planning and implementing optometric vision therapy programs.

optometrist /optom′ətrist/ [Gk, *optikos,* sight, *metron,* measure], a person who practices optometry. An optometrist is awarded the degree of Doctor of Optometry (O.D.) after completion of at least 3 years of college followed by 4 years in an approved college of optometry. A state examination and license are also required. See also **optician, optometry.**

optometry /optom′ətrē/ [Gk, *optikos,* sight, *metron,* measure], the practice of primary eye care, including testing the eyes for visual acuity, prescribing corrective spectacles or contact lenses and topical medications, and managing binocular vision disorders. See also **optician.**

OPV, abbreviation for **oral poliovirus vaccine.**

-opy. See **-opia.**

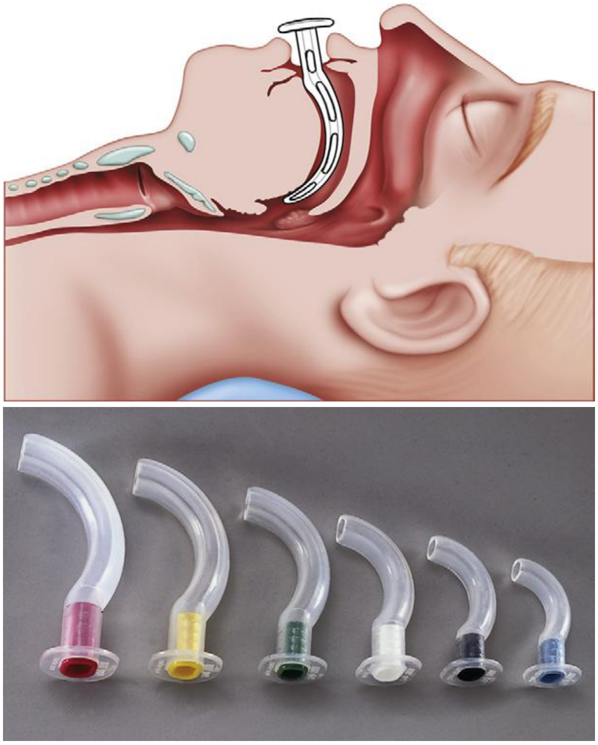
OR, O.R., abbreviation for **operating room.**

ora /ō′rə/ *pl. orae* [L], an edge or margin.

oral /ôr′əl/ [L, *oralis,* pertaining to the mouth], pertaining to the mouth. Compare **buccal, parenteral.**

oral administration of medication, the administration of a tablet, a capsule, an elixir, or a solution or other liquid form of medication by mouth. An adequate amount of water should be given to lubricate or dissolve the solid medications or to dilute the liquid forms for swallowing. Preparations with a disagreeable taste may be given with something of sufficient flavor to disguise the bad taste. Substances that are harmful to the teeth are given through a straw. People who have difficulty swallowing pills or capsules may find it easier to swallow the medication if they look up as they swallow. Looking up while swallowing opens the esophagus. With patients who have difficulty swallowing, the oral cavity is always checked for pocketing the medication. Research shows that sitting up for 15 to 30 minutes after oral medications promotes dissolution of the medication and decreases gastric irritation. Oral administration of medication includes **buccal administration of medication** and **sublingual administration of medication.**

oral airway, a curved tubular device of rubber, plastic, or metal placed in the oropharynx during general anesthesia and other situations in which the level of consciousness is impaired. Its purpose is to maintain free passage of air and keep the tongue from obstructing the trachea. The artificial airway is not removed until the patient begins to awaken and regains pharyngeal, cough, and swallowing reflexes.



Oral airways *(Courtesy Rusch, Inc.)*

oral and maxillofacial surgeon. See **dental surgeon.**

oral and maxillofacial surgery [L, *oralis,* pertaining to the mouth; Gk, *cheirourgos,* surgeon], one of the nine recognized dental specialties. Oral and maxillofacial surgery is the specialty of dentistry which includes the diagnosis, surgical and adjunctive treatment of diseases, injuries, and defects involving both the functional and esthetic aspects of the hard and soft tissues of the oral and maxillofacial region. Also called **maxillofacial surgery, oral surgery.** See also **dental surgeon.**

KaVo

Surgical handpiece for oral surgery
(Courtesy KaVo Dental, Charlotte, North Carolina)

oral cancer, a malignant neoplasm on the lip or in the mouth that occurs at an average age of 60, with a frequency eight times higher in men than in women. Predisposing factors are alcoholism; heavy use of tobacco; poor oral hygiene; ill-fitting dentures; syphilis; Plummer-Vinson syndrome; betel nut chewing; and, in lip cancer, pipe smoking and overexposure to sun and wind. Premalignant leukoplakia or erythroplasia or a painless nonhealing ulcer may be the first sign of oral cancer; localized pain usually occurs later, but lymph nodes may be involved early in the course. Diagnostic measures include digital examination, biopsy, exfoliative cytology, x-ray film of the mandible, and chest films to detect metastatic lung lesions. Almost all oral tumors are epidermoid carcinomas. Adenocarcinomas occur occasionally, whereas sarcomas and metastatic lesions from other sites are rare. Small primary lesions may be treated by excision or irradiation, and more extensive oral tumors may be treated by surgery, with removal of involved lymph nodes and preoperative or postoperative radiotherapy. Among chemotherapeutic agents administered are cisplatin, methotrexate, 5-fluorouracil, bleomycin, and Adriamycin. Postoperative nursing care involves maintenance of airway patency, relieving pain, promoting adequate nutrition, and health teaching regarding follow-up care and psychosocial adjustment if body image has been affected.

oral cavity [L, *oralis,* pertaining to the mouth, *cavum,* cavity], the space within the mouth, containing the tongue and teeth. See also **mouth.**

oral cavity proper. See **mouth.**

oral character, (in psychoanalysis) a kind of personality that exhibits patterns of behavior originating in the first phase of infancy, the **oral stage.** This personality is characterized by optimism, self-confidence, and carefree generosity reflecting the pleasurable aspects of the stage; or pessimism, futility, anxiety, and sadism as manifestations of frustrations or conflicts occurring during the period. See also **oral eroticism, psychosexual development.**

oral contraceptive (OC), oral hormone medication for contraception. The two major sex hormones in females are estrogens and progestins. When synthetic forms of these hormones are taken, they inhibit the production of gonadotropin-releasing hormone by the hypothalamus; the pituitary therefore does not secrete gonadotropins to stimulate follicular maturation and ovulation. Depending on the formulation, cyclical changes in the uterus, vagina, and breasts may be similar to a normal menstrual cycle. Progestin-only oral contraceptives generally do not block ovulation. Instead they cause the cervical mucus to remain thick, which prevents the entry of sperm into the uterus and fallopian tubes. Seasonale, an extended-cycle method of contraception with menstrual periods every three months, was recently approved by the FDA. Contraindications to the oral contraceptives include pregnancy, diabetes mellitus, liver disease, hyperlipidemia, thrombotic complications, coronary artery disease, and sickle cell disease. Patients with depression and migraine headaches and those who are heavy cigarette smokers need to be followed up more often. The pregnancy rate when oral contraceptives are used correctly is less than 0.2% a year. See also **contraception.**

oral decongestant, a drug such as pseudoephedrine prescribed for the relief of nasal congestion. Oral decongestants do not appear to cause nasal swelling after long periods of use. They are commonly combined with antihistamines for the treatment of allergic rhinitis. Abuse may cause constipation.

oral dosage, the administration of a medicine by mouth.

oral eroticism, (in psychoanalysis) a libidinal fixation at, or regression to, the oral stage of psychosexual development, often reflected as an oral character. Also called *oral erotism.* Compare **anal eroticism.**

oral examination [L, *oralis,* pertaining to the mouth, *examinatio,* weighing], a clinical, visual, and tactile inspection and investigation of the hard and soft structures of the oral cavity for purposes of assessment, diagnosis, planning, treatment, and evaluation. Before the examination, the client's full medical and dental health histories are obtained and studied for information concerning predisposition to bacteremia and the resulting need for premedication. If available, radiographs or dental images are used in conjunction with an oral examination.

oral-facial-digital (OFD) syndrome, type I, an X-linked dominant disorder lethal in males characterized by camptodactyly, polydactyly, and syndactyly; cranial, facial, lingual, and dental anomalies; and mental retardation, familial trembling, alopecia, and seborrhea of the face and milia. Also called **orodigitofacial dysostosis, orofaciodigital syndrome,** *type I*

oral-facial-digital (OFD) syndrome, type II. See **Mohr's syndrome.**

oral-facial-digital (OFD) syndrome, type III, an autosomal-recessive disorder characterized by postaxial hexadactyly of the hands and feet; ocular, lingual, and dental anomalies; and profound mental retardation. Also called **orodigitofacial dysostosis, orofaciodigital syndrome,** *type III*

oral hairy leukoplakia. See **hairy leukoplakia.**

oral health maintenance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as maintenance and promotion of oral hygiene and dental health for the patient at risk for developing oral or dental lesions. See also **Nursing Interventions Classification.**

oral health promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of oral hygiene and dental care for a patient with normal oral and dental health. See also **Nursing Interventions Classification.**

oral health restoration, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of healing for a patient who has an oral mucosa or dental lesion. See also **Nursing Interventions Classification.**

oral herpes. See **herpes simplex.**

oral hygiene[1], the condition or practice of maintaining the tissues and structures of the mouth. Oral hygiene includes brushing the tongue and teeth to remove food particles and residue, bacteria, and plaque; massaging the gums with a toothbrush, dental floss, or water irrigator to stimulate circulation and remove foreign matter; and cleansing dentures and ensuring their proper fit to prevent irritation. Dependent or unconscious patients are assisted in maintaining a healthy oral condition. Such care includes lubricating the lips and cleaning the inside of the cheeks, the roof of the mouth, and the tongue as well as the teeth and gingiva. In addition, the health care provider checks for carious teeth, broken teeth, and loose teeth that might be swallowed or aspirated.

oral hygiene[2], a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the condition of the mouth, teeth, gums, and tongue. See also **Nursing Outcomes Classification.**

oral hypoglycemic agent, an oral antidiabetic agent commonly used in the treatment of type 2 diabetes mellitus. Oral hypoglycemic agents are not prescribed as a substitute for diet and exercise but rather as adjunctive therapy. An oral hypoglycemic agent cannot be used as monotherapy in patients with type 1 diabetes mellitus since these patients lack sufficient insulin.

oral mucosa, the mucous membrane of the cavity of the mouth, including the gums.

oral pathology, the branch of pathology that deals with the structural and functional changes in cells, tissues, and organs of the oral cavity that cause or are caused by disease.

oral poliovirus vaccine (OPV), an attenuated preparation of live poliovirus that confers immunity to poliomyelitis. Also called **Sabin vaccine.**

■ INDICATIONS: Replaced by inactivated poliovirus vaccine (IPV), OPV supplies in the United States will be limited once existing supplies are depleted. It was routinely prescribed for immunization against poliomyelitis, but its use is now limited to treatment in areas with outbreaks of paralytic polio.

■ CONTRAINDICATIONS: Immunosuppression, concomitant use of corticosteroids, cancer, immunoglobulin abnormalities, or acute infection prohibits its use.

■ ADVERSE EFFECTS: Adverse effects are uncommon. Cases of vaccine-induced paralytic disease have occurred but are very rare. Nonetheless, it is because of the risk of vaccine-induced paralytic poliomyelitis that an all-IPV immunization schedule is recommended for children in the United States.

oral prophylaxis [L, *oralis,* pertaining to the mouth; Gk, *prophylax,* advance guard], the science and practice of preventing the onset of diseases of the teeth and adjoining mouth tissues. It involves removing bacterial plaque, food debris, stains, and calculus from the crowns and roots with hand scaling or ultrasonic scaling instruments and hand or electric polishers.

oral rehydration solutions (ORS) [L, *oralis,* pertaining to the mouth, *re + hydor,* water, *solutus,* dissolved], solutions of electrolytes and glucose used in oral rehydration therapy.

The recommended electrolytes include NaCl, KCl, and trisodium citrate.

oral rehydration therapy (ORT), the adjustment of water, glucose, and electrolyte balance in a dehydrated patient by giving fluids with measured amounts of essential ingredients by mouth.

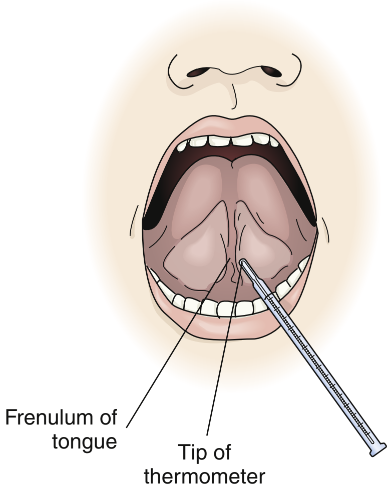
oral sadism, (in psychoanalysis) a sadistic form of oral eroticism manifested by such behavior as biting, chewing, and other aggressive impulses associated with eating habits. Compare **anal sadism.**

oral stage, (in psychoanalysis) according to Freud, the initial stage of psychosexual development occurring in the first 12 to 18 months of life, when the feeding experience and other oral activities are the predominant source of pleasurable stimulation. Adult patterns of behavior associated with this stage include overeating, loquaciousness, alcoholism, smoking addictions, and a sarcastic personality. See also **oral character, psychosexual development.**

oral surgeon. See **dental surgeon.**

oral surgery. See **oral and maxillofacial surgery.**

oral temperature [L, *oralis,* pertaining to the mouth, *temperatura*], the body temperature as recorded by a clinical thermometer placed in the mouth. It is normally around 98.6° F (37° C), but it may vary within a fraction of a degree, depending on the individual and such factors as time of day, sleep, and exercise and whether measured before or after a meal. See also **normal temperature.**



Placement of thermometer for oral temperature measurement *(Sorrentino, 2008)*

oral tolerance therapy, a treatment in which a patient ingests a foreign protein in an attempt to develop tolerance to that protein when it is encountered as an antigen. In addition to inhibiting allergic reactions, the therapy may suppress immune responses in general.

Orap, a trademark for an oral neuroleptic drug **(pimozide).**

ora serrata retinae, the irregular, serrated demarcation between the retina and the ciliary body. It is the most anterior peripheral part of the retina.

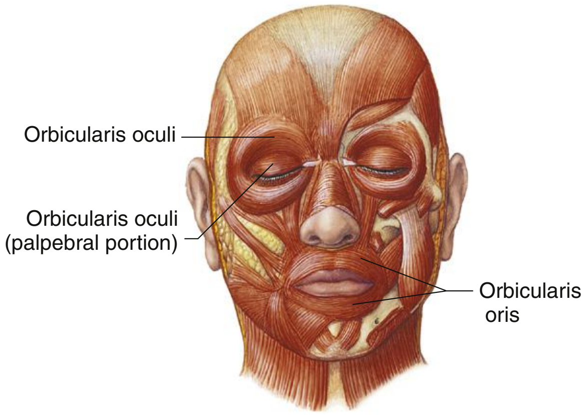
orb /ôrb/ [L, *orbis,* circle], describing something spheric or globelike.

orbicular /ôrbik′yələr/ [L, *orbiculus,* little circle], pertaining to something round.

orbicular bone [L, *orbiculus,* little circle; AS, *ban*], a knob on the end of the long process of the incus that articulates with the stapes.

orbicularis ciliaris /ôrbik′yo͞olär′is/ [L, *orbiculus,* little circle; *cilium,* eyelash], one of the two zones of the ciliary body of the eye, extending from the ora serrata of the retina to the ciliary processes at the margin of the iris. The orbicularis ciliaris is about 4 mm wide and increases in thickness as it approaches the ciliary processes.

orbicularis oculi, the muscular body of the eyelid, encircling the eye and comprising the palpebral, orbital, and lacrimal muscles. It arises from the nasal part of the frontal bone, the frontal process of the maxilla in front of the lacrimal groove, and the anterior surface of the medial palpebral ligament. The palpebral muscle functions to close the eyelid gently; the orbital muscle functions to close it more energetically, such as in winking. Also called **orbicularis palpebrarum.** Compare **corrugator supercilii, levator palpebrae superioris.**



Muscles of the face: orbicularis oculi and orbicularis oris *(Patton and Thibodeau, 2010)*

orbicularis oris, the muscle surrounding the mouth. It consists partly of fibers derived from other facial muscles such as the buccinator that are inserted into the lips and partly of fibers proper to the lips. It serves to close and purse the lips.

orbicularis palpebrarum. See **orbicularis oculi.**

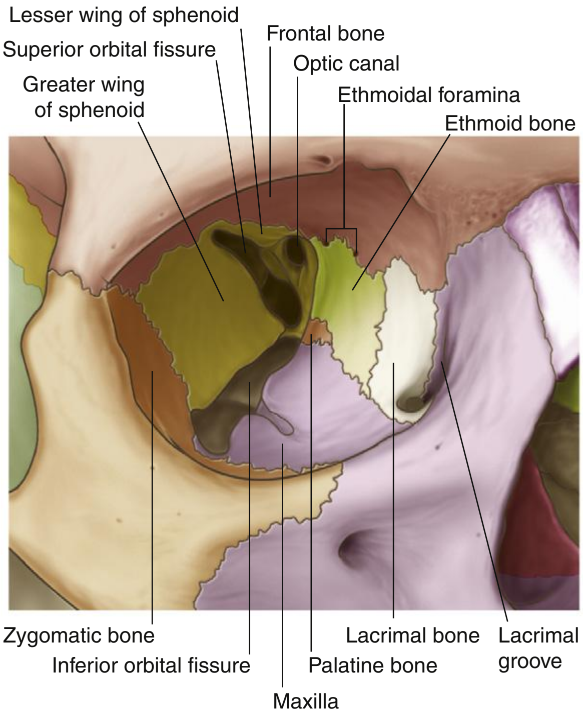
orbicularis pupillary reflex, a normal phenomenon elicited by forceful closure of the eyelids or attempting to close them while they are held apart, resulting first in constriction and then dilation of the pupil.

orbit /ôr′bit/ [L, *orbita,* wheel track], one of a pair of bony, conical cavities in the skull that accommodate the eyeballs and associated structures, such as the eye muscles, nerves, and blood vessels. The medial walls of the orbits are approximately parallel with each other and with the middle line, but the lateral walls diverge widely. The roof of each orbit is formed by the orbital plate of the frontal bone and the small wing of the sphenoid bones. The openings that communicate with each orbit are the optic foramen, the superior and the inferior orbital fissures, the supraorbital foramen, the infraorbital canal, the anterior and posterior ethmoidal foramina, the zygomatic foramen, and the canal for the nasolacrimal duct. —*orbital, adj.*

orbital aperture /ôr′bitəl/, an opening in the cranium to the orbit of the eye.

orbitale /ôrbitā′lē/ [L, *orbitalis,* pertaining to the orbit], an anthropometric landmark, the lowest point on the inferior margin of the orbit.

orbital fat, a semifluid adipose cushion that lines the bony orbit supporting the eye. Selective loss of fatty tissue caused by hormonal imbalances may produce “bulging” of the eye.



Bones of the orbit *(Drake, Vogl, and Mitchell, 2010)*

Traumatic loss of the fat causes a sunken appearance of the eye. Replacement of the fat by tumor or abnormal tissue may be discovered on ophthalmological examination. The examiner gently presses on the front of the eyes through the eyelids. Normally each eye may be displaced 0.5 cm into the socket.

orbital fissure [L, *orbita,* wheel track, *fissura,* cleft], the space between the floor and lateral wall of the orbit, serving as a conduit for nerves and blood vessels.

orbital hypertelorism. See **ocular hypertelorism.**

orbital hypotelorism. See **ocular hypotelorism.**

orbital myositis, an inflammation of the external ocular muscles. The process, which is generally autoimmune, may be associated with pain, forward displacement of the eyeball, and paralysis of the ocular muscles. It can be part of orbital inflammatory syndrome.

orbital optic neuritis. See **optic neuritis.**

orbital pseudotumor, a specific inflammatory reaction of the orbital tissues of the eye, characterized by exophthalmos and edematous congestion of the eyelids.

orbitography /ôr′bitog′rəfē/, the radiographic examination of the bony cavity containing the eye.

orbitomeatal line /ôr′bitō′mē·ā′təl/ [L, *orbita,* wheel track, *meatus,* passage], a positioning line used in radiography of the skull that passes through the outer canthus of the eye and the center of the external auditory meatus.

orbitopathy /orbitop′əthē/ [L, *orbita,* wheel track + Gk, *pathos,* disease], disease affecting the orbit and its contents.

Orbivirus /ôr′bivī′rəs/ [L, *orbis,* ring], a genus of the Reoviridae family of viruses that contains double-stranded ribonucleic acid. It is characterized by an outer layer of rings of capsomeres. Insects are hosts for orbiviruses. Colorado tick fever and African horse sickness are among infections caused by species of these viruses. Orbiviruses are primarily animal pathogens; only 7 out of 100 of these are linked to clinical human disease.

orcheoplasty. See **orchioplasty.**

orchi-. See **orchio-.**

orchidectomy /ôr′kidek′təmē/ [Gk, *orchis,* testis, *ektomē,* excision], surgical removal of one or both testes. It may be indicated for serious disease or injury to the testis or to control cancer of the prostate by removing a source of androgenic hormones. Also called **orchiectomy.**

orchiditis. See **orchitis.**

orchido-. See **orchio-.**

orchidoplasty. See **orchioplasty.**

orchiectomy. See **orchidectomy.**

orchio-, orchi-, orchido-, prefix meaning "testes": *orchiocatabasis, orchiopathy, orchioscirrhus.*

orchiopexy /ôr′kē·ōpek′sē/ [Gk, *orchis* + *pexis,* fixation], an operation to mobilize an undescended testis, bring it into the scrotum, and attach it so that it will not retract.

orchioplasty /ôr′kē·ōplas′tē/ [Gk, *orchis,* testis, *plassein,* to mold], a surgical procedure involving a testis. Also called **orcheoplasty, orchidoplasty.**

orchis. See **testis.**

orchitis /ôrkī′tis/ [Gk, *orchis* + *itis,* inflammation], inflammation of one or both of the testes, characterized by swelling and pain. The condition is often caused by mumps, syphilis, or tuberculosis. Symptomatic treatment includes support and elevation of the scrotum, cold packs, and analgesics. Also called **didymitis, orchiditis.** —*orchitic, adj.*

orchitis parotidea. See **mumps orchitis.**

orciprenaline sulfate. See **metaproterenol sulfate.**

ordered pairs [L, *ordo,* series, *par,* equal], pertaining to graph coordinates in which the first number of the pair represents a distance along the *x* (horizontal) axis and the second number is plotted along the *y* (vertical) axis.

orderly /ôr′dərlē/, **1.** *n,* an attendant who assists in the care of hospital patients. **2.** *adj,* in order; with regular arrangements, method, or system. —*orderliness, adj.*

order of procedure, the sequence in which the required steps are taken to complete an operation, such as preparation of the patient and preparation of the cavity and restoration of a tooth.

order transcription, a nursing intervention from the Nursing Interventions Classification (NIC) defined as transferring information from order sheets to the nursing patient care planning and documentation system. See also **Nursing Interventions Classification.**

Orem, Dorothea E. [1914-2007], author of the Self-Care Nursing Model, a nursing theory introduced in 1959. The Orem theory describes the role of the nurse in helping a person experiencing inabilities in self-care. The goal of the Orem system is to meet the patient's self-care demands until the family and/or patient is capable of providing care. The process is divided into three categories: *universal,* which consists of self-care to meet physiological and psychosocial needs; *developmental,* the self-care required when one goes through developmental stages; and *health deviation,* the self-care required when one has a deviation from a healthy status. Assessment is made of therapeutic self-care demand, the self-care agency, and self-care deficits in the areas of knowledge, skills, motivation, and orientation. There are three systems for meeting the patient's self-care deficits. They are *wholly compensatory,* in which the patient has no active role; *partly compensatory,* in which the patient and nurse have active roles; and *educative development,* in which patients can meet their need for self-care with some assistance from the nurse.

Orencia, a trademark for **abatacept.**

Oretic, a trademark for a diuretic **(hydrochlorothiazide).**

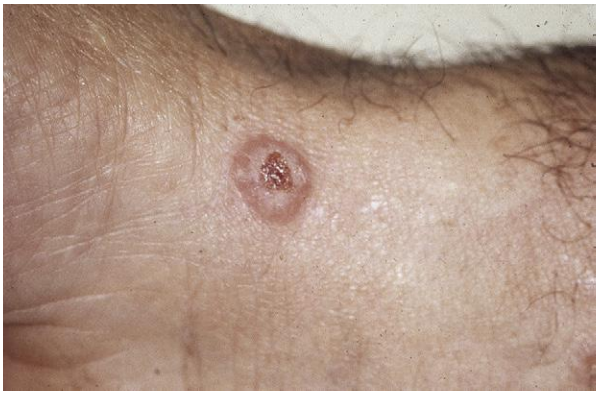
-orexia, suffix meaning "(condition of the) appetite": *anorexia, cynorexia, dysorexia.*

orexigenic /ôrek′sijen′ik/ [Gk, *orexis*, longing, *genein*, to produce], a substance that increases or stimulates the appetite.

oreximania /ôrek′simā′nē·ə/ [Gk, *orexis* + *mania*, madness], a condition characterized by a greatly increased appetite and excessive eating resulting from an unrealistic or exaggerated fear of becoming thin. Compare **anorexia nervosa.**

orexis /ôrek′sis/ [Gk, longing], **1.** desire, appetite. **2.** the aspect of the mind involving feeling and striving as contrasted with the intellectual aspect.

orf [AS], a contagious viral skin disease acquired from infected sheep and goats, characterized by painless vesicles that may progress to red, weeping nodules and finally to crusting and healing. Fingers, hands, wrist, and face are common sites. Treatment is not necessary because the condition is self-limited, and active infection results in immunity. Also called **contagious pustular dermatitis.**



Orf *(Conlon and Snydman, 2000)*

Orfadin, a trademark for **nitisinone.**

organ [Gk, *organon*, instrument], a structural part of a system of the body that is composed of tissues and cells that enable it to perform a particular function, such as the liver, spleen, digestive organs, reproductive organs, or organs of special sense. Each one of the paired organs can function independently of the other. The liver, pancreas, spleen, and brain may maintain normal or near normal function with over 30% of the organ damaged, destroyed, or excised. Also called **organon, organum.**

organ albumin, albumin characteristic of a particular organ.

organelle /ôrgənel′/ [Gk, *organon*, instrument], **1.** any one of various specialized macromolecular structures bound within most cells, such as the mitochondria, the Golgi apparatus, the endoplastic reticulum, the lysosomes, and the centrioles. **2.** any one of the tiny structures of protozoa associated with locomotion, metabolism, and other processes. Also called *organella*.

organic /ôrgan′ik/ [Gk, *organikos*], **1.** *n,* any chemical compound containing carbon, other than simple metal carbonate, hydrogen carbonate, or cyanides. Compare **inorganic. 2.** *adj,* pertaining to an organ.

-organic, suffix meaning “related to the internal organs of the body”: *enorganic, homorganic, psychorganic*.

organic brain syndrome. See **organic mental disorder.**

organic chemistry, the branch of chemistry concerned with the composition, properties, and reactions of chemical compounds containing carbon. Specifically, the study of the hydrocarbons and their derivatives.

organic disease [Gk, *organikos* + L, *dis* + Fr, *aise*, ease], any disease associated with detectable or observable changes in one or more body organs.

organic dust, dried particles of plants, animals, fungi, or bacteria that are fine enough to be wind-borne. Many kinds of organic dust cause various respiratory disorders if inhaled. See also **asthma, bagassosis, byssinosis, hay fever.**

organic dust toxic syndrome (ODTS), any nonallergic, noninfectious respiratory illness caused by inhalation of organic dust, as from moldy silage, hay, or other agricultural products. Symptoms include shaking chills or sweats, cough or shortness of breath, headache, anorexia, and myalgia. See also **farmer’s lung, hypersensitivity pneumonitis.**

organic evolution, the theory that all existing forms of animal and plant life have descended with modification from previous simpler forms or from a single cell; the origin and perpetuation of species.

organic foods, foods that have been produced and processed without the use of commercial chemicals such as fertilizers or pesticides or synthetic substances that enhance color or flavor. Organic foods must meet legally regulated production standards in order to use the term organic.

organic headache, a headache caused by any of a wide variety of intracranial disorders, including sinus or ear infections, brain tumors, and subdural hematomas. See also **headache.**

organic mental disorder (OMD), any of a *DSM-IV* class of psychiatric disorders characterized by progressive deterioration of the mental processes and caused by permanent brain damage or temporary brain dysfunction.

organic mental syndrome, former term for a constellation of psychological or behavioral signs and symptoms associated with brain dysfunction of unknown or unspecified cause and grouped according to symptoms. Designating certain conditions as having an organic basis, possibly implying that others do not, is currently discouraged. Compare **organic mental disorders.**

organic mood syndrome, a term used in a former system of classification, denoting an organic mental syndrome characterized by the presence of manic or depressive mood disturbance caused by a specific organic factor and not associated with delirium. Such disorders are now mainly classified as *substance-induced mood disorders* and *mood disorders due to a general medical condition*. See also **organic mental syndrome.**

organic motivation. See **physiological motivation.**

organic murmur, an abnormal cardiac sound caused by congenital or acquired heart disease.

organic personality syndrome, a term used in a former system of classification, denoting an organic mental syndrome characterized by a marked change in behavior or personality, caused by a specific organic factor and not associated with delirium or dementia. The most common causes are space-occupying lesions of the brain, head trauma, and cerebrovascular disease. See also **organic mental syndrome.**

organic psychosis [Gk, *organikos* + *psyche*, mind, *osis*, condition], a condition characterized by a loss of contact with reality caused by an alteration in brain tissue function.

organic solvents, chemicals, such as benzene, that damage tissues by dissolving fats and oils. Exposure is mainly by inhalation but may also occur by ingestion or by skin or eye contact. Organic solvents affect a wide variety of systems, and the signs and symptoms of exposure depend on the organ involved and duration of contact. Treatment consists of removal of the agent from the body, gastric lavage when indicated, and supportive care.

organic vertigo [Gk, *organikos* + L, *vertigo*, dizziness], vertigo that is associated with a central nervous system disorder such as cerebellar lesions or tabes dorsalis.

organification /ôrgan′ifikā′shən/, a process in the thyroid gland whereby iodide is oxidized and incorporated into tyrosyl residues (tyrosine) of thyroglobulin. Organification is catalyzed by the enzyme thyroid peroxidase.

Organisation Mondiale de la Santé. See **World Health Organization.**

organism /ôr′gəniz′əm/ [Gk, *organon,* instrument], an entity capable of carrying on life functions. All organisms are composed of cells.

organization center /ôr′gənīzā′shən/ [Gk, *organon* + *izein,* to cause], a focal point within the developing embryo from which the organism grows and differentiates. In vertebrates this point is the chorda-mesoderm of the dorsal lip of the blastopore.

organizer /ôr′gənī′zər/ [Gk, *organon* + *izein,* to cause], (in embryology) any part of the embryo that induces morphological differentiation in some other part. Those parts that are formed and in turn give rise to other parts are classified as organizers of the second degree, third degree, and so on as the embryo develops in complexity. Kinds of organizers include **nucleolar organizer, primary organizer.**

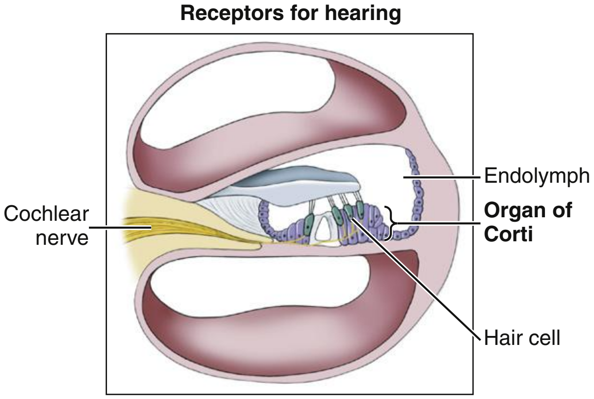
organo-, prefix meaning "organ or organs": *organofaction, organogenesis, organoleptic.*

organoaxial volvulus, the more common of the two types of gastric volvulus, in which the stomach twists around its longitudinal axis. This type is more common in the elderly.

organocarbamate insecticide poisoning /ôr′gənō-kär′bəmāt/, an adverse reaction to pesticides derived from esters of carbonic acid. Some of those insecticides are formulated in methyl alcohol, acquiring its added toxicity. The effects are similar to those of organophosphate insecticides, but the toxicity is less, and the duration of effects is shorter. The organocarbamate insecticides rarely produce overt central nervous system effects. See also **organophosphate insecticide poisoning.**

organochlorine insecticide poisoning /-klôr′ēn/, an adverse reaction to DDT-like pesticides such as chlordane and methoxychlor. Symptoms include central nervous system disorders, convulsions, increased myocardial irritability, and depressed respiration.

organ of Corti [Gk, *organon;* Alfonso Corti, Italian anatomist, 1822–1888], the true organ of hearing, a spiral structure within the cochlea containing hair cells that are stimulated by sound vibrations. The hair cells convert the vibrations into nerve impulses that are transmitted by the cochlear part of the vestibulocochlear nerve to the brain. Also called **spiral organ of Corti.** See also **basilar membrane.**



Organ of Corti *(Herlihy, 2011)*

organ of Giraldés. See **paradidymis.**

organ of Golgi. See **neurotendinous spindle.**

organogenesis /-jen′əsis/ [Gk, *organon* + *genesis,* origin], (in embryology) the formation and differentiation of organs and organ systems during embryonic development. In humans the period extends from approximately the end of the second week through the eighth week of gestation. During this time the embryo undergoes rapid growth and differentiation and is extremely vulnerable to environmental hazards and toxic substances. Any interference with the sequential processes involved with organogenesis causes an arrest in development and results in one or more congenital anomalies. Also called *organogeny.* See also **embryological development, prenatal development.** —*organogenetic, adj.*

organoid /ôr′gənoid/ [Gk, *organon* + *eidos,* form], **1.** *adj,* resembling an organ. **2.** *n,* any structure that resembles an organ in appearance or function, specifically an abnormal tumor mass. See also **organelle.**

organoid neoplasm, a growth that resembles a body organ. Compare **heterologous tumor.**

organoid tumor. See **teratoma.**

organomegaly /-meg′əlē/ [Gk, *organon,* instrument, *megas,* large], abnormal enlargement of an organ, particularly an organ of the abdominal cavity.

organon. See **organ.**

organophosphate, any of a class of anticholinesterase chemicals used in certain pesticides and war gases. Organophosphates act by causing irreversible inhibition of cholinesterase.

organophosphate insecticide poisoning /-fos′fāt/, an adverse reaction to organophosphate pesticides such as malathion, and chlorothion, as well as nerve gas agents. Symptoms include nausea, vomiting, abdominal cramping, headache, blurred vision, and excessive salivation.

organophosphorus /or′gäno-fos′fārus/, a compound containing phosphorus bound to an organic molecule. Some are used as insecticides and others are nerve gases; they are highly toxic acetylcholinesterase inhibitors.

organophosphorus compound poisoning, poisoning, often fatal, by excessive exposure to an organophosphorus compound. There are usually neurological symptoms, such as axonopathy and paralysis.

organotherapy /-ther′əpē/ [Gk, *organon* + *therapeia,* treatment], the treatment of disease by administering animal endocrine glands or their extracts. Whole glands are no longer implanted, but substances derived from animal organs are widely used. Also called **Brown-Séquard's treatment.** —*organotherapeutic, adj.*

organotypic growth /ôr′gənōtip′ik/ [Gk, *organon* + *typos,* mark], the controlled reproduction of cells, such as that which occurs in the normal growth of tissues and organs. Compare **histiotypic growth.**

organ procurement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as guiding families through the donation process to ensure timely retrieval of vital organs and tissue for transplant. See also **Nursing Interventions Classification.**

organ specificity, a term describing a substance or activity that is identified with a specific organ, commonly applied to enzymes that function in particular organ systems.

organum. See **organ.**

orgasm /ôr′gasəm/ [Gk, *orgein,* to be lustful], the sexual climax, a series of strong involuntary contractions of the muscles of the genitalia, accompanied in males by ejaculation of semen, experienced as exceedingly pleasurable, set off by sexual excitation of critical intensity. —*orgasmic, adj.*

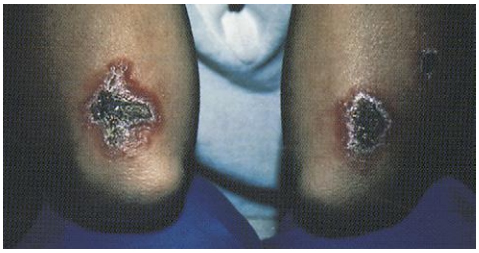
orgasmic maturity /ôrgas′mik/, the physiological maturity of the reproductive system that enables the individual to complete the adult sexual response cycle.

orgasmic platform [Gk, *orgein* + Fr, *plate-forme,* a flat form], congestion of the lower vagina during sexual intercourse.

orient /ôr′ē·ənt/ [L, *oriens,* rising sun], **1.** to make someone aware of new surroundings, including people and their roles; the layout of a facility; and its routines, rules, and services. New patients are oriented to a hospital, as are new staff to a hospital unit. **2.** to help a person become aware of a situation or simply of reality, such as when a patient recovers from anesthesia. **—orientation,** *n.,* **oriented,** *adj.*

Oriental medical practices, a term referring to ancient forms of medicine that focus on prevention and secondarily treat disease with an emphasis on maintaining balance through the body by stimulating a constant, smooth-flowing Qi energy. Herbs, acupuncture, massage, diet, and exercise are also used.

oriental sore. See **cutaneous leishmaniasis.**



Oriental sore *(Auerbach, 2012/Courtesy Dr. Richard Kaplan)*

orientation /ôr′ē·əntā′shən/ [L, *oriens* + *itio,* process], **1.** the direction of a fragment of nucleic acid inserted into a vector. The orientation of the fragment may be the same as that of the genetic map of the vector (the n orientation) or opposite (the u orientation). **2.** the awareness of one's physical environment with regard to time, place, and the identity of other people; the ability to adapt to such an existing or new environment. Disorientation is usually a symptom of organic brain disease and most psychoses.

orientation and mobility specialist, a human services professional who specializes in helping the visually impaired and legally blind to acclimate to their physical environments.

oriented. See **orient.**

Orientia tsutsugamushi /ôr′e·enshe′ə tso̅o̅tso̅o̅gəmo̅o̅′she/ [L, *oriens,* east; Jpn, *tsutsuga,* illness + *mushi,* tick], a species of organisms, formerly known as *Rickettsia tsutsugamushi,* that causes scrub typhus. It is widespread throughout southern and eastern Asia, northern Australia, Indonesia, and the Pacific islands and is transmitted from infected rodents to humans by mites of the family Trombiculidae.

orifice /ôr′ifis/ [L, *orificium,* opening], the entrance or outlet of any body cavity. Also called **ostium.** *—orificial, adj.*

ori gene /ôr′ē/, (in molecular genetics) the site or region in which deoxyribonucleic acid replication starts.

origin /ôr′ijin/ [L, *origo,* source], the more fixed or most proximal attachment of two points of a muscle. Compare **insertion.**

Orimune, a trademark for an active immunizing agent **(live oral poliovirus vaccine).**

Orinase, a trademark for an oral sulfonylurea antidiabetic **(TOLBUTamide).**

Orlando (Pelletier), Ida Jean, (1926–2007), a nursing theorist who first described her nursing process theory in *The Dynamic Nurse-Patient Relationship* (1972). Her theory stresses the reciprocal relationship between the nurse and patient and the use of the nursing process to meet the patient's need and thus alleviate distress. Three elements—patient behavior, nurse reaction, and nursing actions—comprise a nursing situation. Orlando divided actions into those that are either automatic or deliberate. Perceptions, thoughts, and feelings are not explored in automatic actions. Deliberate actions are those that may yield solutions to problems and also prevent problems. She focused on the patient's verbal and nonverbal expressions of needs. The nurse reacts to the patient's behavior by discerning both the meaning of the distress and what would alleviate the distress. Orlando's contribution as a theorist has advanced nursing from personal and automatic responses to disciplined and professional practice responses.

orlistat, a lipase inhibitor.

- INDICATION: It is used to manage obesity.
- CONTRAINDICATIONS: Malabsorption syndrome, cholestasis, and known hypersensitivity to this drug prohibit its use.
- ADVERSE EFFECTS: Adverse effects include back pain, arthritis, myalgia, tendinitis, depression, anxiety, dizziness, headache, fatigue, nausea, vomiting, abdominal pain, infectious diarrhea, rectal pain, tooth disorder, urinary tract infection, vaginitis, menstrual irregularity, influenza, upper respiratory infection, eye-ear-nose-throat symptoms, dry skin, and rash. Common side effects include insomnia, oily spotting, flatus with discharge, fecal urgency, fatty/oily stool, oily evacuation, and fecal incontinence.

Ornish diet, a vegetarian diet containing 10% of calories from fat, 20% from protein, and 70% from carbohydrates, used in combination with stress reduction techniques and moderate exercise for the prevention and treatment of cardiovascular disease.

ornithine /ôr′nithēn/, an amino acid, not a constituent of proteins, that is produced as an important intermediate substance in the urea cycle. It is formed by the hydrolization of arginine by arginase and is subsequently converted into citrulline. It decomposes by losing carbon dioxide, producing putrescine and a strong foul odor characteristic of decaying animal tissue. Also called **diaminovaleric acid.**

ornithine carbamoyltransferase, an enzyme in the blood that increases in patients with liver and other diseases. Its normal concentration in serum is 8 to 20 mIU/mL. Also called **ornithine transcarbamoylase.**

ornithine carbamoyltransferase (OCT) deficiency, an X-linked aminoacidopathy involving the biosynthesis of urea. Most hemizygous males show complete deficiency and do not survive the neonatal period. Heterozygous females show varying degrees of deficiency and age of onset. Characteristic signs include hyperammonemia, neurological abnormalities, and orotic aciduria.

ornithine cycle. See **urea cycle.**

ornithine transcarbamoylase. See **ornithine carbamoyltransferase.**

Ornithodoros /ôr′nithod′ərəs/ [Gk, *ornis,* bird, *doros,* leather bag], a genus of ticks, some species of which are vectors for the spirochetes of relapsing fevers.

ornithosis. See **psittacosis.**

oro-, prefix meaning "mouth": *orolingual, oromaxillary, oropharynx.*

orodigitofacial dysostosis. See **oral-facial-digital syndrome, types I, II, III.**

orofacial /ôr′ōfā′shəl/ [L, *os, oris,* mouth, *facies,* face], pertaining to the mouth and face.

orofaciodigital syndrome. See **oral-facial-digital syndrome, types I, II, III.**

oropharyngeal dysphagia /ôr′ōfərin′jē·əl/, difficulty in either the oral or pharyngeal phases of swallowing, such as in chewing, initiating the swallow, or propelling the bolus through the pharynx to the esophagus. It is caused by multiple neurological, structural, or other medical conditions.

oropharyngeal isthmus. See **faucial isthmus.**

oropharynx /ôr′ōfer′ingks/ [L, *oris,* mouth; Gk, *pharynx,* throat], one of the three anatomical divisions of the pharynx that lies posterior to the mouth and is continuous above with the nasopharynx and below with the laryngopharynx. It extends behind the mouth from the soft palate above to the level of the hyoid bone below and contains the palatine and lingual tonsils. Compare **laryngopharynx, nasopharynx.** —*oropharyngeal, adj.*

orotic acid /ôrot′ik/, a pyrimidine synthesized in the cell from carboxyl phosphate and aspartic acid by means of condensation, dehydration, and oxidation.

orotic aciduria, a rare autosomal-recessive inherited disorder of pyrimidine metabolism. It includes signs and symptoms of macrocytic hypochromic anemia with megaloblastic changes in bone marrow, leukopenia, retarded growth, and urinary excretion of large amounts of orotic acid.

Oroya fever. See **bartonellosis.**

-orphan, suffix for morphine-derived opioid agonists or antagonists.

orphan disease /ôr′fən/, any rare health disorder for which no treatment has been developed. See also **orphan drug.**

orphan drug /ôr′fən/ [Gk, *orphanos,* without parents; ME, *drogge*], a term that generally refers to drugs needed to treat rare diseases but can encompass any pharmaceutic product available to physicians and patients in countries other than the United States that has not been "adopted" by a domestic pharmaceutic manufacturer or distributor. An orphan drug may not be available in the United States because total sales would not justify the expense of research and development or because the medication may be a natural substance that cannot be effectively protected by patent laws against competition from a similar form of the product. The U.S. Orphan Drug Act of 1983 offers federal financial incentives to commercial and nonprofit organizations to develop and market drugs previously unavailable in the United States for rare diseases affecting fewer than 200,000 people. The FDA assists in the process with its office of Orphan Product Development.

orphan virus [Gk, *orphanos,* without parents; L, *virus,* poison], a virus that has been isolated and identified, although it has not been associated with any particular disease.

orphenadrine citrate /ôrfen′ədrēn/, a skeletal muscle relaxant with anticholinergic and antihistaminic activity.

■ INDICATION: It is prescribed in the treatment of severe muscle strain.

■ CONTRAINDICATIONS: Myasthenia gravis, glaucoma or other contraindications to anticholinergic agents, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are those associated with anticholinergic activity, such as dry mouth and tachycardia, and allergic reactions.

-orrhagia, -rrhagia, -rrhage, suffix meaning "excessive flow": *hemorrhage, metrorrhagia.*

-orrhea, -rrhea, suffix meaning "flow or discharge": *galactorrhea, rhinorrhea.*

-orrhexis, -rrhexis, suffix meaning "to rupture": *angiorrhexis, enterorrhexis.*

orrho-, oro-, prefix meaning "blood serum": *orrhomeningitis, orrhoreaction, orrhorrhea.*

ORS, abbreviation for **oral rehydration solutions.**

ORT, abbreviation for **oral rehydration therapy.**

orthetist. See **orthotist.**

ortho, abbreviation for *orthopedic.*

ortho- /ôr′thə-/, prefix meaning "straight, normal, correct": *orthobiosis, orthodontist, orthotopic.*

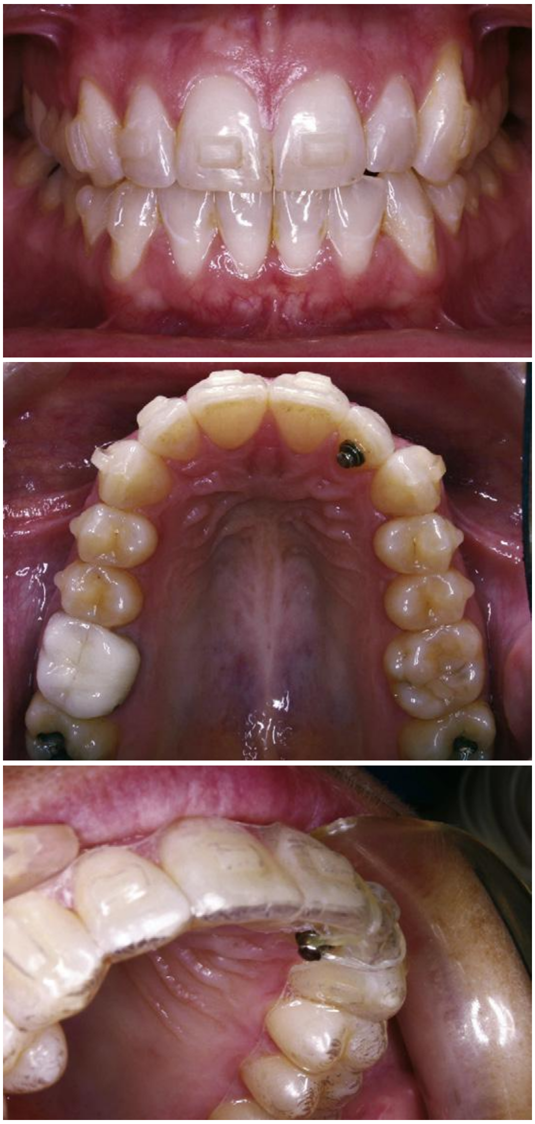
orthoboric acid. See **boric acid.**

orthochromatic /or′thō·krō·mat′ik/, denoting a photographic emulsion sensitive to all colors except red.

orthoclase ceramic feldspar /ôr′thəklās/ [Gk, *orthos,* straight, *klassis,* breaking, *keramikos,* pottery], a plentiful clay in the solid crust of the earth, used to fill space and give body to fused dental porcelain. Compare **feldspar.**

Orthoclone OKT3, a trademark for an immunosuppressant drug **(muromonab-Cd3).**

orthodontic appliance /-don′tik/ [Gk, *orthos* + *odous,* tooth], any device used to modify tooth position. Kinds of appliances are **extraoral anchorage, intraoral orthodontic appliance,** and **retainer.**



Invisalign *(Proffit, Fields, and Sarver, 2007)*

orthodontic attachment. See **bracket.**

orthodontic band, a thin metal ring, usually made of stainless steel, that is fitted over a tooth and bonded or cemented to it for securing orthodontic attachments to the tooth. See also **adjustable orthodontic band.**

orthodontics and dentofacial orthopedics /ôr′thədon′tiks/ [Gk, *orthos* + *odous,* tooth], the specialty of dentistry concerned with the diagnosis and treatment of malocclusion and irregularities of the teeth.

orthodontic wire. See **arch wire.**

orthodontist /-don′tist/, a dental specialist who practices the diagnosis, prevention, and correction of malocclusion along with neuromuscular and skeletal abnormalities of the developing or mature oral structures of the teeth.

orthodromic conduction /ôr′thədrom′ik/ [Gk, *orthos* + *dromos,* course; L, *conducere,* to connect], the conduction of a neural impulse in the normal direction, from a synaptic junction or a receptor forward along an axon to its termination with depolarization. Compare **antidromic conduction.**

orthogenesis /ôr′thəjen′əsis/ [Gk, *orthos* + *genesis,* origin], the theory that evolution is controlled by intrinsic factors within the organism and progresses according to a predetermined course rather than in several directions as a result of natural selection and other environmental factors. *—orthogenetic, adj.*

orthogenic /-jen′ik/ [Gk, *orthos* + *genein,* to produce], **1.** pertaining to orthogenesis; orthogenetic. **2.** pertaining to the treatment and rehabilitation of children who are mentally or emotionally disturbed. See also **orthopsychiatry.**

orthogenic evolution, change within an animal or plant induced solely by an intrinsic factor, independent of any environmental elements. Also called **bathmic evolution.**

orthognathic surgery, reconstruction of the mandible, the maxilla, or both, performed to repair acquired or congenital facial defects like cleft palate. Surgery is usually not performed until the patient has enough permanent teeth to permit postoperative immobilization. Although an oral and maxillofacial surgeon performs the surgery, an orthodontist and sometimes a speech and language therapist are involved in the planning. Root canal surgery is a common complication.

Orthohepadnavirus /or′thohepad′nahvi′rus/, a genus of hepadnaviruses that includes the hepatitis B virus infecting humans.

orthokinetic cuff /-kinet′ik/ [Gk, *orthos,* straight, *kinesis,* movement; ME, *cuffe*], an elastic covering for a muscle that provides tactile stimulation sufficient to induce contraction and that restricts contraction of an opposing muscle.

orthokinetics /-kinet′iks/ [Gk, *orthos,* straight, *kinesis,* movement], **1.** a therapy for hypertrophic osteoarthritis in which an effort is made to change muscular action from one group to another to protect a joint. **2.** a therapy for spasticity that uses an orthotic device to enable contraction of one muscle while inhibiting its antagonist. **3.** the movement of microscopic particles in the same direction during sedimentation as a result of the effect of gravity on Brownian motion.

orthologous genes /ôrthol′əgəs/, genes in different species that are similar in their nucleotide sequences, suggesting that they originated from a common ancestral gene.

orthomolecular medicine, a system for the prevention and treatment of disease based on the theory that each person's biochemical environment is genetically determined and specific to the individual. Therapy is provided by supplementation with substances naturally present in the body, such as vitamins, minerals, trace elements, and amino acids, in amounts that are optimized for each individual to correct nutritional deficiencies and the resulting biochemical abnormalities.

orthomyxovirus /ôr′thəmik′sōvī′rəs/ [Gk, *orthos* + *mykes,* fungus; L, *virus,* poison], a member of a family of viruses that includes several organisms responsible for human influenza infection.

Ortho-Novum, a trademark for oral contraceptives containing an estrogen **(ethinyl estradiol** or **mestranol)** and a progestin **(norethindrone).**

orthopaedics. See **orthopedics.**

orthopantogram /ôr′thəpan′təgram/ [Gk, *orthos* + *pan,* all, *gramma,* record], a radiograph that is taken extraorally and shows a panoramic view of the entire dentition, alveolar bone, and other adjacent structures on a single film.

orthopedic nurse /-pē′dik/ [Gk, *orthos* + *pais,* child], a nurse whose primary area of interest, competence, and professional practice is the branch of nursing concerned with the prevention and correction of disorders of the locomotor system, including the skeleton, muscles, joints, and related tissues.

orthopedic oxford, a hard leather shoe with a leather or rubber sole, sometimes with a steel shank between the floor of the shoe and the sole, and with firmly constructed sides that support the foot in an upright position. The shoe is constructed so that assistive devices can be added. It is used to relieve pain and improve function in foot disabilities.

orthopedics /-pē′diks/ [Gk, *orthos,* straight, *pais,* child], a branch of health care that is concerned with the prevention and correction of disorders of the musculoskeletal system of the body. Also spelled **orthopaedics.**

orthopedic surgery [Gk, *orthos,* straight, *pais,* child, *cheirourgia,* surgery], the branch of medicine that is concerned with the treatment of the musculoskeletal system, mainly by manipulative and operative methods.

orthopedic traction, a procedure in which a patient is maintained in a device attached by ropes and pulleys to weights that pull on an extremity or body part while countertraction is maintained. Traction is applied most often to reduce and immobilize fractures, but it also is used to overcome muscle spasm, stretch adhesions, correct certain deformities, and help release arthritic contractures. Side arm traction is a kind of skin traction used to align a fractured humerus after open reduction. Skeletal traction is exerted directly on a bone by means of a wire or pin inserted under anesthesia during the open reduction of a fracture; the ends of the pin protruding through the skin on both sides of the bone are sometimes covered with corks and are attached to a metal U-shaped spreader or bow, which in turn is attached to the traction rope. Skin or skeletal traction applied to a lower extremity by a balanced suspension apparatus, such as the Thomas splint and Pearson's attachment, permits the patient to move more freely in bed. The leg is balanced with countertraction, and any slack in traction caused by the patient's movements is taken up by the suspension apparatus. Bryant's traction, for treating fractures of the femur shaft in young children, uses a suspension apparatus to hold the legs at right angles to the body. A girdle that fits over the iliac crests and pelvis is used to apply traction for the relief of low back pain, and a cervical halter is used in applying traction to reduce neck pain. Cervical traction also may be used when a fracture of the cervical spine is suspected. Traction may be applied directly to the skin if the rope-pulley-weight system is attached to bands of adhesive, moleskin, or foam rubber or to a splint affixed to the affected limb.

■ METHOD: To maintain the required constant pull, the traction ropes are kept taut, free to ride over the pulleys, and securely tied to the weights, which must hang free—away from the bed and off the floor. Countertraction is maintained by elevating the patient's bed under the body part to which traction is applied. A chest restraint sheet may be applied to the patient in side arm traction for countertraction if necessary. During the initial stages of traction, the involved extremity is checked every 2 hours for quality of the distal pulse, color, warmth, motion, sensation, pain, and swelling. Blood pressure, temperature, pulse, and respirations are recorded every 4 hours until stable. Pain is controlled, and the patient is positioned as ordered. If the patient is in balanced suspension, abduction of the leg and a 20-degree angle between the thigh and bed are maintained; the heel is kept free of the sling under the calf. A harness restraint is used to prevent a child in Bryant's traction from turning over, and the child's buttocks are raised slightly from the mattress. Bed linen is changed only as necessary, and an air mattress is used when required. Every 2 hours the patient is helped with deep breathing and coughing exercises. Bony prominences are massaged, but vigorous rubbing is avoided. Lotion is applied to the skin, which is periodically inspected for signs of redness, abrasions, blisters, dryness, itching, excoriation, and pressure areas. For patients in skeletal traction, the pin insertion sites are inspected for signs of infection. The patient is observed every 4 hours for neurological signs, such as tingling, numbness, and loss of sensation or motion; for thrombophlebitis in the involved extremity; and for evidence of a pulmonary blood clot or fat embolus, as indicated by decreased breath sounds, fever, tachypnea, diaphoresis, anxiety, pallor, bloody or purulent sputum, tachycardia, or acute, severe chest pain. Oral hygiene is administered every 4 hours, and, unless contraindicated, a daily intake of 2 to 3 L of fluids is encouraged. As the patient's condition improves, his or her position is changed every 4 hours; if the kind of traction permits and if the upper extremities are not involved, a trapeze is added to the bed. The patient is taught to perform range-of-motion exercises with the uninvolved extremities, dorsiflexion and plantar flexion of the ankles, and isometric exercises, such as gluteal and abdominal contraction. A high-protein, low-carbohydrate diet is served, and vitamin and iron therapy may be ordered. The immobilized patient uses a flat, fracture bedpan and usually requires stool softeners or a mild laxative.

■ INTERVENTIONS: The patient in traction often needs extensive physical care and emotional support. The patient is encouraged to verbalize feelings and concerns about prolonged hospitalization and absence from work or school. To the greatest degree possible, the nurse encourages the patient to participate in self-care and to engage in diversions, such as handicrafts, reading, watching television, and listening to the radio. If the patient is not allowed to elevate to the head of the bed, specialized glasses called prism glasses aid in the ability to watch television.

■ OUTCOME CRITERIA: Diligent attention and nursing care are necessary to prevent pressure ulcers, infection, constipation, kidney stones, and other sequelae of immobility.

orthopedist /-pē′dist/, a physician who specializes in orthopedics. Also called *(informal)* **orthopod.**

orthopnea /ôrthop′nē·ə/ [Gk, *orthos* + *pnoia*, breath], an abnormal condition in which a person must sit or stand to breathe deeply or comfortably. It occurs in many disorders of the cardiac and respiratory systems, such as asthma, pulmonary edema, emphysema, pneumonia, congestive heart failure, and angina pectoris. Assessment includes noting the number of pillows used by the patient. Patients with orthopnea also report sleeping in recliners. Also spelled *orthopnoea*. See also **dyspnea.** —*orthopneic, adj*.

orthopneic position /ôr′thopnē′ik/ [Gk, *orthos*, straight, *pnoia*, breath; L, *positio*], a body position that enables a patient to breathe comfortably. Usually it is one in which the patient is sitting up and bent forward with the arms supported on a table or chair arms. Also called *orthopnea posture*.

orthopod. See **orthopedist.**

orthopoxvirus /or′thopoksvi′rus/, any member of a genus of poxviruses, including the viruses that cause human smallpox and vaccinia.

orthopsychiatry /-sīkī′ətrē/ [Gk, *orthos* + *psyche*, mind, *iatreia*, treatment], the branch of psychiatry that specializes in correcting incipient and borderline mental and behavioral disorders, especially in children, and in developing preventive techniques to promote mental health and emotional growth and development. It involves a collaborative approach from psychology, psychiatry, and psychiatric social work. See also **mental hygiene.**

orthoptic /ôrthop′tik/ [Gk, *orthos* + *ops*, eye], **1.** pertaining to normal binocular vision. **2.** pertaining to a procedure or technique for correcting the visual axes of eyes improperly coordinated for binocular vision.

orthoptic examination, an ophthalmoscopic examination of the binocular function of the eyes, typically performed by an orthoptist. A stereoscopic instrument presents a slightly different picture to each eye. The examiner notes the degree to which the pictures are combined by the normal process of fusion. If the person has diplopia, separate pictures are seen. If the person has suppression amblyopia, only one picture is seen. Vision training may improve binocular vision in some conditions.

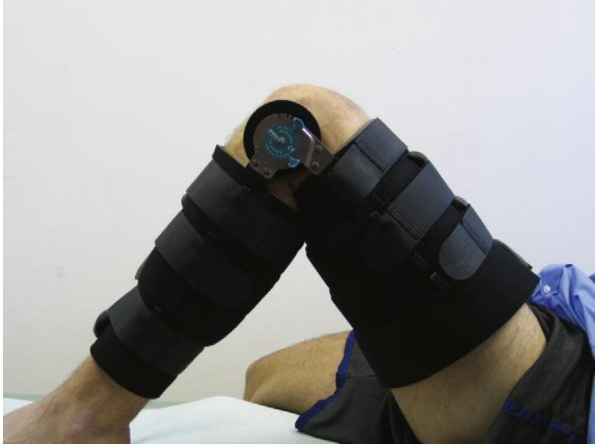
orthoptic training [Gk, *orthos*, straight; *ops*, eye; ME, *trainen*], a type of therapy for correction of squint or other ocular muscle disorders by the use of eye exercises.

orthoptist /ôrthop′tist/ [Gk, *orthos* + *ops*, eye], a person qualified by postsecondary training and successful completion of an examination by the American Orthoptist Council who, under the supervision of an ophthalmologist, tests eye muscles and teaches exercise programs designed to correct eye coordination defects.

orthoroentgenography /ôr′thōrent′gənog′rəfē/, a radiographic method for measuring disparity of limb length. Three separate radiographs are made of the hip, knee, and ankle (for the leg) or the shoulder, elbow, and wrist (for the arm) to produce an image of the whole limb.

orthoscopy /ôrthos′kəpē/ [Gk, *orthos*, straight, *skopein*, to view], the use of an orthoscope for examining the fundus of the eye.

orthosis /ôrthō′sis/ [Gk, *orthos*, straight], a force system designed to control, correct, or compensate for a bone deformity, deforming forces, or forces absent from the body. Orthosis often involves the use of special braces. —**orthotic,** *adj*., *n*.



Knee orthosis *(Courtesy Breg, Carlsbad, California)*

orthostasis /-stā′sis/, maintenance of an upright standing posture. In some medical tests a patient may need to maintain orthostasis for a long period to stimulate a rise in aldosterone concentration.

orthostatic /-stat′ik/ [Gk, *orthos* + *statikos,* standing], pertaining to an erect or standing position.

orthostatic albuminuria. See **orthostatic proteinuria.**

orthostatic hypotension, abnormally low blood pressure that occurs when an individual suddenly assumes the standing posture. It can produce dizziness and fainting. Also called **postural hypotension.**

orthostatic intolerance, an abnormal response to standing upright that results from decreased blood pressure and inadequate blood flow to the brain, characterized by a variety of symptoms, including lightheadedness, palpitations, tremulousness, visual disturbances, and syncope. It occurs in both acute and chronic forms and is frequently seen as a transient condition in space travelers returning from microgravity. The cause is unknown but may be related to abnormalities in the autonomic regulation of cardiovascular function.

orthostatic proteinuria, presence of protein in the urine, especially in teenagers who have been standing for a long period. It disappears when they recline and is of no pathological significance. Also called **orthostatic albuminuria, postural albuminuria, postural proteinuria.**

orthotic /ôrthot′ik/ [Gk, *orthos,* straight], pertaining to **orthosis.**

orthotics /ôrthot′iks/ [Gk, *orthos,* straight], the design and use of external appliances to support a paralyzed muscle, promote a specific motion, or correct a musculoskeletal deformity.

orthotist /ôr′thətist/ [Gk, *orthos,* straight], a person who designs, fabricates, and fits braces or other orthopedic appliances prescribed by physicians. A certified orthotist is one who passed the examination of the American Orthotist and Prosthetic Association. Also spelled **orthetist.**

orthotonos /ôrthot′ənəs/ [Gk, *orthos* + *tonos,* tension], a straight, rigid posture of the body caused by physiological tetanus, resulting from strychnine poisoning or tetanus infection. The neck and all other parts of the body are in a position of extension but not as severely as in opisthotonos. Compare **emprosthotonos.**

orthotopic liver transplantation [Gk, *ortho,* straight, *topos,* place], a graft of liver tissue occurring at its natural place or on the proper part of the body.

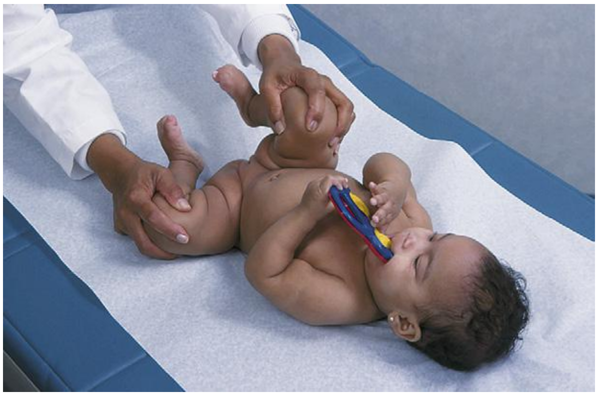
orthotopic neobladder, a urinary reservoir fashioned from a bowel segment that is in the normal anatomical position of the bladder and attached directly to the urethra, with discharge of urine through the urethra.

orthotopic ureterocele, a ureterocele occurring in a ureter in the proper position in the trigone of the bladder. It may be small and asymptomatic or large and extending deeply into the bladder.

orthovoltage /-vōl′tij/ [Gk, *orthos,* straight; Count Alessandro Volta], the energy range of 100 to 350 kiloelectron volts supplied by some x-ray generators used for radiation therapy. Such generators have been replaced in many health facilities by equipment that operates in the megaelectron volt range. See also **volt.**

Ortolani's sign /ôr′təlä′nē/ [Marius Ortolani, twentieth-century Italian surgeon], a click heard in a test for a congenital dislocated hip. It is noted in infancy when the hip slips into or out of the socket. Also called *Ortolani click.*

Ortolani's test [Marius Ortolani; L, *testum,* crucible], a procedure used to evaluate the stability of the hip joints in newborns and infants. The baby is placed on his or her back, and the hips and knees are flexed at right angles and abducted until the lateral aspects of the knees are touching the table. The examiner's fingers are extended along the outside of the thighs, with the thumbs grasping the insides of the knees. Internal and external rotation are attempted, and symmetry of mobility is evaluated. A click or a popping sensation (Ortolani's sign) may be felt if the joint is unstable, caused by the head of the femur moving out of the acetabulum under pressure from the examiner's hands during rotation and abduction. See also **congenital dislocation of the hip.**



Ortolani's test *(Seidel et al, 2011)*

Orudis, a trademark for a nonsteroidal antiinflammatory agent **(ketoprofen).**

-ory, suffix meaning "pertaining to, function of, process of": *sensory.*

os. See **bone.**

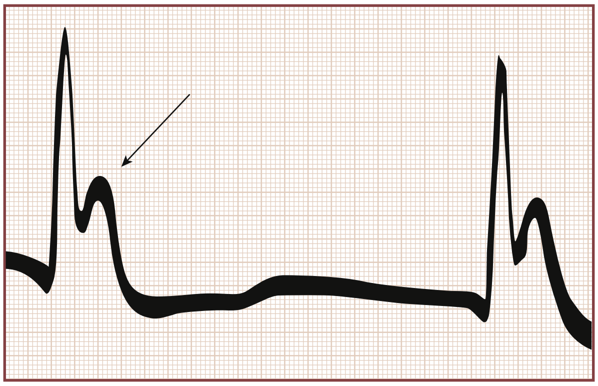
-os, suffix signaling singular nouns: *biologos, hepatomphalos, megophthalmos.*

Os, symbol for the element **osmium.**

OS, **1.** abbreviation for *oculus sinister,* a Latin phrase meaning "left eye." **2.** abbreviation for a computer **operating system.**

Osborne and Cotterill procedure, the surgical correction of a chronic dislocated elbow by means of capsular reefing, the folding in or overlapping of soft tissue followed by surgical suture to make the joint tighter.

Osborn wave, an abnormal upward deflection in the electrocardiogram (ECG) occurring at the junction of the QRS complex and the S-T segment. It is often found in ECGs of patients with moderate hypothermia and becomes more pronounced as body temperature declines. Also called **J wave.**



Osborn wave *(Goldman et al, 2008)*

osc, **1.** abbreviation for **oscillator.** **2.** abbreviation for **oscilloscope.**

os calcis. See **calcaneum, calcaneus.**

os capitatum. See **capitate bone.**

oscheitis /os′kē·ī′tis/, an inflammation of the scrotum.

oscheo-, prefix meaning "scrotum": *oscheocele, oscheolith, oscheoma*.

oscillation (HFO) /os′ilā′shən/ [L, *oscillare,* to swing], **1.** a back and forth motion. **2.** vibration or the effects of a mechanical or electric vibrator.

oscillator (osc) /os′ilā′tər/ [L, *oscillare,* to swing], an electric or other device that produces oscillations, vibrations, or fluctuations, such as an alternating electric current generator.

oscillopsia /os′silop′sē·ə/, abnormal jerky eye movements which are commonly associated with multiple sclerosis but can also result from head injury. They create a subjective sensation that the environment is oscillating.

oscilloscope (osc) /osil′əskōp/ [L, *oscillare,* to swing; Gk, *skopein,* to look], an instrument that displays a visual representation of electric variations on the fluorescent screen of a cathode ray tube. The graphic representation is produced by a beam of electrons on the screen. The beam is focused or directed by a magnetic field that is influenced in turn by a source such as an amplified current produced by heart contractions. As used in cardiology, the oscilloscope can function as a continuous electrocardiogram.

os coxae. See **innominate bone.**

os cuboideum. See **cuboid bone.**

-ose, **1.** suffix meaning a "carbohydrate": *cellulose, lactose, sucrose*. **2.** suffix meaning a "primary product of hydrolysis": *albumose, nucleose, myoproteose*.

oseltamivir, an antiviral.

■ INDICATION: It is used to treat type A influenza.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include fatigue, diarrhea, abdominal pain, and cough. Common side effects include headache, dizziness, insomnia, nausea, and vomiting.

Osgood osteotomy /oz′go͝od/, a surgical procedure for correcting the malrotation of a femur.

Osgood-Schlatter disease /-shlat′ər/ [Robert B. Osgood, American surgeon, 1873–1956; Carl Schlatter, Swiss surgeon, 1864–1934], inflammation or partial separation of the tibial tubercle caused by chronic irritation, usually as a result of overuse of the quadriceps muscle. The condition is seen primarily in muscular, athletic adolescent boys and is characterized by swelling and tenderness over the tibial tubercle that increase with exercise or any activity that extends the leg. Treatment consists primarily of preventing further irritation during the healing process, which may necessitate complete immobilization of the knee in a cast. Any residual nonunion of a proximal fragment after healing may require surgical excision. Also called *Osgood's disease,* **Schlatter-Osgood disease, Schlatter's disease.**

OSHA /ō′shä/, abbreviation for *Occupational Safety and Health Administration,* the federal agency that regulates worker safety.

os hamatum. See **hamate bone.**

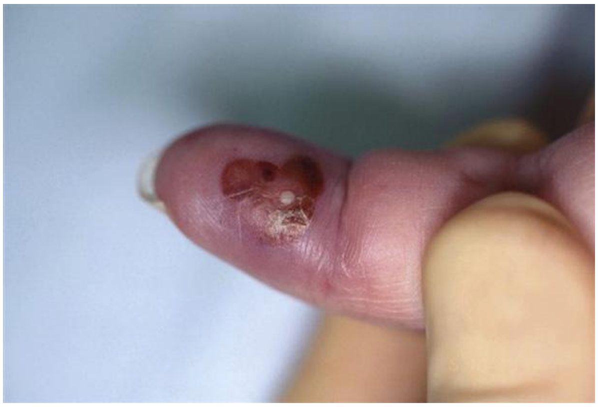
os hyoideum. See **hyoid bone.**

-osis, **1.** suffix meaning a "(specified) action, process, or result": *homeosis, narcosis, zygosis*. **2.** suffix meaning "increase in a pathological condition": *calcicosis, psittacosis, varicosis*.

OSL dosimeter, abbreviation for **optically stimulated luminescence dosimeter.**

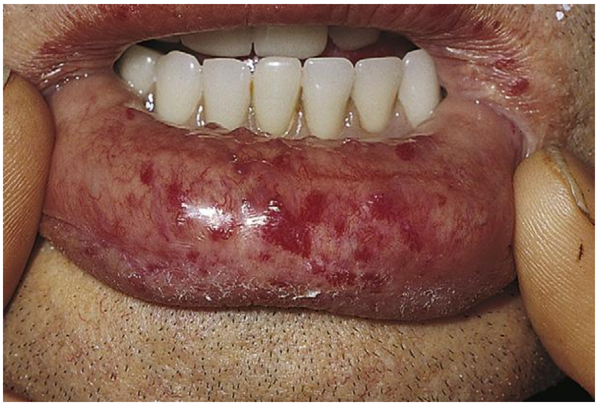
Osler's disease. See **Osler-Weber-Rendu syndrome, polycythemia.**

Osler's nodes /ōs′lərz/ [William Osler, American-British physician, 1849–1919], tender reddish or purplish subcutaneous nodules of the soft tissue on the ends of fingers or toes, seen in subacute bacterial endocarditis and usually lasting only 1 or 2 days. The nodes represent bacterial embolisms from the infected heart valve.



Osler's nodes *(Nguyen and Maaretns, 2004)*

Osler-Weber-Rendu syndrome /ōs′lər web′ər rando͞o′/ [William Osler; Frederick P. Weber, British physician, 1863–1962; Henri J.L.M. Rendu, French physician, 1844–1902]. See **hereditary hemorrhagic telangiectasia.**



Osler-Weber-Rendu syndrome *(Callen et al, 2000)*

os lunatum. See **lunate bone.**

osm, **1.** abbreviation for **osmosis.** **2.** abbreviation for *osmotic*.

os magnum. See **capitate bone.**

osmesthesia /os′məsthē′zhə/ [Gk, *osme,* odor, *aisthesis,* feeling], the ability to perceive and distinguish odors; the sense of smell.

-osmia, suffix meaning "(condition of the) sense of smell": *dysosmia, hemianosmia, merosmia*.

osmium (Os) /oz′mē·əm/ [Gk, *osme,* odor], a hard, grayish, pungent-smelling metallic element. Its atomic number is 76; its atomic mass is 190.2. Used to produce alloys of extreme hardness, it is highly toxic and is slowly converted to the highly volatile, pungent-smelling, extremely toxic osmium tetroxide (OsO_4) in air.

osmo-, **1.** prefix meaning “odor”: *osmoceptor, osmodysphoria, osmonosology*. **2.** prefix meaning “impulse or osmosis”: *osmophilic, osmosology, osmotaxis*.

osmoceptors /oz′mōsep′tərz/ [Gk, *osme* + L, *recipere*, to receive], receptors in the anterior hypothalamus that respond to osmotic pressure, thereby regulating thirst and production of the antidiuretic hormone.

osmol, osmolal. See **osmole.**

osmolal gap /ozmōl′əl/, a difference between the observed and calculated osmolalities in serum analysis. The calculated osmolar values include sodium concentration multiplied by 2, plus glucose and blood urea nitrogen.

osmolality /oz′mōlal′itē/, the osmotic pressure of a solution expressed in osmols or milliosmols per kilogram of water. Normal adult blood osmolality is 285 to 295 mOsm/kg H_2O. Compare **osmolarity.**

osmolal solution, the solute concentration expressed in the number of osmoles per kilogram of solvent.

osmolar /osmō′lər/, pertaining to the osmotic characteristics of a solution of one or more molecular substances, ionic substances, or both, expressed in osmoles or milliosmoles.

osmolarity /oz′mōler′itē/, the osmotic pressure of a solution expressed in osmoles or milliosmoles per liter of the solution. Compare **osmolality.**

osmolar solution, the solute concentration expressed in the number of osmoles per liter of solution.

osmole /os′mōl/ [Gk, *osmos*, impulse, *osis*, condition + mole (molecule)], the quantity of a substance in solution in the form of molecules, ions, or both (usually expressed in grams) that has the same osmotic pressure as one mole of an ideal nonelectrolyte. Also spelled **osmol. —osmolal,** *adj*.

osmology /ozmol′əjē/ [Gk, *osme*, odor, *ōsmos*, impulse, *logos*, science], **1.** the science of the sense of smell and the production and composition of odors. **2.** the branch of science that is concerned with osmosis.

osmometer /ozmom′ə·tər/ [Gk, *ōsmos*, impulse + *metron*, measure], **1.** a device for measuring the acuity of the sense of smell. **2.** a device for measuring osmotic pressure either directly or indirectly. It was formerly used to assess the extent of dehydration or blood loss.

osmometry /ozmom′ətrē/ [Gk, *ōsmos*, impulse, *metron*, measure], the field of study that deals with the phenomenon of osmosis and the measurement of osmotic forces. *—osmometric, adj.*

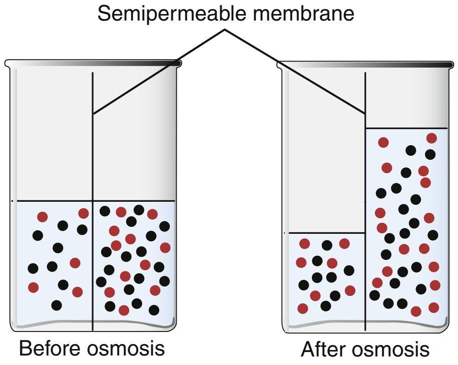
Osmone-Clarke procedure, a surgical method for correcting splayfoot. It involves soft tissue release of the medial and lateral foot with peroneus brevis tendon transfer.

osmoreceptor /-risep′tər/ [Gk, *ōsmos*, impulse; L, *recipere*, to receive], **1.** a neuron in the hypothalamus that is sensitive to the relative fluid/solute concentration in the blood plasma and that regulates the secretion of antidiuretic hormone. **2.** a receptor of smell stimuli.

osmoreceptor cell, a cell that recognizes changes in extracellular fluid osmolality.

osmoregulation /-reg′yəlā′shən/ [Gk, *ōsmos*, impulse; L, *regula*, rule], the act of influencing or controlling the speed and extent of osmosis.

osmosis (osm) /ozmō′sis, os-/ [Gk, *ōsmos*, impulse, *osis*, condition], the movement of a pure solvent such as water through a differentially permeable membrane from a solution that has a lower solute concentration to one that has a higher solute concentration. The membrane is impermeable to the solute but is permeable to the solvent. The rate of osmosis depends on the concentration of solute, the temperature of the solution, the electrical charge of the solute, and the difference between the osmotic pressures exerted by the solutions. Movement across the membrane continues until the concentrations of the solutions equalize. **—***osmotic* **(osm),** *adj*.



Osmosis *(Lewis et al, 2007)*

osmotic diarrhea, a form of diarrhea associated with water retention in the bowel resulting from an accumulation of nonabsorbable water-soluble substances. An excessive intake of hexitols, sorbitol, and mannitol (used as sugar substitutes in candies, chewing gum, and dietetic foods) can result in slow absorption and rapid small intestine motility, leading to osmotic diarrhea. It may also occur in infants if they intake an undiluted concentrated form of formula. The severity of the condition varies directly with the amount of such sugar substitutes consumed and diminishes when intake is reduced. Also called **chewing gum diarrhea, dietetic food diarrhea.**

osmotic diuresis, diuresis resulting from the presence of certain nonabsorbable substances in tubules of the kidney, such as mannitol, urea, or glucose.

osmotic fragility, an assay in which whole blood is pipetted to each of a series of saline solutions of graduated concentration. The series begins with water and increases in concentration to normal (0.85%) saline. The osmotic fragility test is used to detect spherocytosis because spherocytes rupture (lyse) in saline concentrations near the normal level. The assay also detects target cells, which, owing to their reduced hemoglobin content, are able to withstand osmotic stress and rupture only at very dilute saline concentrations. Also called *erythrocyte fragility*.

osmotic pressure, **1.** the pressure exerted on a differentially permeable membrane separating a solution from a solvent, the membrane being impermeable to the solutes in the solution and permeable only to the solvent. **2.** the pressure exerted on a differentially permeable membrane by a solution containing one or more solutes that cannot penetrate the membrane, which is permeable only by the solvent surrounding it. See also **osmosis.**

osmotic transfection, a method of inserting foreign deoxyribonucleic acid (DNA) molecules into cells by putting cells into a dilute solution that causes them to rupture. The cell membranes quickly repair themselves without irreversible injury to the cells. During the rupture period the alien DNA is added to the fluid and is absorbed into the cell nuclei. The foreign DNA can be detected in the cells as a transfection marker.

os naviculare pedis. See **scaphoid bone.**

-osphresia, -osphrasia, suffix meaning a “condition of the sense of smell”: *anosphresia, hyperosphresia, oxyosphresia*.

osphresio-, prefix meaning “odor”: *osphresiolagnia, osphresiology, osphresiophilia*.

osphresis /osfrē′sis/ [Gk, smell], olfaction; the sense of smell.

oss-, prefix meaning “bone”: *osseocartilaginous, ossicle, ossific*.

osseointegrated implant /os′ē·ō·in′tegrātəd/ [Gk, *osteon*, bone; L, *integrare*, to make whole], an endosteal implant containing pores into which osteoblasts and supporting connective tissue can migrate, made of metallic, ceramic, or polymeric materials. Also called *osteointegrated implant*.

osseous /os′ē·əs/ [L, *os*, bone], bony; consisting of or resembling bone.

osseous labyrinth [L, *os*, bone; Gk, *labyrinthos*, maze], the bony part of the internal ear, which transmits sound vibrations from the middle ear to the eighth cranial nerve. It is composed of three cavities: the vestibule, the semicircular canals, and the cochlea, all of which contain perilymph, in which a membranous labyrinth is suspended. Also called **labyrinthus osseus.** Compare **membranous labyrinth.**

ossicle /os′ikəl/ [L, *ossiculum*, little bone], a small bone such as the malleus, the incus, or the stapes, all of which are ossicles of the middle ear. —*ossicular, adj*.

ossiferous /osif′ərəs/ [L, *os*, bone, *ferre*, to bear], pertaining to the formation of bone or bone tissue.

ossification /os′ifikā′shən/ [L, *os* + *facere*, to make], the development of bone. **Intramembranous ossification** is that preceded by membrane, such as in the process initially forming the roof and sides of the skull. **Intracartilaginous endochondral ossification** is that preceded by rods of cartilage, such as that forming the bones of the limbs.

ossify /os′ifī/ [L, *os*, bone, *facere*, to make], to develop into bone.

ossifying fibroma /os′ifī′ing/ [L, *os* + *facere*, to make], a slow-growing, benign neoplasm, occurring most often in the jaws, especially the mandible. The tumor is composed of bone that develops within fibrous connective tissue.

oste-. See **osteo-.**

ostealgia /os′tē·al′jə/ [Gk, *osteon*, bone, *algos*, pain], any pain that is associated with an abnormal condition within a bone, such as osteomyelitis. —*ostealgic, adj*.

osteanagenesis. See **osteoanagenesis.**

osteitis /os′tē·ī′tis/ [Gk, *osteon* + *itis*, inflammation], an inflammation of bone caused by infection, degeneration, or trauma. Symptoms include swelling, tenderness, dull aching pain, and redness in the skin over the affected bone. Some kinds of osteitis are **osteitis deformans** and **osteitis fibrosa cystica.** See also **osteomyelitis, Paget’s disease.**

osteitis deformans. See **Paget’s disease.**

osteitis fibrosa cystica, an inflammatory degenerative condition in which normal bone is replaced by cysts and fibrous tissue. It is usually associated with hyperparathyroidism.

osteitis fibrosa disseminata. See **Albright’s syndrome.**

ostembryon. See **lithopedion.**

ostemia /ostē′mē·ə/, an abnormal congestion of blood in a bone.

ostempyesis /os′təmpī·ē′sis/, an accumulation of pus within a bone.

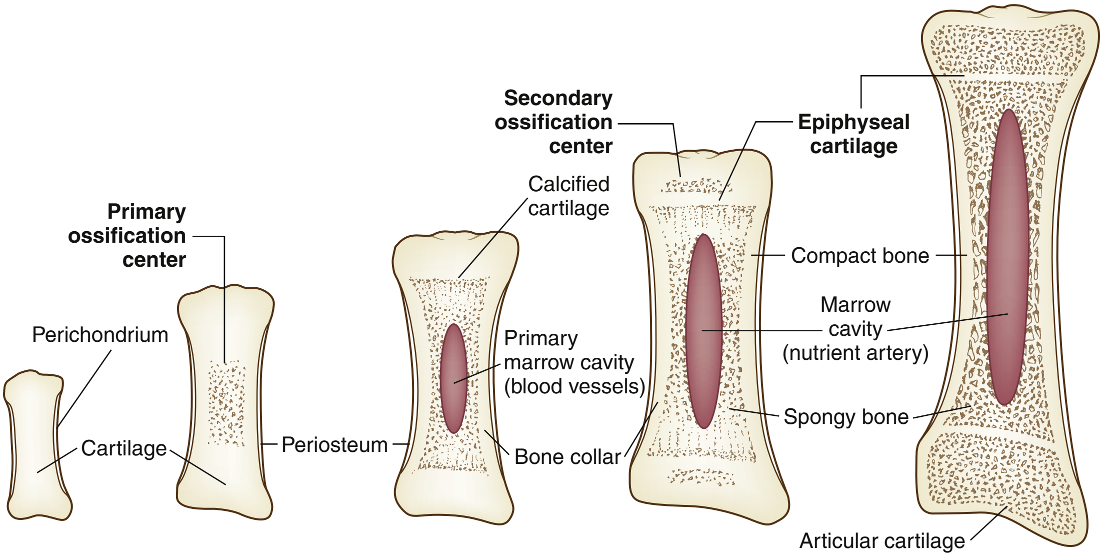
osteo /os′tē·ō/, **1.** abbreviation for **osteopath. 2.** abbreviation for **osteopathy. 3.** pertaining to bone osteology—study of bones.

osteo-, oste-, prefix meaning “bone”: *osteoanesthesia, osteocele, osteopathy*.

osteoanagenesis /os′tē·ō·an′əjen′əsis/ [Gk, *osteon* + *ana*, again, *genesis*, origin], the regeneration or formation of bone tissue. Also called **osteanagenesis.**

osteoaneurysm /-an′yəriz′əm/, a dilation of the wall of a blood vessel within a bone.

osteoarthritis /os′tē·ō′ärthrī′tis/ [Gk, *osteon* + *arthron*, joint, *itis*, inflammation], a form of arthritis in which one or many joints undergo degenerative changes, including subchondral bony sclerosis, loss of articular cartilage, and proliferation of bone spurs (osteophytes) and cartilage in the joint. Inflammation of the synovial membrane of the joint is common late in the disease. Osteoarthritis is the most common form of arthritis. Its cause is unknown but may include chemical, mechanical, genetic, metabolic, and endocrine factors. Emotional stress often aggravates the condition. The disease usually begins with pain after exercise or use of the joint. Stiffness, tenderness to the touch, crepitus, and enlargement develop. Deformity, incomplete dislocation, and synovial effusion may eventually occur. Involvement of the hip, knee, or spine causes more disability than osteoarthritis of other areas. Treatment includes rest of the involved joints; use of a cane, a walker, or crutches to decrease weight-bearing; heat; and antiinflammatory drugs. Overweight patients may be



Secondary ossification center
Epiphyseal cartilage
Calcified cartilage
Primary ossification center
Compact bone
Marrow cavity (nutrient artery)
Perichondrium
Primary marrow cavity (blood vessels)
Spongy bone
Cartilage
Periosteum
Bone collar
Articular cartilage

Ossification *(McCance and Huether, 2010)* advised to lose weight. Systemic corticosteroids are contraindicated, but intraarticular injections of corticosteroids may give relief. Surgical treatment is sometimes necessary and may reduce pain and greatly improve the function of a joint. Hip replacement, joint debridement, fusion, and decompression laminectomy are some of the surgical procedures used in treating advanced osteoarthritis. Compare **rheumatoid arthritis.** Also called **degenerative joint disease.**

■ OBSERVATIONS: Early symptoms include deep, aching joint pain that is aggravated by exercise and that worsens as the day progresses. Inactivity contributes to stiffness. Midcourse of the disease is marked by reduced joint motion, tenderness, crepitus, grating sensation, flexion contractures, and joint enlargement. Manifestations late in the disease include tenderness on palpation, pain with passive ROM, increase in degree and duration of pain, joint deformity, and subluxation. Diagnosis is made by using clinical exam, with presence of usual manifestations plus possible Heberden's or Bouchard's nodules of the finger joints. Gait analysis may reveal altered motion patterns. Radiology may reveal narrowed joint space, increased density of subchondral bone, pseudocysts in subchondral marrow, and/or osteophytes at joint periphery. Analysis of synovial fluid typically shows high viscosity fluid that is yellow or transparent in color. Cultures of fluid are negative; WBC count is 200 to 2000/μL, with less than 25 polymorphonuclear leukocytes. Osteoarthritis of the spine can cause compression of the spinal cord, leading to weakness in the extremities, incontinence of bowel and bladder, and impotence.

■ INTERVENTIONS: Treatment is aimed at pain reduction, slowing the degenerative process, and increasing joint mobility. Oral analgesics are used for pain; NSAIDs are used for inflammation; muscle relaxants and intraarticular steroid injections provide some transient relief. Topical agents (capsaicin) may provide temporary pain relief. Dietary supplements glucosamine and chondroitin sulfate are used for pain relief and improving joint mobility. Arthroscopy, osteotomy, laminectomy, fusion, and/or total joint replacement may be considered if conservative therapy fails.

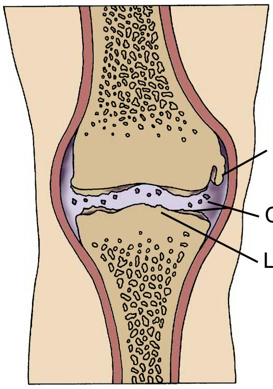
■ NURSING CONSIDERATIONS: Nursing goals include pain management, maintenance of joint function, and increasing activity tolerance and maintaining independence in self-care activities. Pain management makes use of a combination of pharmacological (analgesics, muscle relaxants, and steroids) and nonpharmacological (moist heat, massage, and rest) methods. Joint function is maintained by a judicious balance of rest and activity and use of a regular exercise program (isometric, isotonic, isokinetic, strengthening, stretching, ROM, and balance exercises). Joint protection measures, such as losing weight to reduce joint load, using assistive devices to aid mobility, avoiding forceful or repetitive movement, using good body mechanics and erect posture, and developing pacing techniques for daily routines can improve activity tolerance. Joint stability can be enhanced by actions such as avoiding soft chairs, using recliners, and placing pillows under knees; wearing sturdy, low-heeled shoes; removing environmental hazards; and using mobility aids and joint support devices. Decreasing pain and increasing joint flexibility lead to prolonged ability to perform activities of daily living.

osteoarthritis deformans endemica. See **Kashin-Bek disease.**

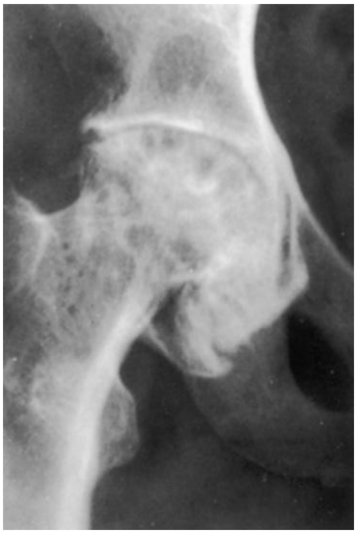
osteoarthropathy /-ärthrop′əthē/ [Gk, *osteon* + *arthron,* joint, *pathos,* disease], any disorder affecting bones and joints.

osteoarthrosis /-arthrō′sis/, a condition of chronic arthritis, usually mechanical, without inflammation.

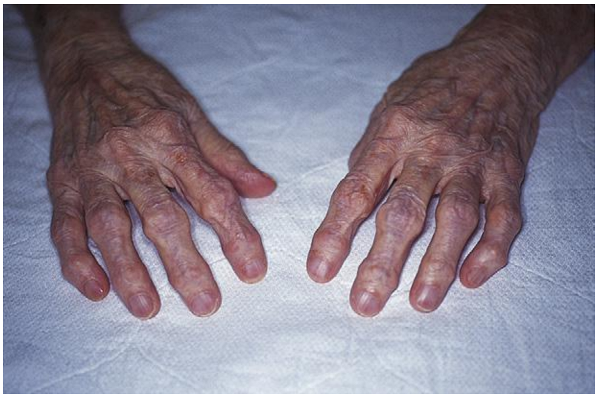
osteoarticular /-artik′yələr/, pertaining to or affecting bones and joints.



Joint changes in osteoarthritis
(Ignatavicius and Workman, 2010)



Osteoarthritis: hip joint involvement *(Moll, 1997)*

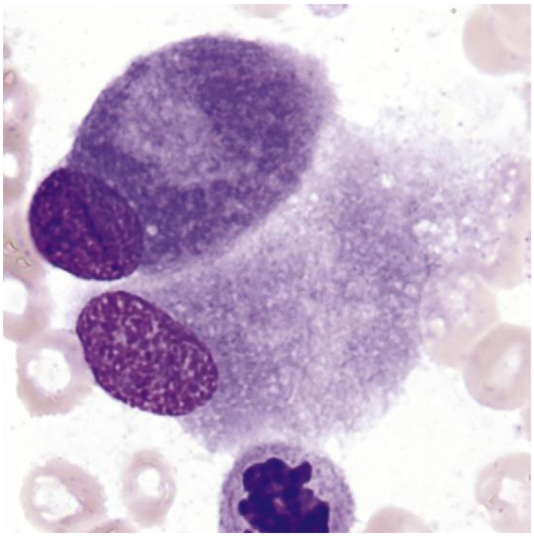


Osteoarthritis: appearance of hands *(Swartz, 2009)*

osteoarticular brucellosis, a form of brucellosis that affects mainly the weight-bearing joints.

osteoarticular graft, a transplant of bone that contains a joint surface.

osteoblast /os′tē·əblast′/ [Gk, *osteon* + *blastos,* germ], a bone-forming cell that is derived from the embryonic mesenchyme and, during the early development of the skeleton, differentiates from a fibroblast to function in the formation of bone tissue. Osteoblasts synthesize the collagen and glycoproteins to form the osteoid matrix and, with growth, develop into osteocytes. See also **ossification.** **—***osteoblastic, adj*.



Osteoblast *(Carr and Rodak, 2008)*

osteoblastic sarcoma. See **giant cell myeloma.**

osteoblastoma /-blastō′mə/, *pl. osteoblastomas, osteoblastomata*, a small, benign, fairly vascular tumor of poorly formed bone and fibrous tissue, occurring most frequently in the vertebrae, femur, tibia, or bones of the upper extremities in children and young adults. The tumor may cause pain, erosion, and resorption of native bone. Excision is the preferred treatment. Also called **osteoid osteoma.**

osteocachexia /-kəkek′sē·ə/, a chronic disease that causes bone wasting, usually resulting from malnutrition.

osteocalcin /-kal′sin/, a protein found in the extracellular matrix of bone and dentin and involved in regulating mineralization in the bones and teeth.

osteocarcinoma /-kär′sinō′mə/ [Gk, *osteon,* bone, *karkinos*, crab, *oma,* tumor], cancer of the bone.

osteochondral graft /-kon′drəl/, a transplant containing both bone and cartilage.

osteochondritis /-kəndrī′tis/ [Gk, *osteon,* bone, *chondros,* cartilage, *itis,* inflammation], a disease of the epiphyses, or bone-forming centers of the skeleton, that begins with necrosis and tissue fragmentation and is followed by repair and regeneration. Kinds of osteochondritis include osteochondritis deformans juvenilis, osteochondritis dissecans, osteochondritis ischiopubica, osteochondritis juvenilis, and osteochondritis necroticans.

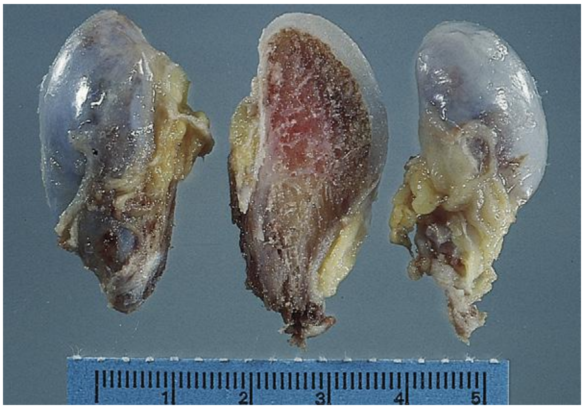
osteochondritis dissecans [Gk, *osteon,* bone, *chondros,* cartilage; L, *dissecare,* to cut apart], a joint disorder in which a piece of cartilage and neighboring bone tissue become detached from an articular surface.

osteochondrodystrophy. See **Morquio's disease.**

osteochondrofibroma /-kon′drōfībrō′mə/, a tumor containing tissues of osteoma, chondroma, and fibroma.

osteochondrolysis. See **osteochondrosis dissecans.**

osteochondroma /os′tē·ōkondrō′mə/ [Gk, *osteon* + *chondros,* cartilage, *oma,* tumor], a benign tumor composed of bone and cartilage. The onset is usually in childhood. It affects more males than females.



Osteochondroma *(Kumar, Cotran, and Robbins, 2003)*

osteochondromatosis /-kon′drōmətō′sis/, the transformation of synovial villi into bone and cartilage masses, causing loose bodies in the joints. It usually develops in joints affected by injury or degenerative disease.

osteochondropathy /-kəndrop′əthē/, a condition affecting both bone and cartilage and characterized by abnormal enchondral ossification.

osteochondrosarcoma /-kon′drōsärkō′mə/ [Gk, *osteon,* bone, *chondros,* cartilage, *karkinos,* crab, *oma,* tumor], a cancer of the bone and cartilage.

osteochondrosis /-kondrō′sis/ [Gk, *osteon* + *chondros,* cartilage, *osis,* condition], a disease affecting the ossification centers of bone in children. It is initially characterized by degeneration and necrosis, followed by regeneration and recalcification. Kinds of osteochondrosis include **Legg-Calvé-Perthes disease, Osgood-Schlatter disease,** and **Scheuermann's disease.**

osteochondrosis dissecans /dis′əkənz/, the formation of a separate center of bone and cartilage on an epiphyseal surface. The stray fragment may remain in place, be absorbed, or break off and become a loose body.

osteoclasia /-klā′zhə/ [Gk, *osteon* + *klasis,* breaking], **1.** the destruction and absorption of bony tissue by osteoclasts, such as during growth or the healing of fractures. **2.** the degeneration of bone through disease. See also **osteolysis.**

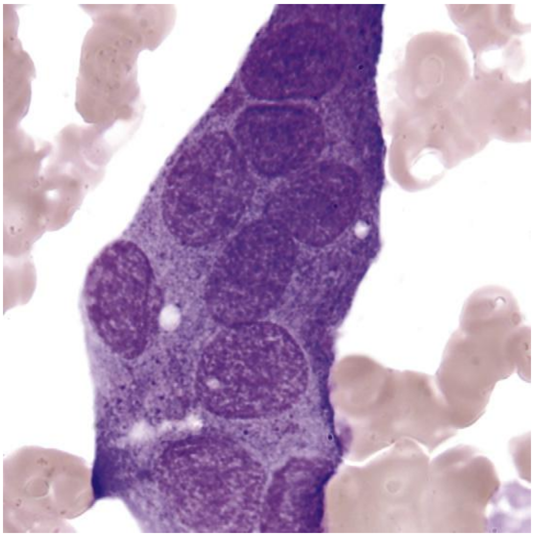
osteoclasis /os′tē·ok′ləsis/, the intentional surgical fracture of a bone to correct a deformity. Also called **osteoclasty.**

osteoclast /os′tē·əklast′/ [Gk, *osteon* + *klasis,* breaking], **1.** also called **osteophage.** a large type of multinucleated bone cell with a large amount of acidophilic cytoplasm that functions to absorb and remove osseous tissue. During bone healing of fractures, or during certain disease processes, osteoclasts excavate passages through the surrounding tissue by enzymatic action. Osteoclasts become activated in the presence of parathyroid hormone and also in a lymphokine substance produced by lymphocytes in such diseases as multiple myeloma and malignant lymphomas. See also **ossification. 2.** a surgical instrument used in the fracturing or refracturing of bones for therapeutic purposes, such as correction of a deformity.

osteoclast activating factor, a lymphokine that promotes the resorption of bone.

osteoclastic /-klas′tik/, **1.** pertaining to osteoclasts. **2.** destructive to bone.

osteoclastoma /os′tē·ōklastō′mə/ *pl. osteoclastomas, osteoclastomata* [Gk, *osteon* + *klasis,* breaking, *oma,* tumor], a giant cell tumor of the bone that occurs most frequently at



Osteoclast in bone marrow *(Carr and Rodak, 2008)*

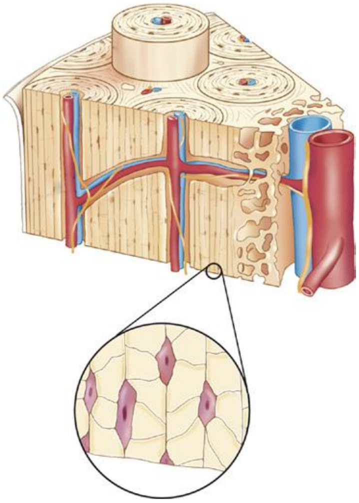
the end of a long bone and appears as a mass surrounded by a thin shell of new periosteal bone. The lesion may be malignant and may cause local pain, loss of function, weakness, and pathological fracture. Also called **giant cell myeloma, giant cell tumor of bone.**

osteoclasty. See **osteoclasis.**

osteocope /os′tē·əkōp/, a painful, syphilitic bone disease.

osteocystoma /-sistō′mə/, a cystic tumor in a bone.

osteocyte /os′tē·əsīt/ [Gk, *osteon* + *kytos,* cell], a bone cell; a mature osteoblast that has become embedded in the bone matrix. It occupies a small cavity and sends out protoplasmic projections that anastomose with those of other osteocytes to form a system of minute canals within the bone matrix. **—***osteocytic, adj.*



Osteocyte *(Muscolino, 2011)*

osteodensitometer /-den′sitom′ətər/ [Gk, *osteon,* bone; L, *densus,* thick; Gk, *metron,* measure], an apparatus for measuring the density of bone tissue.

osteodentin /-den′tin/, dentin that resembles bone. It is found chiefly in the teeth of fish and certain other animals but also occurs occasionally in humans when odontoblasts are entrapped by rapidly developing secondary dentin.

osteodermia /-dur′mē·ə/, a condition in which skeletal changes occur in the skin, such as a bony tumor of the skin. Also called **osteoma cutis.**

osteodiastasis /-dī·as′təsis/, an abnormal separation of bones.

osteodynia /-din′ē·ə/, bone pain.

osteodystrophy /-dis′trəfē/ [Gk, *osteon* + *dys,* bad, *trophe,* nourishment], any generalized defect in bone development, usually associated with disturbances in calcium and phosphorus metabolism and renal insufficiency, such as in renal osteodystrophy. Also called *osteodystrophia.*

osteoenchondroma /os′tē·ō·en′kəndrō′mə/, a benign bone and cartilage tumor within a bone.

osteofibrochondrosarcoma /-fī′brōkon′drōsärkō′mə/, a malignant tumor containing bone, cartilage, and fibrous tissues.

osteofibroma /-fībrō′mə/ [Gk, *osteon,* bone; L, *fibra,* fiber; Gk, *oma,* tumor], a tumor composed of both bony and fibrous tissues.

osteogenesis /-jen′əsis/ [Gk, *osteon* + *genesis,* origin], the origin and development of bone tissue. Also called **osteogeny.** See also **ossification. —osteogenetic, osteogenic, osteogenous,** *adj.*

osteogenesis imperfecta, a genetic disorder involving defective development of the connective tissue. It is inherited as an autosomal-dominant trait and is characterized by abnormally brittle and fragile bones that are easily fractured by the slightest trauma. In its most severe form, the disease may be apparent at birth, when it is known as osteogenesis imperfecta type II. The newborn has multiple fractures that have occurred in utero and is usually severely deformed because of imperfect formation and mineralization of bone. Most infants die shortly after birth, although a few survive as deformed dwarfs with normal mental development if no head trauma has occurred. If the disease has a later onset, it is called osteogenesis imperfecta type I and usually runs a milder course. Symptoms generally appear when the child begins to walk, but they become less severe with age, and the tendency to fracture decreases and often disappears after puberty. Other manifestations of the condition include blue sclerae, translucent skin, hyperextensibility of ligaments, hypoplasia of the teeth, recurrent epistaxis, excess diaphoresis, mild hyperpyrexia, and a tendency to bruise easily and develop otosclerosis with hearing loss. There is a broad expressivity of the disease so that the number and extent of pathological features may range from minimal to severe involvement. Also called **Adair-Dighton syndrome, brittle bones, fragilitas ossium, hypoplasia of the mesenchyme, osteopsathyrosis.**

osteogenetic. See **osteogenesis.**

osteogenic, composed of or originating from any tissue involved in the development, growth, or repair of bone. Also **osteogenous.**

osteogenic myeloma. See **myeloma.**

osteogenic sarcoma. See **osteosarcoma.**

osteogenous. See **osteogenic.**

osteogeny. See **osteogenesis.**

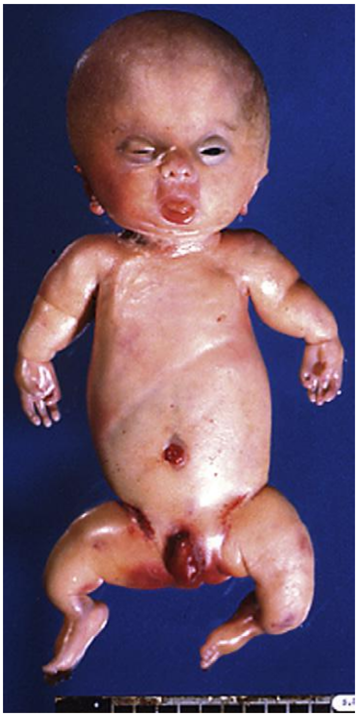
osteohalisteresis /-hal′istərē′sis/, a condition of soft bones caused by a loss or deficiency of mineral elements.

osteoid /os′tē·oid/ [Gk, *osteon* + *eidos,* form], pertaining to or resembling bone.

osteoid osteoma. See **osteoblastoma.**

osteolipochondroma /-līp′ōkəndrō′mə/, a cartilage tumor with bone and fat elements.

osteolipoma /-līpō′mə/, a fatty tumor containing bone elements.



Osteogenesis imperfecta *(Lipson, 2005)*

osteology /os′tē·ol′əgē/ [Gk, *osteon,* bone, *logos,* science], the branch of medicine concerned with the development and diseases of bone tissue.

osteolysis /os′tē·ol′isis/ [Gk, *osteon* + *lysis,* loosening], the degeneration and dissolution of bone caused by disease, infection, or ischemia. The condition commonly affects the terminal bones of the hands and feet, such as in acro-osteolysis, and is seen in disorders involving blood vessels, such as Raynaud's disease, scleroderma, and systemic lupus erythematosus. —*osteolytic, adj.*

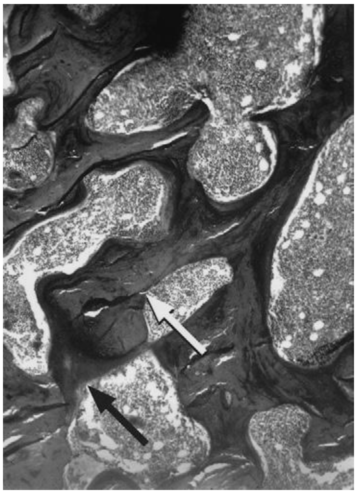
osteolytic hypercalcemia /-lit′ik/, a malignancy associated with excess calcium in the blood. It may be caused by either widespread skeletal metastases or extensive bone marrow involvement by a primary hematologic tumor.

osteoma /os′tē·ō′mə/, *pl.* **osteomas, osteomata,** a tumor of bone tissue.

-osteoma, combining form meaning a "tumor composed of bone tissue, usually benign": *endosteoma, myosteoma, periosteoma.*

osteoma cutis. See **osteodermia.**

osteomalacia /-məlā′shə/ [Gk, *osteon* + *malakia,* softening], an abnormal condition of lamellar bone, characterized by a loss of calcification of the matrix and resulting in softening of the bone. It is accompanied by weakness, fracture, pain, anorexia, and weight loss. The condition is the result of an inadequate amount of phosphorus and calcium available in the blood for mineralization of the bones. This deficiency may be caused by a diet lacking these minerals or vitamin D, by a lack of exposure to sunlight and hence an inability to synthesize vitamin D, or by a metabolic disorder causing malabsorption of minerals. Osteomalacia results from and also complicates many other diseases and conditions. Treatment usually includes administration of the necessary vitamins and minerals and therapy appropriate for the underlying disorder. Also called **adult rickets.** See also **hyperparathyroidism, Paget's disease, rickets.**



Osteomalacia *(Goldman et al, 2008)*

osteomas, osteomata. See **osteoma.**

osteomesopyknosis /-mez′ōpiknō′sis/, a genetic disorder transmitted as an autosomal trait, characterized by osteosclerosis of the axial spine, pelvis, and proximal areas of long bones.

osteomyelitis /-mī·əlī′tis/ [Gk, *osteon* + *myelos,* marrow, *itis,* inflammation], local or generalized infection of bone and bone marrow, usually caused by bacteria introduced by trauma or surgery, by direct extension from a nearby infection, or via the bloodstream. Staphylococci are the most common causative agents.

■ OBSERVATIONS: The long bones in children and the vertebrae in adults are the most common sites of infection as a result of hematogenous spread. Persistent, severe, and increasing bone pain; tenderness; guarding on movement; regional muscle spasm; and fever suggest this diagnosis. Draining sinus tracts may accompany posttraumatic osteomyelitis or osteomyelitis from a contiguous infection. Specific diagnosis and selection of therapy depend on bacterial examination of bone, tissue, or pus.

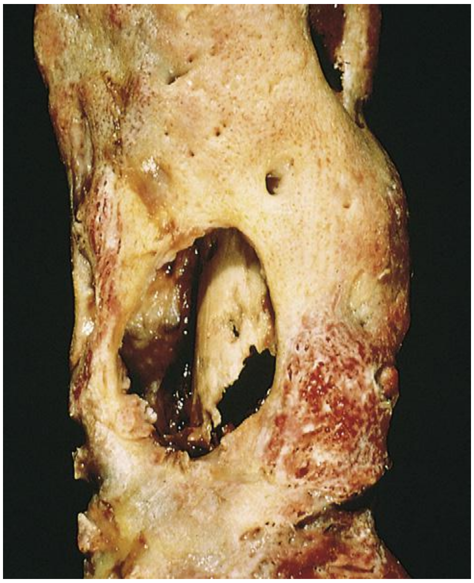
■ INTERVENTIONS: Treatment includes bed rest and parenteral antibiotics for several weeks. Surgery may be necessary to remove necrotic bone and tissue, obliterate cavities, remove infected prosthetic appliances, and apply prostheses to stabilize affected parts. Chronic osteomyelitis may persist for years with exacerbations and remissions despite treatment.

■ NURSING CONSIDERATIONS: Normal precautions are used in disposing of any drainage. Absolute rest of the affected part may be necessary, with a careful positioning using pillows and sandbags for good alignment. During the early phase of infection, pain is extremely severe, and extraordinary gentleness in moving and manipulating the infected part is essential. —*osteomyelitic, adj.*

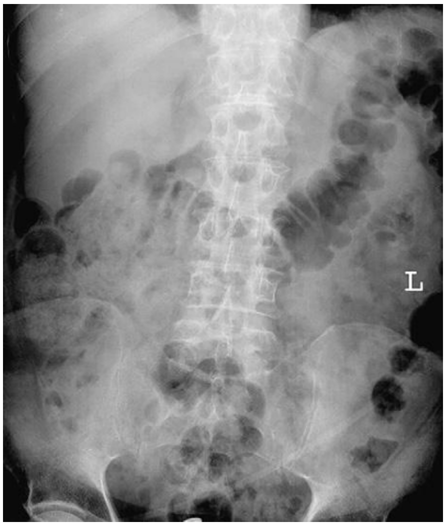
osteomyelodysplasia /os′tē·ōmī′əlō′displā′zhə/ [Gk, *osteon,* bone, *myelos,* marrow, *dys* + *plasis,* forming], a loss of bone tissue through absorption of minerals, usually associated with leukopenia and sometimes with fever. It may result from an excess of parathyroid hormone.

osteon /os′tē·on/ [Gk, bone], the basic central structural unit of compact bone, consisting of the haversian canal and its concentric rings of 4 to 20 lamellae. Most of the units run with the long axis of the bone. Also called **haversian system.**

-osteon, -osteum, suffix meaning "bone": *melacosteon, otosteon, pleurosteon.*



Chronic osteomyelitis *(Kumar et al, 2007)*



Osteopenia *(Kowalczyk and Mace, 2009)*

osteonal bone /os′tē·ō′nəl/, bone tissue composed of tiny chalky tubes with an arteriole running down the middle and circular laminations of bone concentric with an artery. It is seen in mature adults.

osteonecrosis /os′tē·ō′nəkrō′sis/ [Gk, *osteon* + *nekros,* dead, *osis* condition], the destruction and death of bone tissue, such as from ischemia, infection, malignant neoplastic disease, or trauma. **—***osteonecrotic, adj.*

osteoonychodysplasia /os′tē·ō·on′i·kō·dis·plā′zhə/ [Gk, *osteon,* bone + *onyx,* nail + *dys,* bad + *plassein,* to form], **1.** also called *onycho-osteodysplasia.* abnormal development of nails and bones. **2.** See **nail-patella syndrome.**

osteopath (osteo) /os′tē·ōpath′/, a physician who specializes in osteopathy. Also called **osteopathist.**

osteopathic. See **osteopathy.**

osteopathic scoliosis. See **congenital scoliosis.**

osteopathist. See **osteopath.**

osteopathology /-pathol′əjē/ [Gk, *osteon,* bone, *pathos,* disease, *logos,* science], the study of bone diseases.

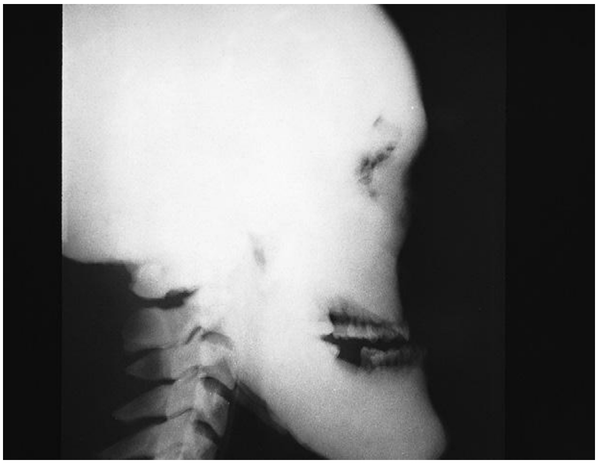
osteopathy (osteo) /os′tē·op′əthē/ [Gk, *osteon* + *pathos,* disease], a therapeutic approach to the practice of medicine that uses all the usual forms of medical diagnosis and therapy, including drugs, surgery, and radiation, but that places greater emphasis on the relationship between the organs and the musculoskeletal system than traditional medicine does. Osteopathic physicians recognize and correct structural problems using manipulation. See also **physician. —osteopathic,** *adj.*

osteopedion. See **lithopedion.**

osteopenia /-pē′nē·ə/ [Gk, *osteon* + *penes,* poverty], **1.** reduced bone mass due to a decrease in the rate of osteoid synthesis to a level insufficient to compensate normal bone lysis. See also **osteoporosis. 2.** any decrease in bone mass below the normal.

osteoperiosteal graft /-per′ē·os′tē·əl/, a bone graft that includes the periosteal membrane covering the bone.

osteopetrosis /os′tē·ōpētrō′sis/ [Gk, *osteon* + *petra,* stone, *osis,* condition], an inherited disorder characterized by a generalized increase in bone density, probably caused by faulty bone resorption resulting from a deficiency of osteoclasts. In its most severe form, transmitted as an autosomal-recessive condition, the bone marrow cavity is obliterated, causing severe anemia, marked deformities of the skull, and compression of the cranial nerves, which may result in deafness and blindness and lead to an early death. A milder, benign form, transmitted as an autosomal-dominant trait, is characterized by short stature, fragile bones that fracture easily, and a tendency to develop osteomyelitis. Also called **ivory bones, marble bones, osteosclerosis fragilis.** See also **Albers-Schönberg disease. —***osteopetrotic, adj.*



Osteopetrosis *(Regezi, Sciubba, and Jordan, 2008)*

osteophage. See **osteoclast.**

osteophlebitis /-fləbī′tis/, an inflammation of the veins that are a part of the vascular system of bones.

osteophyte /os′tē·əfīt/, a bony outgrowth, usually found around a joint. It is commonly seen in degenerative joint disease.

osteoplast. See **osteoblast.**

osteoplastica /-plas′tikə/, a form of bone inflammation associated with cystic fibrosis.

osteoplasty /o′stē·əplas′tē/ [Gk, *osteon,* bone, *plassein,* to mold], plastic surgery performed on bone tissue.

osteopoikilosis /os′tē·ōpoi′kilō′sis/ [Gk, *osteon* + *poikilos,* mottled, *osis,* condition], an inherited condition of the bones, transmitted as an autosomal-dominant trait, characterized by multiple areas of dense calcification throughout the osseous tissue, producing a mottled appearance on x-ray examination. It is a benign condition, usually without symptoms and of unknown cause. Also called **osteosclerosis fragilis congenita. —***osteopoikilotic, adj.*

osteoporosis /os′tē·ōpərō′sis/ [Gk, *osteon* + *poros,* passage, *osis,* condition], a disorder characterized by abnormal loss of bone density and deterioration of bone tissue, with an increased fracture risk. It occurs most frequently in postmenopausal women, sedentary or immobilized individuals, and patients on long-term steroid therapy. Osteoporosis may be without a known cause or secondary to other disorders, such as thyrotoxicosis or the bone demineralization caused by hyperparathyroidism. **—osteoporotic,** *adj.*

■ OBSERVATIONS: Individuals are typically asymptomatic early in the disease. The first symptom is usually a dull, aching, constant pain in the bones, particularly the back and chest. The pain may radiate down the leg, and muscle spasms may be present. As the spinal column mass diminishes, dorsal kyphosis and cervical lordosis increase, leading to multiple compression fractures of the spine and a reduction in height. Other fractures occur with minimal or no trauma. Clinical evaluation reveals a complex of risk factors such as estrogen deficiency, androgen deficiency, hyperthyroidism, nulliparity, chronic malnutrition, long-term lack of calcium intake, long history of tobacco use, ethanol abuse, steroid use or abuse, sedentary life-style, immobility, familial history, and underlying skeletal disease. Bone mineral density (BMD) tests reveal loss of bone density. X-rays show decreased radiodensity after 25% to 40% loss of bone calcium. Immobility from increased fractures and deformity from spinal crushing are common complications.

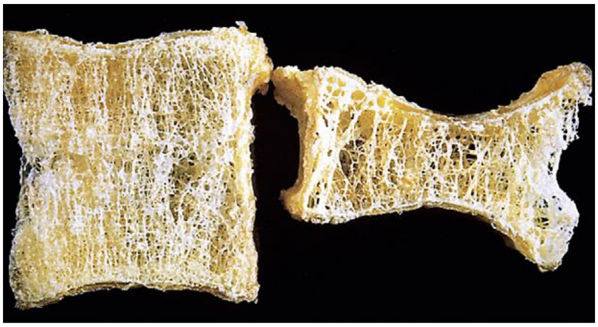
■ INTERVENTIONS: Acute treatment focuses on calcium and vitamin D supplementation; use of calcitonin, bisphosphonates (etidronate, alendronate, pamidronate), or selective estrogen receptor modulators (raloxifene) to prevent bone resorption; nonsteroidal antiinflammatory drugs for pain; and use of estrogen-progestin supplements, which is controversial. Calcium levels are monitored regularly.

■ NURSING CONSIDERATIONS: Nursing care is aimed at prevention and early detection. Prevention is centered around proper nutrition with a balanced diet rich in calcium and vitamin D; regular exercise that emphasizes strengthening and weight bearing; cessation of tobacco use and ethanol abuse; and adequate fluoride ingestion. Bone density surveys should be encouraged every 1 to 3 years after age 49 for early detection. Acute care stresses good nutrition with calcium and vitamin D supplementation; a consistent exercise regimen, including moderate, weight-bearing hyperextension and resistance exercises to slow calcium loss and strengthen musculature; heat and massage for muscle spasm; orthopedic supports for back and neck to prevent stress fractures; and canes to aid in walking. Instruction in fall and fracture prevention measures is important to help the individual decrease fracture risk and maintain independence in activities of daily living. Education about medication effects and side effects is needed.

osteoporosis of disuse [Gk, *osteon,* bone, *poros,* passage, *osis,* condition; L, *dis,* not; ME, *usen,* to act], a decrease in bone mass that occurs in sedentary people or patients confined to bed for a long period.

osteoporotic /-pərot′ik/ [Gk, *osteon,* bone, *poros,* passage, *osis,* condition], pertaining to osteoporosis.

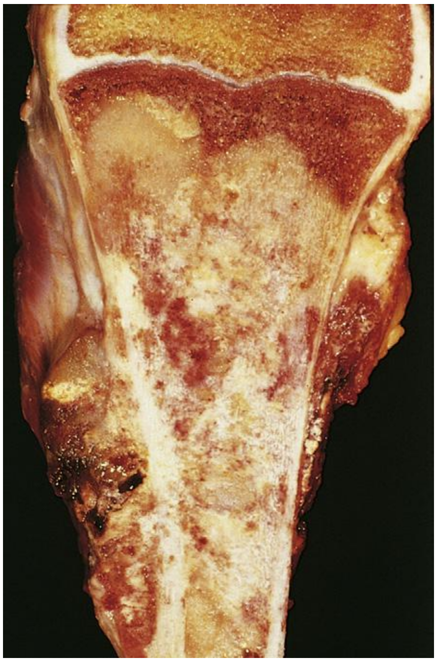
osteopsathyrosis. See **osteogenesis imperfecta.**



Normal vertebra *(right)* compared to osteoporotic vertebra *(left)* *(Kumar et al, 2007)*

osteorrhaphy. See **osteosuture.**

osteosarcoma /os′tē·ō′särkō′mə/ [Gk, *osteon* + *sarx,* flesh, *oma*], a malignant tumor of the bone, composed of anaplastic cells derived from mesenchyme. It is the most common type of primary malignant bone tumor, accounting for 35% of such malignancies. It occurs most often in the distal femur. Metastasis to the lung occurs more often in males than in females. It occurs most frequently between the second and fourth decade of life. Also called **osteogenic sarcoma.**



Osteosarcoma *(Kumar et al, 2007)*

osteosclerosis /os′tē·ōsklerō′sis/ [Gk, *osteon* + *skleros,* hard, *osis,* condition], an abnormal increase in the density of bone tissue. The condition occurs in a variety of disease states and is commonly associated with ischemia, chronic infection, and tumor formation. It also may be caused by faulty bone resorption as a result of some abnormality involving osteoclasts. See also **achondroplasia, osteopetrosis, osteopoikilosis. —osteosclerotic,** *adj.*

osteosclerosis fragilis. See **osteopetrosis.**

osteosclerosis fragilis congenita. See **osteopoikilosis.**

osteosclerotic. See **osteosclerosis.**

osteosuture /-so͞o′chər/, the surgical repair of a fractured bone by wiring or suturing the fragments together. Also called **osteorrhaphy.**

osteosynovitis /-sin′ōvī′tis/ [Gk, *osteon,* bone; Gk, *syn,* together; L, *ovum,* egg; Gk, *itis,* inflammation], an inflammation of the synovial membrane of a joint and the surrounding bone tissue.

osteosynthesis /-sin′thəsis/, the surgical fixation of a bone by any internal mechanical means. It is usually performed in the treatment of fractures.

osteotabes /-tā′bēz/, a condition usually affecting infants in which bone marrow cells are destroyed and the marrow disappears.

osteotelangiectasia /-telan′jē·əktā′zhə/, a sarcoma of the bone characterized by dilated capillaries.

osteothrombophlebitis /-throm′bōfləbī′tis/, a progressive inflammation of small venules and intact bone often accompanied by clot formation.

osteothrombosis /-thrəmbō′sis/, a blockage of blood vessels in bone tissue.

osteotome /os′tē·ətōm′/ [Gk, *osteon* + *temnein,* to cut], a surgical instrument for cutting through bone.

osteotomy /os′tē·ot′əmē/ [Gk, *osteon* + *temnein,* to cut], the sawing or cutting of a bone. Kinds of osteotomy include block osteotomy, in which a section of bone is excised; cuneiform osteotomy to remove a bone wedge; and displacement osteotomy, in which a bone is redesigned surgically to alter the alignment or weight-bearing stress areas.

osteotripsy /-trip′sē/, any percutaneous reduction of a bony prominence or callus.

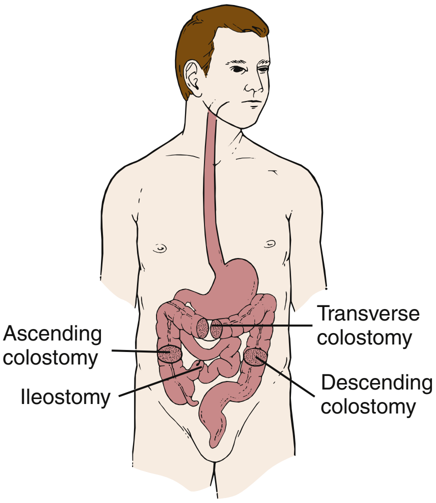
-osteum. See **-osteon.**

ostium. See **orifice.**

ostium primum defect, ostium secundum defect. See **atrial septal defect.**

ostomate /os′təmāt/ [L, *ostium,* mouth], a person who has undergone an ostomy.

ostomy /os′təmē/ [L, *ostium,* mouth,], *(informal)* a surgical procedure in which an incision or stoma is surgically created in the wall of the abdomen to allow the passage of urine from the bladder or of intestinal contents from the bowel. An ostomy procedure may be performed to correct an anatomical defect, relieve an obstruction, or permit treatment of a severe infection or injury of the urinary or intestinal tract. Each procedure is named for the anatomical location of the ostomy, such as a colostomy, ureterostomy, cecostomy, or cystostomy.



Ostomy sites

-ostomy, suffix meaning to "form a new opening or pertaining to a mouthlike opening": *colostomy, tracheostomy.*

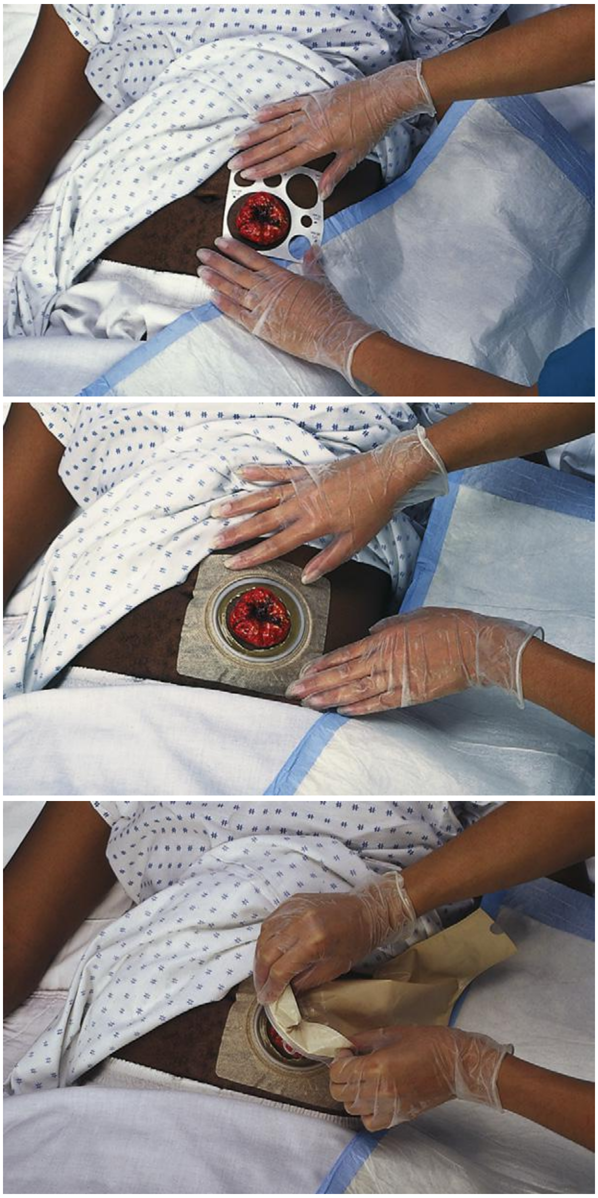
ostomy care^1**,** the management and support of a patient with a surgical opening created in the bladder, ileum, or colon for the temporary or permanent passage of urine or feces, necessitated by carcinoma, intestinal obstruction, trauma, or severe ulceration distal to the site of the incision. In most cases the opening is covered with a temporary disposable bag in the operating room.

■ METHOD: The patient with a colostomy or an ileostomy is helped to accept the stoma and the change in body image that frequently causes grief or in some instances denial. Discussions of the person's feelings are encouraged, and questions regarding the procedure and possible changes in the person's life-style are answered in a positive manner. The disposable bag, called an appliance, is changed when necessary, and the character, color, and amount of odor and drainage are

Comparison of ileostomy and colostomy

		Colostomy		
	Ileostomy	*Ascending*	*Transverse*	*Sigmoid*
Stool consistency	Liquid to semiliquid	Semiliquid	Semiliquid to semiformed	Formed
Fluid requirement	Increased	Increased	Possibly increased	No change
Bowel regulation	No	No	No	Yes (if there is a history of a regular bowel pattern)
Pouch and skin barriers	Yes	Yes	Yes	Dependent on regulation
Irrigation	No	No	No	Possibly every 24-48 hr (if patient meets criteria)
Indications for surgery	Ulcerative colitis, Crohn's disease, diseased or injured colon, birth defect, familial polyposis, trauma, cancer	Perforating diverticulitis in lower colon; trauma; inoperable tumors of colon, rectum, or pelvis; rectovaginal fistula	Same as for ascending; birth defect	Cancer of the rectum or rectosigmoidal area; perforating diverticulum; trauma

From Lewis SL et al: *Medical-surgical nursing: assessment and management of clinical problems,* ed 8, St Louis, 2011, Mosby.



Ostomy care *(Harkreader, Hogan, and Thobaben, 2007)*

observed. Mucus secretion from the stoma usually begins within 48 hours after the surgery, fecal drainage within 72 hours. The stoma is inspected periodically for color, bleeding, stricture, retraction, and infection and is measured periodically to determine the size of the appliance that is to be used. There is mild to moderate swelling of the stoma the first 2 to 3 weeks postoperatively. Size of the stoma is determined with a stoma measuring card. Each time the temporary or permanent appliance is changed, the skin around the stoma is washed with soap and water, rinsed thoroughly, and patted dry with a clean towel. If the skin is irritated or excoriated, karaya powder, alone or mixed with an ointment, is spread over the area before the appliance is reinstalled. A pouch should never be placed directly on irritated skin without the use of a skin barrier. An adhesive substance may be used to maintain a tight seal with the appliance. Deodorant drops, aspirin, or various bismuth or chlorophyll preparations or mouthwash solutions are added to the ostomy bag to control odor. The diet is planned according to the kind of ostomy. Ileostomates require food high in sodium and potassium, such as bananas, citrus juices, molasses, and cola, and are advised to avoid fried, highly seasoned, and rich foods, nuts, raisins, raw fruits other than bananas, and anything that produces gas or causes diarrhea. Gas-producing foods such as cabbage, beans, broccoli, cauliflower, and corn; foods causing disturbing odors such as onions, eggs, and fish; and sharp condiments are contraindicated. A low-residue diet is ordered for most ostomates. The fluid intake is carefully maintained.

Premium
Paste

Ostomy pouches *(Potter and Perry, 2007)*

■ INTERVENTIONS: Before discharge, each step in the care of the stoma and surrounding skin is rehearsed with the patient; the equipment that will be available at home is used during this rehearsal. The patient is urged to establish a regular pattern of evacuation and to report any signs of wound infection or obstruction, such as nausea, vomiting, decreased drainage from the stoma, abdominal distension, and cramps. Normal daily activity is encouraged.

■ OUTCOME CRITERIA: Visiting nurse referrals may be indicated for client assessment and education. Referrals to support groups are also encouraged. Clients are encouraged to keep appointments with care providers. The ability of the patient to adjust to the ostomy procedures and equipment is greatly affected by the nursing care received in the days after surgery. A positive patient, matter-of-fact approach; sensitive emotional support; and thorough teaching of self-care measures are essential aspects of ostomy nursing care.

ostomy care^{2}, a nursing intervention from the Nursing Interventions Classification (NIC) defined as maintenance of elimination through a stoma and care of surrounding tissue. See also **Nursing Interventions Classification.**

ostomy irrigation, a procedure for cleansing of, stimulating of, and regulating evacuation from an artificially created orifice. Fluids used in irrigation include tap water and saline or medicated solutions. Necessary equipment includes properly sized irrigator tips, catheters, drainage bags that allow for insertion of the catheter, water-soluble lubricants, gloves, an irrigation container, and shields to prevent leakage. Loop and double-barrel colostomies require a sequential irrigation of the proximal loop, distal loop, and rectum to prevent the accumulation of discharge.

ostomy self-care, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the personal actions to maintain an ostomy for elimination. See also **Nursing Outcomes Classification.**

ostrac-, ostraco-, prefix meaning "like a hard shell": *astracosis, ostracod*.

os trapezium. See **trapezium.**

os trapezoideum. See **trapezoid bone.**

os trigonum /os′trigō′nəm/, a small foot bone just posterior to the talus. It is sometimes confused with a fracture of the posterior tubercle of the talus. Also called **Bardeleben's bone.**

os triquetrum. See **triangular bone.**

OT, **1.** abbreviation for **occupational therapist.** **2.** abbreviation for **occupational therapy.**

ot-. See **oto-.**

otalgia /ōtal′jə/, a pain in the ear. Also called **otodynia, otoneuralgia.**

OTC, abbreviation for **over the counter.**

OTC drug, an over-the-counter medication. See **patent medicine.**

Othello syndrome /ōthel′ō/ [Othello, jealous Shakespearean character], a psychopathological condition characterized by suspicion of a spouse's infidelity and morbid jealousy. This condition may be accompanied by rage and violence and is frequently associated with paranoia.

-otia, suffix meaning "(condition of the) ear": *melotia, microtia, synotia*.

otic /ō′tik, ot′ik/ [Gk, *ous,* ear], pertaining to the ear. Also **auricular.**

-otic. See **oto-.**

otics /ō′tiks, ot′iks/, a group of drugs used locally to treat inflammation of the external ear canal or to remove excess cerumen.

otic vertigo, a sensation of rotation motion caused by an inner ear disease. Its subcategories are Meniere's disease, inner ear dysfunction, fistula or other pressure sensitivity, unilateral paresis, and benign paroxysmal positional vertigo.

otitic /ōtit′ik/ [Gk, *ous,* ear], pertaining to otitis.

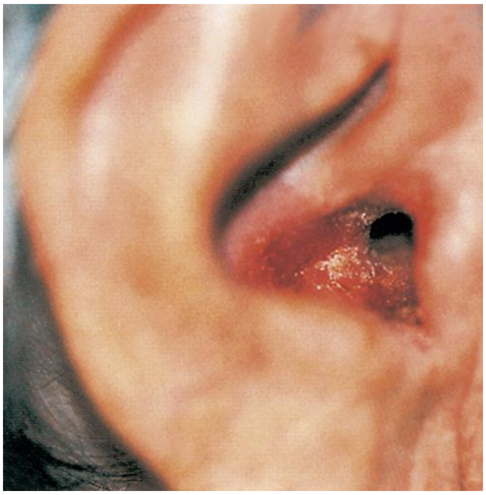
otitic barotrauma. See **barotrauma.**

otitis /ōtī′tis/ [Gk, *ous* + *itis,* inflammation], inflammation or infection of the ear. Kinds of otitis are **otitis externa** and **otitis media.**

otitis externa, inflammation or infection of the external canal or the auricle of the external ear. Major causes are allergy, bacteria, fungi, viruses, and trauma. Allergy to nickel or chromium in earrings and to chemicals in hair sprays, cosmetics, hearing aids, and medications, particularly sulfonamides and neomycin, is common. ***Staphylococcus aureus, Pseudomonas aeruginosa,*** and ***Streptococcus pyogenes*** are common bacterial causes. Herpes simplex and herpes zoster viruses are frequently implicated. Eczema, psoriasis, and seborrheic dermatitis also may affect the external ear. Abrasions of the ear canal may become infected, and excessive swimming may wash out protective cerumen, remove skin lipids, and lead to secondary infection. Otitis externa is more prevalent during hot, humid weather. Folliculitis is particularly painful in the external auditory meatus and is a common occupational hazard in nurses, caused by irritation from the earpieces of stethoscopes. Treatment includes oral analgesics, thorough local cleansing, topical antimicrobials to treat infection, and topical corticosteroids to reduce inflammation. Prevention includes measures to reduce maceration of the skin and to avoid trauma.

otitis interna. See **labyrinthitis.**

otitis mastoidea [Gk, *ous,* ear, *itis,* inflammation, *mastos,* breast, *eidos,* form], an inflammation of the middle ear associated with a mastoid infection.

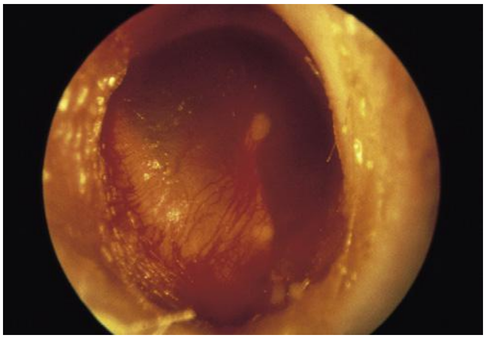


Otitis externa *(Milford and Rowlands, 1999)*

otitis media, an inflammation or infection of the middle ear, common in early childhood. Acute otitis media is most often caused by ***Haemophilus influenzae, Moraxella catarrhalis,*** or ***Streptococcus pneumoniae.*** Chronic otitis media is usually caused by gram-negative bacteria such as ***Proteus, Klebsiella,*** and ***Pseudomonas.*** Allergy, ***Mycoplasma,*** and several viruses also may be causative factors. Otitis media is often preceded by an upper respiratory infection.

■ OBSERVATIONS: Organisms gain entry to the middle ear through the eustachian tube. The small diameter and horizontal orientation of the tube in infants predisposes them to infection. Obstruction of the eustachian tube and accumulation of exudate may increase pressure within the middle ear, forcing infection into the mastoid bone or rupturing the tympanic membrane. Symptoms of acute otitis media include a sense of fullness in the ear, diminished hearing, pain, and fever. Usually only one ear is affected. Squamous epithelium may grow in the middle ear through a rupture in the tympanic membrane; development of a cholesteatoma and hearing loss may occur if repeated infections cause an opening to persist. Pneumococcal otitis media may spread to the meninges.

■ INTERVENTIONS: Treatment includes antibiotics, analgesics, local heat, nasal decongestants, needle aspiration of secretions collected behind the membrane, and myringotomy.



Otitis media *(Mir, 2003)*

■ NURSING CONSIDERATIONS: Parents are taught to recognize and watch for early warning signs of otitis media. The use of vaporizers and decongestants is often recommended during an upper respiratory tract infection as prophylaxis against otitis media. Chronic otitis media may result in hearing loss and delays in speech development.

otitis sclerotica [Gk, *ous,* ear, *itis,* inflammation, *sclerosis,* hardening], a sclerosing type of inflammation of the middle ear.

oto-, ot-, -otic, combining form meaning "ear": *otoantritis, otoblennorrhea, otocyst, parotic, hematotic.*

otoacoustic emissions, echoes emitted by the outer hair cells of the inner ear. These echoes are used to evaluate the integrity of the inner ear and to screen hearing in newborns.

otocephalic, otocephalous. See **otocephaly.**

otocephalus /ō′tōsef′ələs/, a fetus with otocephaly.

otocephaly /ō′tōsef′əlē/ [Gk, *ous* + *kephale,* head], a congenital malformation characterized by the absence of the lower jaw, defective formation of the mouth, and union or close approximation of the ears on the front of the neck. See also **agnathocephaly. —otocephalic, otocephalous,** *adj.*

otocranial debris, otoliths that have been dislodged by trauma and may move about in the semicircular canals when the head changes position.

otodynia. See **otalgia.**

otolaryngologist /-ler′ing·gol′əjist/ [Gk, *ous* + *larynx* + *logos,* science], a physician who specializes in the diagnosis and treatment of diseases and injuries of the ears, nose, and throat. Also called **ENT specialist.** Compare **otologist.**

otolaryngology /-ler′ing·gol′əjē/ [Gk, *ous* + *larynx* + *logos,* science], a branch of medicine dealing with the diagnosis and treatment of diseases and disorders of the ears, nose, throat, and adjacent structures of the head and neck.

otolith /ō′təlith/ [Gk, *ous,* ear, *lithos,* stone], **1.** a calculus in the middle ear. **2.** any of the crystals of calcium carbonate attached to the hair cells of the inner ear as gravity orientation receptors.

otolith righting reflex [Gk, *ous* + *lithos,* stone], an involuntary response in newborns in which tilting of the body when the infant is in an erect position causes the head to return to the upright position. The reflex enables the infant to raise the head and is important for development of later gross motor skills. Absence of the reflex may indicate central nervous system damage.

otologist /ōtol′əjist/, a physician trained in the diagnosis and treatment of diseases and other disorders of the ear. Compare **otolaryngologist.**

otology /ōtol′əjē/ [Gk, *ous* + *logos,* science], the study of the ear, including the diagnosis and treatment of its diseases and disorders.

-otomy, suffix meaning "to make an incision or cut into": *phlebotomy, tracheotomy.*

otomycosis /ō′tōmīkō′sis/, a lesion of the external ear caused by a fungus infection.

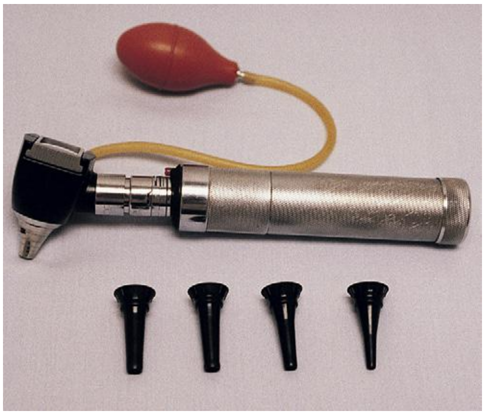
otoneuralgia. See **otalgia.**

otoneurology. See **neurotology.**

otoplasty /ō′təplas′tē/ [Gk, *ous* + *plassein,* to mold], a common procedure in reconstructive plastic surgery in which, for cosmetic reasons, some of the cartilage in the ears is removed to bring the auricle and pinna closer to the head.

otopyosis /ō′təpi·ō′sis/, a pus-producing inflammation of the ear, occurring either in the tympanic cavity or the external auditory meatus.

otorrhea /ō′tərē′ə/ [Gk, *ous* + *rhoia,* flow], any discharge from the external ear. Otorrhea may be serous, sanguinous, or purulent or contain cerebrospinal fluid. *—otorrheal, otorrheic, otorrhetic, adj.*



Otoscope with various sizes of specula and a pneumatic attachment

otosclerosis /ō′tōsklərō′sis/ [Gk, *ous* + *skleros,* hard, *osis,* condition], a hereditary condition of unknown cause in which irregular ossification occurs in the ossicles of the middle ear, especially of the stapes, causing hearing loss. It is usually first noticed between 11 and 30 years of age. Women are affected twice as often as men. The condition may worsen during pregnancy. Stapedectomy or stapedotomy is usually successful in restoring hearing.

otoscope /ō′təskōp′/ [Gk, *ous* + *skopein,* to look], an instrument used to examine the external ear, the eardrum, and, through the eardrum, the ossicles of the middle ear. It consists of a light, a magnifying lens, a speculum, and sometimes a device for insufflation.

otoscopy /ōtos′kəpē/ [Gk, *ous,* ear, *skopein,* to view], an inspection of the tympanic membrane and other parts of the outer ear with an otoscope, an instrument for examining the drum membrane.

otospongiosus. See **otosclerosis.**

ototoxic hearing loss, hearing loss caused by ingestion of toxic substances. Also called **toxic deafness.**

ototoxicity /ō′tōtok′sisitē/ [Gk, *ous* + *toxikon,* poison], the harmful effects of certain substances on the eighth cranial nerve or the organs of hearing and balance. Common ototoxic drugs include the aminoglycoside antibiotics, aspirin, furosemide, and quinine. *—ototoxic, adj.*

OTR, abbreviation for *occupational therapist, registered.*

Otrivin, a trademark for a nasal adrenergic vasoconstrictor **(xylometazoline hydrochloride).**

Otto pelvis /ot′ō/ [Adolph W. Otto, German surgeon, 1786–1845], a type of hip dislocation which involves a gradual central displacement of the femur. The cause is unknown.

O.U., abbreviation for *oculus uterque,* a Latin phrase meaning "either eye."

oubain /wäbā′in/, a crystalline glycoside derived from the seeds of *Strophanthus gratus* and the wood of *Acocanthera oubaio.* It blocks Na+K+ATPase similarly to strophanthin-K and the digitalis glycosides and is often used in pharmacological studies because of its greater solubility in water. It is used as an arrow poison in Africa.

Ouchterlony double diffusion [Orjan T.G. Ouchterlony, Swedish bacteriologist, b. 1914], a form of gel diffusion technique in which antigen and antibody in separate cells are allowed to diffuse toward each other.

ounce (oz) /ouns/ [L, *uncia,* one twelfth], a unit of mass equal to $^{1}/_{16}$ of a pound avoirdupois or 28.349 grams. Also called *ounce avoirdupois*.

-ous, -eous, suffix meaning an "element or compound with a valence lower than the corresponding one ending in *-ic*": *cuprous, ferrous, hypochlorous*.

outbreak /out′brāk′/, in epidemiology, the occurrence of infection with a particular disease in a small, localized group, such as the population of a village. The term is sometimes used more broadly to refer to an epidemic or a pandemic.

outbreeding [AS, *ut,* out, *bredan,* to breed], the production of offspring by the mating of unrelated individuals, which can lead to superior hybrid traits or strains. Compare **inbreeding.** See also **heterosis.**

outcome [AS, *ut* + *couman,* to come], the condition of a patient at the end of therapy or a disease process, including the degree of wellness and the need for continuing care, medication, support, counseling, or education.

outcome criteria, standards that focus on observable or measurable results of nursing and other health service activities.

outcome data, information collected to evaluate the capacity of a client to function at a level described in the outcome statement of a nursing care plan or in standards for patient care.

outcome measure, a measure of the quality of medical care, the standard against which the end result of the intervention is assessed.

outer zone of renal medulla, the part of the renal medulla nearest to the cortex. It contains part of the distal straight tubule and the medullary collecting tubule and is subdivided into the *inner stripe* and the *outer stripe*.

outlet [AS, *ut* + *laetan,* to permit], an opening through which something can exit, such as the pelvic outlet.

outlet contraction. See **contraction.**

outlet contracture, an abnormally small pelvic outlet. It may be anteroposterior or transverse and is of significance in childbirth because it may impede or prevent passage of a baby through the birth canal. Anteroposterior contracture caused by fixation of the coccyx may sometimes be overcome by the force of labor, freeing the bones and allowing them to move back. Significant narrowing of the space between the ischial tuberosities is unlikely to be overcome and is most commonly associated with a heavy, android type of pelvis.

outlet forceps. See **low forceps.**

outlier, **1.** (in managed care) a case in which costs exceed the allowable amount for the specific diagnosis or treatment. The outlier amount is typically specified in advance in the contract between the provider and payer. **2.** (in research) an observation that differs from all others, suggesting that a gross error has occurred in sampling, measurement, or analysis.

outline form [AS, *ut* + *lin,* thread], the shape of the cavosurface of a prepared tooth cavity before the tooth surface or surfaces are restored.

out-of-body experience (oobe), a sensation that the mind has separated temporarily from the body. The feeling tends to occur when the patient is asleep, in a trance, or unconscious as during surgery. The person visualizes his or her body as an impersonal observer might. In some cases the person visualizes objects or persons who are beyond the range of normal senses. Occasionally a patient near death learns after awakening that he or she has been declared clinically dead during the moments of the experience. See also **near-death experience.**

out of phase, a series of events or actions that are not synchronous with a previously established periodic process or phenomenon. An oscillation or periodic process that runs in an opposite direction or pattern is sometimes described as 180 degrees out of phase.

out-of-plan services, services given to a patient by a provider outside the managed care system. The patient may be responsible for a larger copayment than if the services were received within the plan.

outpatient (OP) [AS, *ut* + L, *patientia,* endurance], **1.** *n,* a patient, not hospitalized, who is being treated in an office, clinic, or other ambulatory care facility. **2.** *adj,* pertaining to a health care facility for patients who are not hospitalized or to the treatment or care of such a patient. Compare **inpatient.**

outpatient anesthesia. See **ambulatory anesthesia.**

output [AS, *ut* + *putian,* to put], **1.** the total of any and all measurable liquids lost from the body, including urine, vomitus, and diarrhea; drainage from wounds and fistulas; and those removed by suction equipment. The output is recorded as a means of monitoring a patient's fluid and electrolyte balance. **2.** the end product of a system.

output amplifier, an apparatus used to increase the amplitude of the voltage output of a generator and control it at a specific level.

output device, any device that converts information from a computer into a form that is readable by humans or another machine, such as a printer or monitor display.

outreach program, a system of delivery of services to patients who are not likely to access treatment independently, particularly mentally ill older adults in rural environments. They are considered most at risk because mental health and social services are usually not readily available. Outreach programs can diagnose and treat homebound clients with physical limitations or major psychiatric illnesses who are socially isolated.

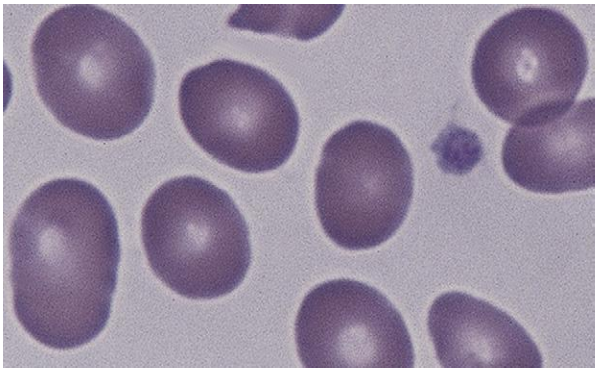
ova. See **ovum.**

ova and parasites test /ō′va/, a microscopic examination of feces for parasites, such as amebas or worms and their ova, which are indicators of parasitic disorders.

ovale malaria. See **tertian malaria.**

oval foramen, **1.** an opening in the septum between the right and the left atria in the fetal heart. This opening provides a bypass for blood that would otherwise flow to the fetal lungs. Most of the blood from the inferior vena cava in the fetus flows through the foramen ovale into the left atrium. After birth the foramen ovale functionally closes when the newborn takes the first breath and full circulation through the lungs begins. Also called **foramen ovale.** See also **ductus arteriosus.** **2.** an oval foramen situated laterally to the foramen rotundum of the sphenoid bone.

ovalocytes /ō′vəlōsīts′/ [L, *ovalis,* egg-shaped; Gk, *kytos,* cell], elliptical or oval-shaped red blood cells with pale centers occasionally found in patients with hereditary elliptocytosis. See also **elliptocytosis.**



Ovalocytes *(Carr and Rodak, 2008)*

ovalocytosis. See **elliptocytosis.**

oval window /ō′vəl/ [L, *ovum;* ME, *windoge*], an aperture in the wall of the middle ear, leading to the inner ear. The footplate of the stapes vibrates in the oval window, transmitting sound waves to the cochlea. Also called **vestibular window.**

ovari-. See **ovario-.**

-ovaria, suffix meaning "(condition of the) ovary or ovarian activity": *anovaria, hyperovaria, hypoovaria.*

ovarian /ōver′ē·ən/ [L, *ovum,* egg], pertaining to the ovary.

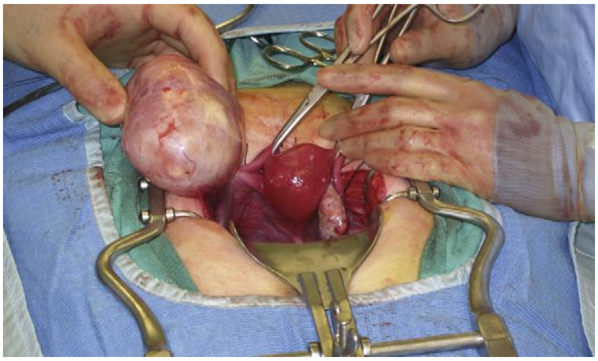
ovarian artery, a slender branch of the abdominal aorta, arising caudal to the renal arteries, and supplying an ovary. Compare **testicular artery.**

ovarian cancer. See **ovarian carcinoma.**

ovarian carcinoma, a malignant neoplasm of the ovaries rarely detected in the early stage and usually far advanced when diagnosed. It occurs frequently in the fifth decade of life. Ovarian cancer appears to be increasing in the United States. Risk factors of the disease are infertility, nulliparity or low parity, delayed childbearing, repeated spontaneous abortion, endometriosis, group A blood type, family history, previous history of breast or colorectal cancer, previous irradiation of pelvic organs, and exposure to chemical carcinogens such as asbestos and talc. After an insidious onset and asymptomatic period, the tumor may become evident as a palpable abdominal or pelvic mass accompanied by irregular or excessive menses or postmenopausal bleeding. In advanced cases the patient may have ascites, edema of the legs, and pain in the abdomen and the backs of the legs. Regular yearly pelvic examinations after 40 years of age contribute significantly to early diagnosis and the possibility of curative treatment. Characteristics of the disease as it advances are abdominal swelling and discomfort, abnormal vaginal bleeding, weight loss, dysuria or abnormal frequency of urination, constipation, and a palpable ovarian mass, especially in postmenopausal women. A Papanicolaou smear may show malignant cells if the tumor is advanced; CA-125 may be elevated; an ultrasonic examination can demonstrate an ovarian mass but does not distinguish between a benign and malignant lesion. A computed tomographic scan may be useful in detecting ovarian cancer, but a definitive diagnosis requires surgical exploration. Most ovarian carcinomas are papillary or serous, followed in frequency by mucinous, endometrial, and undifferentiated cancers. In many cases the cancer spreads over the surface of the peritoneum, and, early in the course of the lesion, tumor cells invade the lymphatic vessels under the diaphragm and the paraaortic nodes. Approximately half of the tumors diagnosed are unresectable. Treatment of resectable lesions consists of total abdominal hysterectomy, removal of both ovaries and tubes, omentectomy, and biopsies of any suspicious sites, especially in the liver and diaphragm. Chemotherapeutic agents that may be administered after surgery include chlorambucil, cisplatin, cyclophosphamide, melphalan, taxol, docetaxel, and thiotepa. Radiation therapy may be used alone or in conjunction with chemotherapy. "Second-look" surgery is usually performed 1 year after chemotherapy to confirm the eradication of the tumor. Also called **ovarian cancer.**

ovarian cyst, a globular sac filled with fluid or semisolid material that develops in or on the ovary. It may be transient and physiological or pathological. Kinds of ovarian cysts include **chocolate cyst,** *corpus luteum cyst,* and **dermoid cyst.**

ovarian fimbria, the longest of the processes that make up the uterine fimbria tube, extending along the free border of the mesosalpinx. It is fused to the ovary, so that the ostium of the tube relates to the ovary. Also called *fimbriated extremity of fallopian tube.*



Carcinoma in the left ovary *(Baggish and Karram, 2011)*

ovarian follicle [L, *ovum* + *folliculus,* small bag], a cavity or recess in an ovary containing a liquor that divides the follicular cells into layers and surrounds an ovum.

ovarian hormone. See **relaxin.**

ovarian hyperstimulation, ovarian enlargement with exudation of fluid and protein.

ovarian pregnancy, a rare type of ectopic pregnancy in which the conceptus is implanted within the ovary.

ovarian reserve, the number and quality of oocytes in the ovaries of a woman of childbearing age.

ovarian seminoma. See **dysgerminoma.**

ovarian varicocele, a varicose swelling of the veins of the uterine broad ligament. Also called **pelvic varicocele.**

ovarian vein, one of a pair of veins that emerge from convoluted plexuses in the broad ligament near the ovaries and the uterine tubes. The veins from each plexus ascend and unite to form single veins. The right ovarian vein opens into the inferior vena cava and the left ovarian vein into the renal vein. In some individuals the ovarian veins contain valves and greatly enlarge during pregnancy. Compare **testicular vein.**

ovariectomy. See **oophorectomy.**

ovario-, ovari-, oario-, ootheco-, prefix meaning "ovary": *ovariocentesis, ovariosteresis, ovariotubal.*

ovariocele /ōver′ē·əsēl/, a hernia of an ovary or protrusion of an ovary through the vaginal wall.

ovariocentesis /ōver′ē·ōsentē′sis/, surgical puncture of an ovary and drainage of an ovarian cyst.

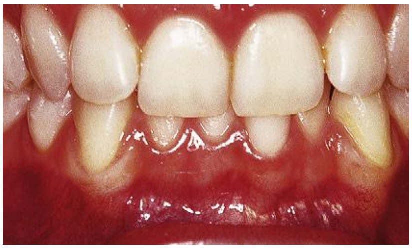
ovariohysterectomy /-his′tərek′təmē/, the surgical removal of the uterus and ovaries.

ovary /ō′vərē/ [L, *ovum,* egg], one of the paired female gonads found on each side of the lower abdomen, beside the uterus in a fold of the broad ligament. At ovulation, an egg is expelled from a follicle on the surface of the ovary under the stimulation of the gonadotrophic hormones follicle-stimulating hormone (FSH) and luteinizing hormone (LH). The remainder of the follicle (corpus luteum) secretes the hormones estrogen and progesterone, which regulate the menstrual cycle by a negative-feedback system in which an increase in estrogen decreases the secretion of FSH by the pituitary gland and an increase in progesterone decreases the secretion of LH. Each ovary is normally firm and smooth and resembles an almond in size and shape. The ovaries generally are homologous to the testes.

Ovcon, a trademark for an oral contraceptive containing an estrogen **(ethinyl estradiol)** and a progestin (norethindrone acetate).

overactive bladder, a condition characterized by a nearly constant urge to urinate. Also called **irritable bladder.** See also **urgency, urinary incontinence.**

overbite /ō′vərbīt/ [AS, *ofer,* over, *bitan,* to bite], increased vertical overlapping of the mandibular anterior (lower front) teeth by the maxillary anterior (upper front) teeth, usually measured perpendicular to the occlusal plane. Compare **overclosure, overjet.**



Overbite *(Nanda, 2005)*

overclosure /-klō′zhər/ [AS, *ofer* + L, *claudere,* to close], an abnormal condition in which the mandible rises beyond the point of normal occlusal contact, caused by drifting of teeth, loss of occlusal vertical dimension, change in tooth shapes through grinding, or loss of teeth.

overcoat /o′vər-kōt/. See **abrasion layer.**

overcompensation /-kom′pənsā′shən/ [AS, *ofer* + L, *compensare,* to weigh together], an exaggerated attempt to overcome a real or imagined physical or psychological deficit. The attempt may be conscious or unconscious. See also **compensation.**

overdenture /-den′chər/ [AS, *ofer* + L, *dens,* tooth], a complete or partial removable denture supported by retained roots or teeth to provide improved support, stability, and tactile and proprioceptive sensation and to reduce bone resorption.

overdose (OD) /-dōs/, an excessive use of a drug, resulting in adverse reactions ranging from mania or hysteria to coma or death.

overdrive suppression /-drīv/ [AS, *ofer* + *drifan,* to drive], the inhibitory effect of a faster cardiac pacemaker on a slower one.

overeruption /-irup′shən/, the projection of a tooth beyond the normal occlusal plane. Also called **supereruption, supraclusion, supraocclusion.**

overflow /-flō/ [AS, *ofer* + *flowan*], the flooding or excessive discharge of a fluid, such as urine, saliva, or bile.

overflow incontinence [AS, *ofer* + *flowan* + L, *incontinentia,* inability to retain], an overflow of urine from a distended paralyzed bladder. See also **incontinence, urinary incontinence.**

overgrafting /-graf′ting/, placing an additional transplant over a previously healed tissue graft. It is sometimes performed to strengthen a split-thickness graft or to replace epithelium that may have been lost.

overgrowth [AS, *ofer* + ME, *growen*], an excessive growth, usually referring to organ or tissue development. Also called **hypertrophy.**

overhang /-hang/ [AS, *ofer* + *hangian,* to hang], an excess of dental filling material that projects beyond the margin of a tooth cavity preparation. It can trigger gingivitis or periodontitis by providing a harbor for bacteria.

overhydration /-hīdrā′shən/, an excess of water in the body. Also called **hyperhydration.**

overinclusiveness /-inklo͞o′sivnəs/ [AS, *ofer* + L, *includere,* to include], a type of association disorder observed in some schizophrenia patients. The individual is unable to think in a precise manner because of an inability to keep irrelevant elements outside perceptual boundaries.

overjet /-jet/ [AS, *ofer* + Fr, *jeter,* to throw], increased projection of the upper teeth in front of the lower teeth, usually measured parallel to the occlusal plane. Also called **horizontal overlap.** Compare **overbite, overclosure.**

overlap /-lap′/, to extend over and cover part of an existing surface or structure.

overlay /ō′vərlā/, to add to an existing condition or structure; to lay on top of something.

overlearning /-lur′ning/, the practice of an ability that continues beyond the point where performance meets a specified standard.

overload /-lōd/, **1.** a burden greater than the capacity of the system designed to move or process it. **2.** (in physiology) any factor or influence that stresses the body beyond its natural limits and may impair its health.

overnutrition /-no͞otrish′ən/, a condition of excess nutrient and energy intake over time. Overnutrition may be regarded as a form of malnutrition when it leads to morbid obesity.

overoxygenation /-ok′sijənā′shən/ [AS, *ofer* + Gk, *oxys,* sharp, *genein,* to produce; L, *atio,* process], an abnormal condition in which the oxygen concentration in the blood and other tissues of the body is greater than normal. The condition is characterized by a fall in blood pressure, decreased vital capacity, fatigue, errors in judgment, paresthesia of the hands and feet, anorexia, nausea, vomiting, and hyperemia.

overresponse /-rispons′/, an abnormally strong reaction to a stimulus.

overriding /-rī′ding/ [AS, *ofer* + *ridan*], **1.** *n,* the slipping of either part of a fractured bone past the other. **2.** *adj,* extending beyond the usual position.

overripe cataract /-rīp/ [AS, *ofer* + OE, *reap*], a cataract in which a completely opaque lens solidifies and shrinks.

oversensing /-sen′sing/, the sensation of stimuli, such as magnetism or static electricity, that are not normally detected by the sense organs.

overshoot /ō′vərsho͞ot′/, **1.** *v,* to go beyond or exceed a target or goal. **2.** *n,* an upper part of a structure that extends beyond the lower part.

over the counter (OTC), (of a drug) available to the consumer without a prescription.

overtone, **1.** any tone produced by voice or a musical instrument that is of a higher frequency than the lowest or fundamental tone of a sound. **2.** a harmonic.

overweight /-wāt/ [AS, *ofer* + *gewiht,* weight], **1.** more than normal in body weight after adjustment for height, body build, and age, or 10% to 20% above the person's "desirable" body weight. **2.** a body mass index between 25.0 and 29.9. See also **body mass index.**

overwintering /-win′təring/, persistence of seasonal infectious agents beyond their normal period of activity, particularly warm weather pathogen vectors that remain operative into the winter months.

ovi-, ovo-, prefix meaning "ovum or egg": *ovipara, oviposit, ovoplasm.*

ovicidal /ō′visī′dəl/, causing destruction of an ovum.

ovicide /ō′visīd/, an agent that destroys ova.

oviduct. See **fallopian tube.**

oviferous /ōvif′ərəs/ [L, *ovum,* egg, *ferre,* to bear], bearing or capable of producing ova (egg cells).

oviparous /ōvip′ərəs/ [L, *ovum* + *parere,* to bring forth], giving birth to young by laying eggs. Compare **ovoviviparous, viviparous.**

oviposition /ō′vipəsish′ən/ [L, *ovum* + *ponere,* to place], the act of laying or depositing eggs by a female oviparous animal.

ovipositor /ō′vipos′itər/ [L, *ovum* + *ponere,* to place], a specialized organ, found primarily in insects, for depositing eggs on plants or in the soil. It may be modified into a stinger, as in worker bees and wasps.

ovo-. See **ovi-.**

ovocenter /ō′vəsen′tər/ [L, *ovum* + *centrum,* center], the centrosome of a fertilized ovum. Also called **oocenter** /ō`əsen′tər/.

ovoflavin /ō′vəflā′vin/ [L, *ovum* + *flavus,* yellow], a riboflavin derived from the yolk of eggs.

ovogenesis. See **oogenesis.**

ovoglobulin /ō′vəglob′yo͝olin/ [L, *ovum* + *globulus,* small sphere], a globulin protein derived from the white of eggs.

ovogonium. See **oogonium.**

ovoid /ō′void/, egg-shaped, oval.

ovoid arch [L, *ovum* + Gk, *eidos,* form; L, *arcus,* bow], a dental arch that curves smoothly from the molars on one side to those on the opposite side to form half an oval.

ovo-lacto-vegetarian. See **lacto-ovo-vegetarian.**

ovomucin /ō′vəmyo͞o′sin/ [L, *ovum* + *mucus,* slime], a glycoprotein derived from the white of eggs.

ovomucoid /ō′vəmyo͞o′koid/ [L, *ovum* + *mucus,* slime; Gk, *eidos,* form], pertaining to a glycoprotein, similar to mucin, derived from the white of eggs.

ovoplasm. See **ooplasm.**

ovotestis /ō′vətes′tis/ [L, *ovum* + *testis,* testicle], a gonad that contains both ovarian and testicular tissue; a hermaphroditic gonad. —*ovotesticular, adj.*

ovo-vegetarian. See **vegetarian.**

ovovitellin. See **vitellin.**

ovoviviparous /ō′vəvivip′ərəs/ [L, *ovum* + *vivus,* living, *parere,* to bring forth], bearing young in eggs that are hatched within the body, as in some reptiles and fishes. Compare **oviparous, viviparous.**

Ovral, a trademark for an oral contraceptive containing a progestin **(norgestrel)** and an estrogen **(ethinyl estradiol).**

Ovrette, a trademark for an oral contraceptive containing a progestin **(norgestrel).**

OVTT, abbreviation for **optometric vision therapy technician.**

ovulation /ov′yəlā′shən/ [L, *ovum* + *atio,* process], expulsion of an ovum from the ovary on spontaneous rupture of a mature follicle as a result of cyclic ovarian and pituitary endocrine function. It usually occurs on or about the eleventh to the fourteenth day before the next menstrual period and may cause brief, sharp lower abdominal pain on the side of the ovulating ovary. See also **oogenesis.** —*ovulate* /ov′yə′lāt/, *v.*

ovulation method of family planning, a natural method of family planning that uses observation of changes in the character and quantity of cervical mucus to determine the time of ovulation during the menstrual cycle. Because pregnancy occurs with fertilization of an ovum extruded from the ovary at ovulation, the method is used to increase or decrease the woman's chance of becoming pregnant by causing or avoiding insemination by spontaneous or artificial means during the fertile period associated with ovulation. The cyclic changes in gonadotropic hormones, especially estrogen, cause changes in the quantity and character of cervical mucus. In the first days after menstruation, scant thick mucus is secreted by the cervix. These "dry days" are "safe days," with ovulation several days away. The quantity of mucus then increases; it is pearly white and sticky, becoming clearer and less sticky as ovulation approaches; these "wet days" are "unsafe days." During and just after ovulation the mucus is clear, slippery, and elastic; it resembles the uncooked white of an egg. The day on which this sign is most apparent is the "peak day," probably the day before ovulation. The 4 days after the "peak day" are "unsafe"; fertilization might occur. By the end of the 4 days, the mucus becomes pearly white and sticky again and progressively decreases in quantity until menstruation supervenes to begin a new cycle. Essential to the effectiveness of this method are thorough instruction by a family planning counselor and strong self-motivation in the couple. During the first cycle, abstinence may be necessary to allow observation of the mucus without the confusing addition of semen or contraceptive foam, cream, or jelly, if being used. Daily close monitoring of the mucus is necessary even after several cycles because the length of the "safe" and "unsafe" periods and the time of ovulation vary from cycle to cycle, as they do from woman to woman. After delivery and during lactation the method is not effective until the menses have become regular. Effectiveness of the method in identifying the most fertile days of the cycle is augmented by using the basal body temperature method. This combined method is called the symptothermal method of planning. Proponents of the ovulation method claim the benefits of low cost, naturalness, and effectiveness. Detractors emphasize a limited public health application of the method, stating that it requires extensive teaching and self-motivation and that its effectiveness is limited by the ability of the user to observe correctly and diligently the changes in the cervical mucus. Abstinence may be necessary for up to 10 days by a woman whose menstrual cycles are long or are of irregular length. Also called **Billings method, cervical mucus method of family planning.**

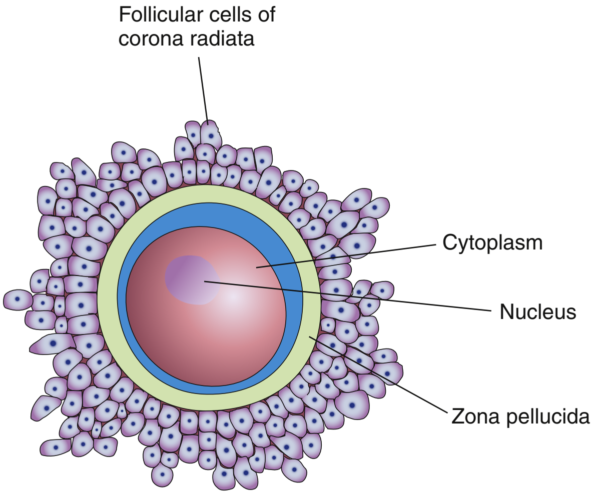
ovulatory /ov′yələtôr′ē/ [L, *ovum*], pertaining to ovulation.

ovulatory phase, the second phase of the human menstrual cycle, during which the luteinizing hormone surge, the follicle-stimulating hormone surge, and ovulation occur. It is followed by the luteal phase.

ovulocyclic /ov′yəlōsī′klik/, pertaining to recurrent events associated with the ovulatory cycle.

ovulocyclic porphyria, episodes of acute abnormalities of porphyrin metabolism that tend to recur in the premenstrual period.

ovum /ō′vəm/ *pl.* **ova** [L, egg], **1.** an egg. **2.** the secondary oocyte (female germ cell) extruded from the ovary at ovulation.



Ovum *(Moore and Persaud, 2008)*

owl-eye cell, an enlarged cell infected by cytomegalovirus and containing large inclusion bodies, found mainly in the renal epithelium.

Owren's disease [Paul A. Owren, Norwegian hematologist, b. 1905], a rare congenital bleeding disorder caused by a deficiency of coagulation factor V. Also called **parahemophilia.**

ox-. See **oxy-**.

ox-, oxi-, prefix meaning "presence of oxygen": *oxidize*.

oxacillin sodium /ok′səsil′in/, a penicillinase-resistant penicillin antibiotic.

■ INDICATION: It is prescribed in the treatment of severe bacterial infections caused by penicillinase-producing staphylococci.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to any other penicillin prohibits its use.

■ ADVERSE EFFECTS: Among the most serious effects are anaphylaxis and other less severe allergic reactions, GI disturbances, and pruritus ani and vulvae.

-oxacin, suffix for nalidixic acid–type antibacterial agents.

oxal-, oxalo-, prefix indicating molecules derived from oxalic acid: *oxalic, oxaloacetate*.

oxalate ($C_2O_4^{2-}$) /ok′səlāt/, an anion of oxalic acid.

oxalated blood /ok′səlā′tid/, blood to which a soluble ester of oxalic acid has been added to prevent coagulation.

oxalemia /ok′səlē′mē·ə/, elevated levels of oxalates in the blood.

oxalic acid ($H_2C_2O_4$) /oksal′ik/, a member of a family of dibasic acids found in many common plants, such as buckwheat, wood sorrel, and rhubarb. It is an important reagent and is used in bleaching and drying. Poisonous if ingested, oxalic acid is used in veterinary medicine as a hemostatic. In dietary intake of foods containing oxalic acid, the substance binds with calcium and is sometimes found in renal calculi and the urine of patients with hyperoxaluria. Also called **ethanedioic acid.**

oxaliplatin, an antineoplastic agent used to treat metastatic carcinoma of the colon or rectum in combination with 5-FU/leucovorin.

oxalosis /ok′səlō′sis/, a condition in which calcium oxalate crystals accumulate in the kidneys, heart, and other organs and urinary excretion of oxalate increases. Oxalosis-inducing agents include oxalic acid, methoxyflurane, ethylene glycol, and ascorbic acid.

oxaluric acid /ok′səlŏŏr′ik/, a compound derived from uric acid or from parabanic acid, which occurs in normal urine.

-oxan, suffix for benzodioxan-derived alpha-adrenoceptor antagonists.

oxandrolone /oksan′drəlōn/, an androgen.

■ INDICATIONS: It is prescribed in the treatment of bone pain accompanying osteoporosis and for the stimulation of weight gain after extensive surgery or trauma or when a pathophysiological reason exists for failure to maintain normal weight.

■ CONTRAINDICATIONS: Cancer of the male breast or prostate, liver disease, pregnancy or suspected pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are hirsutism, acne, liver toxicity, electrolyte imbalances, and various endocrine effects in some patients.

oxaprozin /ok′säpro′zin/, a nonsteroidal antiinflammatory drug, used in treatment of arthritis.

oxazepam /oksā′zəpam/, a benzodiazepine tranquilizer.

■ INDICATIONS: It is prescribed to relieve anxiety and nervous tension and manage ethanol withdrawal, and it has unlabeled use for treatment of simple partial seizures.

■ CONTRAINDICATIONS: Acute narrow-angle glaucoma, psychotic disorders, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are withdrawal symptoms resulting from discontinuation of treatment. Dizziness and fatigue commonly occur.

oxazolidinone /ok′säzo-lid′ĭ-nōn/, any of a class of synthetic antibacterial agents effective against gram-positive organisms.

oxcarbazepine /oks′kär-baz′ĕ-pēn/, an anticonvulsant used in the treatment of partial seizures. It is administered orally.

-oxef, suffix for oxacefalosporanic acid–derived antibiotics.

-oxemia, suffix meaning a "(specified) state of oxygen in the blood": *anoxemia, hyperoxemia, hypoxemia*.

-oxia, suffix meaning "(condition of) oxygenation": *anoxia, asthenoxia, hypoxia*.

oxiconazole /ok′sĭ-kon′äzōl/, a topical antifungal agent used as the nitrate salt in treatment of athlete's foot and ringworm.

oxidant /ok′sidənt/ [Gk, *oxys*, sharp], an oxidizing agent.

oxidase /ok′sidās/ [Gk, *oxys*, sharp], an enzyme that induces biological oxidation by activating the oxygen in molecules containing the element, such as hydrogen peroxide.

oxidation /ok′sidā′shən/ [Gk, *oxys*, sharp, *genein*, to produce, L, *atio*, process], **1.** any process in which the oxygen content in a compound or the number of bonds to oxygen (or another electronegative element, such as a halogen) is increased. **2.** any reaction in which the positive valence of a compound or a radical is increased because of a loss of electrons. **3.** any process in which the hydrogen content in a compound or the number of bonds to hydrogen (or another element of low electronegativity, such as a metal) is decreased. **—oxidize,** *v., oxidative, n*.

oxidation-reduction reaction, a chemical change in which electrons are removed (oxidation) from an atom, ion, or molecule, accompanied by a simultaneous transfer of electrons (reduction) to another. The reaction may also involve the transfer of electronegative atoms (e.g., oxygen) or atoms of low electronegativity (e.g., hydrogen or metal) from one molecule to another. Also called **redox.**

oxidative phosphorylation /ok′sidā′tiv/, an ATP-generating process in which oxygen serves as the final electron acceptor. The process occurs in mitochondria and is the major source of adenosine triphosphate generation in aerobic organisms.

oxidative stress, **1.** any of various pathological changes seen in living organisms in response to excessive levels of cytotoxic oxidants and free radicals in the environment. **2.** use of antioxidant intake in the diet to provide both preventive and therapeutic advantage and reduce the damaging effects of free radicals on cellular constituents.

oxidative water [Gk, *oxys*, sharp, *genein*, to produce, L, *ativus*, related to], water produced by the oxidation of molecules of food substances, such as the conversion of glucose to water and carbon dioxide.

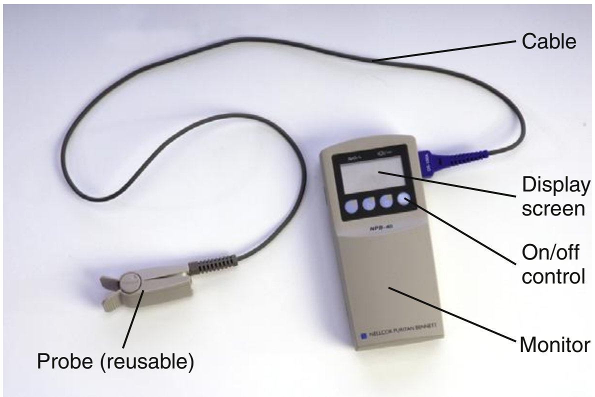
oxide /ok′sīd/, **1.** a compound of oxygen and another element or radical. **2.** a dianion of oxygen, O^{2-}.

oxidize /ok′sidīz/ [Gk, *oxys*,sharp, *genein*, to produce, *izein*, to cause], (of an element or compound) to combine or cause to combine with oxygen, to remove hydrogen, or to increase the valence of an element through the loss of electrons. **—oxidation,** *n., oxidizing, adj*.

oxidizing agent, a compound that readily gives up oxygen or accepts hydrogen or electrons from another compound. In chemical reactions an oxidizing agent acts as an acceptor of electrons, thereby increasing the valence of an element.

oxidoreductase /ok′sidō′riduk′tās/, an enzyme that catalyzes a reaction in which one substance is oxidized while another is reduced. An example is alcohol dehydrogenase.

oximeter /oksim′ətər/, a device used to measure oxyhemoglobin in arterial blood. See also **pulse oximeter.**



Pulse oximeter *(Bonewit-West, 2012)*

oximetry, a photodiagnostic method of monitoring arterial blood oxygen saturation (SaO_2). Oximetry is commonly used to titrate levels of oxygen in hospitalized patients. It is used for monitoring the patient's oxygenation status during the perioperative period or any other time of heavy sedation, during mechanical ventilation, and in many clinical situations such as pulmonary rehabilitation programs and stress testing. See also **pulse oximeter.**

oxprenolol /oks-pren′älol/, a nonselective beta-adrenergic blocking agent, administered orally as the hydrochloride salt in the treatment of hypertension, hypertrophic cardiomyopathy, cardiac arrhythmias, and myocardial infarction.

Oxsoralen, a trademark for a pigmentation agent **(methoxsalen).**

oxtriphylline /oks′trəfil′ēn/, a bronchodilator.

■ INDICATIONS: It is prescribed in the treatment of bronchial asthma, bronchitis, and emphysema.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or other xanthine derivatives prohibits its use. It is used with caution in patients with ulcer or coronary disease for whom cardiac stimulation might be harmful.

■ ADVERSE EFFECTS: Among the more common adverse effects are GI distress, palpitations, nervousness, and insomnia.

oxy-, **1.** prefix meaning "sharp, quick, or sour": *oxyblepsia, oxycephalia, oxyecoia.* **2.** prefix indicating the presence of oxygen in a compound: *oxyacanthine, oxycamphor, oxyquinoline.*

oxyacoia, an abnormal hearing acuity. Increased sensitivity to sound is sometimes associated with paralysis of the stapedius muscle.

oxybenzene. See **carbolic acid.**

oxybutynin chloride /ok′sibo͞o′tinin/, an anticholinergic.

■ INDICATION: It is prescribed in the treatment of neurogenic bladder.

■ CONTRAINDICATIONS: Glaucoma, obstruction of the GI or urinary tract, ulcerative colitis, paralytic ileus, toxic megacolon, or known hypersensitivity to this drug or to other anticholinergics prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are decreased sweating, urinary retention, blurred vision, tachycardia, and severe allergic reactions.

oxycalorimeter /ok′sēkal′ôrim′ətər/, an apparatus that measures the heat of combustion of organic materials in terms of oxygen consumed. Each liter of oxygen is roughly equivalent to 5 kilocalories.

oxycellulose /ok′sēsel′yəlōs/, **1.** cellulose that has been oxidized so that all or most of the glucose residues have been converted to glucuronic acid residues for use as an absorbent in chromatography. **2.** cellulose that has been partially oxidized for use as a local hemostatic.

oxycephaly /ok′sisef′əlē/ [Gk, *oxys* + *kephale,* head], a congenital malformation of the skull in which premature closure of the coronal and sagittal sutures results in accelerated upward growth of the head, giving it a long, narrow appearance with the top pointed or conic. Also called **acrocephaly, hypsicephaly,** *oxycephalia,* **steeple head, tower head, tower skull, turricephaly.** See also **craniostenosis.** —*oxycephalous, adj., oxycephalus, n.*

oxycodone hydrochloride /ok′sikōdōn/, an opioid analgesic.

■ INDICATION: It is used to treat moderate to severe pain, often in combination with nonopioid analgesics. OxyContin is a formulation that should be used only when severe persistent pain is anticipated.

■ CONTRAINDICATIONS: It is used with caution in many conditions, including head injuries, asthma, impaired renal or hepatic function, or unstable cardiovascular status. Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are drowsiness, dizziness, nausea, constipation, respiratory and circulatory depression, and drug addiction.

oxygen (O) /ok′səjən/ [Gk, *oxys,* sharp, *genein,* to produce], a tasteless, odorless, colorless gas essential for human respiration and metabolism. Its atomic number is 8; its atomic mass is 15.9994. Oxygen makes up approximately 21% of the gases in the atmosphere. In anesthesia, oxygen functions as a carrier gas for the delivery of anesthetic agents to the lungs. In respiratory therapy, oxygen is administered to increase the amount circulating in the blood. Overdose of oxygen can cause irreversible toxicity in people with pulmonary abnormalities, especially when complicated by chronic carbon dioxide retention. Prolonged administration of high concentrations of oxygen may cause irreversible retinal damage to infants' eyes. An oxygen-rich environment is favorable to fire and explosion. Thus smoking, open flame, or electric spark must be avoided when oxygen is being administered. See also **oxygen toxicity.**

oxygenation /ok′səjənā′shən/, the process of combining or treating with oxygen. —*oxygenate, v.*

oxygen capacity of blood, the maximum amount of oxygen that can combine chemically with a given amount of hemoglobin in blood. It does not include oxygen dissolved in plasma. Although 1 g of hemoglobin theoretically can bind a maximum of 1.34 mL of oxygen at standard temperature and pressure, this value is never actually achieved in vivo because of factors such as the formation of carboxyhemoglobin and the presence of methemoglobin or other inactive hemoglobins.

oxygen concentration in blood, the concentration of oxygen in a blood sample, including both oxygen combined with hemoglobin and oxygen dissolved in the plasma.

oxygen consumption, the amount of oxygen used by the body per minute. For normal aerobic metabolism, it is about 250 mL/min. Also called **oxygen uptake (VO_2).**

oxygen cost of breathing, the rate at which the respiratory muscles consume oxygen as they ventilate the lungs.

oxygen debt, the quantity of oxygen that the lungs take up during recovery from exercise or apnea that is in excess of the quantity needed for resting metabolism before the exercise or apnea. Oxygen debt represents replenishment of the oxygen store that was depleted during the time that oxygen uptake from the air was inadequate for aerobic metabolism. See also **oxygen consumption.**

oxygen delivery system, a device that delivers oxygen through the upper airways to the lungs at concentrations above that of ambient air. There are two general types: the **high-flow oxygen delivery system**, which can supply all of the needs of a patient for inspired gas at a given fractional inspired oxygen, and the **low-flow oxygen delivery system,** which cannot supply all of the patient's needs for oxygen and delivers fractional inspired oxygen that varies with ventilatory demand.

oxygen dissociation curve, graphic expression of the affinity of hemoglobin for oxygen as a function of the partial pressure of oxygen. Dissociation is influenced by pH, temperature, and carbon dioxide pressure. Formerly called *oxyhemoglobin dissociation curve*.

oxygen enhancement ratio (OER), a measure of tumor sensitivity to the presence or absence of oxygen, expressed as the ratio of radiation dose required to produce a given effect with no oxygen present to the dose required to produce the same effect in 1 atmosphere of air.

oxygen hood, a device placed over the head of a patient to deliver high concentrations of oxygen.

oxygen mask, a device used to administer oxygen, shaped to fit snugly over the mouth and nose and secured in place with a strap or held with the hand. The mask has inspiratory and expiratory valves allowing oxygen to be inhaled or pumped into the respiratory tract and carbon dioxide to be exhaled into the environment. Oxygen flows at a prescribed rate through a catheter to the mask. See also **Ambu bag.**

Oxygen mask *(Potter et al, 2011)*

oxygen P50, the oxygen pressure necessary for 50% saturation of hemoglobin at body temperature and at pH 7.4 or for 40 mm Hg of carbon dioxide pressure. The P50 is used as a measure of hemoglobin affinity for oxygen.

oxygen radicals [Gk, *oxys,* sharp; L, *radix,* root], a substituent group of chemical elements rich in oxygen but incapable of prolonged existence in a free state. Oxygen radicals are used in some types of therapy.

oxygen saturation, **1.** the fraction of the hemoglobin molecules in a blood sample that are saturated with oxygen at a given partial pressure of oxygen. Normal saturation is 95% to 100%. **2.** percentage of hemoglobin-bound oxygen compared to total capacity of the hemoglobin.

oxygen saturation, percentage of hemoglobin-bound oxygen compared to total capacity of the hemoglobin.

oxygen store, the total quantity of oxygen stored in various body compartments, including the lungs, arterial and venous blood, and tissues. In a 70-kg human, blood contains about 800 mL of oxygen as oxyhemoglobin, muscles contain about 150 mL as oxymyoglobin, alveolar gas contains a few hundred milliliters, and about 50 mL is dissolved in the tissues.

oxygen tension, the partial pressure of oxygen molecules dissolved in a liquid, such as blood plasma.

oxygen tent [Gk, *oxys,* sharp; ME, *tente*], a canopy that encloses the head and neck of a patient and provides humidified oxygen. See also **Croupette.**

oxygen therapy^1, any procedure in which oxygen is administered to a patient to relieve hypoxia.

■ METHOD: Of the many methods for providing oxygen therapy, the one selected depends on the condition of the patient and the cause of hypoxia. Low or moderate amounts of oxygen may be supplied to postoperative patients by a nasal catheter or cannula. A precise amount of oxygen may be delivered by a Venturi mask. Patients with chronic obstructive lung disease must receive low-flow oxygen to prevent the elimination of their stimulus to breathe (low O_2 levels). If hypoxia is the result of impaired cardiac function, a high concentration of oxygen may be delivered by a nonrebreathing or partial rebreathing mask. Humidity and drugs in aerosol form may be given with oxygen through a variety of devices, such as an aerosol face mask, Croupette, or T-piece.

■ INTERVENTIONS: Thorough and careful observation of the patient's need for oxygen and response to therapy are important. The concentration of oxygen received by the patient must not be assumed by the rate and concentration at which it is delivered; a person whose respirations are rapid and shallow receives more oxygen than does a person breathing deeply and slowly. Many clinical situations require frequent laboratory evaluations of the levels of arterial blood gases or oxygen saturation levels by means of pulse oximetry. Thorough knowledge of the equipment used and the condition being treated enables the nurse to care safely and effectively for the patient who requires oxygen.

■ OUTCOME CRITERIA: Oxygen therapy may be used in the treatment of any condition that results in hypoxia. Although there are several kinds of hypoxia, all result in hypoxemia. Oxygen administration may relieve hypotension, cardiac arrhythmias, tachypnea, headache, disorientation, nausea, and agitation characteristic of hypoxia, as well as restore the ability of the cells of the body to carry on normal metabolic function.

oxygen therapy^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as administration of oxygen and monitoring of its effectiveness. See also **Nursing Interventions Classification.**

oxygen tolerance, an increased capacity to withstand the toxic effects of abnormally high oxygen tension as a result of any adaptive change occurring within an organism.

oxygen toxicity, a condition of oxygen overdosage that can result in pathological tissue changes, such as retinopathy of prematurity or bronchopulmonary dysplasia. It can also decrease the hypoxic drive to breathe.

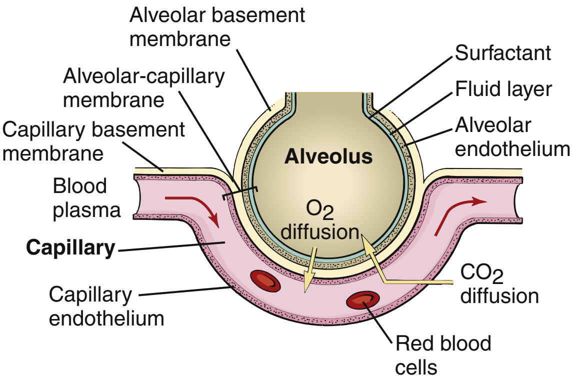
oxygen transport, the process by which oxygen is absorbed by red blood cell hemoglobin in the lungs and carried to the peripheral tissues. Hemoglobin combines with oxygen when present at a high concentration, such as in the lungs, and releases oxygen when the concentration is low, such as in the peripheral tissues. See also **hemoglobin.**

oxygen uptake (VO_2). See **oxygen consumption.**

oxygen-utilization coefficient. See **coefficient.**

oxyhemoglobin /ok′sēhē′məglō′bin, -hem′-/ [Gk, *oxys* + *genein,* to produce, *haima,* blood; L, *globus,* ball], hemoglobin that is transporting bound oxygen. Also spelled *oxyhaemoglobin*.

oxymesterone /ok′sēmes′tərōn/, an androgen and anabolic steroid involved in tissue building.



Oxygen transport *(Beare and Myers, 1998)*

oxymetazoline hydrochloride /ok′sēmətaz′əlēn/, an adrenergic vasoconstrictor.
■ INDICATION: It is prescribed topically in the treatment of nasal congestion and for the relief of eye redness caused by minor eye irritation.
■ CONTRAINDICATIONS: Hyperthyroidism, diabetes, use of a monoamine oxidase inhibitor within 14 days, or known hypersensitivity to this drug prohibits its use.
■ ADVERSE EFFECTS: Among the more serious adverse effects are rebound congestion, central nervous system stimulation, hypertension, and transient stinging.

oxymetholone /ok′sēmeth′əlōn/, an anabolic steroid.
■ INDICATIONS: It is prescribed in the treatment of anemias caused by antineoplastic drugs.
■ CONTRAINDICATIONS: Cancer of the male breast or prostate, liver disease, pregnancy or suspected pregnancy, or known hypersensitivity to this drug prohibits its use.
■ ADVERSE EFFECTS: Among the more serious adverse effects are hirsutism, acne, liver toxicity, electrolyte imbalances, and, depending on the patient's age, various endocrine effects.

oxymorphone hydrochloride /ok′sēmôr′fōn/, an opioid analgesic.
■ INDICATIONS: It is prescribed for relief of moderate to severe pain, as a preoperative medication, and to support anesthesia.
■ CONTRAINDICATION: Drug dependence, increased intracranial pressure, respiratory depression, or known hypersensitivity to this drug prohibits its use. It should not be used for extended periods during pregnancy.
■ ADVERSE EFFECTS: Among the more serious adverse effects are drug dependence, urinary retention, and respiratory or circulatory depression.

oxyntic cell, a hydrochloric-acid producing cell of the stomach.

oxyopia /ok′sē·ō′pē·ə/ [Gk, *oxys* + *opsis* vision], unusual acuteness of vision. A person with normal (20/20) vision when standing 20 feet from the standard Snellen eye chart can read the seventh line of letters, each of which is an eighth of an inch high. An individual with oxyopia can read smaller letters at that distance. Also called *oxyopy*.

oxyphil cell /ok′səfil/, a cell of the parathyroid glands that takes up acidic stains and has a dark nucleus and fine, granular cytoplasm. Such cells occur singly or in small groups and increase in number with age. Also called *oxyphilic cell*.

oxytalan /ok′sētal′ən, oksit′ələn/, a type of connective tissue fiber particular to the periodontal membrane.

oxytetracycline /ok′sētet′rəsī′klēn/, a tetracycline antibiotic.
■ INDICATIONS: It is prescribed in the treatment of bacterial and rickettsial infections.
■ CONTRAINDICATIONS: Pregnancy, early childhood, or known hypersensitivity to this or other tetracyclines prohibits its use. It is used with caution in patients who have renal or liver dysfunction.
■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, phototoxicity, potentially serious superinfections, and various hypersensitivity reactions. Discoloration of teeth may occur in children exposed to the drug in utero or before 8 years of age.

oxytetracycline calcium, a tetracycline antibiotic.

oxytocia /ok′sētō′shə/, rapid childbirth.

oxytocic /ok′sitō′sik/ [Gk, *oxys* + *tokos*, birth], **1.** pertaining to a substance that is similar to the hormone oxytocin. **2.** any one of numerous drugs that stimulates the smooth muscle of the uterus to contract. The administration of an oxytocic can initiate and enhance rhythmic uterine contraction at any time, but relatively high doses are required for such responses in early pregnancy. Oxytocic agents commonly used include oxytocin, certain prostaglandins, and the ergot alkaloids. These drugs are used to induce or augment labor at term, control postpartum hemorrhage, correct postpartum uterine atony, produce uterine contractions after cesarean section or other uterine surgery, and induce therapeutic abortion. These drugs are used with extreme caution in parturients with severe hypotension and hypertension, partial placenta previa, cephalopelvic disproportion, or grand multiparity. The risk of using these agents is much higher in mothers who have undergone recent uterine surgery or who have suffered recent sepsis or trauma. The most serious adverse reaction is sustained tetanic contraction of the uterus, resulting in fetal hypoxia or rupture of the uterus.

oxytocin^{1} /ok′sitō′sin/, an oxytocic.
■ INDICATIONS: It is prescribed to stimulate contractions in inducing or augmenting labor and to contract the uterus to control postpartum bleeding.
■ CONTRAINDICATIONS: Cephalopelvic disproportion, unfavorable fetal position, or known hypersensitivity to this drug prohibits its use.
■ ADVERSE EFFECTS: Among the more serious adverse effects are tetanic contraction, jaundice, uterine rupture, and fetal anoxia.

oxytocin^{2}**,** a polypeptide secreted by magnocellular neurons in the hypothalamus and stored as a posterior pituitary hormone along with vasopressin. It promotes uterine contractions and milk ejection and contributes to the second stage of labor.

oxytocin challenge test, a stress test for the assessment of intrauterine function of the fetus and the placenta. It is performed to evaluate the ability of the fetus to tolerate continuation of pregnancy or the anticipated stress of labor and delivery. A dilute IV infusion of oxytocin is begun, regulated by an infusion pump. The uterine activity is monitored with a tocodynamometer, and the fetal heart rate is monitored with an ultrasonic sensor as the uterus is stimulated to contract by the oxytocin. The amount of solution infused is increased as necessary to cause the uterus to contract for 30 to 40 seconds three times every 10 minutes. The fetal heart rate is observed for variability and for the timing of any marked variation from the normal in relation to uterine contractions. Decelerations of the fetal heart rate in certain repeating patterns may indicate fetal distress. One quarter of the infants diagnosed by this method as being in distress are normal. Therefore, other tests of fetal well-being are recommended before performing an emergency cesarean section or induction of labor.

oxyuriasis. See **enterobiasis.**

oxyuricide /ok′sē·o͞o′risīd/, an agent that destroys pinworms.

Oxyuris vermicularis. See ***Enterobius vermicularis.***

oz, abbreviation for **ounce.**

oz ap [L, *uncia*], abbreviation for *apothecary ounce,* a unit of weight equal to 31.1035 grams.

ozena /ōzē′nə/ [Gk, *ozein,* to have an odor], a condition of the nose characterized by atrophy of the nasal conchae and mucous membranes. Symptoms include crusting of nasal secretions, discharge, and, especially, a very offensive odor. Ozena may follow chronic inflammation of the nasal mucosa.

ozone (O_3) [Gk, *ozein,* to have an odor], an allotropic form of oxygen consisting of molecules containing three oxygen atoms. Ozone is formed when oxygen is present in an electric discharge, as might occur in a lightning storm. Ozone is used as a bleaching, cleaning, and oxidizing agent and has a faint, chlorinelike odor.

ozone hole, a seasonal depletion of the steady-state ozone concentration in the stratosphere, particularly over Antarctica.

ozone shield, the layer of ozone that hangs in the atmosphere from 20 to 40 miles above the surface of the earth and protects the earth from excessive ultraviolet radiation. Some experts claim that the manufacture of various chemicals, such as chlorofluorocarbons used as propellants in aerosol sprays, and the effects of high-flying jet aircraft are destroying this protective layer and allowing excessive amounts of ultraviolet radiation to penetrate the earth's atmosphere, thus subjecting humans to increased dangers of skin cancer and other health problems. Some chemistry experts and federal health officials also claim that an additional threat comes from nitrous oxide in nitrogenous fertilizers rising into the atmosphere and reacting unfavorably with the ozone shield. The ozone shield is implicated in certain health problems that affect some air travelers. See also **ozone sickness.**

ozone sickness, an abnormal condition caused by the inhalation of ozone that may seep into jet aircraft at altitudes over 40,000 feet. It is characterized by headaches, chest pains, itchy eyes, and sleepiness. Exactly why and how ozone causes this condition is not known. It is more prevalent early in the year and occurs more often over the Pacific Ocean.

oz t [L, *uncia*], abbreviation for *troy ounce,* a unit of weight equal to 31.103 grams.

P

***P*,** **1.** abbreviation for *power*. **2.** abbreviation for **pressure.**

P, **1.** symbol for the element **phosphorus. 2.** symbol for *after*, or *post*. **3.** (in genetics) symbol for *first parental generation*. **4.** symbol for *first pulmonic sound*.

p, symbol for *gas partial pressure*. See **partial pressure.**

p-, symbol for **para-.**

p17, symbol for a protein that lines the interior of the human immunodeficiency virus envelope.

P1E1, P2E1, P3E1, P4E1, P6E1, trademarks for fixed-combination ophthalmic drugs containing a cholinergic **(pilocarpine hydrochloride)** and an adrenergic (epinephrine bitartrate). The numbers indicate the percentage of each ingredient in the solution; for example, P2E1 contains 2% pilocarpine hydrochloride and 1% epinephrine bitartrate.

P_2, symbol for *second pulmonic sound*.

p24, symbol for a protein that surrounds the ribonucleic acid and reverse transcriptase of the human immunodeficiency virus.

P_{50}, the partial pressure of oxygen at which hemoglobin is half saturated with bound oxygen.

P & A, **1.** abbreviation for *percussion and auscultation*. **2.** abbreviation for *posterior and anterior*.

pA, abbreviation for *picoampere*.

Pa, **1.** symbol for *pascal*. **2.** symbol for the element **protactinium.**

PA, **1.** abbreviation for **physician assistant. 2.** abbreviation for **pulmonary artery.**

P-A, p-a, abbreviation for **posteroanterior.**

PABA, abbreviation for **paraaminobenzoic acid,** a topical sunscreen.

pabulin /pab′yəlin/ [L, *pabulum,* food], products of fat and protein digestion found in the blood after a meal.

pabulum /pab′yələm/ [L, food], a substance that is food or nutrient.

PAC, abbreviation for **premature atrial complex.**

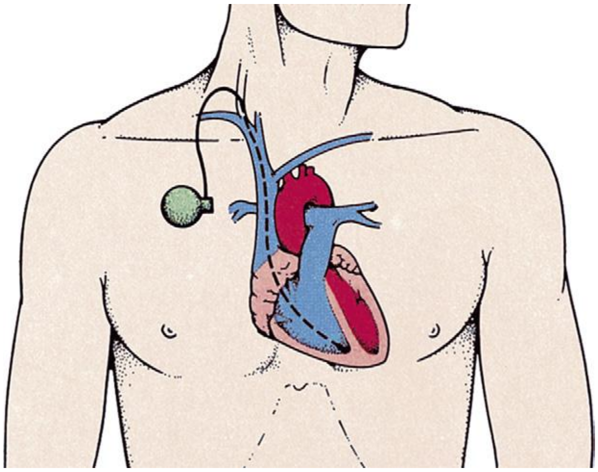
pacchionian foramen /pak′ē·ō′nē·ən/ [Antonio Pacchioni, Italian anatomist, 1665–1720], a thick opening in the center of the diaphragm of sella through which the infundibulum passes. Also called **foramen diaphragmatis.**

pacchionian granulations. See **arachnoid villi.**

PACE /pās/, abbreviation for **Program of All-Inclusive Care of the Elderly.**

PACE II, an interdisciplinary assessment and planning system that focuses on evaluation of the physical health of nursing home residents. It includes checklists of defined (diagnosed) conditions, abnormal laboratory or other findings, risk factors, and other impairments and disabilities.

pacemaker [L, *passus,* step; AS, *macian,* to make], **1.** the sinoatrial node composed of specialized nervous tissue and located at the junction of the superior vena cava and the right atrium. It initiates the contractions of the atria, which transmit the impulse onto the atrioventricular (AV) node, thereby initiating the contraction of the ventricles. An ectopic or idioventricular pacemaker, originating in the atria, AV node, or ventricle, may cause contractions in cases of abnormal heart functioning. Also called **cardiac pacemaker. 2.** an electric apparatus used in most cases to increase the heart rate in severe bradycardia by electrically stimulating the heart muscle. A pacemaker may be permanent or temporary, emit the stimulus at a constant and fixed rate, or fire only on demand.



Pacemaker *(Thibodeau and Patton, 2007)*

pacemaker management: permanent, a nursing intervention from the Nursing Interventions Classification (NIC) defined as care of the patient receiving permanent support of cardiac pumping through the insertion and use of a pacemaker. See also **Nursing Interventions Classification.**

pacemaker management: temporary, a nursing intervention from the Nursing Interventions Classification (NIC) defined as temporary support of cardiac pumping through the insertion and use of temporary pacemakers. See also **Nursing Interventions Classification.**

pachometer, equipment used to measure the thickness of an object. See **pachymeter.**

pachy- /pak′i-/, prefix meaning “thick”: *pachycephaly, pachymucosa*.

pachyblepharon /-blef′əron/ [Gk, *pachy,* thick], a thickening of the tarsal border of the eyelid.

pachycheilia /-kī′lē·ə/, an abnormal thickening or swelling of the lips.

pachycholia /-kō′lē·ə/, a thickening of the bile.

pachychromatic /-krōmat′ik/, characterized by coarse chromatin filaments.

pachychymia /-kī′mē·ə/, thickness of the partially digested food moving from the stomach into the duodenum.

pachydactyly /pak′ēdak′tilē/ [Gk, *pachy* + *daktylos,* finger], an abnormal thickening of the fingers or toes. —*pachydactylic, pachydactylous, adj*.

pachyderma /-dur′mə/, an overgrowth or thickening of the skin and subcutaneous tissues.

pachyderma alba /-dur′mə/ [Gk, *pachy* + *derma,* skin; L, *albus,* white], an abnormal state in which the buccal mucosa has an appearance suggestive of whitened elephant hide. Also called **pachyderma oralis.**

pachyderma laryngis, an overgrowth of epithelium in the posterior glottis, sometimes affecting the vocal cords.

pachyderma oralis. See **pachyderma alba.**

pachyderma vesicae, a potentially malignant condition of white plaques in the mucous membrane at the base of the bladder.

pachydermoperiostosis /-dur′moper′ē·ostō′sis/, a syndrome characterized by a thickening and folding of the facial skin, clubbing of the fingers, and new bone formation over the ends of the long bones.

pachyglossia /-glos′ē·ə/, an abnormal thickening of the tongue.

pachygnathy /-gnoth′ē/, an abnormal thickening of the jaw. See also **macrognathia.** —*pachygnathous, adj.*

pachygyria /-jī′rē·ə/, a broadening and flattening of the gyri of the brain.

pachyleptomeningitis /-lep′təmin′injī′tis/, an inflammation of all the membranes of the brain and spinal cord.

pachylosis /-lō′sis/, a condition of rough, dry, and thickened skin.

pachymenia /-mē′nē·ə/, an abnormal thickness of the skin or other membranes.

pachymeninges. See **pachymeninx.**

pachymeningitis /-min′injī′tis/, an inflammation of the dura mater.

pachymeningopathy /-mining′gōpath′ē/, an abnormality, other than inflammation, involving the dura mater.

pachymeninx /-mē′niks/ *pl.* **pachymeninges** [Gk, *pachys,* thick, *meninx,* membrane]. See **dura mater.**

pachymeter /pakim′ətər/ [Gk, *pachy* + *metron,* measure], an instrument used to measure thickness, especially of a thin structure, such as a membrane or a tissue. Also called **pachometer.**

pachynema /pak′inē′mə/ [Gk, *pachy* + *nema,* thread], the postsynaptic tetradic chromosome formation that occurs in the pachytene stage of the first meiotic prophase of gametogenesis.

pachynsis /pakin′sis/, any thickening of tissues having a pathological cause.

pachyonychia /pak′ē·ōnik′ē·ə/, an abnormal thickness of the fingernails or toenails.

pachyonychia congenita [Gk, *pachy* + *onyx,* nail; L, *congenitus,* born with], a congenital deformity characterized by abnormal thickening and raising of the nails on the fingers and the toes and thickening of skin on the palms of the hands and the soles of the feet. The papillae of the tongue also atrophy, causing a whitish coating over the lingual surface.

pachyotia /pak′ē·ō′shə/, an abnormal thickness of the auricle of the ears. Also called **boxer's ear.** See also **cauliflower ear.**

pachypelviperitonitis /-pel′vēper′itənī′tis/, pelvic peritonitis associated with a thickening of the tissues.

pachyperitonitis /-per′itənī′tis/, an inflammation and abnormal thickening of the tissues of the peritoneum.

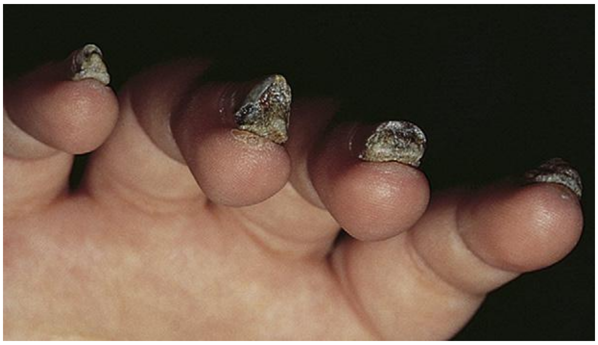
pachypleuritis /-plŏŏrī′tis/, an inflammation and thickening of the pleural membranes.

pachysalpingitis. See **parenchymatous salpingitis.**

pachysalpingoovaritis /-salping′gō·ō′verī′tis/, an inflammation and thickening of the tissues of the ovaries and fallopian tubes.

pachysomia /-sō′mē·ə/ [Gk, *pachys,* thick, *soma,* body], an abnormal thickening of the soft tissues of the body.

pachytene /pak′itēn/ [Gk, *pachy* + *tainia,* ribbon], the third stage in the first meiotic prophase of gametogenesis, in which the paired homologous chromosomes form tetrads. The bivalent pairs become short and thick and intertwine so that four chromatids are visible. See also **diakinesis, diplotene, leptotene, zygotene.**



Pachyonychia congenita
(Hordinsky, Sawaya, and Scher, 2000)

pachyvaginalitis /-vaj′inəlī′tis/, an inflammation and thickening of the membrane covering the testis and epididymis.

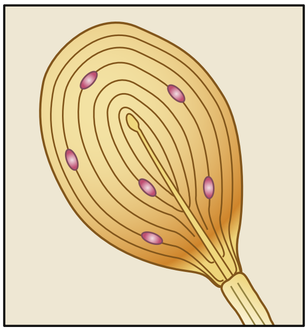
pachyvaginitis /-vaj′inī′tis/, chronic inflammation and thickening of the walls of the vagina.

pacifier /pas′ifī′ər/ [L, *pacificare,* to bring peace], **1.** an agent that soothes or comforts. **2.** a nipple-shaped object used by infants and children for sucking. The safest pacifiers are constructed in one piece, are large enough that only the nipple fits into the mouth, and have a handle that can be easily grasped. The American Academy of Pediatrics recommends waiting to introduce a pacifier until a baby is 1 month old and breastfeeding is well established.

pacing [L, *passus,* step], setting of the heart's rhythm by the sinus node, by another site in the heart, or by an artificial electrical stimulator. Also called **atrial pacing, endocardial pacing, sequential pacing, ventricular pacing.** See also **programmable pacemaker.**

pacing wire [L, *passus,* step; AS, *wir*], the electrical connection between a pulse generator and a pacing electrode in a cardiac pacemaker.

Pacini's corpuscles /päsē′nēz/ [Filippo Pacini, Italian anatomist, 1812–1883; L, *corpusculum,* little body], special sensory end organs resembling tiny white bulbs. Each is attached to the end of a single nerve fiber in the subcutaneous, submucous, and subserous connective tissue of many parts of the body, especially the palm of the hand, sole of the foot, genital organs, joints, and pancreas. They average



Pacini's corpuscle *(Patton and Thibodeau, 2010)* about 3 mm in diameter, are pressure sensitive and vibration sensitive, contain numerous concentric layers around a central core, and in cross section resemble an onion. Also called *pacinian corpuscles*. Compare **Golgi-Mazzoni corpuscles, Krause's corpuscles.**

pacinitis /pas′inī′tis/, an inflammation of the Pacini's corpuscles.

pack [ME, *pakke,* bundle], **1.** a treatment in which the entire body or a portion of it is wrapped in wet or dry towels or in ice for various therapeutic purposes, as with cold packs for reducing high temperatures and swellings or for inducing hypothermia during certain surgical procedures, especially heart surgery and organ transplantation. **2.** a tampon. **3.** the act of applying a dressing or dental cement to a surgical wound. **4.** a surgical dressing to cover a wound or to fill the cavity left from extraction of a tooth, especially a wisdom tooth.

package insert (P.I.), a leaflet that, by order of the U.S. Food and Drug Administration, must be placed inside the package of every prescription drug. The leaflet must include the trademark for the drug, its generic name, and its mechanism of action; state its indications, contraindications, warnings, precautions, adverse effects, and dosage forms; and include instructions for the recommended dose, time, and route of administration.

packed cells [ME, *pakke,* bundle; L, *cella,* storeroom], a preparation of blood cells separated from liquid plasma, often administered in severe anemia to restore adequate levels of hemoglobin and red blood cells without overloading the vascular system with excess fluids. Also called *packed red blood cells*. See also **bank blood, component therapy, pooled plasma.**

packed cell volume (PCV) [ME, *pakke* + L, *cella,* storeroom, *volumen,* paper roll], percentage of packed red blood cells in a centrifuged column of whole blood. Also called **hematocrit reading.**

packer, an instrument for tamponing or introducing a pack of gauze into a wound. See also **plugger.**

packing [ME, *pakke*], **1.** material used to fill a wound or cavity. **2.** the act of inserting material into a wound or cavity, especially a wound with tunneling.

paclitaxel, an anticancer drug derived from the bark of the rare, slow-growing Pacific yew tree. It is used in the treatment of ovarian cancer. Paclitaxel prevents cancer cells from dividing; it arrests cell division by attaching to microtubules that regulate the formation of spindles necessary for cell division. The anticancer effect of paclitaxel was discovered by the National Cancer Institute in 1963 during a routine investigation of thousands of plant compounds. It takes about 60 pounds of yew bark to produce enough paclitaxel to treat a single patient for several weeks. Semisynthetic and synthetic methods of production have reduced, but not eliminated, the use of yew bark.

$PaCO_2$, abbreviation for **partial pressure of carbon dioxide in arterial blood.**

PACS, abbreviation for *picture archiving and communications system,* a network of computers used by radiology departments that replaces film with electronically stored and displayed digital images. It provides archives for storage of multimodality images, integrates images with patient database information, facilitates laser printing of images, and displays both images and patient information at work stations throughout the network. It also allows viewing of images in remote locations.

pad [D, *paden,* cushion], **1.** a mass of soft material used to cushion shock, prevent wear, or absorb moisture, such as the abdominal pads used to absorb discharges from abdominal wounds or to separate viscera and improve accessibility during abdominal surgery. **2.** (in anatomy) a mass of fat that cushions various structures, such as the infrapatellar pad lying below the patella among the patellar ligament, the head of the tibia, and the femoral condyles.

PAD, **1.** abbreviation for **peripheral arterial disease.** **2.** abbreviation for **pulsatile assist device.**

p.ae [L, *partes* + *aequales*], symbol for *equal parts*.

paed-, paedo-. See **ped-, pedo-.**

paediatrician. See **pediatrician.**

paediatrics. See **pediatrics.**

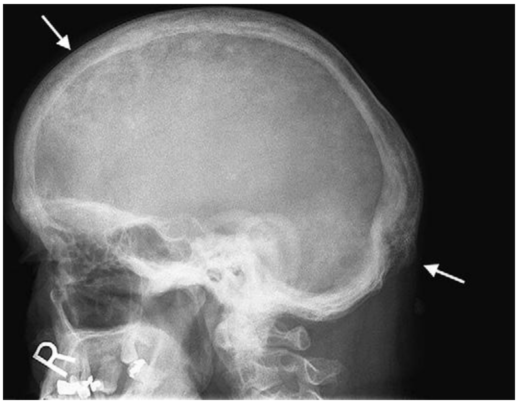
paedogenesis. See **pedogenesis.**

paedophilia. See **pedophilia.**

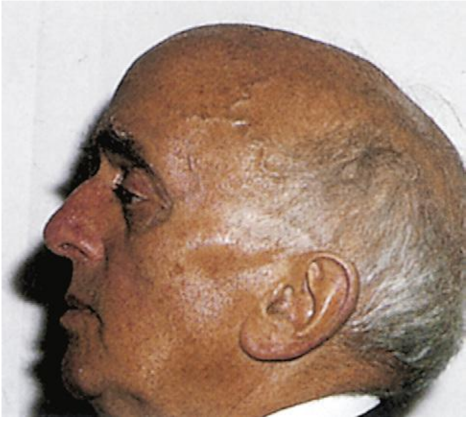
pagetoid /paj′ətoid/, resembling Paget's disease.

Paget-Schroetter's syndrome, Paget-von Schroetter's syndrome. See **effort thrombosis.**

Paget's disease /paj′əts/ [James Paget, English surgeon, 1814–1899], a common nonmetabolic disease of bone of unknown cause, usually affecting middle-aged and elderly people and characterized by excessive bone destruction and unorganized bone repair. Also called **osteitis deformans.**



Paget's disease: skull radiograph
(Kowalczyk and Mace, 2009)



Paget's disease: enlarged skull *(Moll, 1997)*

Paget's disease of the nipple. See **nipple cancer.**

Pagliaro combined modality treatment, the use of chemotherapy in combination with surgery or irradiation or both in the treatment of cancer.

pagophagia /pā′gōfā′jē·ə/ [Gk, *pagos,* frost, *phagein,* to eat], an abnormal condition characterized by a craving to eat enormous quantities of ice. It is associated with a lack of the nutrient iron. *—pagophagic, pagophagous, adj.*

-pagus, suffix meaning "conjoined twins": *craniopagus, pygopagus, thoracopagus.*

PAHA, abbreviation for **paraaminohippuric acid.**

PAHA sodium clearance test, a procedure formerly used for detecting kidney damage or certain muscle diseases that determined the rate at which the kidneys removed the sodium salt of para-aminohippuric acid from the blood and urine.

PAHO, abbreviation for *Pan American Health Organization.*

PAI, abbreviation for *plasminogen activator inhibitor.*

PAI-1, abbreviation for **plasminogen activator inhibitor 1 test.**

pain [L, *poena,* punishment], an unpleasant sensation caused by noxious stimulation of the sensory nerve endings. It is a subjective feeling and an individual response to the cause. Pain is a cardinal symptom of inflammation and is valuable in the diagnosis of many disorders and conditions. It may be mild or severe, chronic or acute, lancinating, burning, dull or sharp, precisely or poorly localized, or referred. Experiencing pain is influenced by physical, mental, biochemical, psychological, physiological, social, cultural, and emotional factors. See also **acute pain, chronic pain, referred pain.**

pain: adverse psychological response, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of observed or reported adverse cognitive and emotional responses to physical pain. See also **Nursing Outcomes Classification.**

Factors that influence pain tolerance

Increase tolerance	*Decrease tolerance*
Alcohol	Fatigue
Drugs	Anger
Hypnosis	Boredom
Warmth	Anxiety
Rubbing	Persistent pain
Distraction	Stress
Faith	Depression
Strong beliefs	

From Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.

pain and suffering, (in law) an element in a claim for damages that allows recovery for the mental and physical pain, suffering, distress, and trauma that an individual has endured as a result of injury.

pain assessment, an evaluation of the reported pain and the factors that alleviate or exacerbate it, as well as the response to treatment of pain. Responses to pain vary widely among individuals, depending on many different physical and psychological factors, such as specific diseases and injuries and the health, pain threshold, fear, anxiety, and cultural background of the individual involved, as well as the way the person expresses pain experiences. See also **pain intervention, pain mechanism.**

■ METHOD: The patient is asked to describe the cause of the pain, if known; its intensity, location, and duration; the events preceding it; the pattern usually followed for handling pain; previous treatments and effectiveness; allergies; and ways in which the pain has affected the activities of daily living. Intensity of pain is often assessed by using pain scales (numeric or face scales). Severe pain causes pallor; cold perspiration; piloerection; dilated pupils; and increases in the pulse, respiratory rate, blood pressure, and muscle tension. When brief, intense pain subsides, the pulse may be slower and the blood pressure lower than before the pain began. If pain occurs frequently or is prolonged, the pulse rate and blood pressure may not increase markedly, and, if pain persists for many days, there may be an increased production of eosinophils and 17-ketosteroids and greater susceptibility to infections. The patient's statements regarding pain; tone of voice, speed of speech, cries, groans, or other vocalizations; facial expressions; body movements; or tendency to withdraw are all noted. Pertinent background information in the assessment includes a record of the patient's chronic conditions, previous surgery, and any illnesses that caused pain; the patient's experiences with relatives and friends in pain; the role or position of the patient in the family structure; and the patient's use of alcohol and drugs, including use of OTC and illicit drugs. Key aspects in evaluating pain intensity are the size of the area, the tenderness within the pain area, and the effects of movement and pressure on the pain. Duration of pain is considered in terms of hours, days, weeks, months, or years. Pain patterns are associated with various sensations such as burning, pricking, aching, rhythmic throbbing, and effects on the sympathetic and the parasympathetic nervous systems. Evaluation includes the meanings the individual may attach to pain, such as a test of character, a penance, or a sign of worsening illness. Such interpretations may affect the intensity of pain and mask its significance.

■ INTERVENTIONS: The nurse establishes a relationship with the patient and uses individual or group counseling to teach the person about pain and how to modify the anxiety associated with it. To increase their effectiveness, analgesics ordered for the patient are administered by the nurse before the pain becomes intense. In addition to helping promote rest and relaxation, the nurse decreases noxious stimuli, provides other pleasant sensory input, and helps to distract the patient by using guided imagery or having the patient walk, watch television, or read. If the patient believes that certain acceptable measures alleviate pain, the nurse uses them. The nurse may refer the patient to a pain clinic.

■ OUTCOME CRITERIA: Dramatic relief of intense or chronic pain is often difficult to accomplish, but the patient can be helped to learn to handle pain effectively and to function fairly normally.

pain control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to control pain. See also **Nursing Outcomes Classification.**

pain: disruptive effects, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of observed or reported disruptive effects of chronic pain on daily functioning. See also **Nursing Outcomes Classification.**

painful bladder syndrome. See **interstitial cystitis.**

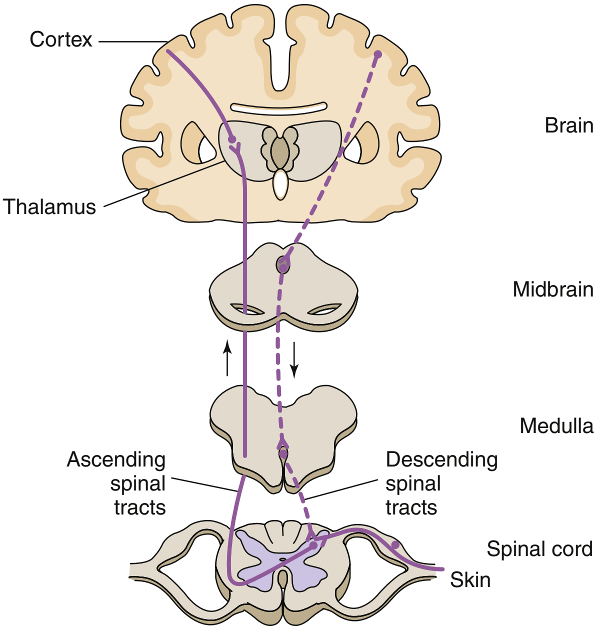
pain intervention, the attempt to relieve pain by various measures, such as administration of NSAIDs and opiates. The psychological effects of pain must be considered. Effective pain intervention depends on proper evaluation of the type of pain the patient is experiencing, the physical and psychological origins of the pain, and the behavioral patterns commonly associated with different kinds of pain. The most common method of pain intervention is the administration of narcotics, such as morphine, but many authorities believe that the exclusive use of pain-killing drugs without consideration and implementation of psychological aids is too narrow an approach. There are few patients without a psychogenic overlay on the physical experience of pain, and comprehensive pain intervention uses methods and procedures that incorporate both psychological and physical measures. Methods of pain intervention for acute pain are different from those for chronic pain. Acute pain, occurring in the first 24 to 48 hours after surgery, is often difficult to relieve, and narcotics seldom alleviate it completely. Some authorities believe that the individual who has undergone repeated surgical operations has a decreased tolerance for pain. The type of pain intervention usually depends on the description of the pain by the individual experiencing it. Mild pain may best be relieved by comfort measures and the distraction afforded by television, visitors, reading, and other passive activities. Moderate pain may best be relieved by a combination of comfort measures and drugs. Cognitive dissonance, often used to ameliorate moderate pain, encourages the patient to reflect on pleasant experiences and describe them to health care personnel. Intervention to relieve severe pain often includes the administration of narcotics, purposeful interaction between the patient and attending hospital personnel, reduction of environmental stimuli, increased comfort measures, and "waking imagined analgesia," in which the patient is encouraged to concentrate on and become distracted by former pleasant experiences, such as relaxing on a beach surrounded by cool ocean water. In the alleviation of all types of pain, dampening or decreasing stimuli that create pain is the chief goal. Pain often increases in a cold room because the muscles of the patient tend to contract, but the local application of cold, such as with an ice pack, often alleviates pain by reducing swelling. Pain intervention seeks to reduce the effects of other factors that compound pain, such as fatigue and anxiety. Coping with pain becomes increasingly difficult as the patient becomes more tired. Sensory restriction may increase pain because it blocks otherwise effective distraction; overstimulation may cause fatigue and anxiety, thus increasing pain. Pain intervention by the use of drugs includes the administration of mild nonnarcotic analgesics and of much more potent and potentially addictive opioids, such as morphine. Opioid analgesics administered for the relief of pain, cough, or diarrhea provide only symptomatic treatment and are used cautiously in the care of patients with acute or chronic diseases. They may obscure the symptoms or the progress of the disease, and repeated daily administration of any opioid eventually produces some tolerance to the therapeutic effects of the drug and some physical dependence on the dosage. The risk of development of psychological and physical dependency on any drug is always present, especially with opioids. In usual doses opioids relieve suffering by altering the emotional component of the painful experience and by effecting analgesia. Some caregivers are so concerned about the addictive dangers of opioids that they tend to prescribe initial doses that are too low or too infrequent to alleviate pain. Some other patients with more rapid metabolisms may require such drugs at shorter intervals. Many drugs are appropriate substitutes for the potent opioids morphine and codeine. Some of the effective semisynthetic substitutes are hydrocodone, dihydrocodeine, and meperidine. The narcotic analgesics act on the central nervous system, but the salicylates and other nonnarcotic drugs act at the site of origin of the pain. Some nonnarcotic drugs, such as aspirin, indomethacin, ibuprofen, or naproxen, also have antiinflammatory and antipyretic activity. In patients who are sensitive to or are unable to take aspirin, acetaminophen is an acceptable substitute, as are the nonsteroidal antiinflammatory drugs. Pain intervention in the treatment of terminal illnesses uses numerous drugs that relieve pain and produce euphoria and tranquility in patients who would otherwise suffer greatly. Nerve block by the injection of alcohol, chordotomy, and other neurosurgical interventions may sometimes be used. Other techniques include acupuncture; hypnosis; behavior modification, in which treatment consists of reducing medication and gradually increasing mobility through exercise and any other appropriate modality; biofeedback; and transcutaneous electrical nerve stimulation. See also **pain assessment.**

pain level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of observed or reported pain. See also **Nursing Outcomes Classification.**

pain management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as alleviation of pain or a reduction in pain to a level of comfort that is acceptable to the patient. See also **Nursing Interventions Classification.**

pain mechanism, the network that communicates unpleasant sensations and the perceptions of noxious stimuli throughout the body in association with physical disease and trauma involving tissue damage. The gate control theory of pain is an attempt to explain the role of the nervous system in the pain response. It states that pain signals that reach the nervous system excite a group of small neurons that form a "pain pool." When the total activity of these neurons reaches a minimum level, a theoretic gate opens up and allows the pain signals to proceed to higher brain centers. The areas in which the gates operate are considered to be in the spinal cord dorsal horn and the brainstem. The pattern theory holds that the intensity of a stimulus evokes a specific pattern, which is interpreted by the brain as pain. This perception is the result of the intensity and frequency of stimulation of a nonspecific end organ. Some authorities believe that bradykinin and histamine, two chemical substances produced by the body, cause pain. Recently discovered pain killers produced naturally by the body are the enkephalins and the endorphins. Some studies indicate that the enkephalins are 10 times as potent as morphine in reducing pain. It is known that after histamine and some other naturally occurring chemical substances are released in the body, pain sensations travel along fast-conducting and slow-conducting nerve fibers. These pain-transmitting neuropathways communicate the pain sensation to the dorsal root ganglia of the spinal cord and synapse with certain neurons in the posterior horns of the gray matter. The pain sensation is then transmitted to the reticular formation and the thalamus by neurons that form the anterolateral spinothalamic tract. It is then conveyed to various areas of the brain, such as the cortex and the hypothalamus, by synapses at the thalamus. The immediate reaction to pain is transmitted over the reflex arc by sensory fibers in the dorsal horn of the spinal cord and by synapsing motor neurons in the anterior horn. This anatomical pattern of sensory and motor neurons allows the individual to move quickly at the touch of some harmful stimulus, such as extreme heat or cold. Nerve impulses alerting the individual to move away from such stimuli are simultaneously sent along efferent nerve fibers from the brain. Also called **gate theory of pain,** *pain pathway.*

pain receptor, any one of the many free nerve endings throughout the body that warn of potentially harmful changes in the environment, such as excessive pressure or temperature. The free nerve endings constituting most of the pain receptors are located chiefly in the epidermis and in the epithelial covering of certain mucous membranes. They also appear in the stratified squamous epithelium of the cornea, in the root sheaths and the papillae of the hairs, and around the bodies of sudoriferous glands. The terminal ends of pain receptors consist of unmyelinated nerve fibers that often anastomose into small knobs between the epithelial cells. Any kind of stimulus, if it is intense enough, can stimulate the pain receptors in the skin and the mucosa, but only radical changes in pressure and certain chemicals can stimulate the pain receptors in the viscera. Referred pain results only from stimulation of pain receptors located in deep structures, such as the viscera, the joints, and the skeletal muscles, and never from pain receptors in the skin.



Pain reception pathway *(Monahan et al, 2007)*

paint [Fr, *peindre*], **1.** *v*, to apply a medicated solution to the skin, usually over a wide area. **2.** *n*, a medicated solution that is applied in this way. Kinds of paint include **antiseptics, germicides,** and **sporicides.**

pain threshold, the point at which a stimulus, usually one associated with pressure or temperature, activates pain receptors and produces a sensation of pain. Individuals with low pain thresholds experience pain much sooner and faster than those with higher thresholds; individuals' reactions to stimulation of pain receptors vary.

pair, **1.** two corresponding items similar in form and function. **2.** one object composed of two joined interdependent parts. See also **base pair.**

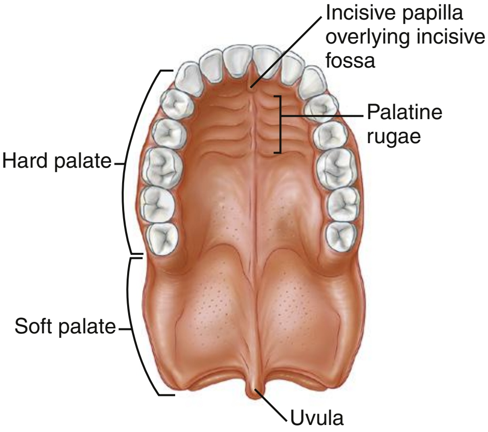
PAL, abbreviation for *posterior axillary line*.

palatable /pal′ətəbəl/ [L, *palatum,* palate], pleasant to the taste.

palatal /pal′ətəl/ [L, *palatum,* palate], **1.** pertaining to the palate or palate bone. **2.** pertaining to the lingual surface of a maxillary tooth.

palatal cyst of the newborn, a common finding in newborns in which small cysts form during embryological development or during development of the minor salivary glands of the hard palate, each of which entrap epithelium which form tiny cysts. Epstein's pearls form along the median palatal raphe, while Bohn's nodules are scattered over the hard palate near its junction with the soft palate.

palatal shelf, lateral palatine process.



Palate *(Drake, Vogl, and Mitchell, 2010)*

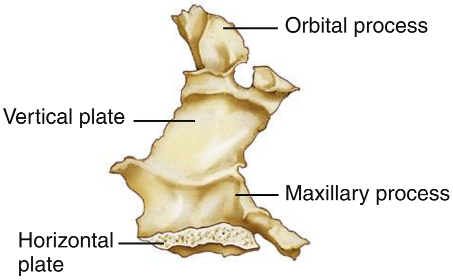
palate /pal′it/ [L, *palatum*], the bony muscular partition between the oral and nasal cavities that forms the roof of the mouth. It is divided into the hard palate and the soft palate. Also called **uraniscus. —palatal, palatine,** *adj*.

palatine [L, *palatum,* palate], pertaining to or belonging to the palate.

palatine aponeurosis, the major structural element of the soft palate to which other muscles of the palate attach. It is attached anteriorly to the margin of the hard palate, but it is unattached posteriorly, where it ends in a free margin.

palatine arch [L, *palatum* + *arcus,* bow], the vault-shaped muscular structure forming the soft palate between the mouth and the nasopharynx. An opening in the arch connects the mouth with the oropharynx; the uvula is suspended from the middle of the posterior border of the arch.

palatine bone, one of a pair of bones of the skull forming the posterior part of the hard palate, part of the nasal cavity, and the floor of the orbit of the eye. It resembles the letter *L* and consists of horizontal and vertical parts and three processes.



Palatine bone

palatine foramina, the openings in the palatine canal. The greater palatine foramina transmit the greater palatine nerve and vessels to the hard palate. The lesser palatine foramina distribute the lesser palatine nerve and vessels to the soft palate.

palatine raphe, a medial longitudinal ridge of the mucosa of the hard palate that ends anteriorly in a small oval elevation, the incisive papilla, which overlies the incisive fossa formed between the horizontal plates of the maxillae immediately behind the incisor teeth.

palatine ridge, any one of the four to six transverse ridges on the anterior surface of the hard palate.

palatine rugae, the numerous transverse folds of the mucosa of the hard palate.

palatine suture, any one of a number of thin wavy lines marking the joining of the palatine processes that form the hard palate. See also **median palatine suture, transverse palatine suture.**

palatine tonsil, one of a pair of almond-shaped masses of lymphoid tissue between the palatoglossal and palatopharyngeal arches on each side of the fauces. They are covered with mucous membrane and contain numerous lymph follicles and various crypts.

palatine torus, a bony ridge along the hard palate at the line of fusion of the left and right jawbone segments. It is believed to be caused by inheritance or environmental influences such as bruxism. There is no treatment unless the overlying tissue is traumatized or interferes with the placement of a denture prosthesis. A large torus can interfere with intubation with an endotracheal tube or insertion of a laryngeal mask airway. Also called **torus palatinus.** Compare **torus mandibularis.**

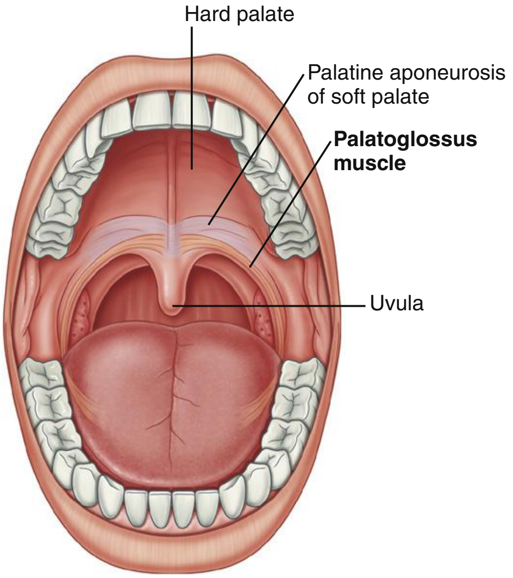
palatine uvula, an elongated mucosal process that hangs from the middle of the back edge of the soft palate.

palatitis, an inflammation of the hard palate.

palato-, prefix meaning "palate": *palatoglossal, palatography, palatomaxillary.*

palatoglossal /pal′ətoglos′əl/ [L, *palatum,* palate; Gk, *glossa,* tongue], pertaining to both the palate and the tongue.

palatoglossus /-glos′əs/, the muscle that underlies the glossopalatine arch. The palatoglossus muscles depress the palate, move the arches toward the midline like curtains, and elevate the back of the tongue. These actions help close the fauces. It is innervated by the glossopharyngeal nerve, or cranial nerve IX.



Palatoglossus muscle *(Drake, Vogl, and Mitchell, 2010)*

palatognathous /pal′ətog′nəthəs/, pertaining to a cleft palate.

palatograph /pal′ətōgraf′/, a device that records the movement of the palate while the person is speaking.

palatomaxillary /-mak′siler′ē/ [L, *palatum* + *maxilla,* jaw], pertaining to the palate and the maxilla.

palatonasal /-nā′zəl/ [L, *palatum* + *nasus,* nose], pertaining to the palate and the nose.

palatopharyngeal /-ferin′jē·əl/, pertaining to the palate and pharynx.

palatopharyngeus /-ferin′jē·əs/, a muscle with an origin at the back of the soft palate and an insertion on the posterior border of the thyroid cartilage and the wall of the pharynx. It acts to raise the pharynx.

palatopharyngoplasty /-fering′gōplas′tē/, the surgical excision of palatal and oropharyngeal tissues. The procedure may be performed to treat cases of snoring or sleep apnea thought to be caused by obstructions in the nose or pharynx. Also called **uvulopalatopharyngoplasty.**

palatopharyngorrhaphy, surgical repair of defects in the uvula, soft palate, and pharynx. See also **staphylopharyngorrhaphy.**

palatoplasty /pal′ətōplas′tē/, plastic surgery of the palate.

palatoplegia /-plē′jē·ə/, paralysis of the soft palate.

palatorrhaphy /pal′ətôr′əfē/, the surgical repair of a cleft palate.

palatosalpingeus /-salpin′jē·əs/, the tensor muscle of the soft palate. It arises from the scaphoid fossa of the sphenoid bone.

palatoschisis /pal′ətos′kisis/. See **cleft palate.**

pale infarct [L, *pallidus,* pallid, *infarcire,* to stuff], a wedge of dead tissue that is white because of an absence of blood. Also called **anemic infarct, white infarct.**

paleo-, prefix meaning "old": *paleocerebellar, paleogenesis, paleostriatum.*

paleocerebellum /pal′ē·ōser′əbel′əm/, the phylogenetically oldest part of the cerebellum, including the vermis, which connects the cerebellar hemispheres, and the flocculus, or lobule, on the posterior lobe. Also called *spinocerebellum.*

paleocortex /-kôr′teks/, the phylogenetically oldest part of the cerebral cortex, particularly the olfactory bulb.

paleogenesis. See **palingenesis.**

paleogenetic /-jənet′ik/ [Gk, *palaios,* long ago, *genesis,* origin], **1.** a trait or structure of an organism or species that originated in a previous generation. **2.** relating to the development of such a trait or structure.

paleokinetic /-kinet′ik/, pertaining to primitive reflexes and other automatic muscular movements.

paleontology. See **biology.**

paleopathology /-pathol′əjē/, the science of disease in ancient eras based on the condition of remains of mummies, skeletons, and other archeological findings.

pali-. See **palin-.**

palikinesia /pal′ikīnē′zhə/, a condition in which involuntary movements are constantly repeated.

palilalia /pal′ilā′lyə/ [Gk, *palin,* again, *lalein,* to babble], an abnormal condition characterized by the increasingly rapid repetition of the same word or phrase, usually at the end of a sentence.

palin-, pali-, prefix meaning "again": *palindromia, palinesthesia, palingenesis.*

palindrome /pal′indrōm′/ [Gk, *palin* + *dromos,* course], a segment of DNA in which identical or almost identical sequences of bases run in opposite directions of the complementary strands. Palindromes are often sites for attack by restriction endonucleases.

palindromia /pal′indrō′mē·ə/, the recurrence of a disease.

palingenesis /pal′injen′əsis/ [Gk, *palin* + *genesis,* origin], **1.** the regeneration of a lost part. **2.** the hereditary transmission of ancestral structural characteristics, especially abnormalities, in successive generations. Also called **paleogenesis.** Compare **cenogenesis. —***palingenetic, palingenic, adj.*

paliperidone, an antipsychotic.

■ INDICATION: This drug is used to treat schizophrenia.
■ CONTRAINDICATIONS: Lactation, seizure disorders, AV block, QT prolongation, torsade de pointes, and known hypersensitivity to this drug or to risperidone prohibit its use. Geriatric patients should not use this drug.
■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, orthostatic hypotension, blurred vision, vomiting, and weight gain. Life-threatening side effects include seizures, neuroleptic malignant syndrome, tachycardia, heart failure, and QT prolongation. Common side effects include EPS, pseudoparkinsonism, akathisia, dystonia, tardive dyskinesia, drowsiness, insomnia, agitation, anxiety, headache, nausea, anorexia, and constipation.

palivizumab, a monoclonal antibody.
■ INDICATIONS: It is used to prevent serious lower respiratory tract disease caused by respiratory syncytial virus in pediatric patients.
■ CONTRAINDICATIONS: Use is prohibited in adults, in patients with cyanotic congenital heart disease, and in patients with known hypersensitivity to this drug.
■ ADVERSE EFFECTS: Adverse effects include nausea, vomiting, diarrhea, increased AST, upper respiratory infection, otitis media, rhinitis, pharyngitis, rash, and injection site reaction.

palladium (Pd) /pəlā′dē·əm/ [Gk, *Pallas Athena,* mythic goddess and protector of Troy], a hard silvery metallic element. Its atomic number is 46: its atomic mass is 106.42. Highly resistant to tarnish and corrosion, palladium is used in high-grade surgical instruments; in dental inlays, bridgework, and orthodontic appliances; and in catalytic convertors.

pallanesthesia /pal′anesthē′zhə/, a condition characterized by an inability to sense vibrations.

pallesthesia /pal′esthē′zhə/ [Gk, *pallein,* to quiver], hypersensitivity to vibration, particularly that caused by a tuning fork placed on a bony prominence.

palliate /pal′ē·āt/ [L, *palliare,* to cloak], to soothe or relieve. —*palliation, n., palliative, adj.*

palliative treatment /pal′ē·ətiv′/ [L, *palliare,* to cloak, *tractare,* to handle], therapy designed to relieve or reduce intensity of uncomfortable symptoms but not to produce a cure. Some kinds of palliative treatment are the use of narcotics to relieve pain in a patient with advanced cancer, the creation of a colostomy to bypass an inoperable obstructing lesion of the bowel, and the debridement of necrotic tissue in a patient with metastatic malignancy. Compare **definitive treatment, expectant treatment.**

pallid /pal′id/ [L, *pallidus,* pale], lacking color.

pallidectomy /pal′idek′təmē/ [L, *pallidus,* pale; Gk *exome,* cutting out], the destruction of all or part of the globus pallidus by chemicals or freezing, in the treatment of Parkinson's disease.

pallidotomy /pal′idot′əmē/, the surgical production of lesions in the globus pallidus for the treatment of extrapyramidal disorders.

pallidum. See **globus pallidus.**

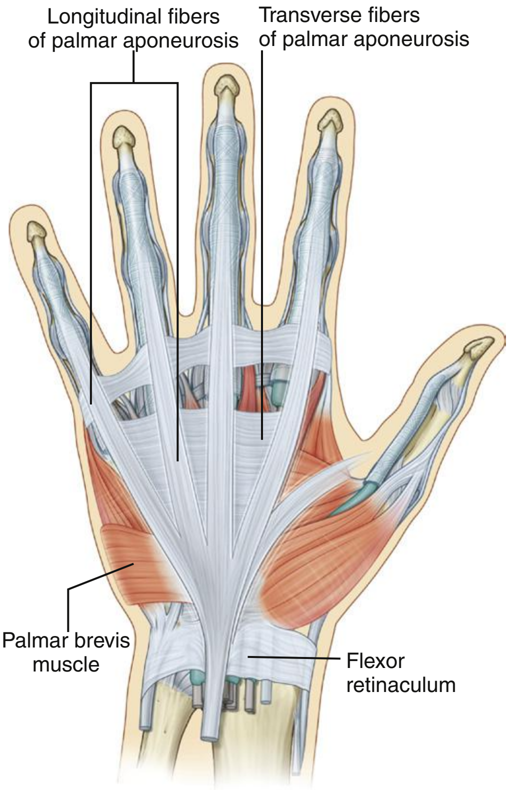
pallium. See **cerebral cortex.**

pallor /pal′ər/ [L, paleness], an unnatural paleness or absence of color in the skin.

palm /päm/ [L, *palma*], the flexor anterior surface of the hand, beyond the wrist to the base of the fingers, exclusive of the thumb and finger. —**palmar,** *adj.*

palm and sole system of identification, a method of identifying individuals by the patterns of ridges in the skin of the palms of the hands and soles of the feet. Like fingerprints, the patterns are helpful in identification of infants and others.

palmar /pal′mər/ [L, *palma*], pertaining to the palm.



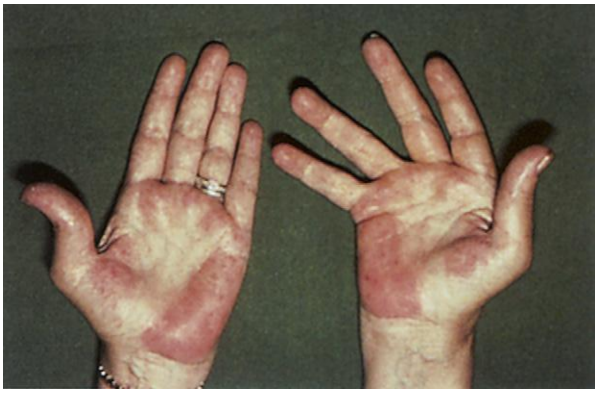
Longitudinal fibers of palmar aponeurosis
Transverse fibers of palmar aponeurosis
Palmar brevis muscle
Flexor retinaculum

Palmar aponeurosis *(Drake, Vogl, and Mitchell, 2010)*

palmar aponeurosis [L, *palma* + Gk, *apo,* from, *neuron,* nerve], a sheet of fascia under the skin of the palm and surrounding the muscles. Also called **palmar fascia.**

palmar crease, a normal groove across the palm of the hand.

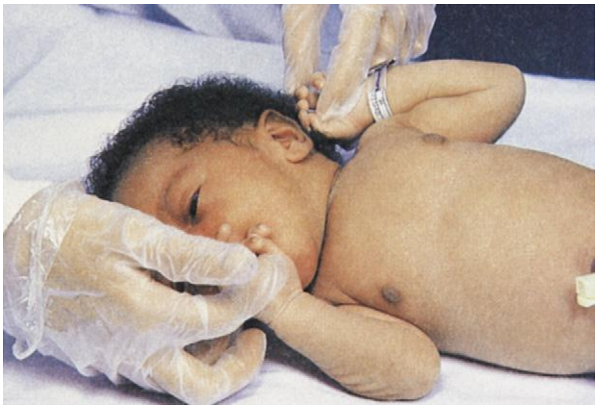
palmar erythema, an inflammatory redness of the palms of the hands.



Palmar erythema *(Moll, 1997)*

palmar fascia. See **palmar aponeurosis.**

palmar grasp reflex [L, *palma,* palm; ONorse, *grapa,* grab], a flexion of the fingers caused by stimulation of the palm of the hand. The reflex is present at birth and usually disappears by 6 months of age.

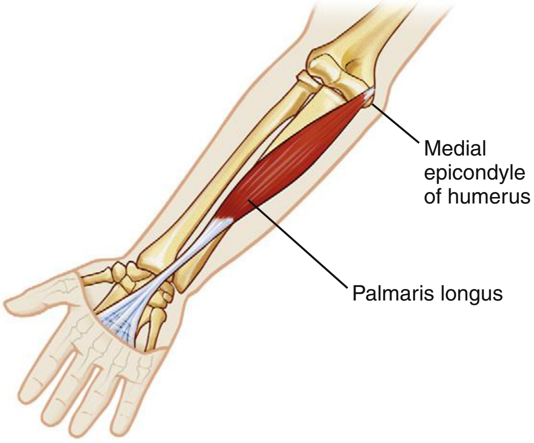


Palmar grasp reflex in the newborn *(Seidel et al, 2011)*

palmar interossei, the four unipennate muscles originating from the metacarpals of the digits with which each is associated. They adduct the thumb and the index, ring, and little fingers at the metacarpophalangeal joints.

palmaris brevis, a small intrinsic muscle of the hand that deepens the cup of the palm by pulling on skin over the hypothenar eminence and forming a distinct ridge. This may improve grip. Palmaris brevis is innervated by the superficial branch of the ulnar nerve.

palmaris longus /pəlmer′is/, a long, slender, superficial fusiform muscle of the forearm, lying on the medial side of the flexor carpi radialis that functions to flex the hand. Compare **flexor carpi radialis, flexor carpi ulnaris.**



Palmaris longus

palmar metacarpal artery, any one of several arteries arising from the deep palmar arch that supply the fingers.

palmar pinch, a thumbless grasp in which the tips of the other fingers are pressed against the palm of the hand. See also **pinch, tip pinch.**

palmar reflex, a reflex that curls the fingers when the palm of the hand is tickled.

palmature /pal′məchər/ [L, *palma*], an abnormal condition in which the fingers are webbed.

palm-chin reflex. See **palmomental reflex.**

Palmer notation, a system for designating teeth in which the mouth is divided into quadrants indicated by a right-angle symbol oriented right or left and up or down. The teeth in each quadrant are numbered from 1 to 8, starting with the central incisor and ending with the third molar. The system is no longer in general use. See also **FDI numbering system, universal tooth coding system.**

palmitic acid ($CH_3(CH_2)_{14}COOH$) /palmit′ik/ [L, *palma*], a saturated fatty acid that commonly occurs in animal and vegetable fats and oils. It is a carboxylic acid used in the production of soaps and candles. Also called **hexadecanoic acid.**

palmitin /pal′mitin/, a triglyceride consisting of palmitic acid present in palm oil and other vegetable and animal fats.

palmityl alcohol. See **cetyl alcohol.**

palmomental reflex /pal′məmen′təl/ [L, *palma* + *mentum,* chin, *reflectere,* to bend back], an abnormal neurological sign, elicited by scratching the palm of the hand at the base of the thumb, characterized by contraction of the muscles of the chin and corner of the mouth on the same side of the body as the stimulus. It is occasionally seen in normal individuals, but an exaggerated reflex may occur in patients with pyramidal tract disease, latent tetany, increased intracranial pressure, central facial paresis, and dementia. Also called **palm-chin reflex.**

palmoplantar erythrodysesthesia, hand-foot syndrome.

palmoscopy /palmos′kəpē/, detection of the pulse or heartbeat.

palonosetron, an antiemetic.

■ INDICATIONS: This drug is used to prevent nausea and vomiting associated with cancer chemotherapy.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

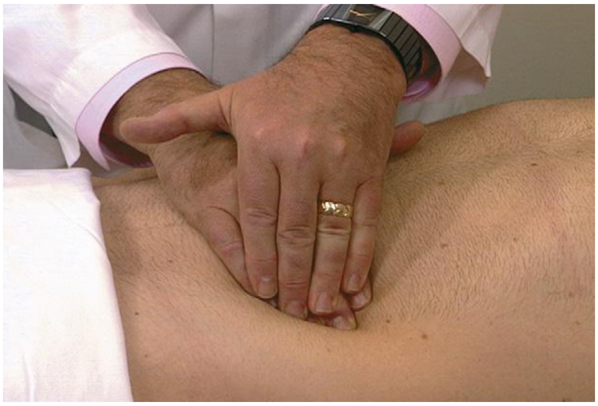
■ ADVERSE EFFECTS: Adverse effects of this drug include abdominal pain, weakness, hyperkalemia, anxiety, rash, and arthralgia. A rare life-threatening side effect is bronchospasm. Common side effects include diarrhea, constipation, headache, dizziness, drowsiness, fatigue, insomnia, fever, and urinary retention.

palpable /pal′pəbəl/ [L, *palpare,* to touch gently], perceivable by touch.

palpation /palpā′shən/ [L, *palpare,* to touch gently], a technique used in physical examination in which the examiner feels the texture, size, consistency, and location of certain body parts with the hands.—**palpate,** *v.*

Technique for light palpation *(Swartz, 2009)*

palpatory percussion /pal′pətôr′ē/ [L, *palpare,* to touch gently; *percutere,* to strike hard], a technique in physical examination in which the vibrations produced by percussion are evaluated by using light pressure of the flat of the examiner's hand.



Technique for deep palpation *(Swartz, 2009)*

palpebra. See **eyelid.**

palpebral commissure. See **canthus.**

palpebral conjunctiva. See **conjunctiva.**

palpebral fissure /pal′pəbrəl/ [L, *palpebra,* eyelid, *fissura,* cleft], the opening between the margins of the upper and lower eyelids.

palpebral gland. See **meibomian gland.**

palpebra superior /pal′pəbrə/, *pl. palpebrae superiores,* the upper eyelid, larger and more movable than the lower eyelid and furnished with an elevator muscle.

palpebrate /pal′pəbrāt/, **1.** *v,* to wink or blink. **2.** *adj,* having eyelids.

palpitate /pal′pitāt/ [L, *palpitare,* to flutter], to pulsate rapidly, as in the unusually fast beating of the heart under various conditions of stress and in certain heart problems.

palpitation /pal′pitā′shən/ [L, *palpitare,* to flutter], a pounding or racing of the heart. It is associated with normal emotional responses and with heart disorders. Some people may complain of pounding heart and display no evidence of heart disease, whereas others with serious heart disorders may not detect associated abnormal palpitations. Some patients complain of palpitations after receiving digitalis because it increases the force of heart contractions. **—palpitate,** *v.*

PALS, abbreviation for **pediatric advanced life support.**

palsy /pôl′zē/ [Gk, *para,* beyond, *lysis,* loosening], an abnormal condition characterized by paralysis. Some kinds of palsy are **Bell's palsy, cerebral palsy,** and **Erb's palsy.**

Paltauf's dwarf. See **pituitary dwarf.**

Paltauf's nanism /päl′toufs/ [Arnold Paltauf, Czechoslovakian physician, 1860–1893; Gk, *nanos,* dwarf], dwarfism associated with excessive production or growth of lymphoid tissue.

Pamelor /pam′ĕ-lor/, a trademark for a tricyclic antidepressant preparation of **(nortriptyline hydrochloride).**

-pamide, suffix for sulfamoylbenzoic acid–derived diuretics.

pamidronate disodium, the disodium salt of pamidronate, used in the treatment of malignancy-associated hypercalcemia, osteitis deformans, and osteolytic bone metastases associated with breast cancer and myeloma. It is administered intravenously.

-pamil, suffix for verapamil-type coronary vasodilators.

Pamine, a trademark for an anticholinergic **(methscopolamine bromide).**

***p*-aminohippurate** /ah-me′no-hip′u-rāt/, a salt, conjugate base, or ester of *p*-aminohippuric acid. The sodium salt is used to measure effective renal plasma flow and to determine the functional capacity of the tubular excretory mechanism.

pampiniform /pampin′ifôrm/ [L, *pampinus,* vine tendril, *plexus,* plaited], having the shape of a tendril.

pampiniform body. See **epoophoron.**

pampiniform plexus [L, *pampinus,* vine tendril, *plexus,* plaited], a network of veins in the spermatic cord that drains the testes into the testicular vein in the lower abdomen.

pan- /pan-/, prefix meaning "all": *panacea, pancarditis, pandemic.*

panacea /pan′əsē′ə/ [Gk, *pan,* all, *akeia,* remedy], **1.** a universal remedy. **2.** an ancient name for an herb or a liquid potion with healing properties. **3.** a remedy for all disease; a cure-all.

panacinar emphysema /pan′əsin′ər/ [Gk, *pan,* all + L, *acinus,* grape], one of the principal types of emphysema, characterized by relatively uniform enlargement of air spaces throughout the terminal bronchioles and alveoli. It is an inherited condition. Also called **chronic hypertrophic emphysema, diffuse emphysema, ectatic emphysema, generalized emphysema, panlobular emphysema, vesicular emphysema.**

Panafil, a trademark for a fixed-combination topical drug containing an enzyme **(papain).**

panagglutinable /pan′əglo͞o′tinəbəl/, pertaining to red blood cells that are agglutinable by the sera of all blood groups of the same species.

panagglutinin /pan′əglo͞o′tinin/, an antibody that causes clumping (agglutination) of red blood cells of all blood groups of a species.

Panama fever. See **Chagres fever.**

pananencephaly /panan′ensef′əlē/, pain that affects all parts of the body.

panangiitis /panan′jē·ī′tis/, an inflammation that affects all layers of a blood vessel.

panarteritis /-är′tərī′tis/ [Gk, *pan,* all, *arteria,* artery, *itis* inflammation], an inflammation that involves all the tissue layers of an artery.

panarthritis /-ärthrī′tis/ [Gk, *pan* + *arthron* joint], an abnormal condition characterized by the inflammation of many joints in the body. **—***panarthritic, adj.*

panatrophy /panat′rəfē/, **1.** a general atrophy of all parts of a body or structure. **2.** a rare disorder associated with atrophy of cutaneous and subcutaneous tissue, characterized by prominence of underlying body structures as all levels of skin and subcutaneous tissue are reduced in thickness.

panbronchiolitis /panbrong′kē·əlī′tis/, chronic inflammation and obstruction of the bronchioles caused by the accumulation of foam cells. It usually leads to bronchiectasis.

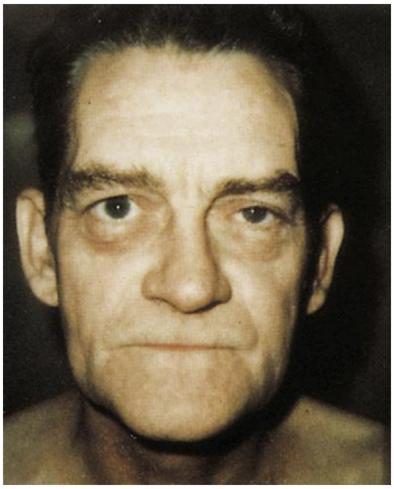
pancake kidney /pan′kāk/ [ME, *panne,* pan, *kaka,* cake, *kidnere*], a congenital anomaly in which the left and right kidneys are fused into a single mass in the pelvis. The fused kidney has two collecting systems and two ureters and frequently becomes obstructed because of its abnormal position.

pancarditis /-kärdī′tis/ [Gk, *pan* + *kardia,* heart, *itis,* inflammation], an abnormal condition characterized by inflammation of the entire heart, including the endocardium, myocardium, and pericardium.

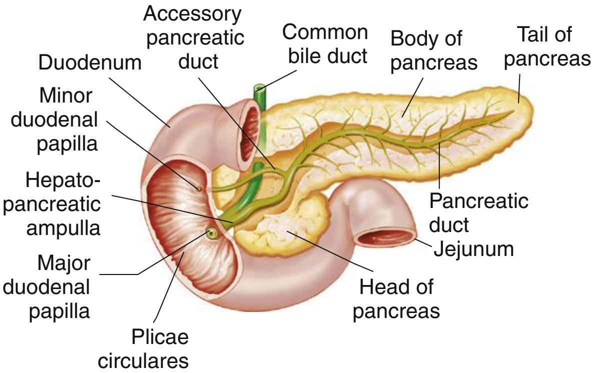
Pancoast's syndrome /pan′cōsts/ [Henry K. Pancoast, American radiologist, 1875–1939], **1.** a combination of signs associated with a tumor in the apex of the lung. The signs include neuritic pain in the arm, atrophy of the muscles of the arm and the hand, and Horner's syndrome and are caused by the damaging effects of the tumor on the brachial plexus and sympathetic ganglia. **2.** an abnormal condition caused by osteolysis in the posterior part of one or more ribs, sometimes involving associated vertebrae.

Pancoast's tumor. See **pulmonary sulcus tumor.**

pancolectomy /-kōlek′təmē/ [Gk, *pan* + *kolon,* colon, *ektomē,* excision], the excision of the entire colon, necessitating an ileostomy.



Pancoast's syndrome *(Skarin, 2010)*



Pancreas *(Patton and Thibodeau, 2010)*

pancreas /pan′krē·əs/ [Gk, *pan,* all, *kreas,* flesh], an elongated grayish pink lobulated gland that stretches transversely across the posterior abdominal wall in the epigastric and hypochondriac regions of the body and secretes various substances, such as digestive enzymes, insulin, and glucagon. It is divided into a head; a flattened, elongated body; and a tail in contact with the spleen. The head of the gland, divided from the body by a small constriction, is tucked into the curve of the duodenum. The tapered left extremity of the organ forms the tail. In adults the pancreas is about 13 cm long. A compound, mixed gland composed of exocrine and endocrine tissue, it contains a main duct that runs the length of the organ, draining smaller ducts and emptying into the duodenum at the major duodenal papilla, the same site that accommodates the entrance of the common bile duct.

pancreas scan, a radiographic scan of the pancreas after the IV injection of a radiopaque contrast medium, used for detecting various abnormalities, such as tumors, cysts, and infections.

-pancreat, suffix meaning "pancreas": *hepaticopancreatic, lienopancreatic, splenopancreatic.*

pancreatalgia /pan′krē·atal′jə/, pain in or near the pancreas.

pancreatectomy /pan′krē·ətek′təmē/ [Gk, *pan* + *kreas* + *ektomē,* excision], the surgical removal of all or part of the pancreas, performed to excise a cyst or tumor, treat pancreatitis, or repair trauma. The GI tract is reconstructed, usually with an anastomosis between the pancreatic duct and the upper jejunum. Drains are left in the wound. After surgery the patient is given a low-sugar, low-fat diet. If the entire pancreas is removed, a brittle type of diabetes develops, requiring precise management of both diet and insulin dosage. The patient may have an insulin pump. A frequent complication is the formation of a fistula in the pancreatic bile duct, allowing digestive enzymes to contact adjacent tissues.

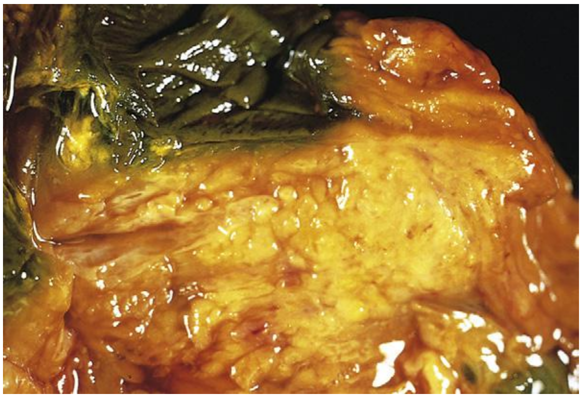
pancreatemphraxis /pan′krē·at′emfrak′sis/, hypertrophy or congestion of the pancreas caused by an obstruction in the pancreatic duct.

pancreatic abscess, an infection characterized by a collection of pus in or around the pancreas.

pancreatic autodigestion, premature breakdown of pancreatic zymogens into digestive enzymes that digest pancreatic tissue, causing acute pancreatitis.

pancreatic buds, two outgrowths, one dorsal and one ventral, from the endodermal lining of the caudal part of the embryonic foregut that fuse and develop into the pancreas.

pancreatic cancer [Gk, *pan* + *kreas* + L, *cancer,* crab], a malignant neoplastic disease of the pancreas characterized by anorexia, flatulence, weakness, dramatic weight loss, epigastric or back pain, jaundice, pruritus, a palpable abdominal mass, recent onset of diabetes, and clay-colored stools if the pancreatic and biliary ducts are obstructed. Symptoms depend on the location of the tumor within the pancreas or in metastatic sites. Diagnostic measures include barium radiographic studies of the stomach and duodenum, transhepatic cholangiography (endoscopic retrograde cholangiopancreatography), laboratory evaluation of liver function, celiac arteriography, computed axial tomography, and magnetic resonance imaging. Exploratory laparotomy is often required for a definitive diagnosis. About 90% of pancreatic tumors are adenocarcinomas; two thirds are in the head of the pancreas. Most tumors are not resectable at the time of diagnosis, but localized cancers in the pancreas may be treated by partial pancreatectomy with excision of the common bile duct, duodenum, and distal part of the stomach. Functioning islet cell lesions may be excised or treated with streptozocin, an antibiotic toxic to beta cells of the pancreas. Total gastrectomy is recommended for gastrin-producing islet cell tumors that are resectable and accompanied by severe peptic ulcer disease. Radiotherapy or chemotherapy with docetaxel, cisplatin, femocitabine, or mitomycin C may offer temporary palliation, but cancer of the pancreas has a poor prognosis. Few people live for more than 1 year after diagnosis. Most nursing care is of a palliative nature. Pancreatic cancer occurs three to four times more often in men than in women. Though uncommon, it is increasing in incidence in the industrialized areas of the world. People who smoke more than 10 to 20 cigarettes a day, have diabetes mellitus, or have been exposed to polychlorinated biphenyl compounds are at increased risk of development of pancreatic cancer.



Pancreatic cancer *(Kumar et al, 2007)*

pancreatic collum, neck of pancreas: a constricted portion marking the junction of the head and body of the pancreas.

pancreatic diabetes [Gk, *pan,* all, *kreas,* flesh, *diabainein,* to pass through], diabetes mellitus caused by a deficiency of insulin production by the islet cells of the pancreas. See also **diabetes mellitus.**

pancreatic diarrhea. See **Verner-Morrison syndrome.**

pancreatic diverticulum, one of a pair of membranous pouches arising from the embryonic duodenum. These two diverticula later form the pancreas and its ducts.

pancreatic dornase, an enzyme from beef pancreas that has been used as a mucolytic for upper respiratory infections and cystic fibrosis.

pancreatic duct, the primary secretory channel of the pancreas. Also called **duct of Wirsung.** Compare **accessory pancreatic duct.**

pancreatic enzyme, any one of the enzymes secreted by the pancreas in the process of digestion. The most important are trypsin, chymotrypsin, steapsin, and amylopsin. See also **pancreatic juice.**

pancreatic enzyme digestion, the action of pancreatic enzymes in the process of breaking down food into its constituents.

pancreatic enzyme therapy, replacement therapy for conditions of pancreatic insufficiency with malabsorption, such as cystic fibrosis.

pancreatic hormone, any one of several chemical compounds secreted by the pancreas and associated with the regulation of cellular metabolism. Major hormones secreted by the pancreas are insulin amylin, glucagon, somatostatin, and pancreatic polypeptide. Somatostatin is secreted by the delta cells, and pancreatic polypeptide is secreted by a group of glandular cells arranged in a halo around each islet of Langerhans. Insulin is secreted by beta cells of the islets of Langerhans; glucagon is secreted by alpha cells of the islets of Langerhans.

pancreatic insufficiency, a condition characterized by inadequate production and secretion of pancreatic hormones or enzymes. It usually occurs secondary to a disease process destructive to pancreatic tissue. Nutritional malabsorption, anorexia, poorly localized upper abdominal or epigastric pain, malaise, and severe weight loss often occur. Alcohol-induced pancreatitis is the most common form of the condition. Supportive care, specific treatment of the cause, and replacement or augmentation of the absent or lacking substances are usually recommended as therapy for pancreatic insufficiency.

pancreatic juice, the fluid secretion of the pancreas, produced by the stimulation of food in the duodenum. It contains water, protein, inorganic salts, and enzymes. The juice is essential in breaking down proteins into their amino acid components, reducing dietary fats to glycerol and fatty acids, and converting starch to simple sugars.

pancreatic lithiasis. See **pancreatolithiasis.**

pancreaticoduodenal /pan′krē·at′ikōdo͞o′ədē′nəl/, pertaining to the pancreas and duodenum.

pancreaticoduodenectomy /pan′krē·ətōdo͞o′ədənek′təmē/ [Gk, *pan* + *kreas* + L, *duodeni,* twelve fingers; Gk, *ektomē,* excision], a surgical procedure in which the head of the pancreas, the entire duodenum, a portion of the jejunum, the distal third of the stomach, and the lower half of the common bile duct are excised, usually to relieve obstruction caused by tumors, often malignant. Continuity is reestablished between the biliary, pancreatic, and GI systems. The operation is performed to remove the periampullary masses that occur in certain forms of biliary tract cancer. Also called **Whipple procedure.**

pancreaticolienal node /pan′krē·at′ikō′lī·ē′nəl/ [Gk, *pan* + *kreas* + L, *lien,* spleen, *nodus,* knot], a node in one of three groups of lymph glands associated with branches of the abdominal and pelvic viscera that are supplied by branches of the celiac artery. The pancreaticolienal nodes accompany the splenic artery along the posterior surface and the upper border of the pancreas. Their afferent vessels, which originate from the stomach, the spleen, and the pancreas, join the celiac group of preaortic nodes. Also called **splenic gland.** Compare **gastric node, hepatic node.**

pancreatic rest, ectopic pancreatic tissue, usually in the stomach or small intestine, forming a polyplike lesion.

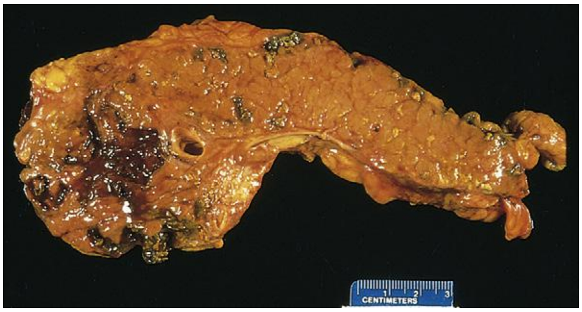
pancreatin /pan′krē·ətin′, -krē·ā′tin/, a concentrate of pancreatic enzymes from swine or beef cattle.

■ INDICATIONS: It is prescribed as an aid to digestion to replace endogenous pancreatic enzymes in cystic fibrosis and after pancreatectomy.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to pork or beef protein, acute pancreatitis, or a flare in chronic pancreatitis prohibits its use.

■ ADVERSE EFFECTS: There are no known serious adverse effects. High doses may cause nausea or diarrhea.

pancreatitis /pan′krē·ətī′tis/ [Gk, *pan* + *kreas* + *itis,* inflammation], an inflammatory condition of the pancreas that may be acute or chronic. **Acute pancreatitis** is generally the result of damage to the biliary tract, as by alcohol, trauma, infectious disease, or certain drugs. It is characterized by severe abdominal pain (generally epigastric or upper left) radiating to the back, fever, anorexia, nausea, and vomiting. There may be jaundice if the common bile duct is obstructed. The development of pseudocysts or abscesses in pancreatic tissue is a serious complication. Treatment includes nasogastric suction to remove gastric secretions. To prevent any stimulation of the pancreas, nothing is given by mouth. The client may be given antacids to decrease the acid, which stimulates the pancreas. IV fluids and electrolytes are administered, and nonmorphine derivatives are given to relieve pain. The causes of **chronic pancreatitis** are similar to those of the acute form. When the cause is alcohol abuse, there may be calcification and scarring of the smaller pancreatic ducts. Abdominal pain, nausea, and vomiting occur, as well as steatorrhea and creatorrhea, caused by the diminished output of pancreatic enzymes. Pancreatic insulin production may be diminished, and diabetes mellitus develops in some patients. Treatment includes analgesics for pain and subtotal pancreatectomy when pain is intractable. A pancreatic extract is given orally to replace the missing enzymes; vitamin supplements are essential; and calcium supplements may be needed. Both forms of pancreatitis are diagnosed by history, physical examination, radiological studies, endoscopy, and laboratory analysis of the amount of pancreatic enzymes in the blood.



Acute pancreatitis *(Kumar et al, 2007)*

pancreatoduodenostomy /-do͞o′ədənos′təmē/, a surgical procedure to establish a fistula or duct from the pancreas into the duodenum.

pancreatogastrostomy /-gastros′təmē/, the surgical establishment of a fistula or duct from the pancreas to the stomach.

pancreatogenic /-jen′ik/, originating in the pancreas.

pancreatography /pan′krē·ətog′rəfē/ [Gk, *pan* + *kreas* + *graphein,* to record], visualization of the pancreas or its ducts by radiography following injection of a contrast medium into the ducts at surgery or via an endoscope, or by ultrasonography, computed tomography, or radionuclide imaging.

pancreatojejunostomy /-jij′o͞onos′təmē/, the surgical establishment of a fistula or duct from the pancreas to the jejunum.

pancreatolith /pan′krē·at′əlith/, a stone or calculus in the pancreas.

pancreatolithiasis /pan′kre·ətolithī′əsis/, the presence of calculi in the pancreas or pancreatic duct.

pancreatolithotomy /lithot′əmē/, the surgical removal of pancreatic calculi.

pancreatolysis /pan′krē·ətol′isis/, destruction of the pancreas by pancreatic enzymes.

pancreatomegaly /-meg′əlē/, an abnormal enlargement of the pancreas.

pancreatopathy /pan′krē·ətop′əthē/, any disease of the pancreas.

pancreatotomy /pan′krē·ətot′əmē/, a surgical incision in the pancreas.

pancreatropic /pan′krē·ətrop′ik/, exerting an influence on the pancreas. Also called *pancreatotropic*.

pancreolauryl test, (for pancreatic function) the oral administration of fluorescein dilaurate and the monitoring of its cleavage to yield lauric acid as a measure of pancreatic esterase activity.

pancuronium bromide /pan′kyərō′nē·əm/, a skeletal muscle relaxant; a nondepolarizing neuromuscular blocker.

■ INDICATIONS: It is prescribed as an adjunct to anesthesia and mechanical ventilation.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to other bromides prohibits its use. Ventilation always must be supported during the use of neuromuscular blockers. Patients with renal and hepatic disease require dosage adjustments, and pancuronium is not recommended during pregnancy. Some diseases (e.g., myasthenia gravis) can potentiate the effects of pancuronium, whereas others (e.g., diabetes mellitus) can antagonize the drug's effects.

■ ADVERSE EFFECTS: The most serious adverse effects are prolonged muscle relaxation and respiratory depression.

pancytopenia /pan′sītəpē′nē·ə/ [Gk, *pan* + *kytos,* cell, *penia,* poverty], simultaneous reduction in red blood cell, white blood cell, and platelet counts. See also **anemia, aplasia, neutropenia. —pancytopenic,** *adj*.

pancytopenia-dysmelia. See **Fanconi's anemia.**

pancytopenic. See **pancytopenia.**

p and a, abbreviation for *percussion and auscultation,* as noted in the patient's chart after physical examination of the chest.

pandemia /-dē′mē·ə/ [Gk, *pan,* all, *demos,* people], a disease epidemic that affects all or most of a population group.

pandemic /-dē′mik/ [Gk, *pan* + *demos,* people], (of a disease) occurring throughout the population of a country, a people, or the world.
